Abstract
With the recent adoptions of 1:1 technology initiatives such as the iPads in schools, it is urgent to provide appropriate professional development opportunities for teachers to maximize student use of the technology. This study provides vital information on the professional development needs of teachers for initial implementation of technology such as the iPad device and what is needed beyond the first year to sustain use in classrooms. One hundred and ninety-one teachers from 10 school districts participated in the study. The results of this study indicate that successful professional development occurs when teachers are allowed time to collaborate with colleagues and learn from peers on how they integrated curriculum with the technology. Collaboration with peers and work time was more important to teachers than one-on-one coaching, or large group professional development. Teachers also voiced a need for ongoing, differentiated professional development due to the wide range of teacher expertise and learning levels with technology.

Keywords: Professional development, 1:1, iPad, integration, implementation, 21st Century Skills
Classroom instruction in a 1:1 environment with technology has increased in schools since the initial iPad launch in 2010 and launch of similar tablet devices. To support teachers’ use of technology for instruction, some schools use professional development time to train teachers on how to use the device and how to integrate the technology into their curriculum. Initial training on the device, learning management systems, and content-specific apps are common during initial adoption as teachers implement the device for the first year, but little research has identified specific professional development activities or topics that teachers feel are needed to sustain the technology use in the classroom. For teachers to use technology to increase student achievement and prepare students with 21st century skills, teachers need to be provided with specific professional development not only to initially implement the technology use, but also to sustain the use on a daily basis as the technology evolves. Research on technology adoption and integration clearly states that if school districts fail to recognize and plan for regular, relevant, and ongoing professional development they are not likely to see widespread use or benefit to most students (Topper & Lancaster, 2013). In addition, specific professional development activities or topics to support classroom instruction with an iPad or similar tablet technology have not been identified. But teachers have identified that they long for professional development to take them to a higher level, the need for more professional development, and time prep with the technology (Chou, Block, & Jesness, 2012; Pogany, 2009). Learning from teachers who have been using the tablet devices provides a foundation for professional development needs specific to the iPad device and can identify other needs for future research in technology integration.
Literature Review

Reform in education has called for increased use of technology in schools to increase student achievement and technology skills. Technology integration, in which the students are the primary user of technology, results in increased student understanding, engagement, and critical thinking (Sheehan & Nillas, 2010). According to Lei (2010), the quantity of technology use has no impact on student achievement, but high-quality technological usage is beneficial to students academically. With the increase of technology in the classroom, the skills that teachers now need to develop and deliver curriculum and instruction has changed. It is critical for teachers to learn how to use the modern day technology to deliver instruction on a daily basis.

According to the National Center for Education Statistics (NCES), in 2009, the ratio of students to computer in a classroom every day was 5.3 to 1. Yet, only 41% of elementary and secondary teachers surveyed use technology often and only 29% sometimes use technology. Previous barriers of limited technology resources have now been reduced as many schools in the United States are moving to 1:1 learning environments (Bebell & O’Dwyer, 2004; Bouterse, Corn, & Halstead, 2009; Inan & Lowther, 2010b; Spires et al., 2012). With the rapid increase of technology, barriers still exist that prevent teachers from integrating technology into their daily curriculum. According to the National Education Association (NEA) and the American Federation of Teachers (AFT), a survey of 1,923 teachers showed there was little evidence that teachers were able to successfully use computers in their teaching yet they had access in their classrooms (NEA, 2008). Failure to use technology effectively can result in a digital disconnect for students and limit the effectiveness of 1:1 initiatives (Dornisch, 2013; Levin & Arafeh, 2002). Some researchers report the overall impact of 1:1 initiatives on student achievement over the last decade is still unclear (Abell, 2008; McLester, 2011; Storz & Hoffman, 2012). Maine
continues to be the largest program of 1:1, despite lack of clear evidence of results (McLester, 2011). Other research groups have documented increased student achievement when technology is integrated successfully in the classroom and the technology can improve student learning and engagement in lessons using technology (Bebell & Kay, 2010; Cheung & Slavein, 2011; Judson, 2010; Shin, Sutherland, Norris, & Soloway, 2011).

As schools continue to acquire more technology, the benefit to students will depend on the teacher’s technological skills and uses in the classroom. Many teachers are still uncomfortable in blending traditional pedagogies with those required to teach in a 1:1 environment (Donovan, 2007). Storz and Hoffman (2012) reported that before and after implementation of a 1:1 initiative, teachers reported feeling unprepared, frustrated, and out of their comfort zone and the shift of teaching practices has not dramatically changed (Storz & Hoffman, 2012). This literature review provides information on technology integration, 1:1 technology adoptions, barriers to technology integration, and the need for research in professional development practices to support teachers in the implementation and sustained classroom use of 1:1 technology.

Technology Integration

Many different definitions for technology integration in education exist in research. Various research groups have attempted to define technology integration into steps or phases for an educator and the skills that are performed (Cuban, Kirkpatrick, & Peck, 2001; Mills & Tincher, 2003; Sandholtz, Ringstaff & Dwyer, 1997). Most recently, schools have used SAMR (Substitution, Augmentation, Modification, and Redefinition) as a framework to evaluate technology integration (Puentedura, 2013). While technology integration lacks a common definition, the common idea of using computing devices (tablets, laptops or PCs) for
instructional purposes is consistently referred to as integration. Some teachers use technology primarily to deliver instruction (Bauer, 2002; Moersch, 1995), however, this would be considered technology use and is different than technology integration. For teachers to use technology as a tool for learning, it incorporates pedagogical principles of active learning, mediation, collaboration, interactivity, and is used to augment or improve instruction (Gorder, 2008; Kulik, 2003; Ross, Hogaboam-Gray & Hannay, 2001). Basic levels of technology integration would be using technology as a substitute for a common classroom practice such as research or writing a paper. In higher-level technology integration, students are using technology to collaborate with someone outside the school or creating an interactive presentation with video or audio that the student has created. Teachers must have the basic knowledge of technology in order to decide when or how to use the technology with the students. In order to effectively use technology, teachers must have also the knowledge and skills to integrate technology beyond substitution and augmentation of existing curriculum. The idea of technology integration is for the learning environment to be more student-centered, transitioning to where the learning activities that are occurring would not have been possible without the use of the technology. Technology integration takes place at different levels depending on the teacher and the situation, and should not be measured by the amount of time technology is used (Earle, 2002). According to previous studies, several factors can lead to effective technology integration: access to technology and support (Hohlfeld, Ritzhaupt, Barron & Kemker, 2008); teachers’ beliefs and attitudes (Becker, 2000; Chen, 2008; Jimoyiannisa & Komisb, 2007; Lim & Chai, 2008; Van Braak, Tondeur, & Valcke, 2004; Vannatta & Fordham, 2004; Wozney, Venkatesh, & Abrami, 2006); pedagogical, content, and technological knowledge (Koelher & Mishra, 2006; Pierson, 2001); demographic characteristics of teachers, such as years of teaching (Bebell, Russell, &
O’Dwyer, 2004; Van Braak, 2001); and ongoing professional development (Becker, 2000); and teaching models or mentors (Bitner & Bitner, 2002).

Despite the barriers, technology integration will continue to be a theme in schools as the rate of placing devices in students’ hands in a 1:1 environment increases. Therefore, continued research in this area to best support teaching will be ongoing. Successful integration into a class ultimately will depend on the teacher regardless of what type of computing device. Common movements in 1:1 adoptions today include laptop or tablet devices over desktop environments. This change is due to the declining cost, increased availability of wireless Internet, curriculum resources from textbook companies that are Internet based, student accommodation features for special education, durability, size, and portability. Also, many educational content-specific applications or apps have been developed for classroom use. Apps are self-contained programs or software designed for mobile technology.

Generally, 1:1 programs are designed to increase academic achievement, increase student engagement, transform the learning environment, increase equity, and increase student’s skills to compete in the 21st century (Abell, 2008). In a 1:1 teaching environment, teachers use computer devices to meet both the professional needs of the teacher and to support the needs of students. Technology in schools can help student learning, prepare students for the future, increase quality of instruction and increase student engagement (Abell, 2008; Hew & Brush, 2006; Lowther, Inan, Strahl & Ross, 2008). One-to-one initiatives also vary on the amount or level of use in each classroom where some teachers use it on a daily basis using multiple apps where other teachers use it occasionally as they see fit into their curriculum. The challenge teachers face today is redesigning lessons for the 1:1 environment where it is not just a tool in the classroom but the teaching and learning for students is different from the past. To truly change the nature
of teaching in a 1:1 environment, it takes a significant transformation in how teachers teach (Pogany, 2009). Research on professional development to understand how to change teacher instruction using 1:1 technology is needed. Research related specifically is needed with iPads. Instruction with iPads is relatively new and instruction relies on course specific apps loaded on the mobile device and/or access to other content via the Internet. According to Tim Cook, CEO of Apple, iPads make up 94% of the market share for educational tablets (Cheng, 2013). Due to the high use in schools of iPads, the need to research iPad specifically benefits a large amount of schools and teachers. It is recognized that technology will continue to evolve, but research in this area provides a base knowledge that could apply to later technologies.

**Teacher Barriers to Technology Integration**

As teachers gain the access to technology in their classroom and begin the implementation process, the level of integration differs among teachers. Based on a study of classroom teachers’ experiences, the primary motivation for teachers to use technology is the belief that the technology will improve them as a professional and it will positively impact student learning (Ottenbreit-Leftwich, Glazewski, Newby, & Ertmer, 2010). While most teachers believe that technology will benefit students, many of today's educators fail to integrate technology into their curriculum or integrate it in a meaningful way. Confusion in teacher practices lies, in part, in the definition of technology integration. Technology integration is not just simple technology use for grading or looking up resources. Technology integration is teachers using technology on a daily basis within lessons (Gorder, 2008). For example, technology integration could mean collaboration with students in different schools in real-time to write a story, or perhaps narrating a story by capturing an audio clip and embedding it in the document. With the increased access to technology devices for both teachers and students and availability of 1:1 Internet access, teaching with technology and technology integration is more than a substitution of what was done in the past. Technology
integration in today’s classrooms should be redefining learning activities in ways that could not have been done in the past. Integration is still limited in teacher practice. This problem of technology integration is not new (Al-Bataneh, Anderson, Toledo & Wellinksi, 2008). Increased availability of technology devices in schools does not necessarily lead to improvement in teaching practices (Inan & Lowther, 2010). Some barriers that have been identified include fear, time, hardware, training, support, climate, technology skills, teaching experience, age, beliefs, and professional development (Hew & Brush, 2007; Inan & Lowther, 2010). Studies have been conducted to identify what factors predict if teachers will integrate technology, but the results have been conflicting. Teachers’ beliefs and readiness, along with support and professional development, were reported by Inan & Lowther (2010a) as key factors as to whether a teacher would integrate technology. However, Males (2011) reported that teacher beliefs and attitudes were not the main reasons a teacher decides to integrate technology nor was amount of time a teacher has been at a school have a bearing on how much that teacher will integrate technology. Educators engaging in professional learning programs that are focused on instructional technology has been found to increase the level of technology use in the classroom, increase student achievement, and alter their beliefs in educational technology (Carter, 2008). Schools do provide educators with various levels of professional development, but effective integration is not happening (Bauer & Kenton, 2005). Therefore, identification of professional development that teachers perceive as beneficial is important as more and more schools convert to a 1:1 environment with technology.
Professional Development

Professional development related to technology integration is now of importance to schools as teachers must change how they teach. Professional development is a cornerstone in professional growth (Carter, 2008). Professional development has taken on various forms over the last 40 years due to research in the field and the spread of information with technology. Strategies for professional development include workshops, expert training, learning communities, job embedded learning, and shared decision-making (Carter, 2008). Not all strategies of professional development work equally well and success may depend on the goal or focus. Professional development efforts that fail tend to be those where the activities are irrelevant to teacher classroom practice or one-shot approaches with little follow-up. Effective professional development is organized around real teacher practice, provides teachers with the opportunity to work and learn together, and brings together teachers who are engaged in similar efforts (Mouza, 2002). In addition, high quality professional development should focus on training teachers to improve student learning and achievement (Carter, 2008).

Teachers no longer have the option to not use technology when they teach if technology is available. Teachers who have been teaching for many years may not have been trained with the same level of technology skills as those who are currently graduating from teacher preparation programs, since most teacher preparation programs infuse technology to varying degrees. Regardless, instructional strategies designed in the past are no longer appropriate in today’s classroom and teachers must be more advanced technology users and implement new teaching strategies (Brooks-Young, 2005). The International Society for Technology in Education (ISTE) established standards for both teachers and students in 2008 to encourage teachers to focus on 21st century skills and to use technology to learn and explore and not simply
just employ technology. Teaching strategies must prepare students with digital age skills. The current standards are focused on higher-order thinking skills and digital citizenship. The standards encourage teachers to help students: (1) demonstrate creativity and innovation; (2) communicate and collaborate; (3) conduct research and use information; (4) think critically, solve problems, and make decisions; and (5) use technology effectively and productively (ISTE, 2008). In order for teachers to adopt new technology standards, professional development must be offered to aid in alignment with these new strategies to effectively incorporate technology.

Frequent professional development that focuses on technology integration is needed for teachers to move from a level of uncertainty to familiarity (Al-Bataineh et al., 2008; Lawless & Pellegrino, 2007; Sugar & Kester, 2007). An expansive literature review conducted by Lawless and Pellegrino (2007) on professional development related to technology found that the best professional development programs are spread out over time with opportunities for follow-up and feedback; and fragmented professional development of one hour or one day does not meet the pedagogical needs of teachers. A realistic technology integration plan should span two-to-five years to get a return for the investment and should include clear expectations, mentoring and practice (Hinson, Laprarie, & Cundiff, 2005; Tournaki, Lyublinkaya, & Carolan, 2011).

Professional development should also be designed to meet the needs of the teacher. Teachers are more likely to integrate technology into their teaching when the professional development is aligned to the content they are expected to teach and it is relevant and useful to their teaching (Penuel, Fishman, Yamaguchi, & Gallagher, 2007). At this time, it is not clear what specific professional development activities teachers feel are most effective to integrate and sustain iPad technology implementation in secondary classrooms. In a recent study of an iPad implementation project, teachers did not feel they had support in the content areas and relied on
colleagues and students for support. This study also indicated that pedagogical behaviors of the teachers remained unchanged after the implementation (Benton, 2012). More information on the type of professional development to support teachers is needed.

**Theoretical Framework**

Challenges in a 1:1 environment still exist with technology integration and teacher use on a daily basis. Although many studies have been conducted to identify teacher barriers, many of those barriers have been eliminated: the number of devices seem to be ubiquitous, students no longer lack technology skills and are often more advanced than the teacher, the Internet connectivity has improved with wireless environments, technology software and hardware is easier to use, and teacher training is prevalent in teacher preparation programs. There appears to be little effort in the amount of daily classroom integration even with readily available technology and research must continue to find out the underlying cause of the problem (Males, 2011). Research in this area could help identify specific professional development that can lead to best practice teaching with this technology. It could also identify when and where the professional development should take place for teachers to most effectively integrate technology.

Second, if technology has been integrated into the classroom, what additional support is needed to sustain the use of technology integration beyond the first year? Research should be conducted to identify strategies that help teachers to implement and sustain technology use at a higher level in the classroom (Mills & Tincher, 2003). Identification of what teachers feel is important for professional development allows for targeted professional development in other schools that are initiating 1:1 technology integration plans. Schools often have limited funding and limited time devoted to professional development and often have professional development needs related to curriculum or district trainings in addition to technology. This research could
assist in making better use of the professional development funds and time.

Lastly, with the need to teach students the skills required for the 21st century, professional development related to technology as a whole needs to be addressed to change teacher practice. We need to consider how to move teachers toward student-centered practices (Ottenbreit-Leftwich et al., 2010). Sheehan and Nillas (2011) have determined that technology integration, in which students are the primary users of the technology, results in increased student understanding, engagement, and critical thinking. Relationships between student achievement and technology use in a statewide study in Idaho showed a statistical significant effect size different in achievement gains based on whether their teachers used technology (Ravitz & Mergendoller, 2002). Yet, teachers still struggle with student-centered instruction especially related to technology. Student-centered instruction is still problematic as teachers focus more on superficially teaching the technology rather than collaborative problem solving or authentic tasks (Polly & Hannafin, 2010). Teachers lack good models to emulate for effective integration of technology in the curriculum (Bitner & Bitner, 2002). Professional development strategies should be designed to show how the technology could enhance student learning. Research is needed to understand high-quality practices for training teachers on strategies to use technology. Continuing to explore the needs of teachers will help move forward 1:1 implementation adoption plans and advanced professional development strategies to propel teachers to a higher level of integration (Pogany, 2009).

**Purpose of the Study**

The purpose of this study was to identify professional development activities or topics that were necessary for technology implementation in secondary classrooms with the iPad and also activities or topics teachers still need to sustain integration in secondary classrooms. This
study also determined if the professional development needs differed based on demographic data of the teachers and the availability of content-specific electronic curriculum resources. Identification of professional development needs that are more strategic towards teachers’ needs can help administration make informed decisions on how to allocate resources for future professional development.

**Research Questions**

1. What professional development activities/topics do teachers identify as necessary for iPad implementation in secondary classrooms?

2. What professional development activities/topics do teachers still need to sustain iPad use in secondary classrooms beyond the first year?

3. Is there a difference in professional development needs for iPad use based on the demographic characteristics of the teachers?

4. Is there a difference between the professional development needs of teachers and the availability of electronic textbooks, curriculum resources, and iPad apps?
Methodology

This study used a mixed methods approach to identify professional development activities and topics that were critical for implementation of iPad technology and what is still needed to sustain the use of the iPads beyond the first year of adoption. A survey instrument was used to collect data on professional development activities and topics critical to implement or sustain iPad integration. The survey was designed by the researcher since a survey tool to identify professional development activities and topics for iPad implementation or sustainability could not be found. The survey consisted of four multiple response questions to identify professional development activities and topics needed to implement and sustain iPad use in classrooms. Open-ended questions were also used to identify any challenges, positive elements, or additional information they wanted to share related to professional development.

Demographic data was collected on content taught, age, gender, years teaching with the iPad, and ethnicity to determine if a difference exists between professional development needs and teacher demographic characteristics. Lastly, multiple response questions were used to identify if content-specific electronic resources, curriculum, and apps are available to determine if there is a difference in the professional development needs based on the availability of electronic resources. The focus population was teachers using iPad devices in schools with 1:1 adoption programs and who have been using the iPads for more than nine months. Twenty-seven school districts in Minnesota were identified with secondary teachers who have used iPads for more than nine months. Ten districts agreed to participate in the study. A total of 533 teachers were invited to participate from the 10 identified school districts. A 90% confidence interval was achieved with 191 teachers participating in the study. This was a volunteer sampling of secondary teachers who have used iPads.
Data Analysis

Quantitative data from the survey was exported from Qualtrics into Statistical Package for Social Sciences (SPSS). Quantitative data from the survey was used to identify professional development activities and topics needed to implement and sustain iPad use. Quantitative data from the survey was also used to determine if the professional development needs for teachers differ based on the availability of electronic resources. Calculating descriptive statistics and creating frequency distributions comprised much of the data analysis. A Pearson Chi-Square test was used to examine the relationship between the professional development needs and demographic characteristics (the content taught, age, years teaching with iPads, and gender). A Pearson Chi-Square test was also used to examine the relationship between the professional development needs and the availability of electronic resources.

Qualitative data was obtained from the open-ended questions related to professional development challenges, successes, and additional information related to professional development and iPad integration. This data was organized and coded into themes by the researcher. The database of the qualitative data was compared to the quantitative data results.

Results

The results showed differences between professional development activities for implementation and what is needed to sustain beyond the first year. The professional development activities needed for implementation reported by teachers included iPad device training, iPad app training, and learning management training. The researcher expected these results, since during the first year of using the device, it would seem likely more training would be required to learn the device. As technology continues to evolve with the iPad or other devices,
professional development during implementation phases would need to address training on the device.

Learning how to use apps on the device was also needed for implementation according to the teachers. New apps are continually being released, but some apps for education are fairly standard within schools. Learning how to integrate the apps into traditional instruction or a former lesson is a challenge that teachers now face. While this finding may be more specific to the iPad, this could be applied to other devices that have similar platforms.

Training on learning management systems was also reported as needed professional development during implementation. Depending on the school district of choice, learning management systems such as Schoology, Edmodo, and Moodle all have different functions for delivery of curriculum. Training on how to upload content, release content for student use, and deliver assessments are some of the various tasks that are needed within the first year.

Lower in priority, but still a need during implementation, was professional development related to instructional strategies with technology. Teaching with technology in the students’ hands, should be less teacher-centered and more student-centered. To keep students engaged, instructional strategies should differ from traditional classroom instruction. The need for instructional strategies carried through to what is needed during sustaining years. As teachers become more comfortable with the device itself, this appears to be a greater need.

Lastly, collaboration with colleagues on technology was a professional development activity that teachers need not only during the implementation phase, but also to sustain iPad use beyond the first year. A teacher learning from other teachers on how to change lessons or how to use the technology to engage students was reported as critical for professional development by many teachers and was supported in the qualitative data as well.
Professional Development Topics

This study shows that teachers feel professional development on instructional strategies is a necessity for sufficient integration. Teacher identified instructional strategies as important for professional development both during implementation and what is needed to sustain beyond the first year. Instruction with devices in the hands of students is very different than a traditional teacher centered lesson. This was not surprising to the researcher because instructional strategies when first using the iPad should look different than traditional instruction. Teachers would no longer be using paper and pencil activities, but lessons and instruction would be more interactive using apps and Internet-based activities.

Other topics for professional development voiced by teachers were classroom management and engagement. More teachers identified classroom management as a topic needed for implementation that shifted to engagement as a topic needed to sustain beyond the first year. Classroom management and engagement are two topics for teachers that go hand-in-hand. If students are engaged, classroom management issues are reduced. If a teacher has good classroom management, it is easier to engage the students in learning. Simply putting the device in a student’s hands does not guarantee engagement or classroom management. The information provided from the qualitative data indicated an increase of students being off-task and trouble with students playing games or being on sites other than what was supposed to be used for instruction. Therefore, teachers expressed frustration and value in professional development related to this topic of management and engagement.

Course design and assessment seemed to be less important topics for teachers for professional development during implementation compared to what is needed for sustaining use. The researcher suspects from personal experience that as a teacher becomes more familiar with
how to use the device, the activities and topics would naturally shift to better instructional practices and course design or assessment. This was also found in a 1:1 study when integrating laptops; there is an evolution that occurs once teachers become familiar with the functionality of the device (Pogany, 2009).

**Qualitative Interpretation**

To provide a richer description of the professional development needs, three open-ended questions were used to identify challenges, successes, or additional information with iPad integration. The responses were hand-coded into themes based on the similarity of response. The qualitative data further sheds light on the specific challenges and successes with professional development and additional information related to iPad integration that was not captured in the close-ended questions. Classroom management and engagement seems to be a greater challenge with the iPad device, and teachers reported the need for professional development in this area. While other studies have indicated increased engagement with technology use, teachers voiced management and engagement as a challenge with issues related to gaming. Perhaps this is a natural occurrence with the iPad since one primary use of the iPad device is iPad gaming apps. Many teachers mentioned that students have a hard time transitioning from gaming to a learning device. The results are similar to results in a 1:1 integration study with laptops in that classroom management is different with a classroom of students looking at the devices and the social interactions and attention of students changed (Pogany, 2009).

Lack of time for training and time for collaboration was also a concern with many teachers as a challenge to the professional development for iPad integration. This correlates well with the activities teachers identify as critical for implementation and needed to sustain iPad integration beyond the first year. The challenges of learning how to use the device or a specific
app and then having no time to play or incorporate that into existing lessons was reported. Time to collaborate with colleagues was limited and some of the successes of the professional development happened when they could learn from others. One teacher stated, “Collaborating with colleagues has been the most beneficial to me. We all have things that work well, and it’s very important to share those ideas.” Another reported, “When we have time to see how other teachers are integrating iPads into their curriculum and are given specific ideas to use in our content areas, I feel that the PD is successful. Most people are intrigued by seeing awesome ideas others have and think, ‘hey, I could do that’, that's pretty cool.” The need for collaboration and time was a major finding in other technology integration studies (Pogany, 2009; Sugar & Kester, 2014).

Another significant theme that emerged from the challenges, successes, and additional information is how the professional development training is delivered. The teachers reported challenges with having large group professional development or a one-size-fits-all approach. Teachers have varied abilities and expertise with technology. One teacher expressed this concern in this way:

The biggest challenge my colleagues and I have faced is that a majority of professional development related to iPad integration is geared toward users who are least familiar with the device or its use. This means that I, along with some friends, are often bored at these PD events, because we already know how to use apps and are comfortable with the iPads. Some teachers, including myself, in our school are proficient with iPads and integrate tech into the curriculum with little or no problem; others don't know how to do simple functions such as getting to their camera roll. This makes PD frustrating—I feel like I do not learn anything.
Teachers reported success when professional development was delivered in small groups and differentiated based on the needs of the teachers. “Offering breakout sessions with a different focus for different learner needs (beginning skills, assessment on iPads, student engagement, etc.) was really respectful and beneficial. Also, training that simulates actual activities we could do in class was also very helpful”, reported one teacher. These results were similar to a study where 1:1 laptops were implemented, that differentiated professional development was recommended to be the best to address the diversified needs of staff (Donovan, Hartley, & Strudler, 2007).

Additional information regarding the qualitative responses is that teachers did not comment on too much training, but rather commented on lack of training, needing more training, ongoing training, and how future training should be designed to meet the needs of the teachers. These results provide evidence that if the training is provided, and teachers are given time to work and collaborate; the integration will likely follow in the classroom. Other research supports these findings that for professional development to be effective it needs to be ongoing and highly focused for improving instruction (Sugar & Kester, 2014; Tournaki, Lyublinskaya, & Carolan, 2014;).

**Demographic Comparisons**

To determine if the professional development needs for implementation and to sustain iPad use had any relationships with the demographic characteristics of the teachers surveyed, a Pearson Chi-Square analysis was used. The demographics analyzed were gender, age, frequency of iPad use, length of time using the iPad, and whether or not electronic resources were available. Analysis of demographic data and the professional development needs showed a few trends that have not been seen in other studies. There was no relationship between the
professional development needs and academic content area or the frequency of use. Regardless of the content taught or how often teachers used the device, there was no difference found in what teachers needed related to professional development. This was also reported in a technology integration study by Gorder (2008).

Age seems to be a bigger factor with the professional development needs. Younger teachers (ages 21-30) seemed to need less device training, training with apps, and one-on-one coaching, where the older (ages 50 years or more) needed more training with the device, training with apps, and one-on-one coaching. This was not surprising to the researcher since younger teachers would be considered more digital natives having experiences with devices providing a comfort level different than that of older teachers. Classroom management results seemed to be the reverse where younger teachers (ages 21-30), showed a greater need for classroom management and older teachers (ages 41-50 and ages 50 and older) less of a need. This information supports the need of differentiated professional development as indicated in the qualitative responses.

The professional development needs related to length of time using the device did show some differences. Teachers who have used the device longer (19 months or greater) showed the need for professional development for device training and instructional strategies during implementation, and those using it from 0-9 months did not need this training. This was surprising to the researcher, that those who had used the device for a shorter period of time needed less training. The increased availability of iPads in recent years for personal use may have contributed to this result as more and more people are using this technology on a daily basis. This also may be attributed to age, with a larger group of older teachers in the “who have used the device 19 or more months”; they might be the group of teachers who indicated the need
for more device training and instructional strategies for professional development. Another possible reason for more training needed for those who have used the device 19 or more months, may be due to the lack of professional development when the adoption in their school took place.

The professional development needs related to the availability of electronic resources showed no relationship except for collaboration. The teachers who indicated there were sufficient electronic resources reported the need to collaborate with colleagues during implementation. This supports the earlier results that listed collaboration with high frequency being needed for both implementation and for sustaining iPad use. This also supports the information provided with challenges and successes with professional development. Teachers voiced the challenge of not having enough time to collaborate and had the most success with professional development when allowed to collaborate with colleagues.

**Discussion**

The findings of this research have implications for teachers, administrators, and those organizing professional development efforts related to technology integration plans in 1:1 environments, specifically with iPads.

For teachers to integrate and sustain iPad use beyond the first year, it is clear from teachers that professional development is essential for technology integration both for implementation and to sustain use. It is also clear that professional development needs are different in the first year as teachers learn the device. Device training, app training and learning management are critical during year one. Collaboration and learning about instructional strategies seem to be an ongoing need for professional development with iPad integration. Teachers should be encouraged to participate in the training provided to improve and increase
classroom use. Teachers voiced a strong emphasis on learning from each other and time to work as critical components for professional development.

For administration and those planning professional development, providing differentiated professional development seems to be very important with technology integration. Level of comfort and expertise can be very different among teachers. Recognition of the various technology levels, learning styles, and implementation rates should be taken into consideration when designing professional development. In addition, meeting the teachers where their needs are, providing frequent training with adequate time to collaborate with colleagues was viewed as the most successful professional development. Professional development traditionally is very structured and a one-size-fits-all approach. Creative approaches with professional development to be less “teacher” directed instruction and a more “student” centered approach where teachers are working together would benefit teachers most. The shift of student-centered classrooms should be consistent with professional development being teacher centered. One common type of professional development that is emerging is the idea of an “unconference” or “open space” conference. This type of professional development activity has also been given the name “ed camps”. This is where groups of professionals collaborate and design professional development around what they need on the spot, rather than a structured session approach. The outcome is not predetermined. This type of professional development provides structure for a community of learners to identify their learning need and be empowered to address that need (Herrington, 2006; Kenny, 2014).

**Recommendations for Future Research**
Collaboration and time to work with colleagues is essential to implement and sustain technology use with the iPad. Future research should be expanded to devices beyond the iPad to see if the needs are the same for technology integration with a wide variety of devices.

Identification of specific instructional strategies may also be an area that should be investigated in future research. Teachers identified the need for professional development related to instructional strategies was needed but which instructional strategies are the most effective has not been identified.

Lastly, past studies have investigated barriers for teacher use. Many of the barriers such as Internet access and device access have been eliminated. With 1:1 adoptions, the vast majority of teachers should be using technology on a daily basis, yet only 65% of the participants in this study were using it daily. It is still unclear what is preventing some teachers’ use of technology.

**Concluding Comments**

The outcomes of this research suggest critical activities and topics that teachers need for professional development for iPad integration. The findings indicate that the professional development needs during implementation do change from what is needed for sustaining use. Device training, app training, and learning management training are critical during implementation. Collaboration and instructional strategies are needed for both implementation and sustaining. While some districts just put the devices in teachers’ hands, the results of this study show the need for differentiated, on-going professional development for implementation and to sustain use beyond the first years. Structured, large group professional development seems to be less favorable for technology integration compared to small group collaboration and individual work time according to the teachers in the study. Time given to learn the technology and the opportunity to learn from other teachers should increase the frequency of teacher and
student use in the classroom and the quality of use as well. As technologies continue to change, giving teachers time to “play” with the technology together might just be the best approach to professional development.

Abstract

Equity and social justice are the basis of a democratic society. The schools are fundamental nurseries for developing democratic values and social justice in a democratic country. Equity in provision of education has been one of the key components of the National Educational Policies of Pakistan. However, the dogmatic and intolerant situation in Pakistan, marked by terrorism, indicates that the schools in Pakistan may not have succeeded in creating spirit of social justice among the students. This study explored how much the schools in Pakistan have succeeded in developing the spirit of democracy and social justice among the students. Main focus was upon teachers’ effectiveness in developing sense of social justice, this was analyzed on Hackman’s (2005) five essential components for social justice education [i.e. tools for (a) content mastery, (b) critical thinking, (c) action and social change, (d) personal reflection, and (e) awareness of multicultural group dynamics]. The data collected from 94 (49 male+45 female) teachers of Multan City schools revealed that teachers adopted pedagogical approaches which lacked in Hackman’s five essential components for social justice education. It is recommended that curriculum and professional development of teachers should be reviewed for making teachers’ pedagogy effective to enable students develop spirit of social justice.

Key Words: Education, Social Justice, Challenges for schools, Punjab, Pakistan

Introduction

Education plays vital role in developing children’s academic, social, emotional and physical abilities. The academic growth cannot be separated from social, emotional and physical potential of the children (Marcinah & Nirmalah, 2015). Hackman (2005) considers five essential components for social justice education, these are tools for (a) content mastery, (b) critical thinking, (c) action and social change, (d) personal reflection, and (e) awareness of multicultural group dynamics. Therefore for the balanced development of students, all the factors are equally important and the students should be prepared to survive among their peers having different socioeconomic backgrounds. Turhan (2010) defined social justice as equality and freedom practiced by all equally. Furthermore, Hytten
and Bettez (2011, p.8) quoted Hackman (2005) that “Social justice education helps students in taking an active part to educate themselves and also provide support to teachers in creating democratic and critical educational environment in institutions”. Hytten and Bettez (2011, p.8) also quoted Murrell (2006) that social justice involves “help to eradicate all kinds of oppressions and unequal treatments”. According to Sommers (2014) it is the responsibility of school to ensure equal participation of all groups for equal distribution of resources to maintain socially justifiable environment in the school. Westheimer and Kahne (2004) suggested that school should develop justice oriented people having broader vision to look at political, economic and social problems in systematic way and able to design workable strategies to bring social change which help to flourish social justice among the masses in general and in educational institutions in particular.

The role of teacher is important in bringing social equity among his/her students, Kaur (2012) stated that “teacher must know the teaching skills and understanding about how the children learn and develop”. Author has also stressed upon idea that for the best teacher who is enthusiastic to move from theory to practice to create a culture of social justice which is different from other contemporary schools. Furthermore, its school administration obligation to work effectively and equitably for all learners. It is moral and political responsibility of institution to provide rich learning opportunities for all learners irrespective of their socio-cultural backgrounds (Kaur, 2012).

Government of Pakistan have incorporated in educational policy of 2009 important facts related to social and national development of all individuals and quoted that “Education is a categorical imperative for individual, social and national development that should enable all individuals to reach their maximum human potential. The system should produce responsible, enlightened citizens to integrate Pakistan in the global framework of human-centered economic development.”
Furthermore, Iqbal (2016) has quoted the constitution of Pakistan under Article 37b is about the provision of social justice and removal of social injustice in general and particularly in educational institutions, it is given under this heading that the state shall “remove illiteracy and provide free and compulsory secondary education within minimum possible period”. Overall, Pakistan is confronted with the problems like poverty, social inequalities and somehow extremism and these problems are directly related to literacy which is crucial for the individual’s development. Iqbal (2016) further added that without providing equal educational opportunity to all individuals by not considering their social and economic status is important role of school to provide such conducive environment for all including poor and ignored people of the society and encourage to become the part of mainstream. Some experts have opined that the countries are under developed because the people are under developed and have limited opportunities to expand their potential and capabilities to serve themselves and the society. Pinto et al (2012, p.3) quoted Gerwirtz (1998) that teachers as well as administrators need a mandatory skills, knowledge and disposition to tackle the challenges of social injustice in their schools. In these situation the only hope is education which can help to get out of this problem, Iqbal (2016), says that “In a developing country like Pakistan, where there is low economic activity, education is the only vehicle for upward social mobility of poor and marginalized people”. It is obvious that education plays a vital role for changing the societies approach towards all social and economic issues. So, schools’ role is unmatchable to transfer culture, values and social justice among students from very beginning of their future practices in their practical life and the education is imparted by our teachers. The researchers decided to seek teachers’ opinion about their practices of social justice through education among their students of different socio-economic and religious status to ascertain the challenges faced by our society.

The present study was delimited to the factors (d) and (e), i.e., to (d) personal reflection, and (e) awareness of multicultural group dynamics. It was further delimited to secondary schools of public sector and private sector of Multan City.

Objectives of the study included, among others, to find views of secondary teachers of public sector and those of the private sector schools about their concept of social justice and their awareness of multicultural group dynamics. The views of male and female teachers among themselves and with those of the other type of schools were compared. The responses were tabulated and analyzed by computing weighted means and compared by using t-test and ANOVA.
A questionnaire for the teachers was developed, pilot tested and finalized. It contained 30 items based upon five point Likert type scale. In the light of factor analysis, 11 items were dropped from the final questionnaire. The instrument was given to 100 teachers, out of which 94 (Male 49 + Female 45) completed questionnaires were received, 94% return. The public/private sector teachers and male/female distribution of the respondents is given in tables 1 and 2.

Exploratory factor analysis using the varimax rotation method reveals a 4 factor solution explaining 55.540% variation in the data with an alpha reliability value of .752 as shown in the table 3. All those items were removed from the analysis, which had factor loading lesser than 0.40 or did not load in any of the factors. As a result, a total of eleven items was removed from the questionnaire.

An independent sample t-test was applied to evaluate whether significant differences existed between genders along the four factors. The results in the table 5 show that significant differences existed between two genders in the factor 1 and factor 2 at p<0.1 significance level with p values of 0.059 and 0.092 respectively. On factor 1, males were relatively more disagreeable with a mean of 1.395 as compared to females with a mean of 1.2029. On factor 2, females were relatively more disagreeable with a mean of 1.1434 as compared to males with a mean of 1.0067. On other factors no significant differences were found as shown in the table 5.

Table 9: ANOVA with respect to qualification levels
**Conclusion:**

Exploratory factor analysis using the varimax rotation method reveals a 4 factor solution explaining 55.540% variation in the data with an alpha reliability value of .752. The factors being:

- **Factor 1:** Equality and sensitivity to social problems.
- **Factor 2:** Solidarity with people and national pride
- **Factor 3:** Prejudice-free attitude
- **Factor 4:** No distinction of social status, sex.

An independent sample t-test was applied to evaluate whether significant differences existed between genders along the four factors. The results show that significant differences existed between two genders in the factor 1 and factor 2 at p<0.1 significance level with p values of 0.059 and 0.092 respectively. On factor 1, males were relatively more disagreeable with a mean of 1.395 as compared to females with a mean of 1.2029. On factor 2, females were relatively more disagreeable with a mean of 1.1434 as compared to males with a mean of 1.0067. On other factors no significant differences were found.

An independent sample t-test was run to evaluate whether significant differences existed between government and private institutions along the four factors. The results show that no significant differences existed between teachers of the two types of institutions on all the factors.

One way analysis of variance (ANOVA) test was conducted to see whether significant differences existed in the perception of respondents with respect to their qualification levels. The results reveal that significant differences exist in the factor 1 at p<0.1 significance level. The results show that respondents with lower education level (B.A B.Ed) had relatively lower agreement levels towards social equity and fairness (factor 1) with a mean of 1.5748 as compared to the respondents with higher education level for instance MA/M.Ed with a mean of 1.2753, M.A/B.Ed with a mean of 1.1639 and M.A with a mean of 1.2660. Rest no significant differences were found in other factors with respect to education levels.
The results show that teachers have strong agreement towards social equity and fairness. This could be attributed to social desirable responses which stipulates that people have tendency to give those responses which are more socially acceptable.

Title: Institutional Isomorphism Meets Academic Disciplinarity: Two Approaches to Implementing a Global Leaders Program at a Japanese University

Abstract:

What is the best way to train "global leaders"? To what extent should an educational institution scaffold their development or, alternatively, let them 'sink or swim'? Should a special class for top-performing students be isolated from the student population to receive independent socialization or integrated to rub elbows with everyone else? These questions are raised in a case study investigating the differing approaches taken by two departments at the same university as they simultaneously implement a curriculum renewal for which they jointly proposed and received government funding.

Observed through the lens of institutional isomorphism, one could predict a priori that the two departments would adopt a similar implementation strategy. Yet, differing approaches were taken. This presentation will discuss reasons for this result, drawing on internal documents, interviews with department leaders, students, and faculty, and participant observation. One of the reasons suggested is academic disciplinarity, and this will be explored in detail. Finally, although it is too early, three years into the curricular reform, to draw definitive conclusions on the relative benefits of each approach as the first cohort has not yet graduated, the presentation will conclude with some interim insights into what each approach has contributed thus far.

What is Known About Elementary Grades

Abstract

Mathematical modelling has often been emphasized at the secondary level, but more research is needed at the elementary level. This paper serves to summarize what is it known about elementary mathematical modeling to guide future research. A targeted and general literature search was conducted and studies were summarized based on five categories: content of mathematical modelling intervention, assessment data collected, unit of analysis studied, population, and effectiveness. It was found that there were three main units of analysis into which the studies could be categorized: representational and conceptual competence, models created, and student beliefs. The main findings from each of these units of analysis is discussed along with future research that is needed.
What is Known About Elementary Grades

Mathematical modelling has mainly been emphasized at the secondary level, but for students to become more adept modelers the elementary grades need to be given more focus. We know that mathematical modelling abilities improve over time (Ikeda & Stephens, 2010). It then makes sense then to start mathematical modelling at earlier ages. There are many benefits to mathematical modelling that elementary students are missing if they are unable to participate in mathematical modelling: developing mathematical understandings (Brown & Edwards, 2011; Lesh & Carmona, 2003), coming to appreciate mathematics more and see it as more real life and applicable (Kaiser & Schwarz, 2006; MaaB, 2010), and developing communication and life skills (English, 2006).

At the elementary level, real world mathematics problems are often traditional word problems where teachers may instruct students on finding key words. Students come to believe that they should identify the numbers in the problem and do some operations with these numbers (Karp, Bush, & Dougherty, 2014; Verschaffel, De Corte, & Lasure, 1994). For example, Alan Schoenfeld (2013) describes a study that Heinrich Radatz did in the elementary grades. Radatz told students this story. “Mr. Lorenz and three colleagues started at Bielefeld at 9 AM and drove the 360 kilometers to Frankfurt with a rest stop of 30 minutes.” There is no question, it is just a story. He told this to kindergartners and they just say, “Thank you for the story.” He tells it to first graders and a few of them combine the numbers to get an answer. Radatz tells the story to 2nd graders all the way up to 6th graders. Every year, more students than the previous grade level combine numbers and give an answer.

We want students to have the opposite effect, where each year they become more adept at reasoning with real world situations. If mathematical modelling is integrated
What is Known About Elementary Grades

more in the elementary grades students will be more used to situations that can be solved, making assumptions and approximations and identifying which is the most important information in a problem and what more information needs to be known. There is good work being done in the elementary grades in mathematical modelling, but more can be done in conducting research with this age group. This paper describes what is known about mathematical modelling at the elementary grade level (age 10 and under) in order that future research can be identified and situated in this literature.

**Essential Elements of Mathematical Modelling**

Mathematical modelling begins with a key question that stems from the real world problem. A key question can guide the solution and work of a mathematical modelling activity. An example of a key question is, how big is someone based on his or her footprint and stride length? (Lesh & Doerr, 2003b) A key question can serve to focus work and is often the way that people approach problems in their jobs.

Both clear verbal and written communication is paramount while students work on a mathematical modelling task and detail their solution. Students must also reflect on the modeling process in order to make explicit the mathematics that they used and how well they understood it. In addition, modelling activities should also be open-ended (Lesh, Carmona, & Moore, 2009).

Our definition of mathematical modelling is an iterative process that involves open-ended, real world, practical problems that students make sense of with mathematics using assumptions, approximations, and multiple representations. Other knowledge besides mathematics can be used as well. Mathematical modeling curricula should have multiple acceptable models that can be developed.
A modelling cycle that appears often in the literature is from Blum and Leib (2007) and connects to several of our essential elements. There is a distinction between the real world and mathematics. It can be seen that students must make sense of the problem with mathematics involving assumptions and approximations, often called mathematizing, and then ensure that the model developed makes sense in the realistic context. Though not shown in the cycle it is well known that the modelling process is iterative in nature (Lesh & Doerr, 2003a).

**Figure 3.** Blum and Leib (2007) modeling cycle

In summary, there are seven essential elements of mathematical modelling: (a) start with a real world problem, (b) work from key questions (c) make sense of the problem with mathematics often involving assumptions and approximations, (d) ensure the mathematics is accurate and makes sense in the realistic situation, (e) goal of clear verbal and written communication throughout often including multiple representations, (f) modeling is an iterative process that involves open-ended problems, and (g) reflection on mathematics used or the modeling process. All of these ideas are included in one
What is Known About Elementary Grades

mathematical modelling activity that appeared frequently in the articles in this paper:

Model-Eliciting Activities

Model-Eliciting Activities (MEAs)

MEAs are client driven, open-ended, realistic problems that are developed based on six principles (Table 1). Often while completing an MEA students will refine, revise, and extend powerful mathematics constructs (Lesh & Doerr, 2003b). MEAs are implemented starting with an opening article or video, then readiness questions to help students become familiar with the real world context and the problem statement. Next students work in groups to solve the problem. They then present their ideas to the whole class. Finally, in their small groups they are given time for revision of their models and for reflection.

What is Known About Elementary Grades

**Methods**

The results of this paper stem from a literature search for studies in the elementary grades on mathematical modelling (age 10 and under). The goals of this paper are to identify empirical studies done with elementary grades mathematical modelling, summarize the studies, and identify areas for future research based on the units of analysis that have been studied. Bryman (2004) describes three central features of any quality literature review: (1) identifying adequate papers, (2) categorizing the papers, and (3) extended analysis including identifying areas of further research. First adequate papers were identified through a targeted and a general literature search. The targeted literature search involved looking at the edited books arising from the conferences of the International Community of Teachers of Mathematical Modelling and Applications (ICTMA). Specific journals were looked at which included the Journal of Mathematical Modelling and Application, Teaching Mathematics and its Applications, Educational Studies in Mathematics, Boletim de Educaco Matematica, Ensenanza de las Ciencias, and Revista latinoamericana de investigacion en matematica educativa. Special issues of journals that focused on mathematical modelling were also investigated which included two issues of ZDM from 2006, one issue of Mathematical Thinking and Learning from 2003, and one issue of the Journal of Mathematics Education at Teachers College in 2013. The general literature search went back to 1970.

This study followed the method of Diaz and Cox’s (2012) study that summarized engineering education articles. All studies on elementary grades mathematical modelling that also meet the essential elements of mathematical modeling were summarized using the categories of content of mathematical modelling intervention, assessment data
collected, unit of analysis studied, population, and effectiveness. There were 21 publications identified. Table 2 describes the number of articles identified from each journal, book, or conference.

Results

Content of Mathematical Modelling Intervention

The content of the mathematical modelling activities fell into three main categories: ratios and proportional relationships, number and operations, and measurement and data/statistics. Three studies’ activities had connections to proportionality (Chan, 2010; English, 2006; Lieven & DeCorte, 1997). Fifth grade students from Belgium experienced a two and a half week unit on realistic modeling. The part of the unit on proportionality had students determine whether solutions based on direct proportional reasoning were appropriate or not. For example using a 100 meter race time to predict an athlete’s 400 meter race time (Liven & De Corte, 1997).
What is Known About Elementary Grades

Australian students used informal notions of proportions as part of a three-year study that involved MEAs, model-exploration activities in which students apply their model to a similarly structured problem with a different context, and model-adaptation problems in which students need to adapt their model to solve a new problem. The example activity discussed in the article has students develop a guide for how consumers can determine the best snack chip (English, 2006). In another study students are given choices of materials and costs to determine the best choice for covering the floor of a room (Chan, 2010). In a butter beans MEA students are given tables of data displaying the weight of butter beans over time and must decide which condition is better. This activity can have connections to rates (English & Watters, 2005).

In the number and operations category the content included arithmetic operations (e.g. Vershaffel, De Corte, & Lasure, 1994), estimation (Peter-Koop, 2004), algebraic tasks that allow for generalizations (Cyrino & Oliveira, 2011), union or separation of two sets (Lieven & De Corte, 1997), and averages (e.g. English, 2010a). There were five studies that involved arithmetic operations with three of the studies using the same ten pairs of word problems that were first used in Verschaffel et. al (1994). For these word problems the first pair could be solved in a straightforward way while the second could not be if the real world situation was seriously taken into account. For example, a first straightforward question asks if a man cuts a clothesline of 12 meter into pieces of 1.5 meters each, how many pieces does he get? The second question in this pair requires some assumptions and approximations to be made. A man wants to have rope long enough to stretch between two poles 12 meter apart, but he has only pieces of rope 1.5 meter long. How many of these pieces would he need to tie together to stretch between
the poles? (Greer, 1993). Six studies had activities with connections to the concept of average (English, 2006; English 2010a; English & Watters, 2005; Reusser & Stebler, 1997; Verschaffel et. al., 1994; Yoshida, Verschaffel, & De Corte, 1997). English (2010a) had two classes of fourth grade students complete two MEAs in which they selected the Australian swimming teams for the Commonwealth Games given swimming times at different meets.

The largest amount of content connections were in the measurement and data/statistics category. The content included: interpreting and dealing with multiple tables of data (e.g. English, 2009), quantifying qualitative data (English, 2006; English, 2007), operationally defining constructs (English, 2006), exploring relationships and trends (e.g. English, 2012), representing and structuring findings/data in visual and text forms (e.g. Watters, English, & Mahoney, 2004), selecting, ranking and aggregating data (e.g. English, 2007), weighted ranks (e.g. English, 2009), sampling (English, 2006), identifying variation in data (English, 2012; Lehrer & Shauble, 2000; Petrosino, Lehrer, & Schauble, 2003), using an optimization model that uses a two-dimensional coordinate grid (Carmona & Greenstein, 2010), area (Chan, 2010), developing a survey and collecting data (Lehrer & Romberg, 1996; Watters et. al, 2004), and simple randomization distribution to test a hypotheses about the nature of ESP (Lehrer & Romberg, 1996).

**Assessment Data Collected**

The studies were mostly qualitative with typical data collected from audio and video recordings, student work, and researcher field notes. As mentioned above there were three studies that used the same ten paired word problems (Reusser & Stebler, 1997;
What is Known About Elementary Grades

Verschaffel et al. 1994; Yoshida et. al, 1997). The second set of ten problems that could not be answered in a straightforward manner were scored with a code of expected answer (not dealing with the real world), technical error, realistic answer, no answer, and other answer. Petrosino et. al (2003) used a seven item test to assess graphical interpretation and statistical reasoning developed in part from National Assessment of Educational Progress (NAEP) items.

An experimental study was conducted that looked at the effects of an experimental realistic modeling program (Lieven & De Corte, 1997). One experimental class and two control classes completed a pre-post test while the treatment group also completed a retention test one month after the post-test. The test consisted of ten items in five pairs of non-standard modelling problems. The first problem in the pair was similar to the problems the students solved in the experimental classes while the second problem in the pair was the same structure but a different context. The test also consisted of five other straightforward word problems. The test questions were similar to those used by Verschaffel et al. (1994).

Another experimental study investigated the effects of a 4 month program on solving mathematics application problems in regards to ability to solve mathematics application problems, beliefs, and standardized mathematics test scores. As part of the program students were taught heuristics for solving problems such as draw a picture, make a table, look for patterns, and simplify the numbers (Verschaffel, De Corte, Lasure, Van Vaerenbergh, Bogaerts, & Ratinckx, 1999).

The Verschaffel et al. (1999) study had the experimental and control classes completed a pre and post test and a retention test. The test had ten nonroutine tasks that
What is Known About Elementary Grades

were scored as correct, wrong, technical errors, or no answer. A self-made Likert
questionnaire was used to assess students’ beliefs about the teaching and learning of
mathematical word-problem solving. In order to get a better insight into the qualitative
changes in students’ problem-solving processes as a consequence of the treatment, three
pairs of students, (one pair high ability, one pair of medium ability, and one pair of low
ability) from each of the four experimental classes were videotaped solving nonroutine
problems. The videotapes were analyzed for the use of the eight heuristics taught in the
program, the frequency of four valuable metacognitive activities (orientation, planning,
monitoring, and evaluation), and the final result of the problem-solving process (correct,
wrong, technical error, or no answer). Teachers in the experimental group were also
observed four times and scored based on ten categories of teacher activities that were
considered essential for the successful implementation of the experimental learning
environment.

Population

The studies were done in a range of countries with nine of the studies occurring in
Australia: Australia (9), U.S. (4), Belgium (3), Singapore (1), Japan (1), Portugal (1),
Germany (1), and Switzerland (1). While the studies did provide some demographic
information, the analysis done in the studies did not focus specifically on this. One of the
studies was conducted in the inner city (English, 2012), four in a suburban location
(English & Watters, 2005; Lehrer & Romberg, 1996; Watters et. al, 2004; Yoshida et. al,
1997), and five with middle Social Economic Status students (English, 2010; English,
2012; Lehrer & Schauble, 2000; Lieven & De Corte, 1997; Verschaffel et. al, 1994). The
What is Known About Elementary Grades

studies covered a good range of ages except no studies were done with kindergarten students or younger.

Considerations for the teachers in the studies were mentioned in four of the studies in which the teachers received professional development on implementing mathematical modelling (English, 2007; English, 2009; English & Watters, 2005; Watters et. al, 2004). A quality example of this is how English (2009) employed a multilevel teaching experiment (Lesh & Kelly, 2000) in her three year longitudinal study of four classes of 3rd grade students. At the first level students create models in their work. At the second and third level the teachers work with the researcher in designing and implementing the modelling problems. The modelling activities challenge the teachers as they consider the mathematical ideas that students might use and the best ways to respond to students’ ideas. Researchers make sense of both the students’ models and the teachers implementation of the modelling activities.

Units of Analysis

There are three main units of analysis for the studies: representational and conceptual competence, models created, and student beliefs. Each of these will be described in more detail below.

Effectiveness

**representational and conceptual competence.**

Representational and conceptual competence involves students developing fluency in working with different representations to develop their conceptual competence or understanding through modelling (e.g. English, 2006; English, 2010a). The studies showed that representational and conceptual competence increases over time as students
What is Known About Elementary Grades

have more experience with modelling. Three studies demonstrated that if students have limited experiences with mathematical modelling they may not take into account the real world situation appropriately (Reusser & Stebler, 1997; Verschaffel et al., 1994; Yoshida et al., 1997). In these studies with fourth and fifth grade students done in Switzerland, Belgium, and Japan all students completed ten pairs of word problems with the first pair being a straightforward word problem and the second a non-routine modelling problem. Students performed poorly on the modelling problems and solved them in a straightforward manner. It was only when the teachers in Switzerland told the students specifically to think about if there is sufficient information to get an answer and also to consider what additional information would be needed did the percentage of students responding appropriately increase to a modest fifty percent. In all three studies students did not have prior experience with mathematical modelling.

Using similar problems to these studies as a pre-post test, Lieven & De Corte (1997) did an experimental study and found the two and a half week modelling treatment group to do statistically better on the post-test. Like the three studies above, both groups of students on the pre-test did not appropriately take into account the real world situations. In a study that used younger students 1st and 2nd grade students had difficulty with the idea of creating a model. The task was for students to guess the grade level of student produced drawings. The 1st and 2nd graders came up with systems of attributes that described categories, but failed to use these rules as a model to guide classification. Fourth and fifth graders also completed the task and were able to use their category systems as rules that sent drawings into fixed categories (Lehrer & Schauble, 2000).
What is Known About Elementary Grades

Students can have developing conceptual understanding before instruction by participating in modelling activities. In an Australian study with seven 4th grade classes where students completed two MEAs, English (2010a) found that students developed concepts that were far more advanced than what would have been taught in a traditional classroom. In another Australian study done with MEAs over a six month period 3rd grade students were able to interpret and work with mathematical information, identify trends and patterns in data, represent their mathematical ideas in different formats, and communicate and justify their mathematical ideas (Watters et. al, 2004). Another study with four classes of 3rd grade students in Australia with MEAs found that there was the emergence of important ideas that students had not experienced in class such as rate of change, aggregating, and averaging (English & Watters, 2005). In a study with one elementary student Cyrino & Oliveira (2011) found the student was able to think algebraically before being subject to explicit teaching of algebra.

There is research support that students can do better at mathematics in general when mathematical modelling is integrated in the elementary classroom. Using an pretest-posttest-retention test experimental design, Verschaffel et. al (1999) had four classes of 5th graders in a modelling treatment group and seven control classes. After receiving modelling instruction with a specific focus on problem solving heuristics the treatment group did statistically better on the posttest and retention test on mathematical modelling. The treatment group also had a medium significant effect size on a mathematics standardized achievement test compared to the control group. In a three year longitudinal study English (2006) found that MEAs enabled students’ mathematical understanding to develop in multiple ways when compared to the traditional classroom
What is Known About Elementary Grades

problem posing. The students were able to create complex mathematical processes and constructs.

**models created.**

Across different studies it was found that elementary students can successfully participate in mathematical modelling (Carmona & Greenstein, 2010; Chan, 2010; English, 2010b; English, 2009; English, 2007; English, 2003; Peter-Koop, 2004). With a modelling activity focused on determining what are important factors in buying a pair of sneakers, students used multiple interpretations and approaches and developed mathematics content (English, 2003). While doing a Fermi problem, which requires estimation of large quantities, most students did not develop and implement a solution plan but still in most cases modelling cycles led to highly appropriate solutions (Peter-Koop, 2004).

Students develop a range of strategies while engaged in mathematical modelling (Carmona & Greenstein, 2010; English, 2003; English, 2007; English, 2009; English, 2010b). In the team ranking MEA in which students need to rank the top five teams out of twelve, students had three primary criteria that were evident in the responses: (a) greatest number of wins, (b) greatest difference between wins and losses, and (c) team with the greatest ratio of wins to losses. In a modelling unit based on the theme of looking after our environment students created a broad range of models in organizing, structuring and representing data. The students also identified a wide range of attributes in their process of sorting a pre-determined set of items that might be in a messy room such as a ribbon, shoe, toy, or dog bone (English, 2010b). In another study, students developed six different types of models that included ranking and aggregating data and
What is Known About Elementary Grades

weighted scores in a problem on where the best place to have a settlement in Australia in 1788 (English, 2007).

**Student beliefs.**

There was one experimental study that investigated student beliefs with fifth grade students in Belgium. The treatment group received twenty lessons total on solving math application problems over a four month span. Beliefs were measured using a Likert survey with two scales. One was on pleasure and persistence in solving word problems and the other was on whether there was one right way to solve problems or if different paths could be taken. The treatment group was statistically significantly higher than the control group on the beliefs items at the conclusion of the study.

**Discussion and Concluding Points**

This paper summarized what is known about mathematical modelling at the elementary school level. While mathematical modelling traditionally has been confined to the secondary school level (English, 2010a), the studies here have shown that elementary students are capable of participating in mathematical modelling and benefit from it. Mathematical modelling done in the studies was often interdisciplinary integrating English language arts, history or STEM concepts. This is a great benefit of mathematical modelling in the elementary grades and can be used as a buy-in to have mathematical modelling implemented more frequently.

As more studies are done with mathematical modelling at the elementary level what is studied can be expanded. Modelling competencies are an important concept that have been researched at the secondary level (e.g. Biccard & Wessels, 2011; Grunewald, 2013; MaaB, 2007) that can be expanded to the elementary level. Modelling
What is Known About Elementary Grades

competencies involve understanding the realistic problem and setting up a model based on reality, setting up a mathematical model from the real world, solving mathematical questions within a mathematical model, interpreting mathematical results in a real solution, validating a solution, metacognition, effective communication and argumentation, and positive attitudes toward real world application problems (MaaB, 2006). English (2010b; 2012) has looked at this in part with her investigation of students’ metarepresentational competence which is students’ explicit recognition of why they represented their data/model in the way they did.

Students’ modelling processes and how they can improve over time can also be investigated further. Experience with the modelling process helps students improve but more research can focus on the best way for elementary students to become familiar, comfortable, and adept with the modelling process. Two modelling processes that appear frequently in the literature can be used or adapted to be focused on with elementary students: Blum and LeiB’s (2007) modelling process and Lesh and Doerr’s (2003a) four step modelling process of description, manipulation, prediction, and verification. Blum and Borromeo Ferri (2009) have also suggested a four step modelling process that they have been found is useful for students in their grant projects that entails: (1) understanding the task, (2) establishing a model, (3) using mathematics, and (4) explaining the results.

Teaching mathematical modelling can be difficult for teachers and studies should take this into consideration. This is due to the fact that when students are engaged in modeling activities, teachers are likely to encounter substantial diversity in thinking (Doerr & Lesh, 2011). This requires teachers to listen to students, respond with useful
What is Known About Elementary Grades

questions, and help students make connections to other mathematical ideas. This is what Shulman (1986) has called pedagogical content knowledge. Hill, Ball, and Schilling (2008) have further developed this construct by breaking it into teachers’ knowledge of content and students, knowledge of content and teaching, and knowledge of curriculum. Teachers’ knowledge of content and students is intertwined with how students think about, know, or learn particular content. Teachers’ knowledge of content and teaching is knowing what misconceptions that students are likely to have, what strategies they will use, and how to respond to them effectively. In four of the studies professional development was provided for the teachers (English, 2007; English, 2009; English & Watters, 2005; Watters et. al, 2004), which should be included in more research to help teachers develop their pedagogical content knowledge. Many of the articles discussed in this paper can be used as a part of professional development because the articles described or provided the modelling curriculum and students’ range of ideas or concepts developed from the activities (e.g. English 2003; English 2007; English 2009). The one main missing piece is questions that teachers can ask and how they can respond appropriately to students’ models to help them further develop their mathematical concepts.

Mathematical modelling needs to begin in the elementary grades and the studies discussed here have shown that elementary students are capable of effectively participating in mathematical modelling and benefit from this approach. Model-Eliciting Activities were used often in the studies and have a solid research base for their structure and implementation. More research can be done on developing, implementing, and assessing MEAs in the elementary grades on a wider range of mathematical content.
What is Known About Elementary Grades

Future research can also focus on expanding the units of analysis that are studied including focusing more on student beliefs, modelling competencies, and how students progress through modelling processes in the same way resources, heuristics, control and beliefs have been studied as key aspects in mathematics problem solving (Schoenfeld, 1985).

6) Abstract:

In the United States, approximately 65,000 undocumented immigrants graduate from high school each year. School counselors are tasked with the role to support these students’ academic, career, and social/personal success. By and large, undocumented students face barriers in accessing higher education and career pathways due to limited information, resources, self-efficacy beliefs, and outcome expectations. This poster project is grounded in Social Cognitive Career Theory (SCCT) and Krumboltz’s Planned Happenstance Theory. We will apply these two counseling career theories to the undocumented student population and provide counseling considerations, recommendations, and tools for helping professionals who serve this population.

6) Abstract:
By and large, undocumented students face barriers in accessing higher education with limited information, resources, and ongoing mental health related issues such as anxiety, depression, Post-Traumatic Stress Disorder (PTSD), and Complex PTSD. School counselors are tasked with the role to support these students’ academic, career, and social/personal success. Due to the gravity of this prevalent issue, school counselors need to be well equipped to support this burgeoning population. This poster session will be grounded in theories such as Multiculturalism, Feminist, Social Justice, and Narrative Therapy frameworks. Presenters will offer two case vignettes that reflect the reality of undocumented students today in the secondary school setting. In addition, presenters will provide resources, recommendations, and creative tools for helping professionals who serve this population.
Blue to White:

The Career Transition of Trades Teachers

Barbara Gustafson
University of Saskatchewan
Saskatchewan Polytechnic
Prince Albert, SK

Submitted to:
Hawaii International Conference on Education, 2017
ID #49
Abstract

This paper describes research conducted at three Western Canadian technical institutes to explore the second-career transition of tradespeople moving from industry trades practice to teaching trades. Topics included motivation for career change, prior learning transfer, additional learning related to the new role, vocational identity change, and factors affecting satisfaction with the second career of teaching. The research findings suggest a strong connection between the first career and the second, serving as both a positive and negative factor in the transition. Recommendations arising from the research for technical institute human resources practice are also presented.
Blue to White: The Career Transition of Trades Teachers

The concept of career has changed with time to include not a singular path from adolescence through to retirement (Holland, 1985; Super, 1957) but changing paths, second careers, and recycling in midlife (Super, 1990). Causes leading to a second career have been identified as external events such as job loss, or decisions regarding work-life balance, family or new interests. The second career can lead to re-experiencing the self-reflection, personal choices and identity negotiation of the first career choice (Erikson, 1980; Marcia, 1980; Smart & Peterson, 1997).

Within education, research has looked at the second-career teacher; however, in a pattern similar to that of educational research in general, examination of the experience of people moving from an established career outside of teaching to teaching has focused on elementary and secondary teachers (e.g., Castro & Bauml, 2009; Eifler & Potthoff, 1998; Swain, Schmertzing & Schmertzing; 2011; Tigchelaar, Brouwer & Korthagen, 2008). There has been relatively little attention in research to post-secondary education and particularly, vocational-technical education; yet, this sub-set of practitioners are, by definition, second-career teachers. Vocational teachers or instructors, including those teaching apprenticeable trades, are recruited and hired as subject-matter experts based on their professional training and experience from industry practice. These industry experts, as they move into a second career to become teachers, could be expected to experience the usual disruptions of any midlife career change. Additionally, they might encounter particular difficulties due to the differences between their first and second careers. They are, in the words of one participant in the current study, “moving from blue to white,” from the blue-collar world of trades to the white-collar world of post-secondary education. These broad occupational categories have been shown to differ not only in the type of work typically
done and the socio-economic class of members, but to use different learning methods, hold
different values, and to have strong sociological separation between the two groups (Lamont,

This paper describes research conducted at three Western Canadian technical institutes to
explore the career transition from industry trades practice to teaching trades. While the group
studied was specialized and relatively small in number (Lin, 2005), understanding the career path
of trades teachers may serve not only those undertaking the transition from trades practice to
teaching as a second career, but also inform the career transition of other teachers drawn from
industry, providing suggestions for practice or further research in the broader picture of post-
secondary vocational-technical education. This understanding could also improve the quality of
instruction for students, potentially improving the historically low completion rates for
apprentices in Canada (Laporte & Mueller, 2011). Topics included motivation for career change,
prior learning transfer, additional learning related to the new role, vocational identity change, and
factors affecting satisfaction with the second career of teaching. This paper sets out the results
from the current research for each topic, relating those results to previous research, followed by a
discussion and recommendations arising from the research.

Background to the Study

Apprenticeship in Trades and Teaching

Teaching is a career often considered in childhood or early adulthood, based on an
“apprenticeship of observation” (Lortie, 1975, p. 67) served by students in the classroom, leading
to university study in education, and then a classroom of one’s own in early adulthood. For post-
secondary professors or lecturers, the observational apprenticeship is typically extended by years
of academic study for graduate degrees to qualify for teaching at the university level. Within the
technical-vocational segment of post-secondary education, however, teachers follow a different path to the instructional role: they must first establish expertise in industry via study and work experience, then move to teaching as a second career.

Within this segment of education, typically delivered in Canada by technical institutes and polytechnics, the instructors who teach trades form a sub-group with a unique path to teaching. Rather than an apprenticeship of observing classroom teaching for many years in both grade school and university, their background includes a formal trades apprenticeship, resulting in journeyperson status. This is the credential upon which hiring is based, along with several years of industry experience.

The educational path of trades apprenticeship is well established, but quite different from that of many other occupations, including teaching. The majority of learning is expected to occur by working alongside a journeyperson on the job site; a small portion of learning happens within the classrooms and shops of a post-secondary institution. In apprenticeship, the workplace is the primary learning space and teaching there relies on observation, demonstration, then practice of skills, rather than on lectures and textbooks (Canadian Council on Learning, 2006; Epstein, 1998; Mokyr, 2003; Sennett, 2008).

Throughout its history, apprenticeship has been defined by its hands-on methods of teaching and learning, a process so common in everyday practice outside of formal education that it is “nearly invisible as a way to explicitly teach and learn” (Johnson & Pratt, 1998, p. 83). Guile and Young (1999) identified apprenticeship as an educational form underpinned by two assumptions: learning by doing and a master as a role model. Coy (1989) describes apprenticeship as “associated with specializations that contain some element that cannot be communicated, but can only be experienced” (p. 2). These descriptions echo Polanyi’s (1958)
concept of tacit knowledge, a form of knowing difficult or impossible to put into words, and also reflect Schon’s (1983) concepts regarding knowing in action, Kolb’s theory of experiential learning (Kolb, 1984; Kolb & Kolb, 2005), and the practical learning heritage of Dewey (1938).

Importance of Teaching in Trades

Trades training is an important part of post-secondary education and job preparation in Canada, supported by government, students, parents, and industry (Laporte & Mueller, 2011). Yet, despite the demand for more training opportunities, and efforts to attract more students to the trades, the completion rate in major trades in Canada has been assessed as low as 7% (Laporte & Mueller, 2011, p. 9). While many factors affect student non-completion, one factor that has received little attention in research is the instructor who work with trades students (Canadian Apprenticeship Forum, 2011; Karmel, 2010).

Finding trades teachers is complicated by the pro-cyclical nature of enrolment in apprenticeship programs (Laporte & Mueller, 2011). Student numbers rise as industry demand rises, creating a need for more teachers. At the same time, trades teachers are part of the pool of existing journeypersons who are in high demand and competitively paid by industry. This simultaneously intensified need for experienced journeypersons, in education and industry, limits the ability of institutions to compete for those who may be the most effective teachers.

Additionally, the challenges of trades teaching may be greater than similar work in other educational settings. Grubb (1999) argued that post-secondary vocational teaching is more complex than post-secondary academic teaching, as open-admission policies create a diverse student population with a variety of learning styles, the wide variety of programs create multiple learning settings, and specialized reading and mathematical skills must be taught so students can use the tools of the occupation. Vorhaus (2010), in an analysis of research on vocational learners
and learning styles, found that vocational learners tend toward a learning style distinct from students in more academic post-secondary settings. Barabasch and Watt-Malcolm (2013) suggested vocational teachers need continuous learning since industry standards and technology are constantly changing, and teacher-student interaction is often one-on-one project-based learning, quite different from the standard classroom. Billett (2012) argued that the particular needs of vocational education would suggest its teachers need “to be carefully selected, prepared, rewarded and permitted to practice” (p. 187) so as to meet the needs of the students and industry.

**Methodology of the Current Study**

The current research set out to understand the career transition of tradespeople, who have learned within a trades apprenticeship model, as they move to teaching in a college setting. The research question asked: what leads tradespeople to move to trades teaching; what competencies do they bring from the first career to the second; how do they learn to teach; how does the vocational identity change with a career change; and what are the factors leading to satisfaction or dissatisfaction with the teaching role.

Given the relatively meagre research in the specific field of trades education, I chose an exploratory mixed-methods approach for this study. Using a constructivist approach to create a qualitative dominant crossover mixed analysis (Creswell & Plano Clark, 2011; Denzin and Lincoln, 2005; Frels & Onwuegbuzie, 2013) gave voice to the self-defined reality of the participants. An electronic survey was created that adapted portions of similar surveys conducted among teachers, although not trades teachers specifically (Berger & D’Ascoli, 2012; Dainty, 2012; Hong, 2010; Ruhland, 2001; Simmons, 2009; Watt & Richardson, 2007). This new instrument gathered input through email invitation and electronic submission from trades teachers (N = 165) at three Western Canadian colleges. This phase was followed by
interpretation panels to explain the quantitative results and add further qualitative data (Noonan, 2002).

The survey was conducted in June 2014. The quantitative data were analyzed with statistical analysis software plus manual coding of qualitative survey data. The results of this analysis were compiled in a report and shared with participants who had indicated a willingness to be a part of interpretation panels and who had provided contact information in the survey. In September through November 2014, panels were conducted with participants ($N = 12$) at the three colleges, asking participants to interpret the survey results and to add further qualitative data through discussion. Panel results were transcribed, member checked, and manually coded. Final analysis by the researcher looked for triangulation within the sets of results.

**Results of the Study**

**Demographic Profile**

The 165 respondents to the survey represented 27 trades areas, with electrician, welder, automotive service technician, and carpenter as the most frequent responses. Ages ranged from 26 to 56 or older, with the 46-55 years category chosen by 46% of respondents. Survey participants were asked to indicate the number of apprentices they had supervised while practicing their trade. The results showed a range of responses: 29% had supervised 26 or more and 10.3% indicated no supervision of apprentices. The survey was dominated by male respondents (97.6% vs. 2.4%); this distribution is in keeping with the ratio of male to female participation in the trades generally (LeFebvre, Simonova, & Wang, 2012; Meredith, 2011).

Years of teaching experience ranged from three years or less (21.2%) to 18 years or more, which was the most common response (21.8%). Survey participants were asked to indicate
any teacher training prior to beginning teaching in post-secondary education and the majority (85.5%) indicated no formal training in teaching prior to being hired to teach.

Motivation to Change Careers

Teaching as an opportunity to share their trades knowledge was the most common choice among survey participants regarding motivation to change careers. This option received the highest overall level of agreement (95.8%), and showed no significant correlation to any other listed motivation factors. Better hours, described within comments in the survey and through the interpretation panels as primarily related to more time with family, received the second highest level of agreement (84.3%). The other six factors received considerably lower levels of agreement, from 49.1% for teaching as *Always something I wanted to do, that I felt called to do* to 13.9% for teaching as *An opportunity for higher pay*. Teaching as a calling was more strongly agreed to by the most-experienced teachers.

Correlation analysis grouped the responses into two categories, with the exception noted above: extrinsic factors, including higher pay, better hours, better benefits, and higher status; and intrinsic factors, including higher status, following a family member’s career path, continuing an enjoyed volunteer activity, and teaching as a calling. Qualitative results spoke to both categories, with comments including: “I instruct because I truly enjoy it. I get a true sense of job satisfaction from preparing students as millwrights for industry,” and “In the field I began to find the work load too much, the opportunity to work less in the field was just not possible. I took the opportunity to teach as a way to help myself and others at the same time.”

**Previous research on motivation.** The mix of intrinsic and extrinsic motivation for career change, and particularly the desire to share knowledge with a new generation as shown in the survey results, is supported by previous research. Backes and Burns (2008) surveyed trades
and health-science teachers regarding motivation to choose teaching as a second career and found the most commonly stated reasons were both extrinsic in the appeal of hours that allowed more family time (30%) and better pay and benefits (28%), and intrinsic in the appeal of a sense of vocation (31%) and love of subject matter and wish to share it (10%) (pp. 103-105). Backes and Burns (2008) also observed an affinity for the first career that was allowed to continue through teaching: “Teaching allows them to make a career change without giving up the identity of being part of their original occupation or profession” (p. 109).

Mealyea (1989) reported altruism as motivation among tradespeople training to enter vocational teaching, as they sought to pass on the industry knowledge they had gained through their previous occupations. Gowdy (1987) studied tradespeople enrolled in a program to train teachers for high school industrial education and found motivation was most commonly rooted in previous teaching experience, indicated by 91.9% of participants, and the positive feelings related to teaching (p. 110). Harms and Knobloch (2005), in their study of students choosing a career in vocational education versus a career in industry, showed that career choice for teachers was guided by intrinsic motives for entry and by extrinsic motive for exit, and suggested recruitment for vocational teachers should focus on intrinsic motivation.

**Continuation and generativity.** Lortie (1975) listed five main attractors to teaching: *interpersonal*, working with people; *service*, helping others; *material benefits*, including salary, pension and working conditions; *time*, the compatibility of the work with family and personal interests; and *continuation*, the attraction of passing on knowledge to a new generation and personal continuation of a place within school and the traditions of schooling. Elements of all five attractors can be seen in the responses within this study; however, the strength of agreement
to teaching as *An opportunity to share my knowledge of the trade* (95.8%) suggests *continuation* is a primary motivator for trades teachers.

Lortie (1975) commented that “widespread contact with each generation is a powerful recruitment resource possessed by few occupations” (p. 29), but that this attraction is not always seen by young recruits to teaching. Unlike sequentially trained teachers, however, trades teachers are not young. The most common age of study respondents was 46-55 years, quite different from the 22-year-old new graduate of an elementary or secondary school teacher training program. The motivation of sharing knowledge with the next generation also connects with Erikson’s (1980) life stages where, in mid-adulthood, the primary challenge is *generativity vs. stagnation*, including a desire to see one’s work continue to the next generation.

**Transition to Teaching**

Once the choice is made to change careers, a transition or “change from one state to another” occurs (Concise Canadian Oxford Dictionary, 2005, p. 1453). This portion of the research looked at the transition in terms of competencies brought to the new role and those developed within it. The preferred methods of learning to meet the requirements of teaching were also examined.

**Teaching competencies.** The survey asked participants to rate themselves against a listed set of 17 competencies common to teaching, both as recalled from initial teaching experience and at the time of the survey. The competency list was established through an analysis of numerous frameworks (Arreola, 2007; Campbell, 2009; Darling-Hammond, 2012; Goldhaber, 2002; Schulman, 1986; Rockoff & Speroni, 2011; Volmari, Helakorpi, & Frimodt, 2009). When viewed through a Knowledge, Skills, Abilities and Other characteristics (KSAO) lens (Landy & Conte, 2007), the retrospective self-ratings showed strongest agreement in the Abilities and
Other categories, representing personality traits or characteristics such as sense of humour, organization, and enthusiasm for teaching. The points of least agreement were in Knowledge and Skills specific to teaching such as preparing lesson plans, use of educational technology, and curriculum development. Over time, it appears these competencies are strengthened, as the present-day self-ratings showed all competencies agreed to by 90% or more of respondents. The teaching knowledge and skill competencies showed the largest magnitude of change when analyzed via a Wilcoxon signed-rank test (Elliott & Woodward, 2007).

The qualitative portion of the research supported these results, with interpretation panel participants expressing a strong feeling that, despite a lack of formal teacher training, teaching competencies had been gained through working with apprentices. As stated by one participant, “In the trades, we’re teaching. We’re teaching all the time.” Another said: “I was all the time on the tools, but all the time I was teaching and sharing with someone else . . . It’s always been part and parcel [of the trades].” In addition to teaching experience gained in the trade, the idea of being “naturally born to teach” was also expressed, supporting the high self-ratings within the survey on competencies such as communications, enthusiasm for teaching, and sense of humour.

In contrast to research participants’ view of the tradesperson as a teacher to apprentices and the teaching competencies brought to the new career, participants expressed the view that their employing institutions did not see them in the same light, often equating teaching competence to specific credentials such as an Education degree. This attitude affected the transition to the new role, being perceived as a lack of support. As stated by one participant:

I do not have a Bachelor of Education. Does that make me a bad teacher, a poor teacher, a horrible teacher? Absolutely not. I brought to [institution] 35 years of life skills, plus a Red Seal. What do I get for those life skills? Nothing.
Learning about teaching. An evaluation of the learning methods preferred by trades teachers was also part of the research. This topic is closely connected to the changes in competence and confidence, essentially asking respondents how they increased their knowledge and skills about teaching and gained confidence. Respondents showed a definite preference for non-formal learning over formal learning. Survey questions asked what methods of learning had been used during the teaching career, ranging from formal classes at a university to self-study and trial and error. Overall, respondents chose discussions with other instructors (96.4%) as the most often used method, with informal mentoring (87.9%) as the next most popular method. Formal training through a university or college was chosen least (38.8%). Use of training methods clustered in two groups in correlation tests: formal methods, including formal training at the employing institution, workshops and formal mentoring; and non-formal methods, including informal mentoring, discussions, self study, and trial and error. Respondents with formal teacher training prior to being hired as a teacher were more likely to indicate use of formal training methods to continue learning about teaching.

Non-formal methods rated most effective. Survey participants were asked to rate learning methods by effectiveness. Mentoring was rated the most effective method of learning to teach; workshops were rated least effective. Discussions within the interpretation panels supported these results. Participants expressed a strong dislike for academically oriented teacher training delivered in a classroom setting. They spoke in favour of a more practical focus, looking for information that could be easily translated into their work with students. Participants praised an informal mentorship program operating at one institute as helpful to new teachers and as building on the traditions of trades practice.
Previous research on learning to teach. Struggles in learning new knowledge and skills in the transition from tradesperson to trades teacher are depicted both in the current study and by previous research. Karmel (2010) described a situation with little support for the new role and concluded that the processes used to train vocational teachers reflect historical influences that see vocational education as simple training for work, rather than education for learning and culture, and as such, the emphasis has been on occupational experience rather than pedagogical knowledge and full preparation for the teaching role. Kouri (2009) detailed personal narratives of individuals who moved from being electricians to teachers and found that “second career teachers begin teaching practice with preconceived beliefs about students, the prescribed curriculum, and teaching practice. They construct curriculum based on these beliefs” (p. 226). The new teachers relied on these beliefs, and previous examples of observed teaching, in the absence of training or an assigned mentor being provided for them within the college. Early frustrations as teachers included a heavy teaching load, and a sense of being alone in their struggles with developing lessons, managing the physical space and equipment in workshops, and maintaining control with students; however, they reported that when asked, colleagues would provide advice and support (Kouri, 2009).

Sauder (2001) found new trades teachers reported stress due to lack of balance between work and personal life, as they put in many extra hours to prepare for the classroom. They expressed feelings of loneliness and isolation, in part because they hesitated to ask for assistance for fear of revealing a lack of expertise. “This situation creates a period of struggle as the newcomer attempts to perform the teaching role while not knowing exactly how the role should be performed” (Sauder, 2001, p. 89). These findings are in keeping with those of Sorcinelli (1992, 1994) regarding new faculty in American colleges. Mealyea (1988) followed a cohort of
new vocational teachers in Australia. Unlike many other post-secondary vocational settings, these teachers received some training for their new roles; nevertheless, Mealyea (1988) found they did not have the usual “anticipatory socialization” (p. 312) of many occupational roles and experienced “considerable dissonance and role strain” (p. 313), leading to anger and anxiety. Tigchelaar, et al. (2008) found that second-career teachers wanted to transfer competencies acquired during their earlier careers to teaching and felt the greatest gains could be made through recognition of their backgrounds in teacher training.

Vocational Identity

Vocational identity was defined by Marcia (1980) as a clear identification with a particular occupation or vocation, based on commitment following active exploration of possible identities. Creating a vocational identity is a part of career development (Graves, 1989; Korthagen, 2004; Simpson, 1967) and of overall identity formation throughout life stages (Erikson, 1980); it is linked to the Aristotelian idea of eudemonia (Wheelwright, 1951) or happiness through use of one’s gifts, and to Maslow’s (1962) concept of self-actualization.

Vocational identity was explored within the survey by one question: Are you a tradesperson, a teacher, or both? If you met someone for the first time today, how would you describe yourself to this person? Respondents could choose one or more of three options: I’m a tradesperson (welder, electrician, etc.); I’m a teacher/instructor; and I’m a teacher/instructor in (welding, electrical, etc.). Respondents most often agreed with I’m a teacher/instructor in my trade; however, the other two statements were also agreed to in the majority of instances. Frequency counts are shown in Table 1 below.

Some variation in the results emerged through chi-square testing of the survey responses against demographic factors. Having another teacher within the immediate family was linked to
increased agreement (82.1%) with the statement *I'm a tradesperson*, ($\chi^2 (1, N = 123) = 3.997, p = .046$). Previous formal teacher training was linked to increased agreement (95%) with the statement *I’m a teacher/instructor* ($\chi^2 (1, N = 125) = 5.926, p = .015$). When compared by years of teaching experience, novice teachers identified most strongly with the statement *I’m a teacher/instructor*.

Interpretation panel participants expressed the view that they saw themselves as teachers while in trades practice as teaching is an integral being a tradesperson, and that this role led them to consider the move to full-time teaching for a long time prior to making the transition, based on enjoyment of working with apprentices. One participant suggested this previous practice of teaching apprentices may make the transition to full-time teaching easier for tradespeople than other vocational teachers:

You have to be a certain person. As tradespeople, we probably mentored somebody, so it’s another step. And some of us slide into the step a little easier. But for the electronics and technology [teachers], they don’t use that [teaching process].

Another participant, however, saw a more defined change in roles occurring over a teaching career, linked to the transition from the workplace culture of trades to college culture, saying “as an instructor, you are moving from blue [collar] to white. You are becoming part of
the white [collar world].” He suggested institutions should force the issue to some extent, using professional development sessions to “push forward this idea that you’re not a tradesman any more, you’re a teacher, and this is what we want from you. We want you to develop skills as a teacher, and your trade is secondary.”

**Previous research on vocational identity.** Vocational identity has been envisioned as three parts: technical knowledge; acceptance into the occupational role through learning and demonstrating skills; and, establishment of an internalized sense of belonging with the vocation that sets the newcomer apart from others as a member of the occupational group (Graves, 1989; Schulman, 2005; Simpson, 1967). Lave and Wenger (1991) theorized a centripetal process toward vocational identity within a community of practice and Korthagen (2004), in research on teacher identity, used a circular model of an onion to explain identity development, suggesting identity layers knowledge, skills, then attitudes and other traits. Finally, the layers create a vocational identity that becomes an integral part of the overall identity of the person, such that one will see oneself, and name oneself, by that vocation.

Research has suggested the first years of teaching, generally, are a time of negotiation of the role before settling into teaching as a career (Chang, 2009; Falk, 2012; Grissmer & Kirby, 1987; Skaalvik & Skaalvik, 2010). Research specific to trades teachers reported dissonance and anger as part of negotiating a new vocational identity for tradespeople as they first moved to a teaching role (Haycock & Kelly, 2009; Mealyea, 1988). Nze and Ginestie (2012) found that identity for vocational teachers was created over many years and was linked to the view of vocational education held by the teachers themselves, and by society around them.

Based on the current study, the transition from identifying as tradesperson to identifying as trades teacher appears different from the creation of a teacher identity envisioned by
Korthagen (2004) or other vocational socialization theorists (Graves, 1989; Schulman, 2005; Simpson, 1967), but rather more evolutionary and integrated. Tradespeople appear to come to teaching with a pre-existing identity as teacher, based on the journeyperson teaching apprentices.

**Dual identity.** Chappell and Johnston (2003) suggested a dual identity of both tradesperson and teacher is an important part of the overall identity for trades teachers, and what distinguishes these educators from school teachers or university lecturers whose initial careers are often in education, an idea that is supported by the findings of the current research where a clear sense of division between trades teachers and other teachers is apparent. Chappell (1999) theorized that for trades teachers, legitimacy and identity as a teacher is tied to industry expertise, as reflected in the views of students and the trade community. This concept was supported by Arreola (2007) as a part of teaching competencies in the larger post-secondary realm, labelled as a *scholarship of proficiency*. An ongoing tie to the trade becomes a part of the trades teachers’ sense of “who they are in the educational project” (Chappell, 1999, p. 218), leading to a need to self-identify as different from other teachers.

If a continued identification with the trade is psychologically necessary to provide a sense of legitimacy in teaching the trade, as Chappell and Johnston (2003) suggested and was reinforced by Haycock and Kelly (2009), then a dual or inclusive identity may be the best choice for a trades teacher. As described by study participants, there is a need to move beyond the trade, of “moving from blue [collar] to white” and to take on the work of embracing the professionalism and theory of teaching. Yet, rather than seeing a re-socialization and change to full identification as teacher as necessary for trades teachers (Andersson, Köpsén, Larson, & Milana, 2013; Mealyea, 1988), perhaps the “Janus-faced occupational identity” suggested by
Haycock and Kelly (2009, p. 4) is the best – if somewhat complicated – choice to support teaching in the trades.

**Satisfaction in the New Role**

The final section within the research asked about the satisfaction respondents felt as teachers, both currently and in comparison to their beginning days as a teacher. Factors were presented within the survey, one sources of satisfaction and dissatisfaction. Qualitative comments were gathered through the survey and the interpretation panel discussions.

Overall, respondents rated themselves as somewhat satisfied (34.5%) or highly satisfied (60%) with teaching. Most respondents said they were as satisfied with the role of teacher currently as when they began (45.5%), or were more satisfied currently (38.2%). From a list of factors that could lead to satisfaction, respondents most often agreed with the statement *I feel rewarded when students succeed* (99.4%). The statement *I feel my work is valued by my institution* received the least agreement (47.8%). Among factors that could lead to dissatisfaction with teaching, the strongest agreement was in reaction to *Not enough time to do the work* (54.5%).

Correlations were found between levels of expressed satisfaction and agreement with the factors listed. The level of satisfaction rose with the level of agreement to statements regarding contact with industry ($\chi^2 (3) = 5.573, p = .039$), feeling valued by a supervisor ($\chi^2 (3) = 20.607, p = .000$), feeling valued by the institution ($\chi^2 (3) = 21.192, p = .000$) and by the public ($\chi^2 (3) = 9.606, p = .022$), suggesting improvements in these particular aspects of the job could have the greatest effect on satisfaction levels.

Qualitative results supported these results. One participant said, “A weld has never said thanks. Students come up and say ‘thanks, you did a great job.’ Personal contact with the
students is my highest reward.’” “[Teachers] are here for those two things: they feel valued by their students and they like teaching to pass that information along,” said another participant.

In contrast, evidence of feeling their work is not valued or recognized by the institution was shown in comments such as:

The problem . . . is that there is a deep-seated and long-term historical bias against tradespeople that goes back centuries. It’s engrained pretty much top to bottom, and in particular, anybody in management, almost invariably, comes from a university background.

Another participant commented, “We’re not invited to the ivory tower. It’s like you’re the stepchild: ‘just get the work done – we’re [management] going to the ball, Cinderella’.”

**Previous research on teacher satisfaction.** Finding satisfaction in working with students is consistent with other studies of second-career teachers (Campbell, 2009; Sauder, 2001). Similarly, time pressure is commonly named as a source of dissatisfaction in studies of trade teacher job satisfaction (Kouri, 2009; Sauder, 2001). The sense of not being valued by the institution is also seen in teacher satisfaction research. Skaalvik and Skaalvik (2011) saw a sense of belonging, drawn from relationships with colleagues and supervisors as well as personal value consonance with the institution, linked to teachers feeling satisfied and likely to continue teaching. Van Maele and Van Houtte (2012) saw trust as key to job satisfaction for teachers, given the interdependent nature of the role. They regarded trust as a major component of social capital within educational institutions, and particularly important to novice teachers’ efficacy: “Because teachers usually do lack many extrinsic rewards – high salaries, promotional opportunities, and so forth – they mainly need to derive satisfaction from intrinsic sources, such
as their work and interactions with students and other adults in school” (Van Maele & Van Houtte, 2012, p. 881).

**Successful transition.** The high level of satisfaction (94.5%) reported by participants suggests that the career transition from tradesperson to trades teacher has been successful for this sample group. Suggested changes to increase satisfaction were provided in the survey, and respondents choose *more support for developing teaching skills and knowledge* most often. A Kruskal-Wallis test was used to test for differences in the stated agreement to satisfaction factors, when compared by level of satisfaction resulted in $\chi^2(3) = 9.405$, $p = .024$ for this suggested change. While on the surface this choice suggests more professional development opportunities, given the comments regarding the type of teacher training currently offered, and the expressed divisions between academics and trades teachers, *more support* may mean something more than just additional workshops; it may mean support in the sense of recognition of existing skills and building upon them in non-formal ways, such as mentoring.

**Discussion and Recommendations**

This research explored the career transition of tradespeople to trades teachers, looking at motivation for change, transfer of prior learning, means of learning additional skills and knowledge once in the new role, changes in vocational identity, and satisfaction with the new role. These findings relate specifically to trades teachers; however, they may also hold true with other groups moving from industry practice to a second career in teaching. Recommendations aimed at assisting in a successful transition to the second career of vocational post-secondary teacher have emerged from the analysis of the data. These recommendations include the following:
Recruitment efforts should focus on the motivational factor of *continuity*, both the opportunity to train the next generation and to continue within the first career in a new way within a new role. Recruitment should promote the improved work-life balance possible as a teacher. The opportunity for continued connection to the first career of trades, through sabbaticals or leave for industry practice, should be a part of the employment package. A continued connection to trades could support job satisfaction as a teacher, provide currency in subject matter to the benefit of students, and build on the personal sense of legitimacy as a teacher of one’s trade.

When providing teacher training programs, a focus on practical and non-formal processes is more likely to be accepted by trades teachers than academic methods. Practical training in the early days of teaching could be particularly useful in building confidence and skill among new teachers, with more theoretical training provided at a later time. Teacher training specifically designed for trades, building on the apprenticeship learning model, and utilizing practices of non-formal, tacit learning, could support the pre-existing identity of teacher while helping tradespeople move toward the full responsibilities of teaching. Opportunities for the recognition of prior learning in teaching knowledge and skills would also support this transition. Encouraging mentorship of novice teachers by experienced teachers, through a matching process and allocation of time for discussions, could be a very effective way to build teaching skills and knowledge in a non-formal and ongoing manner that would be more readily accepted as familiar from trades practice. Physically grouping teachers of the same subject or trade, through clusters of office space and classrooms, could foster mentoring and discussion.

Creating a sense of inclusion, through positive relationships with colleagues and with the institution, could help retain trades teachers. Considering this group when planning college
events, and encouraging informal interaction with other teachers via common meeting spaces, would help build a more-inclusive culture. Trades teachers want to see institutional management positively recognize their work and the contribution of trades programs to the institute. This recognition, whether in the form of a casual conversation, being featured in institutional advertising, through inclusion of journeypersons in the management ranks, or other means, would be welcomed and would encourage retention of teachers.

**Reflections of Blue and White**

Throughout the various topics within this study, the first career of trades was connected by respondents, in both positive and negative ways, to the second career of teaching. The research found that tradespeople moving to teaching are motivated primarily by pride in their trade and a desire to see the craft continue through their teaching. Tradespeople bring a strong sense of having already been a teacher, created through working with apprentices, to the role of teacher. They rate themselves highest in the general abilities and traits associated with teaching, but learn in the pedagogical knowledge and skills competencies to gain confidence in their overall teaching competency over time. In learning to teach, trades teachers prefer non-formal learning methods, similar to the apprenticeship learning model, including mentorship and discussions. They reject overly academic training as impractical and an expression of the lower status accorded to trades teaching within higher education.

The transition of identity from tradesperson to trades teacher is an evolution: it grows from the role of teacher embedded within being a tradesperson, and includes trades knowledge gained through their own apprenticeship and practice, becoming a new combined identity that makes one more than a teacher, more than a tradesperson, but rather a teacher of the trade. Trades teachers are generally satisfied with their work, suggesting a successful transition to the
new career, with satisfaction derived from interactions with students and relationships with colleagues. Dissatisfaction comes from time constraints and from a sense of trades work not being valued within the institution.

The connection between the first and second career was a positive factor in motivation to change careers and satisfaction with the new role, building on pride in trades work and teaching apprentices while in industry, and allowing a continued connection with trades through teaching a new generation in the classroom. The negative emerged in expressions of feeling undervalued by the institution, through the institutes’ training for teaching, in perceived divisions between trades programs versus academically-oriented programs, and versus the leadership of the employing institutes.

The idea of blue-collar and white-collar boundaries has been explored by sociologists (Lamont & Molnar, 2002), looking at divisions based on working class versus middle class and boundaries of profession, both of which may be in play in this situation. Lamont (2000) found distinct boundaries created by blue-collar men that set them apart from white-collar counterparts. Lubrano (2005) and Ryan and Sackrey (1995) have explored the sense of division between individuals with working-class roots and those of middle-class background in university settings. Mealyea (1988) and Chappell and Johnson (2003) saw evidence of a distinction created and sustained among trades teachers, separating them from other vocational and technical teachers. Within the current study, comments from participants suggest this distinction is not simply self-created, but is created or reinforced by the institution, as well. More research would be needed to understand the potential importance of these boundaries, how they arise, and the effect on career transitions from blue to white collar work.

Advantages and Disadvantages of Distance Education in comparison to Traditional Education

Topic Area of Submission: Online Education

Presentation Format: Paper Presentation

2-3 Sentence Description: Online education has drastically changed as it has been developed to cater to the working population. It has given students the capacity to learn from home while earning a degree online. Overall, comparing distance education with traditional education will show us the pitfalls of learning in the online environment. In general, students have to decide which environment works best for them as it relates to their learning.

Hawaii International Conference on Education

Topic: Advantages and Disadvantages of Distance Education in comparison to Traditional Education

By: Dr. Antoinette Davis

Mathematics & Statistics Lecturer

Eastern Kentucky University
Current distance education is often referred to as web-based education that uses the Internet and communication technologies (Tallent-Runnels et al., 2006). The Internet is also used to supplement instruction, as in the use of a website to communicate information to students who are in a face-to-face class (Tallent-Runnels et al., 2006). Distance Education has made learning more efficient as you can take classes from anywhere as long as there is a data connection. Today, most distance courses use digitized lectures, audio supplementation, discussion boards, and interactive software to incorporate the active use of writing, problem analysis, and collaborative learning (Navarro & Shoemaker, 1999). All of these elements are needed in order to make an online course more interactive. Pucel and Stertz (2005) found that “web-based delivery permits educational processes to be implemented at times and places that fit around a working student’s job and family responsibilities” (p. 8).

Proponents of distance learning stress that properly designed online courses can better accommodate different learning styles and provide more individualized instruction to each student than can the traditional classroom (Navarro & Shoemaker, 1999; Sosin, 1997). In online courses, an instructor can upload videos and lectures so that students can learn at their own pace. Harrison and Stephen (1996) argued that online education shares some fundamental characteristics with the face-to-face educational environment such as: interactive group communication, as students can interact with one another in such formats as dyads, seminars, group projects, and role plays, take part in online lectures, or contact the instructor, tutors, and subject experts online. All of these elements combined can assist students in the process of learning online. Offenholley (2006) found that online math courses built a sense of community, encouraged higher-order thinking, and provided opportunities for peer collaboration. Hostetter and Busch (2006) found that instructor immediacy behaviors and social presence among students can be enhanced in an online course, thus creating a learning community that facilitates educational excellence. Instructor immediacy is needed in order to continue the flow of the course over time.
In comparison with traditional face-to-face classroom learning that centers on instructors who have control over class content and learning process, online learning offers a learner-centered, self-paced learning environment (Hiltz & Turoff, 2002; Morales, Cory, & Bozell, 2001; Piccoli, Ahmad, & Ives, 2001). In online education, it places the student at the forefront of their learning and they have options on how they will participate and complete their assignments. Swan (2002) reported that students perceived online discussions as more equitable and more democratic than traditional classroom discussions.

English (2007) believes that discussions offer a forum for quiet students to develop and verbalize ideas, promote in-depth response and reflection, encourage peer affirmation, and provide opportunities for more student-instructor and student-student interaction. Often times, shy students are able to find their “voice” on the Discussion Board. The online threaded discussion group is a valuable way for instructors to give all students an opportunity to find their voices comfortably, whether writing in response to literature or someone else’s writing (English, 2007; Offenholley, 2006). In the online environment, other interactive activities can be planned such as: group projects, live chat, etc. Because students in a traditional classroom lecture can simultaneously observe a teaching process, listen to an instructor, and watch slides or transparencies (Zhang, Zhao, Zhou, & Nunamaker, 2004), they often feel a high level of connection with the instructor and that they truly are a part of the group (Hannay & Newvine, 2006).

While online systems may be useful platforms with which instructors and students can exchange ideas and can hold discussions, they are often insufficient for mathematical sciences courses to provide distance students the same learning possibilities that traditional face-to-face students are benefiting from (Fedele & Li, 2008). A possible alternative would be adding video lectures so that online students can see and experience the lecture in the same way that traditional students do. The need to provide
real time access for distance students to ongoing class discussions and lectures (Li, Uvah, Amin, & Hemasinha, 2009) has promoted both synchronous and asynchronous conferencing modes that actually generate more frank discussion among students than traditional classroom instruction (Sproull & Keisler, 1993). If a student prefers face-to-face interaction, then the synchronous model would be the best way to learn online. If a student prefers to work independently with very little interaction from the instructor, then the asynchronous model would be a great alternative. A mixed-mode university course combining online learning and face-to-face meetings can encourage students to formulate and express their own ideas more than would be the case in traditional classrooms (Breton et al., 2005). The hybrid is another way of bridging the gap for students who want the best of online and traditional education. What is best about the face-to-face and online formats can be combined to create a hybrid RST (reduced seat time) course, a fast-growing format for university courses, in which the students meet face-to-face with the instructor and students for classes during the week and operate online at other times (Dolan, 2008).

The major factor that negatively affects distance students is the need to feel they belong to the class and that they are not “distant” (Amin & Li, 2010). It is important to promote interaction in these types of setting so that students can feel engaged in the course. It is a fact that limiting the exchange of feedback to online learning postings and discussion forums may not provide distance students with the interactive learning experience and feeling of belonging to a class they usually would get in a traditional face-to-face class (Amin & Li, 2010). Distance students may feel less connected to the class as compared to face-to-face students (Li et al., 2009). But students can interact with other students inside and outside of the classroom. Overall, their online experience is a two-way street. One possible approach in helping distance students to stay enrolled is involving them in group work in the class (Amin & Li, 2010). Group work is one of the best ways to get students to involved so that they can learn from one another and the instructor in the course. Bielman, Putney, and Strudler (2000) noticed that simple emoticons, such as
smiley faces, in online communications with one another can often compensate for the missing visual and nonverbal communication cues. In terms of communication, it is a good idea to make phone calls to students so that they can place a voice with the picture of their instructor in the Instructor section of the course.

Gunawardena (1995) asserts that “the development of social presence and a sense of online community becomes key to promoting collaborative learning and knowledge building” (p. 164). It is important for the instructor to allow students to interact in the course and to find ways to build a successful community within the course. According to Rovai (2002), it is the method of teaching, not the environment for delivering the course that influences feelings of community. Lastly, Chao and Davis (2001) found that there are many facets to the online success of math courses such as paying attention to the design and utilization of effective online pedagogy, maintaining active communication between students and the instructor, encouraging interaction between students in the classroom, and using computer programs like Excel as a way to illustrate statistical concepts in the classroom. All of these items are important as it relates to building and facilitating a successful online course. Overall, it is important to look at all of the characteristics that are involved with taking online and traditional courses so that students can find the best way for them to learn. In each situation, students will have to adjust to the instructor, students in the course, and the overall course material. In time, students will find their preferred method of taking courses and this will help them to succeed as they proceed towards graduation.

Title: How do we establish social presence within online mathematics courses?

Topic Area of Submission: Mathematics Education

Presentation Format: Paper Presentation

2-3 Sentence Description: Social Presence is a concept that is very important with students in the online environment. In learning mathematics online, social presence is a crucial component of learning online. Rovai (2001) presents a model of community that suggests that social presence, student-instructor ratio, transactional distance, instructor immediacy, lurking, social equality, collaborative learning, group facilitation, and self-directed learning all have an impact on the sense of community within online environments. Overall, social presence can encourage students to interact in class, complete their course assignments, and to complete the course successfully.

Social presence, simply put, are social relationships in online education (Hostetter & Busch, 2006). These relationships can be between student-student interaction and/or student-instructor interaction. It basically encompasses all possible relationships that can form within an online course. When instructors connect with others in new social situations, they create social presence or a degree of interpersonal contact (Gunawardena & Zittle, 1997). The instructor in an online mathematics course sets the tone on whether the course will be interactive or not. It is the instructor’s responsibility to allow students to work together on various projects, assignments, and on the Discussion Board.

However, in online mathematics courses, interaction is especially important so that students can make sure that they are on the right track with their learning in the online community. For Example: $3x + 5 = 17$ (below are the student’s steps)

\[
\begin{align*}
3x + 5 &= 17 \\
+5 &+5 \\
\hline
3x &= 22
\end{align*}
\]

The above problem illustrates that the student has a portion of the concept and needs a bit of assistance from the instructor or students in the online mathematics course. The student added five instead of subtracting five as the student should be trying to isolate the variable by moving 5 to the right hand side. Due to this error, the student’s answer will be wrong. So it will be up to the entire community of learners to step up and show this student how to effectively complete this problem. If the student subtracted 5 from both sides, then the next step would be $3x = 12$. Then dividing by 3 on both sides would result in a final answer of $x = 4$. The student could check their answer by substituting 4 into the original equation to make sure that they received the correct answer.

In instances like these, it is important for instructor to enter the online classroom and email at least 5 out of 7 days a week to facilitate all student questions. In order to generate social presence between students and the instructor, the instructor must take into account the isolation felt by students when online communication lags (Scollins-Mantha, 2008). In the online mathematics classroom, interaction must be consistent especially with “shy” students. These students must know that they can voice their opinions via email or the Discussion Board and they will receive a response. Shy students tend to sit in the back quietly because they do not want to talk in public. But in the online environment, they are able to talk freely amongst their peers and the instructor of the online mathematics course.

As mathematics educators become more comfortable with emerging technologies that offer enhanced teaching and learning opportunities, they are more receptive to administrative requests for additional online general studies mathematics courses such as College Algebra and Elementary Statistics (Hegeman, 2015). These technologies can include lecture videos, ScreenCast, PowerPoint
presentations, TeacherTube videos, etc. All of these technologies can be used in the online mathematics course so that students can feel more interactive online. Research indicates teaching presence in the online classroom, as defined by Anderson, Rourke, Garrison, and Archer (2001), plays an important role in the development of a class climate that provides students with a rewarding educational experience. Teaching presence can be established by lecture videos (in asynchronous classes) and real-time lectures (in synchronous classes). The class climate must be created in an intentional way so that students will feel like they are getting the same amount of instruction and interaction as they would in a traditional classroom. Each of these items increases social presence in the online mathematics course.

In a study of online student satisfaction, all three categories of teaching presence—design and organization, facilitating discourse, and direct instruction—were found to be highly correlated with course satisfaction and student perception of learning (Shea, Pickett, & Pelz, 2003). All online mathematics courses must be taught with the students in mind. The facilitation process must be seamless so that students can feel that they can ask a question and they will get an answer within a reasonable time frame (24 hours or less). Direct instruction has to be directed to the students so that students can use the lecture in a way that will help them to complete their coursework. The lecture must be detailed so that students have an overview on what will be discussed in the current Unit. Sample problems can be discussed so that students can see them illustrated so that they can practice them at home.

Rovai (2001) presents a model of community that suggests that social presence, student-instructor ratio, transactional distance, instructor immediacy, lurking, social equality, collaborative learning, group facilitation, and self-directed learning all have an impact on the sense of community within online environments. Other important characteristics of social presence in online mathematics courses are: posting an Instructor Profile and responding to the profiles of students in the course, holding online office hours, emailing students when their work is not submitted, and posting feedback to all submitted assignments.

All of the above characteristics are important to establishing social presence in online mathematics courses. An instructor can use some or all of these items in order to promote social presence between students and with students and the instructor. Overall, social presence is established by being “present” in the classroom and adding value to a student’s online experience. Ning Shen and Khalifa (2008) considered social presence as a major design principle in computer-mediated community and an important determinant of online community participation. It is important to establish community from the beginning of the course so that students will know what is expected of them as the course progress. Lastly, online
mathematics courses can be difficult but with the right amount of social presence and interaction, students can feel confident in completing the Units and the course successfully.

Georgia State University
Abstract

Rehabilitation Counseling and Special Education transition services are needed to increase access to the primary labor market, community participation, and independent living for individuals with disabilities. This may be especially true during an individual’s stage of development known as transition and emerging adulthood, which is when this interdisciplinary training model may have the most impact. This paper is intended to address the specific personnel needs of Special Education teachers and of Rehabilitation Counselors to serve individuals with disabilities during the transition and emerging adulthood stage of development. A conceptual model of coursework and clinical experiences at the graduate level is offered.

Key words: Transition services; Rehabilitation Counseling; Special Education
A Model of Interdisciplinary Training for Rehabilitation Counselors and Special Educators

A shortage of qualified rehabilitation professionals continues in state vocational rehabilitation (VR) agencies. This trend will continue, primarily due to the expected retirement of many currently employed rehabilitation counselors, high turnover rates, and the inability of existing programs to produce enough graduates to meet the public sector’s replacement needs (Rehabilitation Services Administration, 2013). Likewise, a shortage of special educators continues to be a chronic problem in the field (Smith, Rob, West, & Tyler, 2010).

This innovative and interdisciplinary training model is timely as it addresses both national and state special education and rehabilitation counseling shortages. Presently, collaborative initiatives between schools and community agencies have been “segregated, isolating, fragmented, or incomplete” (Repie, 2005, p. 280). This oftentimes ambiguous and unregulated service is further complicated by an overrepresentation of significant challenges for youth and emerging adults with disabilities from diverse populations in special education programming (Artiles & Bal, 2008; Mandell, Davis, Bevans & Guvara, 2008). This unique model will address these national and state trends by introducing an innovative training opportunity that will result in professionals who have an interdisciplinary understanding and experiences to support the theory underpinning the model. Studies suggest that professionals who hold a master’s degree perform significantly better with consumers and students (Fleming, Del Valle, Kim, & Leahy, 2013; Smith et al., 2010). The intersection of services for youth and young adults with disabilities may occur during the mid to late teen years when transition services are offered and the stage of emerging adulthood (EA) is starting.

Transition for Youth with Disabilities

All youth experience both vertical (normative, predictive) and horizontal (individual specific) transitions in life (Wehmeyer & Webb, 2012). Vertical transitions are typical lifespan points in time such as becoming an adolescent. Horizontal transitions, such as getting married, are contingent upon abilities and/or interests of the person with regard to those events. Unfortunately, data suggest that youth with disabilities do not successfully achieve many of the horizontal and vertical transitions in life that a youth without a disability may accomplish. According to the National Longitudinal Transition Study 2 (NLTS2; 2006), approximately 63% of youth with disabilities complete school compared to 82% of youth without disabilities. Two years after graduation, youth with disabilities are less employed as compare to their peers.
without disabilities (46% to 59% respectively). Of those employed, the average number of hours worked per week was 29 with a median hourly rate of $7.30. Only 33% of these youth received job related benefits (e.g., insurance, leave, vacation, retirement). Similarly, only 33% of youth with disabilities were enrolled two years after graduation in some kind of postsecondary school education as compared to 68% of youth without disabilities. Furthermore, 3-5 years after graduation, only 37% are living independently compared to 60% of those without disabilities.

Regardless of what data are used, youth with disabilities are not meeting or achieving the same horizontal transitions in life as compared to their counterparts without disabilities. Given this information, it is important that secondary transition services be molded to provide those services that create the greatest impact in horizontal change for transitioning emerging adults. The interdisciplinary preparation of special education teachers and rehabilitation counselors who meet the secondary needs of students with disabilities should take into consideration the requirements identified in the Individuals with Disabilities Improvement Education Act (IDEA, 2004). The IDEA requires that transition services be provided to students with disabilities beginning no later than age 16 while services may be provided earlier as determined by the IEP team. Transition services include a coordinated set of activities for a child with a disability that focuses on results-oriented academic and functional outcomes that will positively affect the child’s movement from school to postsecondary settings. Activities that support this movement should consider “postsecondary education, vocational education, integrated employment (including supported employment), continuing and adult education, adult services, independent living, or community participation ([34 CFR 300.43 (a)] [20 U.S.C. 1401(34)]).” Transition services should be written as measureable postsecondary goals that are based on age-appropriate transition assessments as “related to training, education, employment and, where appropriate, independent living skills ([34 CFR 300.320(b) and (c)] [20 U.S.C. 1414 (d)(1)(A)(i)(VIII)]).”

What transition services are taught can be categorized based on the level of evidence available for a given practice. Test, Mazzotti, Mustian, Fowler, Kortering, and Kohler (2009) conducted a systematic review of secondary transition correlational studies that identified 16 transition practices focused on improving the post-school outcomes of students with disabilities. Table 1 provides a summary of each practice and the level of evidence (i.e. effect size) for them. Outcome measures include post-school education, employment indicators, and independent living. The practices identified are those where evidence is available.
Contingent upon the needs of students with disabilities, practices with stronger levels of evidence should be used first with the understanding that not all the potential practices have been studied. Taking this into consideration, a model interdisciplinary training program for rehabilitation counselors and special educators focused on the secondary transition needs of students with disabilities should take into consideration identified practices with greater emphasis placed on those with more evidence. As transition continues, these young adults move into the emerging adulthood stage.

**Emerging Adulthood**

Emerging adulthood (EA) is a developmental period experienced by individuals ages 18 – 29, who live in industrialized nations (Arnett, 2000). Therefore, this lifespan time-period of emerging adulthood runs concurrently with transition services. EA however, specifically focuses on the developmental period and the changes that occur during this time-frame, lending new information about these individuals to service providers, such as special education teachers and rehabilitation counselors. According to Arnett (2000), in industrialized nations the transition to adulthood has become protracted to the extent that it warrants another developmental period, explaining this life-course time-period that is unlike adolescence or adulthood.

There are five characteristics describing emerging adults that include: (1) self-exploration (e.g., identity development); (2) uncertainty; (3) self-focus; (4) optimism; and (5) transition (Arnett, 2000). The first characteristic, self-exploration, provides time for, and facilitates one’s identity development. During self-exploration EA spend time learning about who they are and how they want to live their life. The second characteristic is uncertainty. During EA change is a constant theme that affects many aspects of life. During this time period an individual is expected to experience many changes in occupations, residential locations, and living arrangements, all contributing to feelings of uncertainty. The third characteristic of EA is self-focus, which ultimately translates into self-sufficiency. Spending time in reflection allows today’s young adults more time to pursue opportunities in interpersonal relationships, work, and education that promote self-knowledge, eventually leading to greater independence in this area. The fourth characteristic is optimism. EA is developmental period that is filled with uncertainty, change. Despite the flux, emerging adults are resilient and remain optimistic in their view of the
future. The last characteristic of the EA period is transition. Transition is the feeling of no longer being an adolescent, yet not quite feeling like an adult (Arnett, 2006). According to Arnett (2006) to feel like an adult one must: (a) be responsible for his or her actions, (b) make decisions independently, and (c) make independent financial decisions. According to Hinton and Meyer (2014) “emerging adulthood offers insight that can enhance the educational and rehabilitation services for young adults. Specifically, EA provides an understanding of the vast changes in the experiences and expectations young adults currently have in relationships, career choices and occupations, residential locations, and living arrangements that are very different from past generations” (p. 144).

It may be beneficial for rehabilitation counselors to understand the theory and trends of EA because a main goal of rehabilitation services is to support individuals with disabilities during this time-period to obtain meaningful employment and other community opportunities. This means helping employers and other related community-based service providers who are unaware of emerging adulthood in efforts to support consumers who are still maturing and transitioning to independence during the EA stage.

Applying the theory of EA to youth and young adults with disabilities provides a new framework for understanding individuals throughout the transition process. Equipping counselors in-training with a complete understanding of transition services, including the IEP process, in addition to a thorough understanding of emerging adulthood will provide counselors with a current and relevant understanding of the experiences and values held by today’s youth and emerging adults with disabilities in the context of evidence based practices.

**A Model for Interdisciplinary Training at the Graduate Level**

The authors present a model that embeds special education coursework into a Rehabilitation Counseling (RC) master’s degree; however, an alternate model could embed Rehabilitation Counseling coursework into a Special Education master’s degree. This training model emphasizes that RC’s will (a) increase their understanding of the transition and emerging adulthood phase of development, (b) increase clinical skills that address education-related transition and emerging adulthood challenges, and (c) collaborate with practitioners and school personnel. When trained effectively, professional RC’s can respond to youth and emerging adults with disabilities who experiences career development difficulties as a result of challenges in their academic, personal and socio-emotional development (Hinton & Meyer, 2014). The provision of
transition and emerging adulthood services can assist youth and emerging adults in navigating career exploration, career development, and other post school outcomes.

Equipping counselors in-training with a complete understanding of transition services, including the IEP process, in addition to a thorough understanding of emerging adulthood will provide counselors and educators with a current and relevant understanding of the experiences and values held by today’s youth and emerging adults with disabilities in the context of evidence based practices. The proposed curriculum encompasses a thorough review of the IEP process, an in-depth understanding of the theory and trends of Emerging Adulthood, and the cultural competence to understand, and work with this unique group of individuals.

To address these areas, the proposed 60 hour curricula includes an innovative and interdisciplinary certificate (18 semester hours) providing students with a depth of information in six specific areas to enhance related services for youth and emerging adults with disabilities including: (1) Transition from School (institution) to Community; (2) Curriculum and Teaching in Secondary Schools; (3) Emerging Adulthood; (4) Occupational, Career, and Placement Services; (5) Advanced Theories in Rehabilitation; and (6) Practicum/clinical experience in transition and emerging adulthood.

There are three objectives for the curricula: (1) Students will earn a master’s-degree in (Rehabilitation Counseling or Special Education); (2) Students will complete the Transition Specialist Certificate Program focused on transition and emerging adulthood; and (3) Students will have clinical experiences in transition services including youth and emerging adults with disabilities. Through the Transition Specialist certificate program, students will (1) develop an understanding of transition and emerging adulthood challenges for youth and emerging adults with disabilities to appropriately support these services consistent with Individualized Education Program federal mandates, (2) increase their knowledge of transition and emerging adulthood interventions that promote educational and post-school success, and (3) collaborate with institutional personnel and other related service providers. The project graduates will be highly prepared in interdisciplinary approaches to serve stakeholders in providing consistent and effective educational supports for a promising future.

The aim of this model is based on several foundational premises: (a) Belief in the full rights, privileges, opportunities, and accommodations for all people with disabilities; (b) Belief in the importance of rehabilitation counselors to assist people with disabilities in achieving their
personal, occupational, social, and economic goals; (c) Belief that theoretical, empirical, and evidence-based best practice knowledge is essential; (d) Belief that competitive employment in the most integrated setting significantly augments the quality of life for persons with disabilities and their families; (e) Belief that all qualified persons, regardless of race, religion, creed, gender, sexual orientation or disability should join in the mission to improve the quality of life for all people with disabilities, in particular, their employment in the primary labor market. The model has three primary goals including (a) supporting programs and youth/emerging adults with disabilities by educating and promoting interdisciplinary training, (b) providing opportunities for clinical experiences in the sites serving youth and emerging adults with disabilities, and (c) evaluating courses and materials to enhance and promote the effectiveness of the program to meet the goals of educating both special educators and rehabilitation counselors. The following table provides a proposed rotation of courses within a two-year master’s degree.

<Insert Table 2 Here>

The proposed model is a six-semester (24 month program), practice intensive, evidenced-based inclusive program for eligible students with the capacity to embrace diversity and collaboration, on multiple levels. Students will learn to work with individuals with congenital and acquired conditions to foster and promote individual goals and outcomes related to living, working, and socializing in the community. Faculty will impart this information through research and coursework by teaching evidence-based practices applicable to current rehabilitation, economic and employment trends.

Conclusions Future Research

Economic trends often dictate the employment landscape job seekers are required to navigate for successful employment. The “great recession” continues to impact local and national labor markets (Fogg, Harrington, & McMahon, 2010) for those with and without disability. Five economic trends affecting employment are a jobless recovery, conservative economic changes in many industries, technological advances, increases in diversity, and a general reduction in funding (Krepecio & Martin, 2012). These changes require improved understanding of employers’ needs; highly specialized and skilled workers; increased flexibility in work schedules; technology driving continuous changes in the marketplace; and declines in employment opportunities for emerging adults, to name a few (Krepecio & Martin, 2012). Unfortunately, higher unemployment rates have a disproportional effect on individuals with
disabilities, often mitigating the benefits of mediators such as greater experience and education. According to Fogg et al. (2010), in times of severe economic hardship factors such as increased education and experience do not facilitate employment for individuals with disabilities, especially youth and emerging adults.

In order to further enhance rehabilitation services for transitioning emerging adults, researchers need to examine best practices that provide optimal outcomes for this population. The Workforce Innovation and Opportunity Act (2014) is a gateway into this area as it specifically mandates that fifteen percent of all vocational rehabilitation agency funds be set aside for transition services for students with disabilities. This legislation also provides pre-employment services to all students with disabilities. This is an opportunity for researchers to implement systems change in rehabilitation services to utilize what we already know about emerging adults into the employment system that serves youth with disabilities. It is evident through the current research on transition and recent legislation, that serving youth with disabilities is important to support the notion of independence and self-sufficiency. Unfortunately, there has been a disconnect between rehabilitation counselors, special educators, and other supportive services such as supported employment providers. One of the issues that exist is the lack of clarity as it relates to which agency or system is responsible for aspects of service delivery and costs. It is now clearer and more defined through the Workforce Innovation and Opportunity Act. By enhancing rehabilitation counselors knowledge and skills in transition services and emerging adulthood we can further close the employment and education gaps that have hindered youth with disabilities in America for decades.

The ideal of living, working and socializing in the community of choice is, on the surface, very simple. For those individuals whose disability has become, for whatever reasons, the defining attribute of their existence, this ideal is often beyond their grasp or, at best, highly elusive (Martin, 2001). Rehabilitation counseling and special education can provide services that may be life-altering, in the sense that positive economic changes can be realized by developing an Individualized Transition Plan and an Individualized Plan for Employment that reflect realistic opportunities to capture the American Dream.

6. Abstract :
This workshop would be an opportunity to share my reflexive work about my experiences as a teacher in Nunavik with the Inuit, in Asia and in British Columbia. I would like to discuss how reflexive practices can contribute to teachers' professional development when confronted to cultural complexity.
My study is a reflexive work on my teaching practice based on an autoethnography of my trajectory as an international student in Quebec, a teacher in Nunavik (with the Inuit), Asia and finally in a French International School in British Columbia, Canada. This journey explores my identities and my cultures which I see in intertwining dynamics, interweaving experiences, and in constant motion in time and space, as I meet cultures (mine, and others). I wonder how my reflection on my personal and professional life experiences in different cultural contexts allowed me to become the person and the teacher I am, and how reflexive practices can contribute to teachers' professional development when confronted to cultural complexity.
This paper presents findings from a qualitative dataset collected during a critical ethnography at one Ontario university in response to the question: How has the concept of transdisciplinarity facilitated or hindered development of research partnerships on a Canadian campus? Transdisciplinarity has been characterized as a global reform movement in higher education Nicolescu, 2002, 2008; Montuori, 2010; Morin, 2008; also Mitchell and Moore, 2012, 2015); and invitations to five of our University’s transdisciplinary hubs yielded a dataset comprised of academic, policy, and legal literature, fourteen face-to-face semi-structured, audio-taped and transcribed interviews with stakeholders and participants in these $1 million initiatives, and dozens of participant observations launching one such consortium. In late 2013, Canada’s national newspaper reported that the implementation of Ontario’s ‘differentiation policy framework’ was the province’s ‘boldest step yet to compel universities and colleges to make hard choices about how they spend their resources…a draft policy designed to stretch limited provincial dollars by narrowing some schools’ missions’ (Bradshaw, 2013, para. two). As part of this reform agenda, the Ministry of Training, Colleges and Universities required that each of its forty-four post-secondary educational (PSE) institutions submit a Strategic Mandate Agreement in response to a set of priority objectives outlined under this rubric of ‘differentiation’ aimed at avoiding duplication and waste of public resources (Government of Ontario, 2013; Brock University, 2013). This province’s objectives are similar to goals found in much of the current Organization of Economic Cooperation and Development’s educational reform research, particularly those of the United Kingdom and Australia, as governments throughout the world grapple with decreased revenues from the 2008 global economic downturn (Organization for Economic Cooperation and Development [OECD], 2014). Within our Agreement, the organizing principle was transdisciplinarity, a concept within our final iteration discussed in seven separate clauses (Brock University and Ontario Ministry of Training, College and Universities, 2014, p. 3). As child and youth scholars we anticipated the opportunities to work towards common ground for our human rights research aimed at opening up the entrenched ‘tower of babble’ (Moore and Mitchell, 2009, p. 30; Mitchell and Moore, 2015) we find in Canada where young people’s voices in research partnerships are most often silently absorbed.
Brain Based Phonetic Reading Approaches

Reading and the Brain examines research, content, and utilizes simulation activities focusing on reading. Participants understand how the brain relates to second language acquisition and learning difficulties. The presentation gives an overview that includes learning disabilities, dyslexia, and centers on difficulties in reading. New insights and research pinpoint best approach to reading instruction, therapies and assessment. This presentation is designed to integrate the latest research, individual activities, group discussion, and practical applications.
The purpose of this study was to assess the importance of diversity as perceived by primary school educators enrolled in a teacher educator program in the Caribbean and to provide recommendations to expand multicultural practices in curriculum development activities. This study was also used to assess the importance of diversity as a component of teacher preparation programs. The survey instrument used in this study has been implemented in the Caribbean Region for a transnational comparison.
Abstract:

The Caribbean is filled with a diverse population of individuals from a variety of culturally significant backgrounds. Teaching professionals within the region bring their own cultural flavor to the learning environment in which they teach, which allows their own personal cultural baggage to take center stage.

Escalating diversity within the nation’s schools provide both opportunities and challenges (Banks, 2004); the same holds true within the Caribbean. World migration and trans-national economic linkages are bringing people throughout the world into increased contact, cultural interaction, and conflict within borders (Banks, 2004).

All teachers bring to the clad their own biases and stereotypical points of view specific to their culture; it is hoped that educators are able to recognize the diversity in their own beliefs as well as grow to become more culturally sensitive.

According to Jenkins (1997), multiculturalism stresses the importance of positive contribution of minority groups and a balanced portrayal of a variety of cultures around the world. However, multicultural education as promoted in universities and schools of education seek to close young people off into identities already ascribed to them (Stotsky, 1999).

The purpose of this study was to access the importance of diversity as it is perceived by primary school educators enrolled in a teacher educator program and to provide recommendations to expand multicultural practices in program planning.

Keywords: Diversity, multicultural education, cultural interactions, teacher diversity, ethnicity
INTRODUCTION

The need to create a cadre of teachers that are culturally sensitive is of utmost importance in the Caribbean. The Caribbean is filled with a diverse population of individuals from a variety of culturally significant backgrounds. The teaching professionals within the region bring their own cultural flavor to the learning environment in which they teach, which allows their own personal cultural baggage to play out.

Issues of race, culture, language, class, and religious diversity have deepened within the United States as a consequence of worldwide population movements and the magnetic pull of earning a better life (Banks, 2004). These same consequences are currently experienced in the Caribbean. The need to create a teaching force that is culturally sensitive is undeniable (Harding, 2005). According to the National Council for Accreditation of Teacher Education (NCATE, 2002) Standards for Professional Development, Standard IV Diversity, teacher candidates must develop proficiencies for working with students from diverse backgrounds; dispositions that respect and value differences, and skills for working in diverse settings (Harding, 2005). Many teacher educators have little time outside of their own culture to develop these proficiencies in a timely manner. The Ministries of Education and other professional organizations play a pivotal role in providing the continued educational development and growth needed to supplement educators throughout the Caribbean. However, in recent social and economic challenging times, educational budgets are geared more towards pressing issues in education, such as, access to education, in terms of who can afford it now that governments cannot afford to provide complete financial assistance. All teachers bring to class their own biases and stereotypical points of view specific to their culture; it is hoped that educators are able to recognize the diversity in their beliefs and become aware of their own beliefs, as well as grow to become more culturally sensitive.

The escalating diversity within the nation’s schools provides both opportunities and challenges (Banks, 2004; Smith, 2009). Diverse classrooms and schools make it possible to teach students from many different cultures and groups how to live together cooperatively and productively (Banks, 2004). However, racial intolerance and inequity are challenges that arise when people of diverse groups come together. Teachers need to acquire the awareness and skills needed to maximize the opportunities and minimize the challenges that diversity offers (Banks, 2004). Teacher education programs and other professional organizations assist teachers to attain the knowledge and behaviors needed to work effectively with students from diverse groups, as well as to help students from mainstream groups develop cross-cultural knowledge, values, and competencies (Banks, 2004).

Diversity in the Caribbean is increasingly reflected in various public and private primary, secondary, and tertiary level institutions throughout the Region. Consequently, in the midst of a noticeable degree of assimilation and acculturation, and in spite of efforts to ignore, belittle, or eliminate some ethnic differences, many citizens have strong feelings of ethnic identity (Trouillot, 1992). Ethnic and cultural diversity continues to permeate life in the Caribbean.

World migration and transnational economic linkages are bringing people throughout the region and the world into increased contact, cultural interaction, and conflict within the nation’s borders. The cultural, racial, ethnic, and religious diversity within the Caribbean provides an excellent context for students to acquire the multicultural understandings and skills necessary to function effectively in their local communities, the nation, and the world (Barth, 1969).
MULTICULTURAL EDUCATION MOVEMENT

According to Banks (1994), educators support multicultural education by creating classrooms that encourage all students from ethnic and cultural groups to develop their talents to the fullest rather than just addressing literacy. The multicultural education movement was and is designed to restructure educational institutions so that all students will acquire the knowledge, skills, and attitudes needed to function effectively in a culturally and ethnically diverse nation and world (Banks, 1993). Furthermore, multicultural education is not an ethnic or gender-specific movement. It is a movement designed to empower all students to become knowledgeable, caring, and active citizens, in a deeply troubled and ethnically polarized nation and world (Montgomery & Diehl, 1983).

According to Jenkins (1997), multiculturalism stresses the importance of positive contribution of minority groups and a balanced portrayal of a variety of cultures around the world. However, multicultural education as promoted in universities and schools of education seek to close young people off into identities already ascribed to them (Stotsky, 1999).

Multicultural education incorporates the idea that all students, regardless of their language, race, ethnicity, religion, social class, cultural background, and gender and sexual orientation, should have an equal opportunity to achieve in school (Banks, 2004).

The Teacher

According to Delpit (1988), the role of the teacher is emphasized as critical in connecting students. The teacher is critical to achieving multicultural understanding in the ecology of the classroom, the teacher is identified as the primary change agent; the source of influence that operates to increase multicultural understanding and acceptance (Delpit, 1988). School is acknowledged as one of the places where different cultures meet and where cultural difference may be negotiated or ignored and/or rejected (Igoa, 1995; Liston & Zeichner, 1996). It is a place where children’s home culture intersects with the dominant culture – referred to as the common culture and is typically the first public audience before which children bring the artifacts and stories of their cultures of origin (Grumet, 1988).

This study addresses the perceptions of multiculturalism and diversity as perceived by teachers within the Caribbean region with the understanding that “diversity” is not a topic that can be suitably trained, but rather something that must be shared and/or experienced.

A similar study was conducted through the National Education Association Student Program (NEA-SP) in 2006. However, the previous study was centered on the preparation and development of pre-service student teachers at various levels of completing their teacher education program. The current survey focuses on teachers within the Caribbean Region, both trained and untrained, currently in their Bachelor of Science Program in Educational Leadership and Management, Literacy, and Math.

Research Questions

Research questions were formulated for the study as follows:

1. Do educators believe that students from low-economic areas have the same opportunity for academic success as student in higher income areas?
2. Should multicultural education be an essential component of all educational programs?
3. Should teacher preparation programs include training related to students with disabilities?
4. Do educators believe that training regarding students' gender and sexual orientation biases have a significant effect on student learning outcomes?
5. Do educators believe that information regarding different religious beliefs have a significant effect on a successful teaching environment?
6. Do educators believe that learning about the second language acquisition have a significant effect on successful teaching?

METHOD

The Research Method

This research study used a descriptive design to collect data to answer specific research questions. Descriptive research depicts present-day conditions, settings, and events, and describes the current status of the topic of study (Charles, 1998; McMillan & Schumacher, 1997). This study also used action research that employed practical procedures to determine the extent of perceptions of multicultural education.

There were four key elements that were addressed in the design of the study: (1) the questions to investigate, (2) what data are relevant, (3) what data needs to be gathered, and (4) how best to analyze the results (Yin, 1994).

Survey Participants

In this study, the sample population consisted of 1,748 students enrolled in the Bachelor of Science Program in Educational Leadership and Management, Literacy, and Math. An introduction letter and survey link was sent to the university sponsored email accounts of students that were enrolled in courses offered in the Educational Leadership, Literacy, and Math programs offered in Semester I.

Instrumentation

The survey questionnaire was administered to 1,748 students. The instrument consisted of measures designed to assess the perceptions of multicultural education as perceived by teachers in the Caribbean. Gall, Borg, and Gall (1996) maintain that questionnaires allow the researcher to collect information that is not directly observable, including feelings, motivations, attitudes, accomplishments, and experiences of the participants. In addition, a well-designed questionnaire can be extremely useful in the collection of data from both closed and open-ended information from a population sample (Glesne, 1993).

Data Collection

Survey data was collected via SurveyMonkey®. All data analysis consisted of descriptive information and conservative statistical testing appropriate in meeting the level of measurement requirements. The survey was comprised of both nominal and ordinal level questions that documented the participant’s perceptions of multicultural education.
There were 12 nominal level questions that asked respondents their specific perceptions of diversity. There were also three (3) ordinal level questions that asked respondents if they considered themselves a minority and their understanding of diversity as it relates to the changing classroom environment. Forty (40) participants located throughout the Caribbean received an identical email informing them of the purpose of the survey and a link provided via SurveyMonkey® where the survey data was collected.

SURVEY RESULTS

In this study, data analysis is based on the 40 respondents. 90.0% were female and 30.0% between the ages of 25 through 30. In response to survey questions, 50.0% strongly believed that student in schools from low-income neighborhoods have the same ability to succeed as those in moderate to high-income neighborhoods. In regards to the belief that educators should learn strategies to deal with the effects of poverty on a child’s ability to succeed in the classroom, 92.5% strongly agree, while 71.8% believed that educators should recognize and understand the cultural values of students that they work with. 57.5% of the respondents strongly believed that educators should promote tolerance of different religious beliefs in their curriculum. However, when respondents were asked if educators should provide a multicultural curriculum for all students, 61.5% strongly believed and 12.8% somewhat disagreed. When asked if educators should promote gender equity in the curriculum and school environment, 80% strongly believed while 10% somewhat disagreed. When Educators were asked if they believe that educators should create a safe and unbiased learning environment for students of different sexual orientations, 64.1% strongly agreed and 7.7% strongly disagreed, while 2.6% had no opinion. An overwhelmingly 90% strongly believed that educators should learn strategies to make accommodations for students with mild to moderate disabilities, while 10% somewhat believed. When respondents were asked if educators should learn strategies to better work with English language learners, 75% strongly believed, while 25% somewhat believed. Respondents were asked if they believed that the teaching population of their country should reflect the demographics of the student population; 52.6% strongly believed and 2.6% strongly disagreed, as indicated in Table 1 (Appendix).

Of the 40 respondents, 97.4% indicated that the term "diversity" was more closely related to "ethnicity", as indicated in Table 2 (Appendix).

When respondents were asked if they believed that their studies prepared them to work with specific populations of students, an overwhelming 69.4% indicated they were prepared to work with multicultural, racially, and/or ethnically diverse student, as indicated in Table 3 (Appendix).

When asked if issues of Diversity should be addressed in all university programs, 67.6% agreed, while 2.5% strongly disagreed, as indicated in Table 4 (Appendix).

When respondents asked in which country they lived, the majority indicated they were from Trinidad and Tobago, as indicated in Table 5 (Appendix).

When asked about their current occupation, 45% indicated "other" while 30% indicated their occupation was that of a teacher, as indicated in Table 6 (Appendix).

Respondents were asked in opened-ended form, what the term “diversity” meant to them. The majority of respondents indicated that diversity means "difference" and includes interactions with persons from different backgrounds, religion, sexual orientation, cultural practice, gender,
and having to co-exist within a community or space of different culture, backgrounds, and ethnicities, free of discrimination or prejudice (See responses below).

- “Diversity means 'variety', which makes everything so appealing to a lot of individuals who have different preferences. This is why there should be variety in everything; because we live with different people whose way of life is always a unique way. This is why I think that this course should have been arranged for the needs of both full-time and part-time students. Instead, it is only meeting the needs of the full-time students.”

- “Diversity to me means 'difference'. Whatever makes each one of us different should be embraced by our education system.”

- “Diversity' is a term used to describe several differences existing within a particular place, topic, etc.”

- “It means an interaction with people of different socio-economic background, ethnicity, cultural practice, sexual orientation, gender, abilities, and religious beliefs, having to coexist in the same communities and work environment.”

- “It is about understanding and accepting that every individual is unique whether by race, religion, etc., and respecting those differences.”

- “People of all different race, class, and creed”

- “It means people of different culture, background, and ethnicity lives and unites as one without any discrimination or prejudice.”

- “Variance in nationalities and cultures”

Respondents were asked if they considered themselves a minority and if their status would impact their ability to teach all children. The majority of persons responded that they had no biases and were well-rounded enough to teach persons from various cultural backgrounds. Some of their responses are listed below:

- “I have no bias when it comes to education.”

- “I do not see myself as a minority because I am Black but perhaps because of my religion: Christian. However, I believe that I am well-rounded and read so I am able to reach children from various cultures and backgrounds.”

- “No; I believe this because I do not look at status when I am teaching as this is not an issue to me.”

- “I do consider myself a minority; this is so because there are others who think that just because they are teachers they are over-educated. However, my status will impact my ability to teach all children as I am a very positive and outgoing person. Also, I am very dedicated to my course of Early Childhood Development & Family Studies. Also, I love teaching children because it is my passion to teach pre-school children.”

- “No; I don't consider myself to be a minority because I believe that I possess certain ways, attitudes and attributes that others can look to as an example.”

- “I will use the word 'minority' to describe who I am. However, there are challenges and sometimes you would feel intimidated when it comes to the children because all you want to do is your best.”

- “I do not consider myself to be in the minority, but there are students who are. This means that I have to develop.”

- “Definitely not”
SUMMARY OF FINDINGS

Research Question #1

Research question #1 asked “Do educators believe that students in low-economic areas have the same opportunity for academic success as students in higher income areas?” The results of the survey tend to support the assertion purported in research question #1 as 50% of those surveyed strongly believed that students in low-economic areas have the same opportunity for academic success as students in higher income areas as opposed to 7.5% of those surveyed who strongly disagreed with this statement.

Research Question #2

Research question #2 asked “Do you believe that diversity issues should be addressed in all university programs?” The results of survey question #2 tend to support the assertion purported in research question #2 as 67.5% of respondents believe that diversity issues should be addressed in all university programs. This belief was affirmed.

Research Question #3

Research question #3 asked “Should teacher preparation programs include trainings related to students with disabilities?” The results of survey question #3 tend to support the assertion purported in research question #3 as 72% of respondents believe that all university programs should include trainings related to students with disabilities. This belief was affirmed.

Research Question #4

Research question #4 “Do educators believe that training regarding a student’s gender and sexual orientation biases have a significant effect on student learning outcomes?” The results of survey question #4 indicates that 64.1% of participants strongly supported the belief that training regarding a student’s gender and sexual orientation has a significant effect on student learning outcomes. It is important to note the 7.7% strongly disagreed while 2.6% had no opinion.

Research Question #5

Research question #5 asked "Do educators believe that information regarding different religious beliefs have a significant effect on a successful teaching environment?” The results of survey question #5 supports the belief that information regarding different religious beliefs have significant effect on a successful teaching environment as 57.7% strongly believed. This belief was affirmed.

Research Question #6

Research question #6 asked “Do educators believe that learning about the second language acquisition have a significant effect on successful teaching?” The results of survey
question #6 supports the belief as 75.0% of survey participants strongly believed that learning about the second language acquisition has a significant effect on successful teaching. This belief was affirmed.

CONCLUSION

Considering that the Caribbean is made up of many different countries and cultures, this survey focused specifically on the countries serviced by The University of the West Indies Open Campus, such as Antigua, Bahamas, Barbados, Belize, British Virgin Islands, Caymans, Dominica, Grenada, Jamaica, Montserrat, St. Kitts & Nevis, St. Lucia, St. Vincent, Trinidad & Tobago, and Turks & Caicos.

The survey revealed that 45.0% of survey participants indicated that they were in occupations other than education. The survey also revealed that respondents strongly believe that students in low-income neighborhoods have the same ability to succeed as their counterparts in high-income neighborhoods. Respondents believe that educators should learn strategies to make accommodations for students with mild/moderate disabilities and to deal with the effects of poverty on a child’s ability to succeed in the classroom. Based on the overall responses, there is a strong belief that the topic of diversity should be included in all programs offered through the University. The topic of diversity is not something that can be taught; it is something that must be experienced.

RECOMMENDATIONS

To further investigate the perceptions of multicultural education of the participants, the study can be further developed by incorporating face-to-face interviews where participants may feel more comfortable in responding. There is a need to expand the study for further research into the true impact that diversity has on the educational system. Based on the finding of this study, it is recommended that multicultural education be embedded into curriculum of all programs.

MERITS AND DEMERITS OF EMERGING TRENDS IN POSTGRADUATE SUPERVISION IN UGANDA’S HIGHER EDUCATION SECTOR

By

James Nkata\(^1\) and Gerald Kagambirwe Karyeija\(^2\)

Uganda Management Institute

The paper seeks to examine the merits and demerits of emerging trends in postgraduate supervision in Uganda’s Higher Education Institutions (HEIs). The paper relies heavily on qualitative methodologies; including a review of various reports, interviews with staff from the regulator, National Council for Higher Education (NCHE), interviews from supervisors, external examiners, postgraduate students and coordinators of research in HIE. The results are at two levels, first, we map out the emerging trends of supervision of graduate education in Uganda. The trends include intense usage of internet based supervision, team supervision, collective supervision, overloaded supervision, unqualified supervisors, uncommitted supervisors. Based on these typologies or emerging trends, we further investigated the merits and demerits of these supervisions trends. We got mixed results; some of these supervision trends are responding to the current situation of massification inclusion of marginal and technological innovation which upholds the essence of higher education research and supervision. On the other hand, we find that the trends are leading to bogus degrees, lukewarm graduates and the ultimate prize is wrinkled scholarship. The study concludes that there is need for a supervision revolution in HEI in order to come back to the first principles of crafting scholars and promoting critical and analytical thinkers.

Key words: Supervision, Postgraduate, Higher Education Institutions, Uganda

---

1 Director General, Uganda Management Institute  
2 Associate Professor, Uganda Management Institute
I. INTRODUCTION

Higher Education Institutions (HEIs) in Uganda are very concerned about how to attract postgraduate students and how to ensure that they graduate in time with good degrees. The terrain of higher education is dynamic and a number of issues are affecting the supervision aspects, including, massive numbers, working class students, limited scholarships, increased pressure for outputs on lecturers, and too much workload. The quality of supervision is dependent on how both the supervisor and the supervisee appreciate their roles. Yet, postgraduate supervision is considered, by many, a very critical component of higher education, because of the major output, the research report.

Several scholars have explored this area of supervision. They have looked at issues of challenges of quality; the unique issues that are faced by distance learning students in supervision (Koffi Boku Quan-Baffour, 2008); experiences of doctoral students (Muriisa, 2015); co-supervision; and the prevailing approaches to supervision and supervision development among others (Elly.S.Grossman, 2015) (Lessing, 2002) (S Taylor, 2005); how doctoral students are supervised (Lee, 2008). This demonstrates that a lot has been done on studying postgraduate supervision. However, not much has been done on Uganda and the teaching and learning through postgraduate supervision is still not fully understood. But more importantly, there are some trends which have emerged in recent past, that need to be further understood and explained.

This paper therefore explores the experiences of students and the practices of supervisors in supervision. It highlights the emerging trends in supervision as seen by the students and the supervisors. The trends include intense usage of internet based supervision, team supervision, collective supervision, overloaded supervision, unqualified supervisors, uncommitted supervisors. Based on these emerging trends, we further investigated the merits and demerits of these supervisions trends. Conclusions are made, with a view of informing HEIs practices and policies that guide the supervision of graduate students.
II. LITERATURE REVIEW

A number of scholars have come up with what is considered good or effective supervision. It has been noted by Heath (2002), that the main objective is to ensure that candidates receive considerable and desirable support to successfully complete their thesis or dissertation. The other skills that have been identified include communication skills, supportive skills, general skills, specialist skills, empathy, genuineness, honesty, non-sexist and non-authoritarian attitudes and ability to adapt to individual supervisees (Aziz, 2014) (Gitte Wichmann-Hansen, July 2015) (Lessing, 2002) (Koffi Boku Quan-Baffour, 2008).

The task of the supervisor has furthermore been seen as ensuring that: the topic on which a candidate embarks does indeed present a problem; the candidate has a clear understanding of the field in which the problem occurs and of the problem itself; the candidate uses the correct methods to solve the problem and does an extended literature study of appropriate sources; and the problem is solved according to the requirements of the methods employed (Deist, 1990).

The practice of supervision does not significantly differ from what has been mentioned above. In a study on students' perceptions of their postgraduate supervision in the Faculty of Education, University of South Africa, it was noted that postgraduate students' expectations are not entirely met regarding some aspects of supervision (Lessing, 2002). Lessing and Schulz further determined that most students, especially at master's level, desire that supervisors refer them to other students or informed people in their research fields and to contact them frequently to alleviate feelings of isolation. However, doctoral students want the freedom of working relatively independently. Although according to (Spear, 2000), to supervise research students is a great privilege, providing inter alia a considerable effervescence to the academic environment of their host departments, and lifelong friendships between supervisors and supervisees, sometimes it is a source of conflict and frustration (Watts, 2010). So for supervisors to be successful, the findings of Ezebilo (2012:53) become helpful even for masters supervisors though they are for PhD supervisors. These include the notion that Supervisors should make themselves relatively accessible to students especially at the early stages of programme; Supervisors should be more transparent to students and should carry them along throughout the research; design and data collection as well as monitor the activities of the students to avoid them deviating from the research project plan; Supervisors should not serve as supervisor for many students at the same time to enable she
or he have considerable time for students; they should be aware that students differ. Some may need more guidance in their research project while others may need less; and they should be interested in the subject of the research.

The state of Higher Education in Uganda report of 2015 by the NCHE indicates that only 6 percent of young people in sub-Saharan Africa are enrolled in higher education institutions compared to the global average of 26 percent. The promising news is that universities in many African countries are experiencing a surge in their enrollment. Between 2000 and 2010, higher education enrollment more than doubled, increasing from 2.3 million to 5.2 million. The report also states that on average there are 50 percent more students per professor at African universities compared to the global average. The report further reveals that Private higher education is one of the fastest growing education sectors in Africa. In 2009, there were around 200 public universities and 468 private higher education institutions on the African continent. Comparatively, there are 1700 public universities and nearly 2500 private universities (4- and 2-year universities) in the U.S. alone. The report also reveals that in terms of academic staff, Uganda has PhD holders (251 Females and 845 males) and masters holders (1094 females and 2699 males); who are responsible for supervision of postgraduate students in the whole country. The worrying part is not the growth in student numbers enrolling for postgraduate studies but the disproportionate output of successful postgraduate students (Ganqa, 2012).

In order for this to happen, supervision has been done in a very traditional and predictable way. What is considered traditional have been largely doing face to face supervision, mostly by reading the hard copy of the dissertation, having one supervisor and few supervisees at a time, there were no postgraduate benchmarks in Uganda until 2015, it was considered a privilege, and not a resource allocation issue to supervise students. In sum, traditional graduate student supervision tended to be based on ‘charismatic authority’ where supervisors were selected by research students on the basis of their charisma as expert scholar-researcher. The traditional model of supervision can no longer work in the current context of a mass higher education system (Yeatman, 1995). Instead, a more systemic and managed approach to graduate supervision pedagogy is necessary (Sze, undated). But are the emerging trends a systematic and managed approach to graduate supervision? This is the question to answer. Very little has been written about the ways in which the emerging trends for supervision in Uganda have manifested themselves and the consequences therein. This paper seeks to cover that gap. The next section deals with the methodology used in this study.
III. METHODOLOGY

The research was undertaken based on interviews conducted amongst 18 postgraduate students from five HEIs, notably Uganda Management Institute, Islamic University in Uganda, Kampala International University, Makerere University Business School and Makerere University. Additionally, we also conducted interviews with ten supervisors, two from each of the mentioned HEI. A number of documents were also reviewed, including external examiners’ reports, minutes of viva voce examinations, and some departmental reports. Participation in some supervision meetings, viva voce and proposal defence also provided invaluable insights into the phenomena under investigation. The study was premised on a descriptive phenomenology perspective, whereby the researchers did not only rely on the experiential descriptions from interviews, literature and observations, but also from own personal experiences as students and supervisors. As such, data sources such as notes, reflective journals memos and informal interviews were visited in line with recommendations by (Groenewald, 2004).

IV. FINDINGS AND DISCUSSION

E – Supervision

Much as we in the era of the internet, there are many supervisors in the studied institutions who have not yet embraced the use of internet based supervision for a number of reasons. Interviews indicated that supervisors prefer to have hard copies because they are easy to read and have comments put in text, it encourages them to meet the students, and it helps them navigate the text by reading back and forth, allows to check for structural issues in the text, is healthier to the eyes and eases documentation of work done. However, as indicated by (Aziz, 2014) most of the graduate students believe that the online supervision should be used in the research because it enables them to ‘meet’ their supervisors.

In this study, one of the students who has been supervised online indicated that it worked for him well. He works with Gulu District Local Government, which is in the northern part of the country, over 350 Km away. His supervisor is based in Kampala. He had this to say:
“I have been getting comments from my supervisor. He replies within two weeks and in case you do not get a reply, he advises that you send him a reminder either by phone or by email. I have found it suitable for me who is far and cannot be able to do it face to face all the time. Having said that, I still get feedback on time, in some cases almost instantly; after about an hour. It saves time and money. It has forced me to learn other computer skills such as using track changes.”

The account above presents a number of issues, most of which are shared by the other respondents. First is the importance of feedback – there is the view that feedback is fast in some cases, second, it helps the students access the supervisors because with an email, you are almost certain that the document is with the recipient unlike when you drop it with the secretary or at the gate and hope that the supervisors will find it later. Third, the students also get to learn how to use the computer. It is not good for the students alone, even the supervisors intimated that they like it too. One of the participants to this study observed that given the numbers, the soft copy becomes easy to handle …”I can even respond to it when I have travelled or attending a boring Workshop…” This resonated with another who noted that “I use Skype and it makes me meet my students at the time of my convenience; even after working hours, during holidays and weekends. My colleagues would find it irregular for me to meet students during those times and in those spaces.” Meaning that the trend is catching on to use internet based modes like blogs, Skype, and email amongst others.

Other advantages given by the supervisors include, but are not limited to; having a clear record of the previous comments, and dates of receipt and reply; avoiding meeting students who may take a lot of their time; having a clear record of unattended to work - by marking the mails unread. All these point to the view that there are a number of merits to the e-supervision which is catching up in many circles, including helping remote supervisors to become effective. Remote supervisors here refer to those who are either part time or are in one way or another attached to the respective institutions, but are not full time faculty.

However, e-supervision is not fully embraced and we received mixed reactions from the respondents. Some of the respondents argue that this mode of supervision is increasing, and that although it has a number of positive aspects that the graduate students liked others felt that it dehumanises supervision. It denies the actors – supervisor and supervisee - facial expression, gestures, counselling and opportunity to get unambiguous feedback. In fact, one
of the supervisees said that in case she does not understand the comments, then it becomes disastrous because many supervisors will not allow you to ask on phone and instead will refer you to the comments and insist that they are actually very busy. As a consequence, students end up running to fellow students or sympathetic intellectuals for interpretation of the comments from the supervisor.

Another challenge that comes with e-supervision according to the respondents is that at times there is limited feedback. It was highlighted that some of the students in the interview were concerned about the lack of feedback from the instructors. The students expected to get immediate feedback but when they remind the supervisors, sometimes they get rude feedback. For instance, one of the doctoral students said:

“When I call my supervisor to remind him about feedback, he rudely tells me that he is aware that the work is supposed to be read. He goes on to remind me that I should know that he is also busy hustling with teaching and doing consultancy work. If you feel that I am not working well with you, please inform the coordinator to appoint another supervisor.”

Such description shows that supervisees consider the online supervision as a way of avoidance from the supervisors. It also demonstrates that supervision is loathed by some supervisors. They take it as a burden, which they would rather do away with, but incidentally cannot because it is a core aspect of their work. Thus, online supervisor is providing creative ways of postponing or avoiding doing work as and when it is desired.

Team Supervision

Team or group supervision here is in two categories. The first category is where a student is given a team of supervisors. It is referred to as team supervisor, co-supervision, joint supervision, supervision committee and many other names. It happens when it is a policy of the HEIs to ensure that the supervision of research degree students should involve at least two people. Usually one of the supervisors is an expert in the area, and preferably has been or is currently handling research projects in the field of study of interest to the supervisee. The second category is where a supervisors invites a group of students and meets them together or at once, especially on the early days of developing their proposals. The groups are said to be between two to ten students, depending on the supervisor, meeting place and the time.
We found out that team supervision is also loved and loathed almost in equal measure, especially by the students. Looking at the first category, the impression got from the supervisors is that it is a worthy idea, and helps fill the gaps when a colleague is less versed in the discipline, has travelled or even dies - described by Delamont et al (2004: 84) as ‘intellectual bereavement’. The student does not have to suffer and progress is easier than when one is dealing with one supervisor. The prospects for greater attention to accountability within academia has also been enhanced (Waghid, 2006). A seasoned supervisor who has graduated four PhDs and two hundred master’s students in a span of ten years opined that “I find team supervision so helpful because it diminishes the menace of ineffectiveness amongst supervisors. When that happens, the chance of having students graduate in time and with quality dissertations is high”. This view was shared by most of the respondents. However, the students cautioned that it can only work well when there is appropriate frequency of supervision and clear delineation of supervisors’ duties and responsibilities within the team (Watts, 2010).

The other common issue that was found is the synergy and energy that comes from cross and inter disciplinary support. Quite often students have topics that cut across disciplines, and having two supervisors or more with varying academic backgrounds. An example we encountered was where a supervisor whose academic background is in the social sciences, has been given MBA students to supervise. She found it very useful to be paired with MBA graduates as co-supervisors. Her experience illustrated that she has benefited a lot by having her colleague take the student through the conceptualisation of the key variables of the study especially in areas that are of a financial and business nature, while she leads the conceptualisation of topics and constructs dealing with human resources and behaviour. The outcome, in her view has been a better dissertation and minimal confliction and conflict.

Interestingly, the experience of the ‘social sciences supervisor’ discussed above, turns out to be the challenge of some other supervisors. A recent graduate fulminated thus after her viva voce:

“I have been torn apart by my supervisors. They rarely agree and as I try to please both, I ended up pleasing none. No wonder it took the proposal defence for me to get direction. Thanks to proposal defence, I would have not been able to get this far. How can two PhD holders fail to agree on
A number of questions thus confront us. First, whether critical thinking can be generated by the differing opinions of supervisors? Second, whether the candidate can survive the ‘ego war’ of the supervisors or may end up being a victim of the same? Third, whether hierarchy differentials in the supervisors, e.g. senior lecturer and lecturer, translates into hierarchy differentials in the quality of supervision. Several answers can be provided to these questions given differing experiences but what seems to be clear from the respondents is the idea that team supervision is also riddled with some demerits.

Moving on to the second category of group supervision which is a more recent trend, the students find it satisfying. A masters student narrated “we have to meet the supervisors when we are about five of us. I am shy and in the initial stages, most of my questions were asked by others or pre-empted by the supervisor. I found it so enriching.” The other advantage was mentioned by students from another institution. They were of the view that research methods classes were inadequate to enable students grasp research and be able to conduct a study successfully. Supervisors found it time saving, convenient, a replacement of tutorials which are long gone.

The downside of supervising many students at a time according to the insider’s views is that it was a theatre where they would have their ego bashed. They would look forward to the supervision meeting with “My supervisor would want me to discuss with the masters students and yet I am a PhD candidate. I felt that it was diminishing my ego which I did not like. He met us together and insisted that research is research.” Supervisors also noted that this kind of supervision may have challenges such as inability to enable critical thinking since you deny students the space to engage, challenge, argue and debate with the supervisor; it also enhances power distance where the supervisor is the guru and the students are attending another class; and the shy ones fail to get opportunity to discuss. Some supervisors are not flexible to welcome independent intellectual thought, while others provide insufficient criticism of work submitted and they lack interest in the theme of the research, ending up imposing a research methodology which is inappropriate for the research undertaken. These ideas are partially in line with the findings of (Gitte Wichmann-Hansen, July 2015), who found three major challenges experienced by the supervisors: (1) facilitating equal
participation within heterogeneous student groups, (2) balancing between providing answers and involving students, (3) identifying and developing the students’ analytical skills.

It is worth noting that these trends have now replaced the traditional supervision of one-on-one and face-to-face supervision. There is need to pay attention to the individual needs and group dynamics in order to have fruitful and useful supervision.

*Overloaded supervision*

The National Council for Higher Education of Uganda which regulates the higher education sector has clear guidelines in the postgraduate benchmarks on the workload for supervisors. It is stipulated that in order or one to supervise a masters students, amongst others, a supervisor shall be allocated no more than eight Master’s Degree students, and where the supervisor also has PhD students, the following alternatives shall apply

(1)No more than 8 Masters Degree students at any one time,

(2) No more than three doctoral students and two Masters Degree students at any one time,

(3) No more than two doctoral students and four Masters Degree students at any one time,

(4) No more than one doctoral student and six Masters Degree students at any one time.

It further stipulates that PhD supervisor shall be allocated no more than four doctoral students at any one time. Where the supervisor also has Master’s Degree students, the following alternatives shall apply:

(1) No more than three doctoral students and two Master’s Degree students at any one time,

(2) No more than two doctoral students and four Master’s Degree students at any one time,

(3) No more than one doctoral student and six Masters degree students at any one time,

(4) No more than 8 Master’s degree students at any one time (NCHE, 2015).

Conversely, the reality on the ground appears different. A number of post graduate supervisors in the visited institutions seem to be overloaded, and in many cases they also feel underpaid at the same time. Incidentally, the overload is also used as an explanation for supervisor frustration. A senior supervisor said that “The amount of work I have to do is immense. I have academic work – teaching, research, third mission. On top of that, I have to do consultancy work because it is a major output for me. I am head of department which weighs me down with administrative work. Leave alone my personal business.” Pressed further that most academics face the same, this particular supervisor said that
“Okay, leave the duties I have said aside. I have been allocated 60 students this year. I have graduated 200 students in four years I have been here. I teach work life balance, but I do not practice it. I am beginning to wonder whether I am in the right place and profession. I am asking God to give me clear answer. Doing this job is a very frustrating experience. But for now, I will stick in here because we are paid good money for supervision.”

It is not only the supervisors who feel the weight of the supervision. The students feel it too. Sometimes improper guidance is given to postgraduate participants which is manifested in, especially time delays, too little guidance and harsh criticism. This challenge is fuelled by supervisors’ study leaves, long leaves, going overseas, late return of chapters submitted a factor caused by overwhelming numbers of supervised students in relation to the supervisor. What was particular singled out was that the supervisors do not pay attention to conceptualisation, measurement of variables, appropriateness of methods and the interpretation of the statics (statistics?) were described by one of the respondents as ‘terrible’. This state of affairs foments a time bomb in the sector. If it is not arrested, a disaster is looming. The very essence of higher education will be negated.

Unqualified supervisors

According to (Muriisa, 2015), in Mbarara University of Science and Technology the few academic staff with PhDs do not have the required research skills to supervise the PhD. He argues that some of them are hardly experienced in research methodologies; they were trained in the same system with poor supervision and therefore may not adequately supervise a PhD to its completion. He adds that there is a misconception in the academia that when one has a PhD may supervise a PhD, but this is not the case. Some do not even have the skills to supervise a master’s degree anyway. The same applies to masters holders. There are many lecturers with masters’ degrees who are considered capable to supervise a master’s degree, but cannot.

Although the NCHE benchmarks suggest that only lecturers with relevant doctorates are expected to supervise Master’s Degree students, it was found out that it is common place to find supervisors who have irrelevant doctorates supervising students. In one of the institutions, a supervisor who had done history has been supervising MBA students. Her colleague had this to say:
“I always notice that he focuses on the structure of the dissertation. The numbering of pages, the English, the number of pages and other such technical issues but adds almost nothing to scholarship. Much as I do not have a PhD, I think that I make a better contribution to the students’ work. I have an MBA from one of the American Ivy league universities, Brown University”.

Whether Ivy league or not may not matter much, but supervising in an area where you have no expertise at all undermines scholarship. Some institutions try to mitigate this by pairing supervisors whereby one of them is a subject expert. Other than the relevant discipline, due to shortage of PhDs in the country, there are a number of master’s lectures supervising master’s dissertations as well. Postgraduate candidates are challenged with statistical data analysis packages (qualitative and quantitative) during data analysis and interpretation. This is attributed to the limited knowledge acquired from supervisors / lecturers. Due to the limited applicability of these skills, majority delay to finish their projects on time, while others hire experts at a high cost.

The other aspect that is often over-looked is national necessity that a supervisor shall not be a relative of the candidate or have any conflict of interest that might affect the quality of supervision. None of the respondents seemed to know that this was in the benchmarks and none of them has seen adherence to this requirement in their institution. So what happens when a supervisor is handling a relative? An enemy? A client in other business? A pastor of his church? A supplier of consultancy services? Conflicts of interest can be as obvious as the ones mentioned here. But they can as well be imperceptible; and if unrecognised and dealt with, they can easily damage the credibility and reputation of postgraduate supervision and its outputs. This calls for enhanced research supervision competencies that supervisors can gain, strengthen, and be measured as noted by Hyatt and Williams (2011 : 58-60).

V. CONCLUSIONS AND RECOMMENDATIONS

The paper has observed that supervisors and students seem to suggest that these trends are on the increase and are affecting the nature and quality of supervision. These trends may not be new globally, but the intensity and rapid adaptation in the study area, together with their popularity raises interest to interrogate into them. This paper has shown that the most
dominant emerging trends are E supervision, team supervision, overloaded supervision, and unqualified supervision. E supervision is all about using ICT to enhance the interaction between the supervisors and the supervisees. Team supervision relates to the team or group being either the supervisors or the supervisees, it can also be either formal or informal. Overloaded supervision concerns the volume of work and unqualified largely refers to non-adherence to best practices and national postgraduate benchmarks. Given this situation, we recommend thus;

With regard to E – supervision, it is suggested that in order to have this rend translate into quality dissertations and a fruitful supervision experience, graduate schools should come up with policies to guide online supervision. There is need to promote the idea of dynamic facilitation as propounded by (Koffi Boku Quan-Baffour, 2008). It suggests that supervisors create optimum conditions for research; allow students generate new forms of knowledge that can confirm but more importantly, interrogate existing perspectives; students to tolerate alternative perspectives from their peers and have good learning infrastructure such as libraries and regular modes of access to their e-resources. E –supervision can also be made more structured and clear provisions be provided for feedback management.

Team supervision can also be bettered at two levels. In the first case of having more than one supervisors superintending over one student. This should be promoted because it leads to better supervision in most cases. To begin with, there is need to have a feedback strategy from the supervisors and a conflict resolution mechanism. Roles and responsibilities between the main supervisors and the co-supervisor should be well spelt out. As much as possible, it is useful to have one of the supervisors as a subject expert, and have the team gender mainstreamed as well. Lastly, the supervisors should always create time to meet as supervisors and also to meet the student together in order to minimise divergences but promote synergies and convergences. These learning communities will be helpful to both the supervisors and the supervisees. On the other hand, where we have a collection of students being supervised by one person, should ensure that the supervisors provide space for full participation by the supervisees, engaging students, and developing the students’ analytical skills.

Concerning overloaded supervision, the main idea is to follow the protocols of NCHE, ensure that the supervisors were not overloaded. Come up with a ratio to determine the optimal distribution of work, and minimise overloads. Then as far as unqualified supervision is
concerned, it is the most dangerous aspect because it undermines the core of supervision. We suggest that the national benchmarks of NCHE are followed and the heads of postgraduate and research schools should ensure that as they allocate supervisors, they take care to ask whether there is a conflict of interest, establish if the supervisors – or at least one of the supervisors, if more than one – has the expertise in the discipline, and take all supervisors for training in postgraduate supervision pedagogy before allowing them to supervise. Thus, these findings will provide a basis for those in charge of managing the supervision process to enhance quality of postgraduate supervision.

Illusions of Inclusion: University Policies that Perpetuate Exclusion of Students of Color

Topic area: Higher Education
Presentation format: Paper Session
Description: This Paper Session will include a discussion about the mechanism of diversity and inclusion policies that create climates of exclusion within higher education institutions. Analyzing the policies, practices and procedures of inclusion across three universities in the San Francisco Bay Area, the authors created a rubric to measure inclusion based on a three point set of criteria: equity, sustainability, and mission-alignment. The findings have implications for the interconnections of race and higher education policy.

Abstract

The purpose of this paper is to explore the policies, practices and procedures of inclusion across three universities in the San Francisco Bay Area: Stanford University, the University of San Francisco, and the University of California at Berkeley. Using a rubric measuring inclusion based on a three point set of criteria (equity, sustainability, and mission-alignment), the authors analyzed four common statements in which inclusion policies for traditionally marginalized students and students of color are contained: university mission statement, diversity program mission statement, diversity statement, and values/goals statements. The analysis revealed that although the values/goals statements align with the missions of the three institutions analyzed, there is often incongruence between the diversity program mission and diversity statements and the missions of the universities. This tension reflects the practice of institutions of higher education to draft policies that reflect inclusion language for diverse populations without making the necessary structural changes that impact values, attitudes, and practices.
International Conference in Education

Title: Deconstructing the Tower of Babel - The Healing Power of Creating an Integrated Therapeutic World in Special Education Through Play and Music

Area: Special Education

Type of Presentation: Poster Session –Submission 101

Description: This presentation will highlight the neurodevelopmental benefits of utilizing collaborative interdisciplinary assessment and therapeutic intervention strategies through play and music for children in special education. It will propose the importance of revolutionizing clinical terminology across disciplines, keeping the integrity of each discipline, while piecing together the diagnostic puzzle in identifying children with special needs and proposing goals and objectives that can be implemented by the whole team.

• Name: Dr. Jean M. Novak, PhD, CCC-SLP

• Department/Division: Communicative Disorders & Sciences

• University/Company/Organization: San Jose State University

• Email Address: jean.novak@sjsu.edu
ABSTRACT:

Close your eyes.... if you were to take yourself on a journey into the future, could you envision a clinical setting where a child’s behavior, as well as his/her cognitive, language, and sensory motor abilities are all being evaluated by clinicians from different disciplines while the child is engaged in a variety of play activities? Could you imagine each clinician observing the child from their disciplinary lens and identifying therapeutic objectives using sophisticated yet common terminology understood and utilized by all, exemplified by, “One Language under WHO”. Could you view these clinicians who, in the past, were like the story, ”The blind men and an elephant”, now putting the pieces of a puzzle together to make a complete and accurate diagnosis with open and empathetic eyes, looking at the gestalt, all at the same time. Can all of this become a reality? Are special education professionals from a wide-range of disciplines ready for a paradigm shift, willing to work together, free from the undue fear of feeling professionally threatened by each other’s disciplines?

This presentation serves to highlight the benefits of interdisciplinary collaboration in special education in the areas of assessment and therapeutic intervention strategies through play. It will propose the importance of preserving the integrity of each discipline in special education, and functioning as a vital means to piece
together the diagnostic puzzle. Furthermore, in order to allow families to better understand and embrace their child, it will address the critical need to consider the child’s ecosystem. Additionally, by providing stimulating activities that promote maintenance and generalization of acquired skills through the healing power of naturalistic environments, successful intervention is indubitable. Lastly, in a collaborative effort to bring this visionary concept to life, The Autism Tree Project Foundation and the New Children’s Museum in San Diego, California and the Magical Bridge Playground in Palo Alto, California will be presented as realistic and plausible examples of potential sites for turning this introspective abstraction into expanding clinical methods in special education practices. Are you ready to explore this vision and embark on a conceivably incredible journey? If so, welcome to this clinically metamorphic expedition. The future may be closer than you think!

6. **Abstract**

   The persistence and attrition of underrepresented minority (URM) students in science, technology, engineering and mathematics (STEM) continues to remain a steadfast problem in education and the workforce. Research has shown that educators, administrators, and policy makers all play a vital role in shaping the future generation of STEM education, programs and the workforce, however, much of the research is deficient in providing URM student perceptions on how key factors such as student engagement, financial support, higher education preparation and institutional environment all impact their persistence in the STEM pipeline. This study employs qualitative research methods, semi-structured interviews and casual conversations to gain insight on common trends for the persistence of four (2 males, 2 females) URM students that were enrolled in a 2012 Summer Bridge Program at Mississippi State University (MSU), a predominately large white institution (PWI). Within this study, emphasis will be placed on the engineering branch of STEM. The research found that small diverse organizations such as National Society of Black Engineering (NSBE) and Increasing Minority Access to Graduate Education (IMAGE) along with financial support in the form of scholarships and alumni waivers, and pre-freshmen summer engineering programs such as Summer Bridge played a major role in URM student persistence in engineering disciplines.

Abstract

The persistence and attrition of underrepresented minority (URM) students in science, technology, engineering and mathematics (STEM) continues to remain a steadfast problem in education and the workforce. Research has shown that educators, administrators, and policy makers all play a vital role in shaping the future generation of STEM education, programs and the workforce, however, much of the research is deficient in providing URM student perceptions on how key factors such as student engagement, financial support, higher education preparation and institutional environment all impact their persistence in the STEM pipeline. This study employs qualitative research methods, semi-structured interviews and casual conversations to gain insight on common trends for the persistence of four (2 males, 2 females) URM students that were enrolled in a 2012 Summer Bridge Program at Mississippi State University (MSU), a predominately large white institution (PWI). Within this study, emphasis will be placed on the engineering branch of STEM. The research found that small diverse organizations such as National Society of Black Engineering (NSBE) and Increasing Minority Access to Graduate Education (IMAGE) along with financial support in the form of scholarships and alumni waivers, and pre-freshmen summer engineering programs such as Summer Bridge played a major role in URM student persistence in engineering disciplines.
Introduction

Many URM students in science, technology, engineering, and mathematics (STEM) majors are either dropping out of institutions of higher education or changing their majors by their sophomore year due to constraints such as rigorous course loads, institutional and academic barriers, as well as environmental factors. Such constraints induce an attrition of URM students at predominately white institutions (PWIs) in STEM. This phenomenon is quite overwhelming and frightening to minority students seeking to gain STEM degrees from PWIs post their secondary studies. Studies conducted on URM student populations in STEM disciplines at PWIs have consistently established that males dominate the interwoven fields in comparison to their female counterparts, and that URM student groups account for a minute percentage of all the students majoring in STEM disciplines at PWIs when quantifying retention. The National Science Foundation (NSF) has shown that minorities continue to remain stagnant in attaining degrees in general compared to the overall population as shown in Figure 1 and 2. In examining Figure 2 a little closer, many Black students are not obtaining degrees in engineering. For the U.S.’s economy to remain globally competitive, policy makers must make it imperative to expand the nation’s scientific, engineering, and technical workforce (Winston, et al., 2008).
Figure 1. Racial/ethnic distribution of S&E bachelor’s degrees: 2000 – 12. Obtained from the National Science Foundation’s Science Education Database.

Notes: S&E = Science and Engineering.
Figure 2. Racial/ethnic distribution of S&E bachelor’s degree recipients, by field: 2012. Obtained from National Science Foundation’s Science Education Database.

Upon transitioning from high school to college settings, underrepresented minority student groups in general have developed a lack of self-efficacy when it comes to selecting and persisting in engineering disciplines. This alarming transition is a direct result of challenging first year coursework, inadequate academic preparation, time management, study skills and personal accountability, which all affect the persistence of students in engineering disciplines at PWIs. Many PWI’s are currently trying to find methods to improve and enhance their engineering
pipelines in order to lessen the attrition rates of URM students seeking to pursue engineering degrees.

URM student groups are usually challenged by their white counterparts to constantly prove themselves, whether it is in the classroom or working collaboratively on a project. Research indicates that there is a lack of representation in engineering for URM student groups due to the fact that members of the affiliated group can foresee career barriers, while their counterparts foresee career opportunities (Winston et al., 2008). Foreseeing such barriers pose emotional and educational barriers to URM STEM groups. Although URM student groups are faced with many challenges, federal projections indicate that an increase in retention and graduation rates of STEM degrees for URM student groups will lead to a positive impact in the nation’s labor force demand for qualified workers (Winston et al., 2008). The ability to overcome many of the challenges and barriers depends upon the improvement of STEM “self-efficacy” within URM students.

This study provides a rich, detailed description of URM students and the factors that stimulated their interests in pursuing an engineering degree from a PWI. More specifically, this study will examine retention and identify key factors that have motivated and aided an URM student population that participated in a 2012 Summer Bridge Program at Mississippi State University with a population of approximately twenty thousand students.

**Background on Key Factors Identified within the literature**

**Student Engagement**

Present research on URM student groups has focused mainly on student retention and student involvement. Vincent Tinto’s (1993) theoretical base model and Alexander Astin’s Theory of Involvement will be used in this study in relation to student engagement. Tinto’s
theoretical concept of student retention is a model that identifies factors that influence students to either persist in or depart from a discipline. In this model, Tinto discuss three major sources of why students may not persist in a discipline: academic difficulties, the inability of individuals to resolve their educational and occupational goals, and their failure to become or remain incorporated in the intellectual and social life of the institution (Tinto, 1993).

According to Myers et al. (2012), “Astin’s Theory of Involvement highlights that students who engage in campus clubs, organizations, and dorm activities are more likely to persist at higher statistical rates when compared to students who are not engaged in such campus-based activities” (p.1). Several authors such as Museus & Liverman (2010), Tinto & Pusser (2006) have found that educators and administrators who set fostering and engaging environments for students usually observe high persistence rates. The authors also state that URM student groups in engineering are highly encouraged to interact more closely with faculty, peers, mentors and organizations both inside and outside of the minority arena to experience success. Student engagement plays a vital role in how well students continue through the engineering curriculum.

Tinto’s and Astin’s models are highly effective in fostering student retention across many disciplines. For the purpose of this study, both models will be used in relation to URM student groups, particularly, African Americans majoring in engineering at a PWI.

**Financial Support**

Students make decisions whether to continue their education beyond a high school diploma by considering the costs and benefits of obtaining a degree in engineering. If students believe that pursuing a bachelor’s degree in engineering will be beneficial in five to six years from now, they more likely will be motivated to persist throughout their studies in engineering.
When financial resources become the underlying factor in choosing to pursue an engineering degree, students must identify what is more important to them and their future. Hurtado et al. (2007, as cited in Slovacek et al., 2011) found that, “underrepresented minority students are frequently impacted by financial and family pressures, and are more likely to become concerned with the ability to finance their college education” (p. 6). In a large PWI in northern Mississippi, scholarships for first year URM students are awarded based upon students’ performance on ACT and/or SAT test scores and high school GPA’s.

Inadequate financial support is one of the most outstanding factors for URM students. Of course this plays a major role in whether a student will persist from year to year in engineering and other STEM related disciplines. With increasing tuition cost, cost of attendance, and student loan financial aid packages, it is unlikely that threats to URM student groups’ ability to pay will decrease (ASHE, 2011).

**Institutional Environment**

In addition to funding opportunities, researchers note the importance of the institutional environmental factors and programs that are geared toward retaining students. When URM student groups step outside of their comfort zone and are placed in a dissimilar environment, relating to the new environment can pose a challenge, especially when coming from a predominately Black high school and transitioning to a PWI. The environment and culture of PWI’s as well as the many engineering departments create challenges for URM students. One aspect of the environment that can affect URM student groups negatively is the individualistic and competitive environment of classes (ASHE, 2011). Courses such as general physics, general chemistry, and calculus eliminate unprepared students from persisting in engineering disciplines (ASHE, 2011).
Pre-College Preparation

One relevant factor that hinders URM students’ success in Engineering is their inadequate levels of academic preparation during their primary and secondary educational years. Success in engineering is based on adequate academic preparation for college level work within the discipline, more specifically mathematics and science courses, which are deemed most important in Engineering. According to ASHE (2011), eight factors in K–12 contribute to the inadequate academic preparation of URM students in Engineering. The factors are: “(1) school district funding disparities, (2) trailing into remedial courses, (3) underrepresentation in Advanced Placement courses, (4) unqualified teachers, (5) low teacher expectations, (6) stereotype threat, (7) oppositional culture, and (8) premature departure from high school” (p. 29).

Upon entering college, many students often choose to pursue STEM disciplines, however, a large portion of URM students leave the field before the duration of the second year (Griffith, 2010). This is perplexing, because student interest is present, but the commitment for URM student groups to persist is not; therefore, the trend of underrepresentation continues. Previous research suggests that college preparation and other educational experiences affect these decisions (Griffith, 2010). It is important to identify what these experiences are so that measures can be taken to replicate success for URM student groups in engineering. College experiences, college environments and family background characteristics in regards to persistence, all play a significant role in the ambitions of a student to persist in engineering. The idea of support for URM students is a driving mechanism for pertaining students in engineering.

Nowadays, to get early preparation for college, many URM senior high school students who are seeking to obtain an engineering degree from a PWI, usually participate in a Summer Bridge program experience before entering into their freshmen semester. The Summer Bridge
program is designed to help incoming minority freshman students become more acclimated with the institutional culture as well as expose them to courses within STEM disciplines hosted by university faculty, staff, graduate and undergraduate students. In an article, Slovacek et al. (2011) stated, “The Summer Bridge component for incoming freshman was found to have substantial impact on a student’s academic performance” (p.27).

**Methodology**

The purpose of this study was to identify factors that influence URM student groups to persist in engineering discipline at a large PWI in Mississippi. This study used a qualitative approach to identify key factors attributed to URM groups’ persistence in engineering. Three research questions were used to guide the interview discussions done within this study:

1. What factors influenced the URM students to persist in an engineering discipline at large PWI in Mississippi?
2. How did academic preparation, financial assistance, and support groups influence URM student groups decisions to remain in engineering at a large PWI in Mississippi?
3. What academic and social factors were attributed to the retention of URM students in engineering at a large PWI in Mississippi?

Transcripts made from the audiotape interviews were checked for accuracy against the original recordings.

**Participants**

The four participants selected for this study were all African Americans, two males and two females. All participants were students in the 2012 Summer Bridge incoming freshmen group. Summer Bridge exposed the URM students to the institutional environment and gave
them the opportunity to take real college course work such as general physics, chemistry and computer programming. Each participant was given an alias to protect their identity. For the purpose of this study, the participants are referred to as “Debra”, “Patsy”, “Aaron”, and “Cade.”

Debra, Patsy, and Aaron went to large high schools located in the city while Cade went to a very small school located in rural Mississippi. Mississippi State University is a large research institution in the southeastern region of Mississippi; it is a PWI with a total population of approximately 20,000 students enrolled. Demographics and attributes of the URM student participants are listed in Table 1.

Table 1. URM student demographics and attributes.

**Parental Influence**

Making the transition from high school to college can be overwhelming for students that rely on their parents to make their decisions. Each participant had a parent or grandparent that influenced his or her decision to attend Mississippi State University and major in engineering. Neither one of Debra or Cade’s parents or grandparents attended college, however, they strongly urged Debra and Cade to pursue engineering for it would provide them with a lucrative career.
path. Cade stated, “Both of my grandparents were very influential and played a major role in my high school and college decisions” Cade grandparents allowed him to participant in preview days hosted by the university. Cade also participated in an honors study abroad program during his senior year in high school. Debra parents were very engaged during her junior year of high school they allowed her to participant in a Science and Engineering Summer Bridge Program at a local university near their home. Patsy and Aaron, both had parents that were college graduates. Their parents were also influential and made a major impact on their collegiate decisions. Both of Aaron’s parents earned their accounting degrees from the same institution. Patsy father attended law school and would often take her to mock trails.

**Institutional programs and environment**

At Mississippi State University, student organizations are very popular. Each engineering discipline has an affiliated engineering organizations at the local, regional and national levels. For example, aerospace engineering is affiliated with the American Institute of Aeronautics and Astronautics (AIAA), and Mechanical Engineering is affiliated with the American Society of Mechanical Engineers (ASME). However, at Mississippi State University there are also other student organizations that are geared toward assisting underrepresented student populations. The interviewees all mentioned NSBE and IMAGE, two local student organizations at Mississippi State University that assist URM student groups throughout their engineering studies.

All of the students stated that NSBE and IMAGE provided them with upper class mentors, which made navigating the engineering curricula less frustrating. For instance, Debra stated that having a mentor has been crucial to her success in engineering. Her mentor has provided her with tips on what classes to take, what teachers to avoid, and how to be successful in the field as an African American female in aerospace engineering. Free tutoring provided
through the NSBE and IMAGE organizations by other URM students in various STEM subjects has also played a major role in helping the URM students in this study to persist in engineering. Several students have stated that without the tutoring program in place, they would not have progressed engineering. The students also mentioned that the talks and panels provided by NSBE and IMAGE from engineering faculty, researchers and engineers within and outside of Mississippi State University has helped them to find purpose in seeking an engineering degree. Aside from exposure to several academic and industry leaders, the students mentioned the multiple opportunities they were given to apply for co-ops and internships just from being involved in the organizations.

The impact of academic preparation, financial assistance, and support groups on URM persistence at a PWI

Academic Preparation

For some participants, choosing to major in engineering was a challenge within itself. While in high school, Aaron did not have to study or take notes. He could easily sit in class and retain information. However, Debra, Patsy and Cade took notes, perhaps Debra would re-write her notes in outline form, while Patsy and Cade would re-read their notes several times until they felt comfortable with the information. Each participant had their own unique approach to studying. Even though Debra, Patsy, and Cade took notes they were all over night crammers. Several similarities were found among each participant when asked about their study habits. Debra stated, “Beforehand it was not a habit. I would study when I absolutely needed too or when I did not know the material from the lecture at all.” Likewise Patsy stated, “I find myself doing more memorization versus studying.” It was found that many students mentioned memorization as a common theme throughout each of their interviews.
Financial Assistance

Preparing for college can be a burden for both parents and students. While in middle and high school some students’ dream of becoming doctors, lawyers, engineers, or even professors; however, without obtaining a college education these things are impossible. The most challenging question parents and students are faced with are “How much will college costs?” and “Can we afford those costs?” The participants noted the importance of receiving scholarships and application waivers. Patsy was a little overwhelmed because she did not receive any scholarships to offset the cost of tuition. Patsy had to take out student loans and her parents were left to pay the remainder of her tuition so that she could attend Mississippi State University.

When Patsy was asked how financial support influenced her decision to attend Mississippi State University she stated, “At first it hindered my decision to attend Mississippi State University because I did not want my parents paying any money, but I recalled when I was little, my dad had always told me that if you don’t get a scholarship and it is a school you really want to go to, I will pay your way in order for you to be a success and achieve your dreams and goals.”

Debra, Aaron, and Cade admitted that scholarship opportunities influenced their decisions profoundly, both to attend and major in engineering at Mississippi State University. While Patsy had chosen Mississippi State University because it was an institution out of the state of Georgia but close enough to make it back home in a reasonable time-frame during academic breaks and that the school was part of the South Eastern Conference. Patsy also mentioned that she wanted to graduate from a large state institution with a good engineering program post her high school studies.

Due to Debra’s outstanding achievement in high school, she received several full scholarships to other institutions in the state of Mississippi, however, most of the schools did not
have the aerospace engineering major she was seeking. Cade also received other scholarship offers, however, he was attracted more to Mississippi State University because of the environment, football games, and the dorms. Aaron on the other hand received the alumni waiver to assist in covering the cost of his tuition. Having financial stability and support played a pivotal role in the four participant’s choice of attending Mississippi State University and majoring in engineering.

Support Groups

From this study, several similarities between all four participants were revealed. Each participant stated that having support groups consisting of parents, mentors, and peers has had a positive impact on their persistence in engineering. Engineers usually collaborate with one another when working on projects and when trying to solve problems. Patsy noted that her parents and her NSBE, IMAGE and study support groups are her major sources of motivation to continue on persisting in engineering. In response to having support groups, the four participants believed that being involved in support groups has helped to enhance their self-efficacies, study habits, and networking opportunities. Debra stated, “It’s a great bond between the 2012 Summer Bridge cohorts and no one wants to be that student that got left behind or did not make it in engineering.” Having a strong and solid support system along with being actively involved in the learning process can make the difference in whether a student regardless of race or socioeconomic status complete the engineering degree program or not.

Summer Bridge

All four participants in this study participated in the 2012 Mississippi State University Summer Bridge Program. The interviewees were similar in that they all mentioned that the program improved their study skills, time management abilities, and provided them with insights
on how to be successful in engineering. In high school, three out of the four participants did not have to study or have a routine for preparing for classes. Summer Bridge not only exposed students to the institutional environment, campus courses, faculty and researchers but required URM students to attend a three hour mandatory structured study hall Sunday through Thursday during the summer of 2012. For Aaron, the summer bridge requirements were a new concept for him due to his lack of taking notes and studying while in high school. Aaron stated, “Summer Bridge was a great experience. I was able to work alongside my cohorts, learn new ideas, theories and concepts, and most of all, how to be a success in engineering. I gained study tips, and developed better study habits.” Summer Bridge provided the four participants lifelong learning skills. Patsy reported that the Summer Bridge Program had a positive influence on her and that it taught her how to manage her time effectively. She noted that, “Summer Bridge helps shape and mold you into becoming a better and more productive student upon entering college your freshmen year. It helps you to gain a better insight and outlook of what is going on around you.”

**Student Engagement**

After examining how the four participants were engaged during their high school years, it was noted that Debra and Cade were highly engaged in academic programs during the full academic year including the summer. Debra stated that being a part of Mu Alpha Theta, a math club that competed in math and science competitions at local universities made her feel more comfortable with mathematics. She also participated in a Summer Bridge Program at during her junior year of high school. Cade reported his use of computer engineering techniques to develop a web page for his local community, while attending high school. In addition, to creating this web site he participated in a study abroad research program in Australia. He also participated in a
summer engineering camp at North University. In contrast, Patsy and Aaron did not participate in any summer programs or any engineering programs throughout their high school years. One unique characteristic of all four participants was their involvement in athletics and leadership positions held during high school.

During Debra’s collegiate years, she participated in NASA’s student competition as an intern in Washington DC, studied abroad during her sophomore year, and served in leadership roles for both IMAGE and NSBE. Patsy’s collegiate experience has been very challenging due to introductory courses such as physics, calculus, and chemistry. Although Patsy continues to face challenges within engineering curricula, she is still persisting as a junior. Aaron is still persisting as a junior in engineering, however, he has noted that the classes are quite challenging and overwhelming. Cade has been very active on campus. He currently holds leadership roles in several student organizations such as the Men of Excellence, NSBE, and IMAGE. Cade also noted that the engineering curriculum is quite overwhelming at times and that he wishes instructors do a better job of instructing the course material.

**Student Interest**

Each participant expressed an interest in math. Debra reported an interest in applied math and science because of its relevance to engineering. All engineering students must complete Calculus I-IV, Chemistry I, Chemistry II as well as Physics I & II. A strong mathematical background is key to completing most engineering prerequisite courses. A students’ passion for a subject can vary depending on a number of factors. In this case the data revealed that the four participant’s high school math teachers influenced them in some way. Cade reported that his math teachers in high school were challenging and made learning math very interesting to him. His teachers used different forms of technology that allowed for interaction among the students.
Cade mentioned that his math teachers made the all of the students compete with other schools using the promethean board. When Aaron was in middle school, he stated that math seemed very easy to him, and mentioned as the years went by, math became more and more complex. Despite the complexity, he mentioned that his love for math continued to grow. Aaron also mentioned that having great math teachers that explained different math concepts in depth, made learning math more meaningful. Patsy stated that math “gets her brain going” because it allows her to keep busy mentally. Her least favorite subjects were reading and English.

Having a career in engineering can lead to a financially stable lifestyle. Each participant expressed a profound interest in the starting salary for engineers. When searching for a career, Debra browsed the internet for jobs, where she found Engineering to be among the top 10 growing job fields and offered a very competitive starting salary. She stated, “I want to live comfortable. I wanting something interesting and money did play a major factor in my final decision.”

**Student preparation and college readiness**

Elementary, middle, and high schools each have curriculums that they are required to follow. The curriculum varies from state to state; however, some high schools do offer advance courses also known as AP (advanced placement) or IB (international baccalaureate) courses. The notion behind advance courses is that they prepare students for college as well as provide for a more challenging lectures, lesson plans, homework and tests.

Each participant took AP/IB courses during their high school years. More specifically, this study revealed that even though the students took these AP/IB courses, they felt somewhat underprepared before they entered college. Debra reported that her school IB program was very challenging and the courses were rigorous. She took eight IB courses her senior year and yet she
felt unprepared for college. Among the eight courses she was mostly interested in the math and science courses, Debra took a mathematical statistics course which was not a preparatory class for the Calculus class she took in college. Although she scored high enough on the ACT to be placed in Calculus I, she stated that the Summer Bridge Program prepped her more than the IB math course taken in high school. When asked “How well did you do in your Calculus I class,” she explained how grateful she was for attending Summer Bridge and taking Pre-Calculus. Debra reported that over the summer she was able to learn different trigonometry functions that were used in Calculus I. Patsy and Cade took AP Algebra and AP Trigonometry while in high school, however when asked how well did they do in their college Trigonometry course, their responses were “good”. They both said that the College Algebra class they had taken in Summer Bridge played a tremendous role in their preparation for Trigonometry.

None of the four participants took Chemistry or Physics courses while in high school. Aaron reported that by not taking these classes in high school was a huge disadvantage for him since he had decided to major in aerospace engineering. Debra took AP Biology, Patsy took AP Environmental Science while Cade had taken General Science in high school. Although each participant took an AP/IB course, they felt no different than the students who had not taken AP/IB courses in high school.

Conclusions and Implications

This study examined four URM engineering students who participated in Mississippi State University 2012 Summer Bridge Program. The study revealed that the Summer Bridge Program served as a positive stimulus for preparing students for their first year of college. More specifically, these findings provide empirical data support to Vincent Tinto’s theory of student retention. The
Summer Bridge Program helped participants improve their study skills, time management, and improved their abilities to become well-rounded engineering students.

The value of financial support, student engagement, and mentorship were all major factors identified within this study that attributed to student interest and persistence in engineering at a large PWI. In addition, small diversity organizations such as NSBE and IMAGE provided URM students with mentorship, tutoring, networking and potential co-op and internships. A concept map of the factors are shown in Figure 3. It was also revealed that AP/IB high school courses did not have an impact on students to persist in engineering. This study provides insight to university administrators and STEM researchers on URM student group persistence from primary sources.

This study was limited to only African American students who participated in the 2012 Summer Bridge Program; however, future research should include representation of other underrepresented students groups (Latinos/Hispanics, and Native Americans etc.). Expanding the range of ethnic groups will give more insight to understand if findings are consistent with other underrepresented groups. This study should also be expanded to understand what factors influence URM students to pursue a degree in engineering and the factors that impacted their departure from the discipline.

The Comments We Make, the Feedback They Take

Balkun Abstract

Students need to trust their classroom teachers and advisers in order to maximize learning and communication. Wise criticism (Yeager et al, 2011) tells us that minority students do not trust comments written on papers and trust must be established. Additional research reminds us that when trust comes first, learning and better relationships follow. Changing both our feedback on written work coupled with specific best practices in the classroom and in the advisor/advisee meeting help to establish rich connections. This workshop will provide hands-on practice with “commenting,” as well as sound research on trust.

Valerie A. Balkun

Johnson & Wales University
This study aims to develop DVD teaching material for clinical nursing English conversation and investigate its effect.

Though the world is becoming more and more internationalized, there are a large number of Japanese people who find it hard to speak English. Also in medical facilities, there are a lot of nurses who have difficulty in speaking English to patients from abroad.

The author is developing DVD teaching material for clinical nursing English conversation for Japanese nursing students in university in order for future nurses to communicate successfully with the growing number of foreigners entering Japan. DVD teaching material focuses on improving students’ ability of English conversation and providing students with knowledge regarding technical terms.

The author uses DVD teaching material in the English class and investigates its effect. Two different groups are examined: one group is with DVD teaching material and the other is without it. The results show that DVD teaching material helps the students to recognize the necessity of clinical nursing English conversation and non-verbal communication tools. Moreover, it is found that it contributes to enhance their interest and eagerness to learn clinical nursing English conversation.

Therefore, DVD teaching material for clinical nursing English conversation can be said to be effective in improving English education for nursing students in Japan.
Abstract

This study examines the experiences of two Black South African women within educational sectors beyond the classroom capacity during my time spent in South Africa as a temporary student during the summer of 2014 exploring education and social reform South Africa under the instruction of Dr. Teboho Moja, New York University. This case study lifted the voices of both Black South African women as they made sense of bell hooks' concept "talking back" the liberated voice (hooks, Talking back: thinking feminist, thinking black). However, this study utilizes hooks' framework on feminism and Blackness to frame how Black women can rightfully claim their voices in predominantly white sectors. In predominantly white sectors, Black women can create their own spaces and position themselves to "talk back". The results of this study demonstrate how these women conceptualize using their voice to create platforms for transformative education and social justice for themselves and students and offer ways to help subjects of the study to break free in tangible ways from the social, psychological and academic sources of their victimology or oppression.

Introduction

South Africa in comparison to America’s many black reform movements also sought and struggled to seek a better delivery system for students of color, particularly, black students. However, one must remember during apartheid the the struggle was not for domination, but for justice within various systems created by non POC. Post apartheid moving into the new democracy established in South Africa has greatly presented many South Africans with the
opportunity to be more effective in the context of revolutionary reform. Though, a struggle still persisting is evident. Historically, in America education and social reform seemed to be introduced by esteemed African Americans who believed in African American children wholeheartedly. As time progressed we began to see many influential black leaders such as WEB DuBois and Booker T. Washington begin to create spaces, where, they too, in a sense practiced bell hooks act, talking back--the liberated voice. These spaces were inclusive and a bit much of a structure male domination. Which silenced the Black woman voice to intervene actively and effectively bring about education and social reform for students of color. Education and social reform in the black community (African Diaspora) give those a part of the movement to be innovative and resilience. However, as a black woman, black professional educator, I have observed the experiences and challenges of Black women who work within educational institutions who can create spaces where their voices can be amplified as evidence of what it means to "talk back--the liberated" voice. All in which prompted me to examine how Black South African women might do the same; ultimately, promoting self awareness.

**Research Question**

Past research questions:

What are practices and conditions amongst Black women within educational spaces that will enable them to practice bell hooks act *talking back* in order to effectively bring education and social reform for students of color in Oakland?

What are the practices and conditions amongst Black South African women (teachers, administrators, professors, artist, etc) positioning themselves to enact bell hooks concept, “talking back” within educational sectors to create platforms for transformative education and social justice for Black South African students?
Present Research Question:

What are the practices and conditions amongst Black women of the African Diaspora within educational sectors and beyond practicing bell hooks notion, talking back to create transformative education and social justice for Black students and Black women?

Terms and Definitions

This research reflectively explores how Black South African women might create spaces within places not constructed to serve them to practice bell hooks act, talking back- the liberated voice, bringing about education and social transformation for students in South Africa. However, one must consider, because this research project was conducted in South Africa for a short period of time, the terms I have decided to use to shape this research was not broadly familiar in comparison to how African American women in the United States make importance of it. Therefore, language played a major role in defining terms in light of Black South African women who are professionals amongst the elite.

The term “talking back” is defined as follows: talking back, is the expression of the Black woman movement from object to subject--the liberated voice (hooks, talking back). An act of freedom which ultimately give lead way to Black women to rightfully claim her voice in predominantly white institutions etc. We all know space, “physically,” is what one may define as a place of dwelling (i.e. home, school, or office building, etc). Though, it also acts as an emotional or psychological state of mind which produces the notion of a sense of belonging. The concept of space used in this case study reflects the experiences of Black women in educational institutions associated with a shared community or support system specifically serving Black women physical, mental, and emotional wants and sense of belonging. Space by definition, correlated, to the research is best defined by Professor Karen Sereferu notion space dictating
meaning; “space dictates meaning. What enters into that space is dictated by the space or can change the meaning of the space.” Space in educational institutions in regards to the Black women is her physical, mental, and emotional components that defines her space.

Description of Research

I decided to conduct a small case study (case method approach) in the period of a month to learn the everyday meanings and sources of agency of Black South African women. I followed two Black South African women working in South African education institutions. My fieldwork consisted of interviewing, volunteering/participant observation within spaces at the University of Pretoria. Each woman was selected because of their credibility. Prior to contacting each woman I was connected to them through a visit to the department Student Affairs at the University of Pretoria.

A case study (case method) was the best approach because it allowed me to explore beyond the four walls of the institution. This approach opened the door for me to gain insight into the lives of each woman personally. By conducting this research as a case study I was able to collect an array of data ultimately serve as data to inform forthcoming research.

Argument

The conditions within South Africa’s educational institutions that suggest Black women are not fully supported are made apparent through Black South African women past and present narratives. These suggestions stem from South Africa’s historical and deficit narrative of Black women in educational institutions deeply rooted in South Africa and previous followings and studies highlighting Black South African women's narratives in South Africa educational and social spaces.

Findings - Conditions and Practices
We are actively committed to struggling against racial, sexual, heterosexual, and class oppression, and see as our particular task the development of integrated analysis and practice based upon the fact that the major systems of oppression are interlocking (Betsch and Guy-Sheftall, Gender Talk). The major systems within educational settings encompasses what Black women (women of the African diaspora) for the past forty plus years has been struggling against. In Oakland Public Schools and Oakland educational settings, Black women who are ranked or amongst the elite deal with overt racism, microaggressions, and the challenge of having to illustrate to their predominantly white students, the relation of whiteness to her blackness as a woman in her respected space of teaching or working. While in South Africa, Black South African women who are amongst the elite deal with covert and overt racism, sexism, and conformity (assimilation verse association). And while the notion of bell hooks act, talking back serves as the premises to this research; each woman I spoke with introduced a new phenomenon called, “talking in” because most expressed each space they were in was not a place to establish platforms utilizing bell hooks notion, talking back - the liberated voice. This new phenomenon reflects the conditions and practices of the women tracked.

**General Conditions and Practices of Black South African Women**

The discourse of leadership in South Africa educationally and socially is a phenomenon in the black feminist context. I say this because education in South Africa has been going through a transition for the past 15 years (The National Report on Development of Education). This transition facing serious objective difficulties which have presented great challenges to meeting the high expectations of the population - especially of the poor and disadvantaged (The National Report on Development of Education). One of the main observations I made while a participant observant visiting the many education and social sites where the dynamics of
leadership; is distributed, who is in leadership, and how it ultimately plays a vital role in creating platforms of transformation where the inclusivity of women, Black South African women is represented. These dynamics of leadership intersects how South Africa is striving towards an inclusive education system. *The National Report on Development of Education* stresses, how inclusivity is one of the basic principles of South African education system. And how it’s approach is needed in order to meet the requirements of the constitution by eliminating injustices within the system. Leadership in terms of Black South African women within educational and (social) institutions is prevalent, however, leadership is dependent upon her stance. Her - the woman stance is usually driven by the people - male ruling (domination) and influence. Therefore, diminishing her voice within a space of enablement. -- Illustrating the lack of inclusivity within education and social spaces. An inclusive education for all is the main principle. However, not strongly demonstrated amongst the elite equally.

**Dr. Nkatha Murguni Conditions and Practices**

During my time as a participant observant in a Human Rights seminar (course) at the University of Pretoria - Dr. Nkatha Murguni an Ethiopian woman, advocate for human rights, specifically child rights, experienced law researcher, and currently a professor at Addis Ababa University stance as a woman in leadership shined a light upon Patricia Hill Collins, *In Fighting Words: Black Women and The Search for Justice* which challenges her audience to think radically about historical and contemporary knowledges produced by black women who have lived and live today. To think about the social circumstances black women often face. As this book is a manual I use to follow black women in educational leadership in my current research, is it fitting I also used this black feminist context as a manual.
The conditions of Dr. Murguni space during her time of instruction (seminar lecture) varied. At the University of Pretoria where her lecture was predominantly male, yet ethnically diverse, she knew herself enough to bring power in her space (lecture). Her space was open for conversations about, making child rights work for children through her personal extensive law background. Her space was also defined by the iconography used. Media and art influenced, and videos in contrast was a huge depiction of previous lectures on Human Right campaigns.

Because the classroom was racially and ethnically diverse; engaged conversation, accustomed norms, and language was selectively used. Within this education setting the challenge of having to illustrate to male students, particularly, African males when you are an African woman their masculinity in relation to you in society often times created a defensive dialogue where students seem uncomfortable. However, Dr. Murguni response to male domination thrown at her in terms of statements made, questions posed, and overall arrogance shown was not to bash them because of their privileged stance or implications, but, more so, to respond with support. What bell hooks defines as, self actualization.

Patricia Hill Collins sense of preparing an intellectual and political space for Black women who will confront the future, reconfigure injustices (Collins, Fighting Words: Black Women and the Search for Justice) - Dr. Murguni created a space her personal meaning dictated based upon her practice and conditions of her space. An intellectual and political space driven by law and rights of a people. There she was able to practice bell hooks act, talking back -- the liberated voice by amplifying her voice within the meaning of her space dictated to based upon the conditions of her practice. I was able to examine the challenges, barriers, and ways African women who are not ethnically South African dictate the meaning of space to bring about reform (transformation) while “talking in” about it.
Dr. Matete Madiba Conditions and Practices

Dr. Madiba is a South African native, educator, administrator, womens leader, and currently director of Student Affairs at the University of Pretoria. She was formerly a High School teacher at an all black and colored high school in the township she is from. During her time as a teacher she explained how poverty was present and the high school facility was inadequate to deliver lessons properly. Though she remain and decided to matriculate and further her college. She registered for college. And during her time/year of registration the college of education was specifically for blacks only. 1994 government was involved with the system during the time she registered for college. And with it there were challenges presented.

While in conversation with Dr. Madiba in comparison to the African American women I interviewed in the United States she explained her experience uniquely different. Her conditions of the various spaces she worked in and currently work in are as defined in *Gender Talk*, struggles against racial, sexual, hetersexual, and class oppression - struggles were made apparent through her experiences. After she completed her college she went into the realm of curriculum design at a predominantly black university (Bush University). Curriculum design afforded her the opportunity to excel in places where there were not many who looked like her. And because of the racial dynamics during the time when apartheid was dying down, racism was still complex in ways. As the acting director at Tech University she experienced struggles not only from non POC, but from her fellow South Africans. In the same way Professor Karen Seneferu (African American Professor) experienced as she defined, “white politics” and the lack of support from other African Americans. White politics in light of Dr. Maiba would be her white counterparts having a hidden agenda, while some having good intentions. I learned
through her experiences this is a sad reality of both African American women and Black South African women.

**Emerging Themes**

Patricia Hill Collins argues: All African American women share the common experience of being Black women in a society that denigrates women of African descent. This commonality of experiences suggests that certain characteristics themes will be prominent in a Black women's standpoint (Collins, Black Feminist Thought). My findings - conditions and practices of each woman I followed all shared commonalities which was illustrated and expressed uniquely. The themes emerged: gender issues, support system (accountability and support in unusual places), lack of respect and loyalty from colleagues, and under-representation, and the a new phenomenon, “talking in.”

**Gender Issues**

Conditions illustrated through women interviewed were spaces where they experienced sexist behaviors. Spaces predominantly driven by their male counterparts. More so, their white male counterparts. During the interview sexist behaviors would later be spoke about in light of gender issues. Highlighting how gender plays a major role in their practices within their respected space.

The concept of “support from unusual places” arose. And the intersection of race, class, and gender. These women spaces reflects South Africa’s past historical foundation - a foundation built on white male domination, which is going through transformation. As expressed, “systems of support sometimes not offered.” Support offered from the women interviewed as a sense of enjoying support not necessarily returned.
Support from unusual places was the network of support from Afrikaans (white men) at times, usually men who acted as mentors. This was simply to gain support and a way of assimilating/associating to be accepted in their respected spaces. This gesture of support aligns with the under-representation or lack of representation and how accountability plays a major role in making up for it. However, I learned of the complexities of the lack of support when I interviewed Dr. Madiba. She stated she typically, “offers support to enjoy support” shined a light on the dynamics of leaderships; how leadership is distributed, who is in leadership, and how this ultimately plays a vital role in creating platforms of transformation as a Black South African woman practicing bell hooks act, talking back - the liberated voice.

Moving Forward

There are spaces Black South African women have created as a representation of their truths they personally hold to be self evident as an entire body. Truths that speak to heal the Black South African woman. Therefore, giving the black woman or in my case the two women I examined a sense of belonging; an open door to act as healing. A creation of a holistic space. As Professor Karen Seneferu defined space - space dictates meaning. What enters into that space is dictated by the space or transform the meaning of space.

Moving forward - In order to create spaces where Black South African women can practice bell hooks act, talking back - the liberated voice. Black South African women will need to collectively come together to collaborate with each other discussing ways they can go through a process of healing, which will ultimately lead to self actualization. Which is an attempt to “talking in.” While, accepting the meaning of truth, trust, and loyalty amongst each other as a body. Once they are able to come to a consensus with each other to establish an authoritative language challenging the status quo serves as a tool to create the oppositional discourse, the
liberatory voice (hooks, talking back). Black South African women can then work towards acts of togetherness that can transform the consciousness of Black South African women, their very being to move towards effectively bringing educational and social reform for students of color in South Africa - in the sense that will be empower black women subjects to research themselves, as people who themselves are subjects and agents as a function of their own participation in the research which will inform how they can implement transformation utilizing bell hooks act, talking back - the liberated voice. While, in the end themes can be "applied" in the sense that it will be seeking ways to help subjects of the study to break free in tangible ways from the social, psychological and academic sources of their victimology or oppression. Again, going back to claiming the essence of bell hooks act, talking back - the liberated voice.

Using Clinical Supervision to Improve Interprofessional Collaboration

Abstract

**Purpose:** The purpose of the presentation is to introduce a novel method of incorporating interprofessional education (IPE) in higher education. Health care is ever-evolving. In addition, recent legislative initiatives, like the Affordable Care Act and the Social Work Reinvestment Act, represent opportunities for academia to explore innovative approaches towards the preparation of future healthcare providers. Interprofessional collaboration (IPC) has been noted as being important to the future of the healthcare system in that IPC is part of the solution for promoting better healthcare outcomes (IOM, 2014; WHO, 2010). Marshall (2011) notes that “interprofessional collaborative practice promotes team identity, conserves energy by a unity in direction, and invites harmony of efforts” (p. 158). The skills need to engage in IPC can be cultivated through interprofessional education (IPE) (Reeves, Perrier, Goldman, Freeth, & Zwarenstein, 2013). Currently, at Northern Michigan University (NMU), there are limited opportunities included in the program curriculums of nursing students and social work students to promote the skills needed to engage in IPE. The curriculums are designed as silos, but that does not reflect the expectations of graduates when they join the workforce.

**Methods:** This project provided opportunities for senior level nursing and social work students to use clinical supervision groups to explore their clinical experiences during one academic semester. Data was gathered pre and post the clinical supervision groups to identify outcomes related to the intervention using the Interprofessional Socialization and Valuing Scale (ISVS) and qualitative data. The data was then compared to a quasi-experimental group of nursing and social work students.

**Results:** Based on the literature review, clinical supervision, as an intervention, has not been fully explored as a methodology for IPE. Qualitative findings suggest that students valued the experience and quantitative data provides insight into the outcomes of interprofessional clinical supervision groups. Findings from this project regarding the experience of students in interprofessional clinical supervision groups could inform future efforts to promote IPE at NMU and other universities.

IRB Approval: HSI5-677
Preparing Teachers for School Tragedy: Reading, Writing, and Lockdown

Jane C. Perkins

May 2015
Abstract

Since the Sandy Hook incident, 17 school-associated violent deaths have been reported between December 15, 2012, and November 14, 2013 (Nicoletti, 2012). Five of the seven deadliest school massacres have occurred in the last 15 years (Nicoletti, 2012).

This mixed method explanatory, sequential design began with a quantitative online questionnaire and assessed the perceptions of crisis preparedness of 307 Rhode Island teachers. Survey data were enhanced using qualitative data gathered from focus groups. Three research questions guided the study: 1) To what extent do RI teachers feel prepared for a major school crisis? 2) Is there a significant relationship between teachers’ preparation for a school crisis and the following demographic variables: grade level taught, years of teaching experience, and urbanicity? 3) What are the teachers’ perceptions of the effectiveness of school emergency drills to enhance preparedness for a school crisis?

Perceptions of school crisis preparedness were examined using survey data. Patterns and themes in the perceptions of emergency preparedness emerged Barriers affecting teachers’ confidence in current safety plans were also identified.

Implications for collaborative efforts that include school and community involvement could result in a coherent plan development. Strategies to improve communication, plan development, and confidence are discussed.
I. INTRODUCTION

The families of Newtown, Connecticut never suspected that when they sent their children to Sandy Hook Elementary School on Friday, December 14, 2012, they might not be returning home. On that December day, 20 children and six adult staff members at that elementary school were shot and killed before their assailant committed suicide by shooting himself. This terrifying event is considered one of the deadliest mass shootings at a high school or grade school in U.S. history. The Sandy Hook Elementary School shooting is only one of many deadly school massacres in American history (Nicoletti, 2012).

Educators have a responsibility to provide students with rigorous curriculum in a safe learning environment. Since Thomas Jefferson founded public education, schools have been charged with a duty to protect. A review of school shootings since 1996 raises many questions about the safety of our children. If children are dying in our schools, why aren’t active shooter drills treated like fire drills?

According to the United States Government Accountability Office, or USGAO (2007), there are no federal laws requiring school districts to have emergency management plan. However, 32 of 50 states reported having their own laws or policies that made them a requirement (2007). The United States Department of Education (USDOE) and the Federal Emergency Management Agency (FEMA) do provide guidelines that support the creation and implementation of emergency management procedures (Allen, Lorek, & Mensia-Joseph, 2008). One of the selected practices that the GAO (2007) recommended districts implement was practicing of their emergency
management plans with first responders on a regular (annual) basis. These drills afford school districts the opportunity to examine their capacity to respond to an emergency, as well as allowing rescue personnel to become familiar with the school system and its personnel (Allen et al., 2008).

Since Newtown, the FBI, along with the Department of Homeland Security and other federal, state, local, tribal and campus law enforcement agencies, has hosted hundreds of meetings, exercises, and presentations with citizen groups, private industry and educational groups. These events have focused on best practices and lessons learned from the school shooting in Newtown, Connecticut, the theater shooting in Aurora, Colorado, and the Sikh Temple shooting in Oak Creek, Wisconsin, as well as the response to the Boston Marathon bombing (Blair & Martindale, 2012).

**Research Questions**

The first two research questions addressed the quantitative portion of this mixed methods study. The third question was designed to obtain qualitative data.

1. To what extent do RI teachers feel prepared for a major school crisis?
2. Is there a significant relationship between teachers' preparation for a school crisis and the following demographic variables: grade level taught, years of teaching experience, and type of community where the school is located?
3. What are the teachers' perceptions of the effectiveness of school emergency drills to enhance preparedness for a school crisis?
Problem Statement

Alba (2011) explored the perceptions of school crisis preparedness with respect to those in key leadership positions responsible for planning, training, and implementation of these efforts in Rhode Island schools. According to his research, there were differences noted among urbanicity and grade level principal groups, as well as among district leadership and first responder personnel. Maintaining a steady state of preparedness is necessary for an emergency response plan to be effective in schools (Alba, 2011; Graham, Shirm, Liggin, Aitken, & Dick, 2006; Kano & Bourque, 2007). The ability to be prepared even in times of no crisis is possible if school administrators collaborate and train with local first responders. Alba’s (2011) research identified potential barriers to implementing training scenarios with regard to administrators working with first responders. His study does not explore and correlate the perceptions of teachers with regard to self-efficacy in school crisis situations, including the differences in perceptions based on: type of school (i.e., urbanicity), grade level taught, and years of teaching experience.

By exploring the perceptions of crisis preparedness at the teachers’ level, the findings from this research could be used to develop strategies that school leaders could implement to raise self-efficacy of teachers, the true first responders. The FBI reports that the average active-shooter incident lasts twelve minutes, and 37% percent of them less than five minutes (Nicoletti, 2012). For 43% of the time, the crime is over before police arrive. In 57% of the shootings, an officer arrives while the shooting is still underway (Blair &
Martaindale, 2013). This means that teachers are responsible for much more than just teaching reading and writing.

II. METHODOLOGY

The study utilized an explanatory, sequential, mixed method design beginning with a quantitative online questionnaire followed by focus groups. The qualitative data were used to further understand the quantitative data. The rationale for using this strategy was “to use qualitative data to provide more detail about the quantitative results and to select participants that can best provide this detail” (Creswell & Plano Clark, 2007, p.122). Since the intent of the study was “not to merge or compare the data”, the sample size of the qualitative data collection was much smaller than the quantitative data collection (Creswell & Plano Clark, 2007, p.122).

Research Questions

The first two research questions addressed the quantitative portion of this mixed methods study. The third question was designed to obtain qualitative data.

1. To what extent do RI teachers feel prepared for a major school crisis?
2. Is there a significant relationship between teachers’ preparation for a school crisis and the following demographic variables: grade level taught, years of teaching experience, and type of community where the school is located?
3. What are the teachers’ perceptions of the effectiveness of school emergency drills to enhance preparedness for a school crisis?

Research Methodology
The invited sample consisted of $N=682$ teachers from three different school districts in Rhode Island. In the quantitative component of the study, demographic data were collected on teachers in the three Rhode Island school districts and their perceptions of the effectiveness of school emergency drills to enhance preparedness for a school crisis. Qualitative data were collected from $N=5$ volunteers from the rural and suburban districts and $N=9$ urban school volunteers using focus groups to explore the perception of the effectiveness of school emergency drills to enhance preparedness for a school crisis. (Creswell, 2009; Patton, 2002).

**Instrumentation**

Quantitative data were gathered through the use of a cross-sectional, self-administered, internet-based questionnaire using SurveyMonkey. This method was used for ease of delivery, participant response, and data collection (Green & Salkind, 2008). Data were downloaded to Statistical Software for Social Sciences 21.0 (SPSS) for statistical analysis (2008).

The survey instrument measured the perceptions of teacher preparedness for a school crisis. The survey questionnaire, entitled *Teachers’ Perceptions of School Safety and Preparedness Survey (TPSSPS)*, was a modification of Alba’s *Principals’ Perceptions of School Safety and Preparedness Survey (PPSSPS)*. Questions that were targeted toward administrators and first responders were deleted from Alba’s instrument. The modified instrument contained 42 items within seven dimensions. Content validity of the survey instrument was based on support from the literature on crisis preparedness and included the
recommendations of \( N=5 \) content experts on school safety survey development. In addition, an Internet version of the survey instrument using SurveyMonkey was piloted by \( N=8 \) RI teachers, who examined the instrument directions, item content, and rating format for readability and ease of understanding. Revisions to the survey were made based on the feedback from the pilot administration.

**Data Collection**

Approval to survey the teachers in the three Rhode Island districts was sought by personally meeting with the superintendents to inform them of the purpose of the study. After approval from the superintendents of the three Rhode Island public school districts, an email was sent to those three districts’ principals and invited them to preview the survey, and encouraged their teachers to complete it. To increase response rate (Huck, 2012), respondents were invited to enter a raffle at the completion of the survey for a $100 Visa Gift Card.

**Data Analysis**

For Research Questions 1-2, descriptive statistics (i.e., frequencies, percents, means and standard deviations) were calculated for the data from the survey items (Huck, 2012). Data analysis for Question 3 was presented utilizing the framework developed by Creswell (2009) and Krueger and Casey (2011). Data were reduced, inductively coded, and cross-case analyzed according to themes and patterns that emerged and were present in narrative text (Krueger & Casey, 2011). The use of exact detail to describe a phenomenon allowed for conclusions to be drawn and transferred to other settings of “proximal similarity” (Trochim, 2006).
Summary

The purpose of this study was to utilize an explanatory, sequential, mixed method design beginning with a quantitative online questionnaire assessing the six domains of crisis preparedness. The survey data were enhanced using qualitative data gathered using focus groups. The survey participants were \( N = 683 \) elementary, middle, and high school teachers from an urban school district, a rural district, and a suburban district. The focus group members participated in the first phase of the study and reflected on the six domains of crisis preparedness. Data analyses included descriptive statistics, ANOVAs and thematic analysis.

By exploring the perceptions of crisis preparedness at the teachers’ level, the findings from this research can be used to develop strategies that school leaders could implement to raise self-efficacy of teachers, the true first responders.

III. RESULTS

The purpose of this research study was to explore the perceptions of Rhode Island teachers with regard to crisis preparedness within their schools. The results of the study may be utilized to create a context for addressing perceived barriers in addition to validating the need to develop future collaborative training efforts. The implications of this study could also outline steps to improve the organizational development and science of crisis management within schools.

Summary of the Results: Quantitative

The Teachers’ Perceptions of School Safety & Preparedness Survey (TPSSPS) contained 42 items within six sections that assessed school
demographics, building access and identification, internal security measures, safety preparedness development, safety preparedness activities with regard to students, safety preparedness activities with regard to teachers’ perceptions of levels of preparedness, and influences on school safety and security. The perceptions of Rhode Island teachers were explored using RQ1: To what extent do RI teachers feel prepared for a major school crisis?

Notable, were descriptive data across dimension means for Access and Identification. A total of 72% of the teachers reported always to Visitors report to the main office ($M = 4.67$, $SD = .57$), and 71% responded always to All Use a buzzer to gain access ($M = 4.37$, $SD = 1.25$). Students and staff in a recent study reported an increased feeling of safety when certain physical features were in place (Bosworth et al., 2011). They cited features such as cameras, visitor passes, fences, monitors, and the physical location of the school as important (2011).

The descriptive data across the Safety Preparedness Development dimension indicated that 43% of respondents annually (and 22% bi-annually) refine their school crisis plans using USDOE guidance. The data mean for Crisis preparedness training (self or staff), was 2.05, but review of the percentages across the Likert-type scale noted 63% of teachers reported never or rarely (> 2 years) engage in Crisis preparedness training. Data for Overall preparation was $M = 2.73$ ($SD = 0.96$), with 40% of teachers responding neutrally. This response is consistent with Response training (41%) and Having a disaster plan (38%). Additionally, 46% of respondents indicated either 1 or 2 (1 = not at all prepared).
Contrary to those findings, TPSSPS data showed that 66% of participants reported a 4 or 5 (5 = extremely well prepared) to Conduct drills and exercises. Based on those findings, teachers might only consider fire drills when they answered the survey question Conduct drills and exercises.

Review of the data specific to crisis events for which schools conducted drills indicated differences between those conducted with students versus those with that are not. A majority of teachers responded Constantly (>4 times annually) or Often (2-4 times annually) for Fire (90%, $M = 4.51$, $SD = 0.99$) drills with students. Additional review of the percentages across the Likert-type scale show 52% of teachers reported that bomb incident drills were drilled with students Occasionally (annually) or Often (2-4 times annually), yet 45% responded Not in plan or In plan, never drilled. Similarly, while the mean for conducting drills with regard to incidents of a hostage situation was 2.02, 27% of participants responded it was In plan, never drilled, however 40% of teachers reported this activity was Not in plan.

A majority of participants reported that the following drills were either Not in plan or In plan, never drilled: Hostages (67%, $M = 2.02$, $SD = 1.11$), Natural disasters (75%, $M = 1.94$, $SD = 1.00$), Chemical/Radiological incident (85%, $M = 1.70$, $SD = .85$), Suicide (86%, $M = 1.72$, $SD = .78$), Terrorist Attack (94%, $M = 1.63$, $SD = 1.01$), and Pandemic flu (94%, $M = 1.39$, $SD = .64$). The data also indicated that teachers responded similarly to Bomb across the Likert-type responses for In plan, never drilled (26%), Occasionally (28%), and Often (24%).
These data are consistent with the 2007 Government Accountability Office National Report: *Emergency Management*, which found that while 95% of districts in the United States had written crisis plans; “more than 25% of districts have never trained, and over 66% do not train at least annually with community partners on how to implement their school plans” (GAO, 2007, p. 21).

**Urbanicity**

The perceptions of Rhode Island school teachers were further explored utilizing the following research question:

RQ2: Is there a significant relationship between teachers’ preparation for a school crisis and the following demographic variables: urbanicity, grade level taught, and years of teaching experience?

One-way analyses of variance were conducted to evaluate the relationship between urbanicity groups and five dimension means of the TPSSPS. Significant differences were indicated for the *Access and Identification* dimension mean such that suburban schools had a greater extent ($\eta^2 = 0.14$, large effect size) of implementing external building security measures than schools in urban and rural school districts (S, $M = 4.13$; R, $M = 3.45$; U, $M = 3.28$). At the item level, differences among urbanicity groups were found for all items in the *Access and Identification* dimension. Teachers from suburban and rural districts indicated a greater extent of having *Visitors report to the main office*, *keeping External doors locked*, using a *Buzzer system*, and using *Visitor badges* than urban districts. Teachers from suburban districts indicated a greater extent of using *External cameras* than urban and rural districts (S, $M = 4.02$; U, $M = 3.47$; R, $M = 3.16$). However, urban schools had a greater extent of using *Student
badges (U, M = 1.22), compared to suburban (S, M = 1.05) and rural (R, M = 1.15) districts.

The NCES survey (2013) reported that 88% of public schools installed locks or put in place a system to monitor doors during school hours in an effort to control access to school buildings. The same survey reported that more than 60% of public schools reported using security cameras to monitor school access (2013).

Although not significantly different, examination of the TPSSPS data show suburban school teachers had a greater extent of perceiving they were prepared with regards to having a disaster plan than those in both rural and urban districts (S, M = 2.88; R, M = 2.84; U, M = 2.70). A similar trend was noted for Response training (S, M = 2.87; R, M = 2.72; U, M = 2.85), and Overall preparedness (S, M = 2.80; R, M = 2.75; U, M = 2.68). Data reviewed for Safety Preparedness Activities: Students and Safety Preparedness Activities: Levels of Preparedness dimensions noted that urban teachers indicated that they are slightly more prepared than their peers to conducting a variety of drills annually students (S, M = 3.87; R, M = 3.98; U, M = 3.61), specifically fire drills (R, M = 4.39).

These data could support the idea that urban locations experience different levels and different types of crime than rural and suburban locations. The urban district in this study consisted of one newly constructed elementary school, in which policies and procedures were newly written and implemented to meet the newly identified safety needs of students and staff. Perhaps, the participants in
this district had a heightened awareness of planning, compared with the other school districts at the time of the study.

Grade Level

One-way analyses of variance were conducted to evaluate the relationship between the grade level groups and five dimension means of the TPSSPS. Inspection of the ANOVA findings indicated significant differences among grade level groups Access & Identification ($p = .001$). Elementary schools had a greater extent ($\eta^2 = .100$, large effect size) of implementing building access and identification security measures than high schools.

Visitors report directly to the main office, Locking external doors, Buzzer system, and Student badges were implemented at a higher rate at the Elementary and middle school level, compared with the rate of high school implementation. Yet, all grade level groups reported high levels of implementation for Visitors report directly to the main office. Ninety-five percent of teachers responded often and always to Visitors report directly to the main office.

No statistically significant differences were found among the grade level groups for Service personnel badges, however, elementary teachers (E, $M = 3.61$) tended to report asking service personnel to wear badges at a higher rate than middle school teachers (M, $M = 3.35$) and high school teachers (H, $M = 2.68$). Elementary teachers reported asking visitors to wear badges while in the building at higher levels of implementation than high school teachers (E, $M =$
4.52; H, \( M = 3.80 \)). However, with regards to faculty and staff wearing IDs, less than half of the respondents (47\%) reported *always* implemented.

These differences could indicate that elementary teachers may perceive the need to more aggressively implement the identification of adult visitors within the building due to the fact that their student populations (ages five through 12) are more vulnerable to harm imposed by intruders.

The post hoc analyses in the *Internal Security* domain showed that the statistically significant group differences were between high and elementary schools for *Perform sweeps*, *Require clear, or ban, book bags*, *Provide support staff with interior keys*, *Provide substitute teachers with interior keys*, *Universally coded interior keys*, *Full-time Student Resource Officer (SRO)*, and *Full-time nurse*. Middle and high school teachers indicated a greater extent of performing random sweeps for contraband (H, \( M = 2.13 \); M, \( M = 1.80 \)), requiring that students use a clear book bag, or banning book bags (H, \( M = 1.04 \); M, \( M = 2.40 \)), and having a full-time Student Relations Officer (H, \( M = 3.64 \); M, \( M = 3.32 \)), than at the elementary level for all three items.

*Providing substitute teachers with interior keys* (E, \( M = 2.05 \); H, \( M = 1.83 \)), and having a *Full time nurse* (E, \( M = 4.83 \); M, \( H = 4.49 \)) were the only two items with a significant difference in implementation where elementary teachers reported a higher implementation rate than high school teachers. *Provide teachers with interior keys* (\( M = 4.55 \)) was reported at a high rate of implementation across all grade levels, with 91\% of ratings approaching *often* and *constantly*. 
Internal security differences between high and elementary school teachers could indicate that teachers’ perceive students ages 15 -18 have a higher likelihood of committing acts of crime, including violence, than those of elementary schools. This is also reflected in the data from the 2008-09 report *Indicators of School Crime and Safety: 2009* (Dinkes et al., 2010), in which it was found that nearly 75% of high schools reported to police violent crimes by students compared to only 20% of elementary schools. These statistics could be the result of high schools and middle schools having more students who are more likely to be challenging authority compared to their elementary school peers.

The Scheffé post hoc indicated that the statistically significant group differences were between high (H) and elementary (E) schools, such that elementary school teachers reported a greater extent ($\eta^2 = 0.152$, large effect size) of crisis preparedness training for themselves or staff members (E, $M = 2.28$; H, $M = 1.78$). Drills to prepare for *Natural disasters*, *Chemical/Radiological incident*, and *Terrorist attack (Level Red)* were reported implemented at a higher rate at the elementary level than at the middle and high school levels, with middle school teachers reporting the lowest rate of implementation. However, all grade level groups reported low levels of implementing drills with response rates approximating *Not in plan or In plan, never drilled* for the following drill types those same items: *Natural disasters* (75%), *Chemical/Radiological Threat* (85%), *Suicide* (86%), *Terrorist attack (DHS Level Red)* (94%), and *Pandemic flu* (94%).
These findings are consistent with those of the SSOCS (2009) in which principals surveyed reported conducting specific student drills at lower rates across all these areas: a natural disaster (83.1%), a bomb (58.4%), a shooting (52.5%), or a hostage situation (38.5%). While a majority of the 2,560 public schools principals surveyed reported that they had written plans for a specific crisis situation, such as a natural disaster (95.8%), a bombing (93.8%), a shooting (83.0%) or a hostage-taking (71.3%), only 40.0% of them had plans for a threat on national security (SSOCS, 2009). Similarly, 36.1% had a plan for an incident of the pandemic flu. The findings from these studies could be an indication that those involved with writing plans might have more knowledge of what drills are in the plan, as compared with teachers, who rely on administration to communicate the procedures and details for conducting the drills in the emergency plan.

**Teaching Experience**

While no statistically significant differences were found among years of teaching experience groups, a trend was noted. For all four items in *Safety Preparedness Development*, teachers with 7-9 years of experience (C) indicated the lowest rate of implementation in all four items. Teachers with 4-6 years of experience (B) tended to indicate the highest level of implementation than their peers. Teachers with the least amount of experience (1-3 years, A) followed the slightly more veteran first group, and teachers with the most experience (10 or more years, D) followed them. Teachers with 7-9 years of experience indicated the lowest rate of implementation in all four items.
Notable was that teachers with 1-3 years of experience indicated a higher level of implementation of drills for Hostages ($M = 2.45$), Chemical/Radiological incident ($M = 1.79$), and Terrorist attack (Level Red) ($M = 1.47$). It is possible that recent worldwide events and school tragedies are on the newest teachers’ minds, or that new teachers are reviewing policy and procedures more carefully than teachers who are more veteran than them. Teachers in all experience groups reported similarly to the implementation of pandemic flu drills (A, $M = 1.40$; B, $M = 1.42$; C, $M = 1.40$; D, $M = 1.39$). The descriptive analysis indicated that 66% of all teaching experience groups reported high levels of Conducting drills and exercises by selecting 4 or 5 (5 = Extremely well prepared). However, Having a disaster plan, Overall preparedness, and Response training approximated less than moderate levels of preparedness (38%, 40%, and 41%, respectively). Sheltering students indicated that 60% of respondents are selected 1 and 2 on the Likert-type scale (1 = Not at all prepared).

At the item level, significant differences among teaching experience groups were found only for using a Buzzer system. Teachers with 10 or more years of teaching experience indicated a greater extent of using a Buzzer system than teachers with 1-3 years, 4-6 years, or 7-9 years.

It is possible that since the Newtown, Connecticut school shooting, the safety awareness of all educators has been heightened by the FBI, the Department of Homeland Security, and other federal, state, local, tribal and campus law enforcement agencies. These organizations have offered hundreds of meetings, exercises, and presentations with citizen groups, private industry and educational
groups, and provided teachers with opportunities to learn about school safety and best practices to keep themselves and their students safe, regardless of teaching experience.

**Summary of the Results: Qualitative**

To explore teachers’ perceptions of crisis preparedness, qualitative focus groups were conducted within each type of school district. Purposefully selected teachers were selected for the focus groups to address Research Question 3: What are the teachers’ perceptions of the effectiveness of school emergency drills to enhance preparedness for a school crisis?

**Procedural Coherence**

As policy and procedures were discussed, there were frequent references to a need for consistency, both across grade levels and through the district. As indicated in the research, “perhaps one of the most important elements of developing district policies in ensuring they are effective and draw on best practices in the field” (Hutton & Bailey, 2007, p. 25). Varying degrees of implementation at the building level was a reoccurring theme within each focus group. Participants agreed that while grade appropriate considerations should be made, some elements of the policies should look the same throughout the district.

Accountability looks different across grade levels and within districts. Teachers in the focus groups expressed a great deal of concern over the fact that they were careful to “take attendance” or “do a head count” once evacuated, but were unclear as to how to document “missing students.” Confusion also
existed at all levels when discussing the most efficient way to line up outside. When there is no designated spot for students and teachers to go, teachers can't model quiet voices for their students because they are trying to direct and collect all their students. There was also noted concern about other teachers not taking drills seriously, as evidenced by the unruly manner in which students waited outside and reentered the building after drills. It was noted that teachers, particularly at the high school level, weren't making any attempts to record student attendance.

Perhaps high school teachers feel that the increased independence of older students lessens the need for them to be monitored, even in an emergency. At the elementary level, on the other hand, participants reported that their students learn best when the teachers model in voice and action exactly what they expect students to do.

Other procedural inconsistencies concerned the members of the focus groups. In one district, elementary teachers were instructed to keep the classroom key in a pocket on the wall next to the door, but the other teachers reported not ever hearing that. Similar comments were made about “cold weather drills”. While some teachers in one district have participated in evacuations on cold days, others commented, “I've never heard of a cold weather drill.” Teachers would feel more confident in their actions and decision-making if they knew that the procedures in place were consistent across grade levels.

Argenti (2002) stated that “employees will know what to do in a crisis only if they have been absorbing the company’s guiding principles all along” (p. 108). A
lack of guidance, support, and accountability from the district level may be a reason for inconsistency in school implementation. Again, drawing from organizational crisis theory, evidenced was the need for structural flexibility and responsibility within integrated response systems under an overarching strategy critical to adaptation and survival during crisis situations (Boin & Hart, 2003; Kapucu, 2006; Rusaw & Rusaw, 2008; Von Clausewitz, 2007; Wang, 2008).

**Clear and Continuous Communication**

The need for continuous communication between district leadership teams and teachers was a common theme in the focus groups. Teachers across all urbanicities and grade levels reported that they “don’t know what the other schools [in their district] are doing”. These concerns arose when talking about fire drill procedures, lockdowns, and other evacuation drills. One teacher even referred to their procedure as “the unspoken rule, or the unspoken ‘do this’ thing”. If “unspoken rules” are guiding staff, it is no wonder that communication is lost and consistency is not present within buildings of the same district, never mind across a district. A frustrated participant asked of her colleague, “Are we doing it or not? What is the protocol?” Her colleague replied by shrugging her shoulders, as if to say she didn’t know.

There were several suggestions for improved communication in the open ended response question about influences on safety. Like the focus group dialogue, analysis of these comments indicated that teachers expressed a need for clarity in written plans, consistent procedures within the district, as well as the timeliness and frequency of the delivery of the content of the plans.
There was also some concern about communication systems that are in different buildings. Teachers with phones in their classrooms felt very confident that they could get help if they needed it because they would just “pick up the phone”. This is consistent with the findings of Bosworth et al. (2011). Staff and students in their study identified certain physical features (cameras, phones, fences) that provided a heightened sense of security simply because they existed (2011). One high school teacher in the suburban focus group was excited to share that there were “even phones on the quad between our two buildings.” She added, “Our campus is very safe.”

Teachers from all urbanicities reported that there were buzzer systems in the schools in their districts. Contrary to this, however, it was reported that buzzers were not installed in each school in the district. The teachers who had the buzzer systems felt like they were taking the appropriate measures to ensure safety by asking that visitors identify themselves before entering the building. These teachers also credited the office staff for “knowing” the adults who frequent the buildings and “getting good at recognizing parents.” The high school teachers in the focus groups were less concerned about that procedure. Perhaps, having two buildings on a campus and more mobile students are factors that support that idea. Even the high school that had buzzers, had doors that remain unlocked for 6 minutes between classes.

A final concern about communication was with the frequency of the review of the plans and the comprehensiveness of that review. Focus group respondents indicated that plans may be reviewed in August in one school, but every three
months in another school in the same district. Another district reported that every drill or evacuation prompted a debrief with immediate changes, while across the town colleagues reported that there is “no communication about crisis planning.” Still other thoughts about communication are that the plan was handed to teachers and they are posted in each classrooms, and it is the teacher’s responsibility to be familiar with the plans.

Some comments made in the open-ended responses indicated that plans were “never” reviewed, or that besides fire drills and “lockdowns”, plans did not exist. There are so many discrepancies about what is in the plan and how to execute the components of the plan. Teachers can’t confidently communicate to their students and prepare them for safety drills because those details are not clearly communicated to teachers.

**Crisis Preparedness Training**

Participants across all urbanicities cited value in multi-agency trainings in order to feel better prepared for a crisis, yet varying degrees of school preparedness professional development existed within districts. Police and fire presence during nonemergency times would be beneficial to the teachers, the students, and the police. One teacher commented that, “The police don’t know who we are and they don’t know what our building looks like on the inside.”

There are many benefits for first responders if they are familiar with the schools in their jurisdiction. Pre-planning for emergencies and disasters should involve an understanding of the physical school and its grounds, as well as scene size-up during the school day, when it is most populated. Common thoughts
around this idea were that the police would be familiar with staff and the layout of the schools if they frequented them during non-crisis times. The middle school and high school teachers in all districts reported that they have a full time Student Resource Officer. This is something that the elementary school felt like they were missing. They only see the police when something is wrong, as noted by one participant, “We are naturally alarmed when see the police walking in our halls.” Making school crisis training a community concern would engage other stakeholders and result in plan coherence, as well.

**Authentic Drills**

Another theme that emerged through the focus groups was the need for a sense of realism when conducting crisis drills at school level. As previously indicated, perceived benefits from collaboratively conducting drills was cited in all the districts. A high school teacher in the suburban district echoed the need for drills at “inconvenient times”. She reflected on a drill that took place at the end of the day, “I loved being thrown off guard like that, because it made me really go into serious mode, even though I was by myself.” Participants thought that more authentic drills at a variety of times would be a better way to prepare for an emergency than the way they are done now.

In an effort to prepare teachers who are reportedly “physically and mentally not capable of protecting their students”, bringing in the experts in the field to conduct and evaluate drills might boost the confidence levels of teachers with regard to implementation. Teachers also recognize, as indicated in the open ended response items of the TPSSPS, that there are many other drills that
should be taken into consideration in order to ensure a safe learning environment for students. The data from the TPSSPS also indicate that teachers attested that they effectively implement fire drills several times a year. This suggests that with authentic practice, the other types of disaster preparation can also evoke feelings of preparedness.

Bandura (1997) explains, “when people are acquiring skills, behavior competencies and adaptational patterns they are very much aware of what they are thinking and doing” (p.341). He further explains that eventually people make their habits of thought and action routine in nature (Bandura,1997). Like any skill, good decision-making comes with practice. Higgins and Freedman (2013) studied how human propensities reduce decision-making capabilities, particularly in times of crisis.

These findings are consistent with the comments made in the open-ended response items to assess Influences on Safety and Security. Respondents indicated that a variety of training is needed, including “scenario-based” multi-agency drills, “more frequent review of the current plans”, “workshops on other drills besides fire, active shooter, and evacuations”. There were multiple comments about the need for a “comprehensive plan” that includes practicing at “all times of the day” and for all situations that are threatening. The importance of realistic drills was also supported by the research of Allen et al, (2008). These researchers suggest that multi-agency drills should take place in order for school personnel and emergency responders to organize their efforts before a crisis takes place (2008).
According to Bandura (1993), mastery experiences allow individuals to link real-life situations to future expectations. A perception of failure on a task can lead to lowered self-efficacy and future expectations of failure. Based on these findings, teacher self-efficacy with regard to protecting students during school tragedies may be higher for teachers who have experienced success in a similar situation. School crises are often not perceived as having positive outcomes. Keeping this in mind, equipping teachers with a high sense of efficacy, may allow them to persist through the challenges encountered during a school crisis.

**Plan Development**

“Who writes the plan? Is there someone overseeing the plan? What is their job? Is that person responsible for communicating the plan to us?” Focus group conversation and comments in the TPSSPS indicated that there was much confusion about whether or not schools had a “safety team” and what the specifics of that job were. It seems that the teachers in this study understand the need for careful planning, clear communication, and evaluation of the plan and its components.

According to organizational crisis theory researchers, the most critical aspect of crisis communication occurs in the preparation phase, in which the organization identifies and addresses potential incidents, and develops basic structural plans (Penrose, 2000; Seeger et al., 2001). Seeger et al. (2001) reported that a distinct component of the planning phase includes development of a crisis management team. This team should consist of coordinated both internal and external emergency response expertise and the members of this
team should meet regularly to not only evaluate plans based on recently identified potential crisis, but also to develop rapport, alleviating unfamiliarity when an incident occurs (Seeger et al., 2001).

Teachers want to be “informed of planning sessions” if not asked to be a part of them. In the suburban and rural school districts, members shared the feeling that they are expected to “carry out the plan” but not “create it”. One participant said that she is a member of the school Crisis Emergency Response Team (CERT), but she didn’t help with plan development, and she didn’t know who wrote the plan. If teachers are “in the trenches”, should they be giving feedback about planning? However, teachers reported that it isn’t just the opportunity to provide input for which they are looking. They also want to be taken seriously. Sometimes leadership teams give teachers a plan to review, but feedback is not well-received, probably due to effort that went into writing the plan. There is also the idea that if the current plan is just “tweaked” then enough modifications have been made until the next review. One participant expressed her hope for “new thinking and a collaborative process” for plan development. If teachers, parents, community members are included in the plan development, then conversation about the plan would not be limited to only those who “wrote” it.

**Influences on Safety and Security**

Comments in the open-ended response item indicated a desire for the district to “properly train a ‘trainer’ who is very knowledgeable in the plan and can teach/review clearly and concisely to all staff and be able to answer all questions.” Similar comments include, “clear communication of the plans and
protocols in place”. This idea is consistent with the research of Gainey (2010) Hull (2010) and Nickerson et al (2006). These researchers also cited challenges such as a lack of equipment and training for staff in addition to lack of personnel with expertise in the area of emergency planning as obstacles to implementing recommended practices. Teachers also noted in the survey that they did not know what they need for equipment, so they don’t know if they are “prepared or not prepared well at all”.

A sense of security would be obtained if some changes were made to the physical structures or school environment. Modifications, like universal keys, doors that lock and unlock from the inside, a vestibule, or a window where visitors could be staged until fully identified would address the barriers suggested by the focus groups and increase teachers’ confidence about the decisions they are making during a crisis. Teachers acknowledged that these were financial issues for the district and would probably not be resolved.

Teachers attitudes and confidence were referenced several times in one of the focus groups. The participants who shared that their colleagues didn’t take the drill seriously considered that acting like a role model was the best way that they could influence their less confident or less willing peers. An idea shared in this open-ended question was, “If teachers are involved in the planning, we might have a better understanding of the districts’ vision and we might be able to better explain the seriousness of it to our colleagues.”
IV. DISCUSSION

The purpose of this two-phased, mixed-methods study, which utilized the sequential strategy, was to explore the perceptions of school crisis preparedness among Rhode Island public school teachers. This chapter detailed the findings, conclusions, and recommendations for addressing policy and practice, as well as those for future research.

Educators have a responsibility to provide students with rigorous curriculum in a safe learning environment. A review of school shootings since 1996 raises many questions about the safety of our children. If children are dying in our schools, why aren’t active shooter drills treated like fire drills?

While there are no federal laws requiring school districts to have an emergency management plan, 32 of 50 states reported having their own laws or policies that required emergency management plans (USGAO, 2007). The United States Department of Education (USDOE) and the Federal Emergency Management Agency (FEMA) do provide guidelines that support the creation and implementation of emergency management procedures (Allen, Lorek, & Mensia-Joseph, 2008).

This study explored teachers’ perceptions of crisis preparedness. Notable in the quantitative data were these findings: Suburban schools had a greater extent of implementing external building security measures than schools in urban and rural school districts. Elementary schools had a greater extent of implementing building access and identification security measures than high schools. Teachers from suburban and rural districts indicated a greater extent of
implementing the access and identification measures. Visitors report to the main office, keeping External doors locked, using a Buzzer system, and using Visitor badges than urban districts. All urbanicities, grade levels, and years of teaching experience groups reported less than moderate levels (40%) of Overall preparedness. Also in the data, all grade level groups and years of teaching groups reported high levels of preparedness regarding Conducting drills (66% was reported for each group).

National research on school emergency preparedness indicated that a majority of school districts across the United States had written emergency management plans, but the drills outlined in plans were not all implemented at the same rate. This lack of fidelity with regard to implementation could have negative repercussions, including reduced response effectiveness during an actual school emergency. The research further indicated the need to identify the barriers that prevented the implementation of safety measures (GAO, 2007).

Patterns and themes emerged when the qualitative focus group data were analyzed. Themes regarding the perceptions of emergency preparedness, and the barriers to teachers confidence in implementing school safety plan were: a desire for coherence among procedures throughout a district, a need for improved communication to provide clarity, a desire for a collaborative and an inclusive process for plan development, that included input from teachers, and can be communicated clearly and concisely to staff, and the need for more frequent training on all areas of crisis preparedness are needed in order for staff to feel confident implementing a crisis plan.
The results of this study may be utilized to create a context for addressing perceived barriers in addition to validating the need to provide comprehensive plan development, review and training for school employees.

Abstract

This paper presents effective and practical orchestral rehearsal techniques that can be adapted to ensembles ranging from advanced middle school orchestras through advanced collegiate orchestras. Rehearsal topics covered in this paper include: style, musicality, tone quality, intonation, ensemble issues, rhythmic accuracy, conducting, and general rehearsal advice. As rehearsal time is always limited, it is essential to achieve musical results quickly and effectively while addressing the educational needs of the students. This paper aims to help current and future teachers hone their rehearsal skills by discussing specific examples which address common rehearsal problems in each
of the musical areas listed above. This paper includes techniques for all stages of rehearsals: how to help students learn to play the notes, how to practice, and how to polish a piece for performance.

In order to discover the most effective orchestral rehearsal techniques, I interviewed twenty musicians who play eleven different orchestral instruments, reviewed current published research, and drew on my experience from eighteen years of conducting orchestral rehearsals. The results of this study are varied and broad in scope. They can be applied to orchestras and other instrumental ensembles of different levels.
Owning “Murse”: Professional Role Development in Male Nursing Students

Owning “Murse”: Professional Role Development in Male Nursing Students

Abstract

Purpose: The purpose of this presentation is to both explain the longitudinal research process of this unique study and to provide qualitative research findings associated with what it is like to be a male nursing student. Historically, the profession of nursing has been dominated by females yet most recently males have increasingly enrolled in United States nursing schools. In 2014 9.1% of registered nurses in the U.S are men. Currently at Northern Michigan University, 15-20% of incoming nursing cohorts are male. Research suggests that male students may experience sexism from floor nurses, faculty, and patients and are more likely to drop out of nursing school. This tiered longitudinal qualitative study explored the experience of being a male nursing student through multiple means. IRB approval was granted at each step of this extended research process.

Methods: Initially, admitted nursing students who were male were asked to participate in a research study in which they submitted journal entries describing what it was like to be a nursing student and what it was like to be a male nursing student during each of their 5 semesters in the nursing program. A total of 8 participants were enrolled in this initial longitudinal inquiry. Content from their journals was analyzed to create a list of precise focus group questions which were then directed to different male nursing students using two focus groups. For example: a student journaled that he felt most women in his Pediatric/Obstetric nursing semester had an advantage with this content because they are female. This was his perception, and to better explore this view of gender-based curricular advantage a focus group question targeting gender advantages was crafted and presented to male nursing students not involved in the journaling phase of the research.

Results: Overall focus group data revealed both thematic similarities and differences when compared to the journal entry analysis of what it is like to be a male nursing student. Findings from all data suggested small relatively easy changes to our nursing program (like changing the color of the pink BSN applications) as well as more involved concerns.

Conclusion: This data increases the understanding of the educational journey for this unique population thereby potentially increasing their level of retention and male recruitment into the program ultimately producing a more diversified nursing workforce.

IRB Approval # HS11-432
Reflections on ubiquitous learning and MOOCs

Reflections on ubiquitous learning and MOOCs

Anthony Cripps and Sean O’Connell

Abstract

Many university students in Japan are unaware of Massive Open Online Courses (MOOCs) and their potential for learning. This paper examines students’ reflections on their exploration of MOOCs and the concept of ubiquitous learning. Three groups of students (n=36) taking a ‘Teaching with Technology’ course at Nanzan University in Japan were encouraged to explore online courses provided by platforms such as Coursera, edX, and FutureLearn, as part of a semester-long research project. The aim of the project was to broaden the students’ knowledge of this growing field and they were given free rein to navigate the MOOC terrain in any way they wished. The students were also encouraged to consider the concept of ubiquitous learning and how it affects both teachers and students. Throughout the project each student kept a diary in which they logged both their MOOC use, and their opinions of the courses. Interviews, diaries, focus groups, reports, and questionnaires all provided rich data. The authors outline the design of the project, before discussing in detail the students’ experiences of mapping the MOOC terrain and their thoughts on ubiquitous learning.

Meeting the needs of English teachers in Japan through intensive
teacher-training workshops

Anthony Cripps, Sean O’Connell and Richard Miles

Abstract

This paper examines the issue of providing support for English teachers in Japan. The presenters explicate how they are crafting a series of intensive teacher-training workshops which are designed to help improve in-service teacher training. In-depth interviews were conducted with in-service English teachers at junior high schools and senior high schools in Japan to ascertain their specific needs. The presenters outline their plans to provide pedagogical support for Japanese teachers of English in three ways; Creating practical lectures and workshops which will address the teachers’ pedagogical needs; Making an online teacher support center (TSC) which will house teaching videos, audio files, word files, and other support material for teachers to freely access whenever and wherever they like; Publishing practical handbooks based on the lectures and workshops.

6. Abstract

   In Japanese public junior high schools, head English teachers are Japanese, and both their willingness and ability to teach English in English varies greatly. The advantages of using the target language to teach the target language have been well documented (Mart, 2013; Watanabe, 2008). This research analyzes the responses of 1000 third-year junior high school students from 10 schools in one school district in one Japanese city and offers a glimpse into how students interpret the use of English in the classroom. It specifically looks at the perception of three factors: the percentage of English vs. Japanese used within a class period; the amount of English interaction in the classroom; and the methods employed by the JTE to introduce new concepts or vocabulary. In Japanese junior high schools, pressure on teachers to teach for testing with time limitations, as well as textbooks written with translations may work against fully implementing a direct method style of teaching on a full-time basis. In a setting where for many of the students the classroom is their only contact point with English the data revealed that a majority of the participants perceived their JTE’s to have used English less than half of the time they taught.

Abstract and/or full paper:

In virtually every community of our country as well as places abroad people have been horrified by school shootings in recent decades. Questions are asked to which there are seemingly no rational answers for such senseless acts of violence. Shootings, bullying, acts of violence by mentally ill perpetrators, fractured and fragile people – no complete answer exists to explain it or stop it – nothing to take away the pain suffered in families, schools and communities that have been brought to their knees by these senseless acts.
In an effort to control the uncontrollable, we react with possible answers to this heinous scenario. While one community hires more school resource officers, another suggests arming undercover people on campus, installing metal detectors, visitor checkpoints, perimeter fencing – the list goes on. We must be vigilant. Lockdown drills are mandated along with fire drills – the entire safety gamut is implemented in an attempt to somehow “be ready” in case the unthinkable happens. We debate the basic issue of how to maintain a safe environment for our students, staff and communities, including malls, churches, concerts, and mass transit areas.

School shootings in this country date back as far as 1764 with the Pontiac School Rebellion. The deadliest school rampage occurred at Michigan Bath School in 1927. College campus shootings include, but are not limited to, the University of Texas (1966), CSU Fullerton (1976), and Virginia Tech (2007). With today’s instant media coverage, who can forget the horrible images of Columbine (1999)? The unthinkable has now become ever more present in our thoughts. We can no longer stay in a world of denial that ‘it won’t happen here’.

What have researchers learned specific to these school tragedies? In one Secret Service study, the Safe Schools Initiative Dec 1974 - May 2002, a common factor was found in the case of every shooter: before one shot is fired, they dream, draw, write, discuss, twitter, plan, gather, purchase, steal, construct, case, practice, dress, pack, load, transport and approach. The Secret Service study also found 93% of attackers engaged in some behavior prior to the attack that caused others to be concerned. These findings were further delineated into five stages of active shooters: (1) Fantasy Stage, (2) Planning Stage, (3) Preparation Stage, (4) Approach Stage, and (5) Implementation Stage (Marcou 2006).

One critical component of ‘readiness’ against the unthinkable lies in the realm of the citizenry themselves. Police officers on every street corner would still not be enough ‘protection’. Without alert eyes and ears of responsible citizens in a free society of government by the people, for the people and of the people, we will consistently fall short of enough ‘protection.’ When we specifically examine school environments, there is irrefutable evidence that school connectedness “was found to be the strongest protective factor for boys and girls to decrease substance abuse, school absenteeism, early sexual initiation, school dropouts, violence, and risk of unintentional injury...” (Center for Disease Control and Prevention 2009).

Given the remarkable Secret Service findings that 93% of attackers engaged in behavior that caused others to be concerned but not speak up, we must create and maintain environments of trust and safety where students and others feel safe to voice their concerns. While addressing issues such as bullying can be prudent, it addresses only one aspect of negative behavior. In a recent study of 7000 students across 50 states, data illustrated anti-bullying programs can have the opposite effect - some programs inadvertently teach students how to ‘bully without leaving evidence behind’ (Jeong & Lee 2013).
How about an approach on the flip side – the positive social skills which serve as an antidote to multiple negative behaviors? This type of approach requires developing a school climate and culture of trust, which does not happen by accident. It requires sound leadership and a plan of action that creates systemic change. Creating and maintaining a safe and trusting environment is intentional, deliberate and requires work with the entire staff. An atmosphere of teamwork from maintenance to transportation to the office staff and beyond is critical. Leadership is about modeling greatness and coaching others to be great – staff and students alike.

In schools in the Shasta Union High School District, as in other districts across 44 states and 7 countries, the EXCEL™ process (trademark of The Flippen Group) is utilized to develop, enhance and model leadership at the administrative, staff and student levels. This leadership training is not only utilized in the field of education but yields success in Fortune 500 companies, professional sports, the military and government entities as well. Identifying constraints within leadership teams in these private sectors directly affects the bottom line – a testament to how critical connectedness is. Leadership in its truest form is about serving others and helping them be successful. Relational capacity is the connectedness every school and team needs to create optimum trust and safety for highest performance.

Further conclusions drawn from the Secret Service found that schools were placing false hope in physical security, when they should be paying more attention to the pre-attack behaviors of students. Zero-tolerance policies and metal detectors "are unlikely to be helpful," the Secret Service study found. The researchers focused on questions concerning the reliance on SWAT teams when most attacks are over before police arrive [and the] profiling of students who show warning signs in the absence of a definitive profile..... Some final guidelines shared:

- Speak up, encourage others to vocalize concerns and take concerns and behaviors seriously.
- Know your students and look for patterns of behavior or changes in behavior indicative of violence.
- Foster an environment of respect and acceptance.

(Redding Police Department 2013)

Through strong leadership and relational capacity we can provide respect, safety and trust for the most optimum chance of learning and performance for all. Schools still need to be vigilant about safety plans and drills. They must include a solid foundation of relational capacity for the best chance of responsible citizenry of, by and for our students.

Strategies and Techniques that Facilitate Transformational Learning
In Study Abroad Participants

Juanita Johnson-Bailey

Norvella P. Carter
Texas A&M University

Abstract
This paper examines the Study Abroad experiences and transformative learning of students who participated in Sub-Saharan African program. Two education professors led Study Abroad Programs to Sub-Saharan Africa for fifteen years that were developed to challenge Western perspectives and encourage the examination of Western practices in an attempt to foster transformative learning. This paper identifies the transformational learning stages that occurred most commonly across the student experiences.

Introduction
As the need for a globally sophisticated citizenry and workforce grows, the demand for Study Abroad programs has emerged as one of the nine top trends in higher education (Dennis, 2003; Lane, 2003; Mapp, 2012). Consequently, there has been a 250% increase in the number of United States students completing Study Abroad Programs in the last ten years (Institute of International Education [IIE], 2005; Krisantas, 2005). Study Abroad Programs are defined as all educational programs that take place outside of the geographical boundaries of the country of origin (Kitsantas, 2004). Most Study Abroad Programs typically involve a combination of course work, demonstrations, experiential activities, and tours. Students may choose to participate in programs sponsored by a U.S. college/university, a non-educational organization, or directly in a foreign university; these programs may vary in length from a full year to a semester, or even a mini-semester. However, some reports indicate that students are increasingly interested in short-term (less than 8 weeks) program models (Arenson, 2003; IIE, 2005; Lewis & Niesenbaum, 2005). Students from both public and private institutions are participating in short-term and long-term Study Abroad Programs.

Background on Participating Universities
The University of Georgia was founded in 1785 and is one of the nation’s oldest state-chartered land and sea-grant institutions in America. With an enrollment of over 32,000 students, the university is ranked among the nation’s top public research universities. As the state’s flagship university, UGA has a critical role in preparing the next generation of leaders for global competence. To meet these challenges, UGA is committed to offering international Study Abroad experiences. The University of Georgia offers its students over 100 faculty-led Study Abroad group programs in addition to exchange programs. UGA is also a member of various consortia and is affiliated with organizations that offer many additional programs. However, students are not limited to these opportunities, and can select from many of thousands of programs offered by American universities or directly enroll in a foreign university for a semester, academic year, or summer. With more than 1,400 students participating in Study Abroad Programs each year, UGA ranks eighth in the nation among public university’s sending students abroad (IIE, 2004).

The Southern Africa Study Abroad Program is a short-term, three credit hour Adult Education course that is open to graduate students enrolled at the University. In years past, the program has accepted cohort groups from other universities, including North Carolina State, University of Arkansas, and Texas A&M. Established in 2000, the Adult Education Program continues to work in partnership with the University of Botswana and its faculty to sponsor educational conferences during the two-week duration as part of the scholarly exchange. The two-week intensive Study Abroad Program averages 10 to 20 students each year and has been offered eight of the past ten years. South Africa and Botswana are visited each time, with visits to the University of Botswana, University of Witswaterand, University of the Western Cape, as regular stopovers. Each year, other countries in Southern Africa are added in rotation to the tour and these have included Zimbabwe, Zambia, Lesotho, and Namibia.

The second university, Texas A&M University, founded in 1876 was Texas’ first public institution of higher learning. It is a land-grant, sea-grant and space-grant institution with an enrollment of more than 48,000 students on its main campus. It ranks as the nation’s fifth largest university with nine branch campuses throughout the state. It also operates branch campuses
globally in Qatar, Mexico City, Mexico, and Castiglion Fiorentino, Italy. It is one of two flagship universities in Texas and boasts a presidential library and an endowment of more than $5 billion.

At Texas A&M University, there are three types of Study Abroad Programs. The first type is a *Faculty-Led Program* that involves studying at a host institution with a Texas A&M professor and a group of students. The second type is a *Reciprocal Exchange program* where you enroll at a foreign university and earn A&M credit. The third type is a *Transfer Credit Program* in which students Study Abroad with an affiliated or non-affiliated program provider. These programs allow students hundreds of Study Abroad opportunities each year.

The Sub-Saharan Africa Study Abroad Program based at Texas A&M is a graduate only program where participants earned six credit hours in Urban Education. The two-week intensive program has featured six educational conferences in Soweto and Johannesburg, South Africa; Livingstone, Zambia; Banjul, Gambia; Dakar, Senegal; and Dar es Salaam, Tanzania. The conferences feature research presentations by professors from the participating African universities, selected student participants, and the program faculty leaders.

**Relevant Literature**

As colleges and universities in the U.S. invest heavily in Study Abroad Programs as a major initiative to internationalize their campuses, their emphasis has been on undergraduate education only (Salisbury, Umback, Paulsen, & Pascarella, 2009). While the infrastructures are elaborate and costly, the return is unknown (Rowan-Kenyon, & Niehaus, 2011; Tarrant, Rubin, & Stoner, 2014). The Institute for the International Education of Students (IES), an international consortium of study abroad schools, developed an IES Model assessment Practice, reports that there are 4 major areas that must be covered and routinely assessed by a Study Abroad Program: the student learning environment, student learning and development of intercultural competence, resources for academic and student support, and program administration and development (Black & Duhon, 2006). Of the four areas, the second, student learning and development of intercultural development is directly related to encouraging learning that transforms the way students think and look at the Study Abroad Programs.
Most Study Abroad Programs are designed for traditional college students. This means that students are restricted in their engagement and therefore their possible return benefits, since most decisions were pre-determined. The top four countries visited by U.S. students for Study Abroad Programs are the United Kingdom, Italy, Spain, and France, drawing 43% of the over 220,000 students who studied abroad in 2005. The destinations that are increasing most in popularity as study locations are China and Argentina, with South Africa ranking 18th in destinations for U.S. students. However, with the growth of service learning as a new focus for Study Abroad, developing nations are experiencing a rapid growth (Fuller, 2007; McMurtie, 2007; Salisbury, Umback, Paulsen, & Pascarella, 2009; Williams, 2008).

Higher education institutions are expecting that Study Abroad Programs will promote intercultural sensitivity (Fuller, 2007) as well as assist in diversifying their curriculum (Salisbury, Umback, Paulsen, & Pascarella, 2009). Additionally, workplace recruiters and prospective employers are placing importance on a job candidates’ international experience in the belief that such experiences provide students with a broad understanding of the emerging global workplace (Gardner, Steglitz, & Gross, 2009). The employers hold the position that employees with international knowledge will positively influence the company’s ability to compete in the global market and that the Study Aboard directly connects to the participants ability to work independently, undertake unfamiliar and risky tasks, identify new problems, and work effectively with others (Gardner, Stieglitz, & Gross, 2009).

Facilitating Transformative Learning in Study Abroad Programs

It is conjectured that Study Abroad Programs will increase social capital and civic engagement. In direct response to these facts, the practitioners designed their Study Abroad African Programs to encourage adults to contribute and connect to the disenfranchised learners they will be connecting to as part of their travels. It is of particular note that only one African country, South Africa, falls in the top twenty Study Abroad destinations. Of equal significance is that U.S. minorities, African Americans and Hispanics, are not represented proportionately in Study Abroad Programs. The importance of the programs being discussed at the workshop is that not only do they feature African countries that are not part of conventional African Study Abroad Programs, but also that the participants are non-traditional learners and minority students.
Since 2000 the adult educators who are facilitating this roundtable discussion have conducted 21 Study Abroad tours and have found that eight of the 10 phases of transformational learning that were set forth by Mezirow (1991) have been particularly pertinent to their students transformational experiences. The phases that have been identified as significant to Study Abroad Programs being discussed were: 1) disorienting dilemma, 2) critical assessment of assumptions, 3) recognition of shared transformative experience with other group members, 4) exploring options for new roles, 5) planning a course of action, 6) acquiring new knowledge and skills for new plans, 7) trying out new roles, and 8) integrating new assumptions based on new perspective.

Of the eight phases recognized by the Study Abroad facilitators as being present among the participant experiences, the most data were generated relative to the disorienting dilemma and using new knowledge to explore options for new roles. These two phases will be explored herein and the other six that were seen in the data will be discussed during the workshop.

While the overall Study Abroad experience is generally seen as a disorienting experience for participants, the adult educators that developed these programs discovered in working with other Study Abroad Programs, as both students and faculty, that the transformative learning experiences were varied and often short lived. The adult educators who are facilitating this workshop attempted to create a Study Abroad experience that would lead to global engagement and have a long-term impact on students. The phases of Transformative Learning seen in the participants have been routinely manifested by the participants in several different ways. The students, who are required to keep video and paper journals, were open in reporting their biases and fears regarding visiting the Dark Continent. One student, a twenty-nine year old Black male wrote: “I have several misconceptions about Africa. Africa is a continent, not a country, but somehow it is always imagined as one big country. When I picture Africa I see the hungry children with flies around them.” Other disclosures that revealed the students uninformed attitudes concerning modern African society included discussions on their fear of wild animal attacks, questions regarding what kinds of exotic and/or substandard foods they would be forced to consume, and speculations on what kinds of huts would serve as their housing. Using film and
readings, the participants discussed their commonly shared negative beliefs and toxic attitudes about the African continent, particularly those on Sub-Saharan African countries.

The disorienting dilemma, the first phase of Mezirow’s stages, occurs most often across the group and is perhaps both generally anticipated, but accepted by both the students and faculty in the Study Abroad Program. The disorienting dilemma begins in Part One of the experience (before leaving the U.S.) and continues throughout the study. However, the gradations of the disorienting dilemma vary according to the participant’s previous experiences and positionality. However, it was noted that the disorientation was most severe with American White student participants who had never been a minority race person over a sustained period. In addition to being unsettled by their new minority status, the White American students also reported experiencing discomfort, anxiety, and fear. At the other end of the same continuum were Black African American students who reported feeling a new level of comfort by the occurrence of not being a minority in an environment over a sustained period for the first time and the joy and newness of seeing “that all the people in charge look like me.” Moreover, another interesting point was that process of transformation was not a linear and rational one as described by Mezirow (1991). Even near the programs’ conclusion, participants were having disorienting dilemmas and using their prior experiences to skip the steps that involved shame and guilt, and were instead processing the new data quickly in order to resolve the conflicts and find their way to action. Moreover, this is in direct contrast to the Transformative Learning process as presented by Mezirow (1991). One student, a thirty-five year old African American mother of five school-aged children, wrote of what she referred to as her fourth disorienting dilemma, which occurred after visiting an orphanage. According to her, each previous dilemma was different and apart from the others in the type of experience and in the resulting learning and evolution. She wrote of her the overwhelming sadness that she imagined was the feelings of the AIDS orphans:

Do you have joy?
Joy in spite of? What is it to be alone?
To have your parents die?
To lose your childhood?
To wonder about your next meal…
Childhood is supposed to be a time of innocence
But happens when innocence is taken?

The participants who studied in South Africa quickly discovered the common ground of being unsettled by the recognition of the poverty and recent history of segregation that the participants encountered in South Africa. These viewpoints were most readily realized as they visited the Black townships, met with the children at the HIV/AIDS orphanages, met with political activists, and visited the Apartheid Museum. These sites and speakers were chosen with the intention of assuring that the students would not experience the Study Abroad Program as a tourist, but rather as an outsider exploring the inside (Hutchison, & Rea, 2011; Ripple, 2010).

During initial meetings before departing the U.S., the participants began to engage in self-examination of their feeling of guilt or shame regarding Africa, an assessment of their socio-cultural assumptions regarding Africa, Mezirow’s second, third, and fourth phases. However, after the disorientation, the next most often documented steps were the exploration of the participants’ options for establishing a proactive stance towards Africa and their desire to use new knowledge to implement courses of action, Phases Five and Six. One graduate student, a forty-five year old Cuban-American wrote in her journal:

A moment of sadness has come as I realize I am ending a journey, a journey that has been emotionally charged, and a journey that has challenged me. It has called into question that I am, who I want to be, and what I want my impact to be. The answers will go unknown until I return to my life. Does my life look different, a day, a month, a year, a decade from this day? This time? Do I remember and implement the lessons learned? Hopefully I will carry this with me forever. Hopefully I grow and learn with each moment and time. The tears fall, but this is not the end. It is a beginning. I have changed. I have begun again, a metamorphosis.

One absolute condition of the participation in the Study Abroad programs is the Full Heart, Empty Suitcase Principle, which requires that each student take two suitcases on their trip, one whose contents are to be left behind. According to the group decision, the contents can be books, clothing, toiletries, toys, or medicines. In most years, the groups have elected to visit orphanages that care for children whose parents died in the AIDS epidemic.

The second part of the Study Abroad Program, the Ground Experience, includes working with a Non-Government Agency (NGO), such as TALK (Teaching African Language and Talk Knowledge) to learn and to become oriented to the African culture (Hartford, 2011; Ripple,
This technique is employed to encourage critical reflection (Brookfield, 1995) which will support the process of transformation, and to avoid the students from being ugly Americans, a term used to refer to perceptions of arrogant behavior by Americans abroad. Using a theoretical frame grounded in Transformative Learning Theory, the adult educators work with the students to challenge assumptions, through critically reflecting in their journals (Hutchinson & Rea, 2011) and through daily debriefing group meetings. In the program, students are coached on the conversational styles of Southern African culture, informed how to avoid common cultural clashes, instructed on manners (issues such as proper dress, appropriate greetings, and African handshakes), and introduced to the Southern Africa cuisine.

An absolute directive of their Program is, Scholar Traveler/Not Tourist, so named as a constant reminder that the purpose is to learn and appreciate indigenous knowledge. The pursuit of African knowledge is operationalized by working with African scholars as subject matter experts, visits to women’s cooperatives, such as the Oodi Weavers in Botswana, research exchanges through a day of presentations by Study Abroad faculty and students, African University faculty and students, and community leaders.

Patten and Peters (2001) suggested that in planning an international program one should blend lecture and structured presentations to enhance the students’ academic experience. This recommendation was of utmost importance in planning the African Programs. As a result, the programs collaborate with institutions of higher education, junior-secondary school, and senior-secondary schools. An exchange of lectures and presentations, and discussions are engaged jointly with American and African scholars and students with local community agencies provide an outlet for additional educational activities. Learning activities include daily journaling, course lectures and presentations, tours (cultural, educational, and historical), and service learning.

There were several important adult education principles that were common across the programs being presented at the workshop discussion that distinguishes the programs as different from the typical undergraduate experience. For example, participants were allowed choices, particularly around events like church attendance or programs that might have been considered political in nature. More importantly, there were experiences built into the Study Abroad Programs that encouraged transformation. For example, there were regular debriefings, lengthy
question, and answer sessions with the speakers. In addition, the educators built in time for critical reflection and intermittently distributed questions that promoted critical thinking. Finally, the faculty modeled active sustained involvement with the staff and with the African programs visited, with the invitation extended to the participants to find a method that would foster their own independent association with the African communities included in the Program.

Conclusion

Overall Study Abroad Programs to Sub-Saharan Africa readily provide the conditions to enable a transformative learning experience for Study Abroad participants. These conditions include cultural, linguistic, and epistemological factors. However, what is necessary to optimize the chances for learners to experience transformational learning is to provide structured opportunities for reflection, engagement, and community – all of which – or any of which can trigger a shift in perspective about identity, racism, colonialism, and privilege. Tools that promote reflection can include free style journals, guided journal assignments that address assigned topics or questions that address cultural/regional differences, personal revelations, daily evening group discussions/debriefings, and post-return debriefings.

The developers of this will share Pre-Trip Strategies, Best Practices for the Field Experience, a Survival Tool-Kit Featuring Tales of Woe/Wonder, and Post-Program Essentials. The faculty will lead exercises that they have developed and share data from past Study Abroad trips to illustrate how Study Abroad Programs, if designed, implemented, and undergirded by transformative learning tenets can provide intense learning experiences. The facilitators draw upon postcolonial transnational perspectives (Dill & Zambrana, 2009) that help students deconstruct master narratives and work on developing new understandings of power, privilege, and nation-based positinalities. Primary data, collected from former participants, suggest that the effect of the students’ perspective transformation is enduring.

Abstract

Instructional and Assessment (I&A) tasks simultaneously address both assessment and instructional needs. Through these tasks, teachers can assess much more than whether or not students can answer questions or perform tasks; student conceptual understanding of numerous embedded notions can be assessed. As students respond to these tasks, they come to deeply understand and connect mathematical concepts. Herein, the assessment and instructional aspects of one rich mathematical task are presented through student work and responses.
Instructional and Assessment Tasks

Open-ended problem solving tasks are becoming increasingly commonplace in K-12 mathematics education. Students often enjoy the engagement with the problem and the interaction with other students in solving it. While, some of these problem solving tasks indeed contain much wonderful mathematics, the precise mathematical concepts embedded in such are often quite elusive. Often, the purpose for such tasks is to observe student problem solving heuristics more so than to assess their understanding of precise mathematical concepts or have them learn through such tasks. Nevertheless, these problem solving scenarios have important roles in mathematics education.

The authors of this paper make a distinction between open-ended problem solving and Instruction and Assessment (I&A) tasks. The latter possess a number of recognizable characteristics. First, they address conceptual understanding of precise mathematical concepts recognizable by both the teacher and the student; they are not simply problem solving experiences. Second, each task can be used to assess student understanding of particular mathematical concepts and also serves as a springboard through which the associated concepts can be investigated and learned. Third, I&A mathematical tasks can be generated to address any grade-appropriate mathematical concept. Fourth, most of these tasks can quite easily be differentiated to address students of differing ability levels. Fifth, I&T tasks address Krutetskii’s (1976) three processes of reversibility, flexibility and generalizability. Last, I&A tasks are solvable through multiple heuristics. Altogether, I&A tasks can be recognized as assessment tasks through which students simultaneously learn, or vice versa.

To provide a window into the application of I&A tasks in the classroom, this paper analyzes transcripts of student work on a mathematical I&A task. In later discussions, this paper
provides some guidance on implementing these tasks in the classroom.

**A Sample I&A Task**

The following is a truncated graph of a polynomial. (All the behavior near the $x$-axis is shown.) There is no scale for the $y$-axis. Write the equation of a polynomial function that would produce this truncated graph.

This task encompasses numerous notions associated with the concept of polynomials including: the definition of polynomial functions and their continuous nature; the role of the leading coefficient and the degree of a polynomial on the graph’s extreme behaviors; the definitions of factors, linear factors, and a factored polynomial; the graphical effects of roots of odd and even multiplicity; and the association of zeros, roots, factors, and $x$-intercepts between the polynomial function and its graph. Beginning with concepts from introductory Algebra, this task intersects PreCalculus through the generalized solution $y = (x - a)^{odd}(x - b)^{even}(x - c)^{odd}(x - d)^{even}$.

This specific task required that students: *reverse* their thinking about polynomials and factoring in a direction counter to what they typically experienced during instruction; be able to *flexibility* solve a problem in more than one way and to be able to understand more than one solution; and *generalize* from specific cases and make deductions from given or known facts.

Notably, all students in this study were from the same high school class under the same teacher and had previously investigated polynomial functions and graphical/algebraic representations in their high school pre-calculus class and had all experienced identical content, instructional practices, and extended problem solving challenges. The classroom teacher assessed the task as both challenging to most students and doable by all. (See Bossé, Adu-Gyamfi, & Chandler, 2014 for a more detailed description of the associated study.)

**Student Solutions**
All students were given up to two hours to complete the three tasks; most took less time (10-90 minutes) as they were either able to solve the problem quite quickly or struggled to persevere through the problem solving process. The following are syntheses of transcripts of student activity and are addressed below in two parts: assessment and learning.

**Assessment**

**Student 1:** (Average to weak student holding a course grade of C. Teacher believes that he will be able to do the task, albeit with a struggle.) With calculator in hand and through trial and error, he enters values and polynomial functions, trying to create a correct graph. *I don’t know what to plug in [the calculator].* (Prolonged pauses.) *I don’t know what “truncated graph” means? We need to know what happens above and below what we see on the graph.* (Prolonged pauses.) *I know what polynomial means. It’s something like \( x^2 + 2x + 3 \). And I think I know what a factor is. 5 is a factor of 10. But I’m not sure that I know what a “polynomial in factored form” means.* (Numerous prolonged pauses and trial and error.) *I keep trying to plug numbers in for a, b, c, and d into \( y = ax^3 + bx^2 + cx + d \), but nothing seems to work. Am I supposed to know how to do this?* (Prolonged pauses.) *I can graph a function by plugging it into my calculator, but I don’t think that the calculator can take a graph and give you the function. Plus, why would you want to do this? The graph is the answer to a problem.*

After a protracted period of time and beginning to demonstrate some degree of exasperation, he is shown by the interviewer \((x - a), (x - b), (x - c), \) and \((x - d)\) as factors. However, he is unsure as to how these are connected to the graph. After another significant duration, he is surprised when told by the interviewer that \( y = (x - a)(x - b)^2(x - c)(x - d)^2 \) represents a possible solution and tries to rewrite it in the form \( px^n + qx^{n-1} + \ldots + rx + s \), which he purports to better understand. He shows no understanding that the leading coefficient has to be positive.

The teacher speaks to the researcher in a private sidebar. *I really expected him to do better. I knew he would struggle some... We covered this material in class and he passed the tests. I am surprised that he didn’t even really know the vocabulary and what linear factors are or how they work in the polynomial. I guess that I learned a lot about him. I’m not sure why I did not see this before. We’ve got a lot of work to do.*

Student 1 demonstrates that he perceives the polynomial function and graph as mostly disjoint and disconnected. He does not: recognize zeros on the graph; understand the corresponding \((x – __)\) binomial in the factored form of the polynomial; or consider the far-left
and far-right behavior of the graph in respect to either the degree of the polynomial or the sign of
the leading coefficient. He only recognizes “polynomial” in the form \( y = px^3 + qx^2 + rx + s \).
Through his activity on this task, the teacher recognizes that: the student has significant gaps in
his knowledge; more concepts seemed to be missing then learned; and that much remedial
instructional effort will be needed.

**Student 2:** (Average to strong student holding a course grade of C. Teacher
believes that she will be quite successful with the task.) She writes down
expressions (i.e., \((x + 2)\times(x + 1^2)\times(x - 1)\times(x - 2^3), (x + 2)\times(x + 1^2)\times(x - 1)\times(x - 2^3)\)), and \(-3x^3 + 2x^2 + 2x + 3\), superficially analyzes them, and then attempts to graph
the function. (Brief pauses.) *I know that a and b represent negative numbers, but
I don’t know if they should be written as negative a and negative b.* She
repeatedly attempts to graph polynomials entered in general form and some in
factored form. (Brief pauses.) *I can see that the line passes through a and c and
that x ‘squareds’ hit the axis at b and d. But I don’t know what that does to the
equation. (Brief pauses.) I think that I need to use a, b, c, and d and graph
something like ax^3 + bx^2 + cx + d.*

After some investigation… *I know that we need to put a, b, c, and d in the
parentheses, but I’m not quite sure how they go in. I know how to use numbers in
an equation, but I’m not sure how to use letters other than x, or how to change
those into numbers. My calculator won’t let me graph letters.* After more
investigation, she points to sets of parentheses on the paper. *I know that some of
these are supposed to be squared somewhere. I don’t know if it is \((x – \text{something})^2\) or \((x – \text{something})^2\). I think it is \((x + 2)\times(x + 1^2)\times(x - 1)\times(x - 2^3)\).*
Her continued investigation (with numerous brief pauses) is full of inquisitiveness
and problem solving, without any semblance of frustration.

The teacher comments to the researcher. *Well, she did pretty well. But I
see that she still has some difficulty with understanding linear factors for positive
and negative roots and where the exponent goes. I didn’t expect these little
concepts to give her trouble. I thought she knew this.*

Student 2 recognizes a number of aspects of the graph itself including: the far left and far
right behavior of graphs of polynomial functions; the association of zeros, roots, and x-intercepts
between the graph and the equation; and the nature and effects of roots of odd and even
multiplicity. However, she still exhibits knowledge gaps regarding: the nature of linear factors
together with their multiplicities; whether the factors should be \((x – a)(x – b)\) or \((x + a)(x + b)\);
whether the exponentiation should be inside or outside the parentheses; and the interconnection
of zeros and intercepts on a graph and zeros and real roots of a function. The teacher recognizes
the particular concepts that need to be remediated for this student.

**Student 3:** (Very strong student with an A+ average in the course. The teacher
expects that he will fully master all the concepts in these tasks.) (Quite fluently,
with only a few very brief pauses – more as a flow of consciousness.) I always
know what a polynomial in factored form looks like – or at least what its x-axis
and far out behaviors look like. But I can’t picture what the graph of a
polynomial in general form (like \( ax^3 + bx^2 + cx + d \)) would look like. This
polynomial is of even degree with a positive leading coefficient. \( a, b, c, \) and \( d \)
represent the zeros of the function. Writing \( x–a, x–b, x–c, \) and \( x–d \) inside the
parentheses produces the same zeros. But we need to also consider the exponent
outside of each parentheses and the multiplicity of the zeros at those values. The
x-intercepts (bouncing off or passing through) show that some zeros are of even
and odd degrees. So, this function must be of degree at least 6. (Very brief
pause.) I think that we can start with \( y = (x – a)(x – b)^2(x – c)(x – d)^2 \). But since
we are only looking at the x-axis and we don’t care what goes on above and
below, \( y = (x – a)(x – b)^2(x – c)^3(x – d)^4 \) could also work. (Very brief pause.) In
fact, \( y = (x – a)^{\text{odd}}(x – b)^{\text{even}}(x – c)^{\text{odd}}(x – d)^{\text{even}} \) could be the answer.

The teacher comments to the researcher. He’s really bright and always
gets it – sometimes even before I teach it. He seems to see both the big picture
and the more minute concepts. I often wonder if his math is better than mine; I
sure know that it will be in the future if he continues. But it is so easy for him, I’m
afraid he will get bored.

Student 3 has a strong understanding of mathematics in the task; understands the salient
ideas from the graph and connections between the graph and the equation; operates on the given
function through either the symbolic or graphical representation; and mentions concepts and
attributes associated with one representation in context of another (e.g., the “roots of the graph”
and “multiplicity of the x-intercepts”). The teacher recognizes that this student has not
sufficiently challenged and decides to provide additional targeted I&A tasks.

The teacher was surprised at the precise student understanding, misunderstandings, and
knowledge gaps that were observable through the task and how the task prescribed precise and
differentiated instruction for each student.

**Learning**
**Student 2:** Approximately 45 minutes later... This polynomial has to be raised to an even power to get this left and right behavior. But, how does that work with the parentheses? (A significant pause with silent thought.) I’m gonna use some numbers instead. She decides to graph \( y = (x + 3)(x + 1)(x - 1)(x - 3) \). It does not produce the correct graph and she attempts to graph other cases. Through protracted trials, she recognizes that \( y = (x + 3)(x + 1)(x - 1)(x - 3) \) implies \( y = (x - a)(x - b)(x - c)(x - d) \).

After more investigation (through a number of pauses) ... I think that there is something here about single and double roots. I think that double roots bounce. Or is that single roots? (Brief Pause.) I think that we need exponents to make some of these bounce. When the graph correctly passes through the desired zeros, she demonstrates uncertainty as to if a double root at \( b \) is accomplished by \( (x - b)^2 \) or \( (x - b)^2 \). (A thoughtful, brief pause.) After successive trials and random variations ... I think it is \( (x + 2) \times(x + 1)^2 \times(x - 1) \times(x - 2)^2 \). After more thought ... It took me a while to figure out why \( (x + a) \times(x + b)^2 \times(x - c) \times(x - d)^2 \) wasn’t right; I needed \( (x - a) \times(x - b)^2 \times(x - c) \times(x - d)^2 \). Hey, I think that \( (x - a)^{odd} \times(x - b)^{even} \times(x - c)^{odd} \times(x - d)^{even} \) works.

The teacher responds to the researcher. She got it! She figured it out – all by herself. I took quite a few days to cover some of these ideas in class. I really thought the class got them – or at least as well as each could. Then, with this one activity she got it. It took her less than a class period; it was time worthwhile.

The progression from Student 2’s previous transcripts to this transcript (over the total span of about 90 minutes, with no assistance from the teacher) demonstrates significant learning of concepts and the formation of connections between the two representations. The teacher was pleased with the student’s progression of learning through the I&A task. Extended transcripts reveal that Student 1 also learned many of the mathematical concepts in the task, but at a slower pace than Student 2. The teacher believed that a simpler version of the task would have led to more efficient learning, decided to create concept-similar tasks that would scaffold learning for this student (e.g., begin with quadratic functions), and decided to allow this student to work with another student on future I&A tasks to diminish potential frustration. For Student 3, already understanding the mathematical concepts in the task, the teacher decides to create parallel I&A tasks (using transcendental functions) to more appropriately challenge the student.
The Instructional & Assessment task served to both assess student understanding and provide them a conduit to learning. This led to the teacher being better able to adjust instruction according to student needs.

**Discussion**

Due to their nature of addressing precise, interconnected, mathematical concepts, I&A tasks may seem more difficult than more traditional classroom instructional questions. Classroom time must be planned to complete these I&A tasks and for students to realize their benefits. Both students and teachers need sufficient time to benefit from these activities. While weaker students benefit from I&A tasks, they do so at a slower pace than others. Because they are given little guidance toward completing the task and the tasks are unusual, they initially struggle with these tasks; however, experience leads them to appreciate these tasks. It is recommended that teachers scaffold I&A tasks to best meet the student’s needs, sequence the problems to begin with those that are more brief before continuing on to more lengthy tasks, and allow them to work with others. I&A tasks can also be readily modified to be deeper and more challenging for stronger students. These students often enjoy the challenge of I&A tasks, prefer them more frequently, can learn through them independent of instruction, and can be asked to create and solve their own I&A tasks.

For any mathematical topic at any level, I&A tasks are available. To demonstrate that these tasks are relevant to all grade levels, a few additional tasks are provided. Notably, for each example, a companion example is provided to differentiate the problem to be either more or less mathematically complex.

**For Elementary Grades.**

1. In the following examples, fill in the blank with an appropriate value and explain why your answer works. Then consider more possibilities for each blank and see if you can find a pattern.
I&A TASKS

9

a. Fill in the blank with a fraction so that the result of 8 ÷ ___ is larger than 8.
b. Fill in the blank with a fraction so that the result of -8 ÷ ___ is less than -8.
c. Fill in the blank with a decimal number so that 8 × ___ is less than 8.
d. Fill in the blank with a decimal number so that 8 × ___ is less than -8.
This task can be amplified by replacing the numeral 8 with a variable.

2. Explain the necessary conditions for the variables such that \( a \times 10^b > c \times 10^d \).
This task can be simplified by using numbers such as \( 1.35 \times 10^{32} \) and \( 9.76 \times 10^{-32} \).

3. Find four evenly spaced numbers between -3.305 and 2.027.
This task can be significantly amplified into a form such as: For \( a \) and \( b \) as positive rational numbers, find \( c \) evenly spaced numbers between \( -a \) and \( b \).

For Middle Grades.

1. Explain whether or not each of the following numbers is rational or irrational:
1.23456789101112…; 1.23456789101112; 1.234234234…; 1.122334455667….
This problem can be enhanced in this way: Write three numbers, in decimal form, which are all irrational numbers and explain why each is so.

2. The long division problem, \( \overline{0.ab \cdots} \), is most usually solved by moving the decimal in the divisor and dividend. Use fractions to explain why \( \overline{ab \cdots} \) is an equivalent expression to solve.
This task can be simplified by using numerals as digits.

3. Find the number that is 3/7 of the way from 2/3 to 3/4.
This task can be amplified by considering: Find the number that is \( a/b \) of the way from \( c/d \) to \( e/f \).

High School.

1. The following functions are equivalent, but in different algebraic forms. What information regarding the function is revealed or hidden in each of the forms?
\[
f(x) = 2x^2 + 3x + 1 \quad g(x) = x(2x + 3) + 1 \quad h(x) = (2x + 1)(x + 1)
\]
This task can be simplified by providing options such as: show it is a quadratic; shows its factors; reveals its roots; reveals its \( y \)-intercept; shows that it is concave up.

2. Explain why the accompanying function and graph are inconsistent.
\[
f(x) = \frac{(x-2)^2(x+1)}{x^2(x+1)}
\]
This task can be simplified with polynomial functions.

3. For \( f(x) = 2x+3 \) and \( g(x) = (x-3)/2, f(g(x))=g(f(x)) \). Is it usually the case that \( f(g(x))=g(f(x)) \)? Explain why or why not.
To increase the complexity of this task: Explain necessary conditions for \( f(g(x))=g(f(x)) \) to be true.
4. For \( \_\_x + \_\_ = \_\_x + \_\_ \), fill in the blanks such that the equation has: one solution; no solution; an infinite set of solutions.
To increase the complexity of this task, create an equation including a quadratic and a linear function.

5. Without converting the graph to an equation, explain everything you can about the graph and its respective function.
To simplify this question, use a polynomial function.

**Conclusion**

It is hoped that this brief introduction to Instructional and Assessment Tasks will evoke interest in them and encourage teachers to try them in their classrooms. The authors have used these tasks with great results. We hope others see their worth and enjoy them also.

BENEFITS & EFFECTS OF PNF STRETCHING IN THE COOL DOWN PHASE OF EXERCISE

Authors: Williamson, J. & Simmons, S.

Corban University
Abstract

PURPOSE: The purpose of this study was to investigate the effects of a 4-week proprioceptive neuromuscular facilitation (PNF) stretching training program compared to a 4-week static stretching training program during the cool down phase of exercise, followed by comparing and analyzing the resulting differences in range of motion (ROM), specifically the extensibility of the hamstring. METHODS: 25 volunteers (male = 13; female = 12; 20.44 ± 1.32 years; BMI 23.65 ± 2.01 lb/in²) were randomly assigned into either PNF stretching experiment groups or static stretching control groups. Before and after the stretching intervention, we determined the maximum extension ROM in the right (R) hamstring. Subjects’ active ROM was measured by use of angular degrees by means of a goniometer at the knee. RESULTS: The PNF group showed a statistically significant increase in hamstring ROM (preROM = 124.00° ± 12.767°, postROM = 136.08° ± 8.301°; t(12) = 4.416, p = .001). The static stretching group showed an increase in hamstring ROM, although not statistically significant (preROM = 136.58° ± 15.012°, postROM = 142.33° ± 12.235°; t(11) = 1.960, p = .076). CONCLUSION: We conclude that a 4-week PNF stretching training program in the cool down phase of exercise increases ROM and is superior to the effects of static stretching.

Key Words: PNF; cooldown; exercise; stretch
Introduction

Muscle flexibility and extensibility is a pertinent topic among competitive athletes, particularly those displaying either hypo-mobility or hyper-mobility. Athletes who display either disposition are at a greater risk of suffering a non-contact injury, such as a muscle strain or joint sprain. Additionally, overly tight muscles, if left unattended, will, over time, result in postural change and compensation due to a lack of available mobility and muscular flexibility that are needed to perform basic mechanical movements. Although genetics plays a significant role, muscles are highly trainable, and significant improvements in flexibility can be made through the implementation of various stretching modalities. The most popular of modalities tend to be static stretching, dynamic stretching, and proprioceptive neuromuscular facilitation (PNF) stretching. It is worthy to note that there is an ongoing debate about what exactly is meant by “flexibility gains” throughout literature. Is the muscular tissue actually lengthening, or is a greater tolerance to stretch being developed?

Folpp, Deall, Harvey, and Gwinn (2006) performed a study that was aimed at determining whether a stretch program would produce positive change in muscle extensibility (making the muscle longer) or produce a greater stretch tolerance. They found while there was no gain in muscle extensibility, there was significant positive change in stretch tolerance. Folpp et al. (2006) emphasized that investigators need to distinguish between extensibility and tolerance, because there is an immense difference. The difference is such that clear reference must be stated in each study. Stretch tolerance is, more often than not, mistaken as extensibility gains, when the reality is that stretch tolerance simply means that one has merely trained the Gogli tendon organs and muscle spindles to tolerate a greater tension and stretch put on the muscle. Additionally, Weppler and Magnusson (2010) argue that in order to gain true muscle
extensibility, one would need to be following a strict regimen of stretching five days a week for at least 8 weeks before any improvement in extensibility would be noticeable. Simply stated, true increases in extensibility of the muscle take an incredible amount of disciplined stretching before any form of noticeable change would begin to occur. With that being said, it is important to note that for the purpose of this research, flexibility gains will be referring to a sensory end point, or a level of stretch tolerance, within the subjects.

Methods

Study Participants

Twenty-five subjects voluntarily participated (male = 13; female = 12) (mean age = 20.44 ± 1.32 years) (mean BMI = 23.63 ± 2.01 lb./in²) in this study. The subjects were all competitive collegiate NAIA division II basketball athletes. Of the participants, six were freshmen, three were sophomores, 11 were juniors, and five were seniors. Throughout the pre-trial testing, the average degrees of ROM the athletes displayed in the PNF group was 124° (preROM = 124.00° ±12.767°), while the static group displayed an average ROM of 136° (preROM = 136.58° ± 15.012°).

Pre-Trial & Post-Trial Testing

Participants were randomly assigned to either a PNF stretching experiment group or a static stretching control group. Each participant’s maximum hamstring extensibility ROM was measured prior to the stretching regimen by means of a goniometer that was used to capture an accurate recording of an active knee extension while the hip was in 55° flexion. To capture the maximum ROM, the participants were instructed to lie down in the supine position, making sure their left legs were completely straight while their right knees were in a state of flexion. The participants were then given heavy, stiff bands and were instructed to place the bands behind
their right knees. Using the bands, the participants were instructed to pull their right knees up to their chests, until the angle of flexion at the hip measured 55° by means of a goniometer. Holding this position, while ensuring the left legs remained straight, the participants were instructed to actively extend their right knees until they reached a maximal sensory end point. The participants’ maximum active ROM was measured by use of angular degrees by means of a goniometer at the knee.

After the participants had performed the prescribed stretching exercises for four weeks, the participants’ maximum ROM was then re-evaluated. The procedures for the post-trial testing were executed in exactly the same manner that the pre-trial testing was conducted.

**Intervention**

Following the pre-trial testing, the subjects were given stretching prescriptions according to their group and were instructed to execute the exercises after every practice and game for four weeks.

The PNF (experiment) group was prescribed two different stretches that targeted the hamstrings, quadriceps, and hip-flexors. The first was a 10-second isometric contraction (50% maximal contraction) of the hamstring in an already extended state, followed immediately by 3-4 seconds of relaxation. During the relaxation phase, the partner would gently lower the participant’s leg all the way to the floor before performing the stretch again. This process of a 10-second contraction followed by 3-4 seconds of relaxing was repeated three times on each leg.

The second stretch that was prescribed for the PNF group also utilized an isometric contract-relax technique with 10 seconds of a 50% maximal contraction of the quadriceps, followed by 3-4 seconds of relaxing, during which the partner would gently lower the participant’s foot to the floor before performing the stretch again. This process was also repeated.
three times on each leg. For this specific exercise, it is vital to understand that the pelvis must be in a neutral position in order for this stretch be of maximal efficacy. This is because, as reported by Witvrouw, Lysens, Bellemans, Cambier, and Vanderstraeten (2000), a significant population of the athletic demographic display overly tight quadriceps and hip-flexors. In order to achieve a neutral state of the pelvis, the participants were instructed to apply a significant amount of pressure to the stretch-subject’s hips by sitting on them, forcing their pelvis into a neutral state (Figure 1).

The static (control) group was prescribed a total of five different traditional static stretches that targeted the hamstrings, quadriceps, hip-flexors, groin, glutes and calves. The participants were instructed to hold each stretch for 30 seconds, on their own count.

**Statistical Analysis**

Before the study was conducted, the significance level was established at $p < 0.05$. Data was analyzed using the statistical software SPSS version 23. The independent variables are the experiment group and the control group. The dependent variable is hamstring ROM. We compared the initial baseline scores to the final baseline scores in each group. Paired sampled t-tests were used to determine the mean between the experimental and control groups. Sample size was pre-determined by the number of athletes on the respective basketball teams.

**Results**

The average increase in ROM for PNF stretching in the cool down phase of exercise was greater than the average increase in ROM for static stretching in the cool down phase of exercise. The overall difference between PNF and static stretching was statistically significant; the mean improvement for the PNF group was $12.07^\circ$ of ROM (preROM = $124.00^\circ \pm 12.767^\circ$, postROM = $136.08^\circ \pm 8.301^\circ$; $t(12) = 4.416$, $p = .001$), while the mean improvement for the static group was
5.75° of ROM (preROM = 136.58° ± 15.012°, postROM = 142.33° ± 12.235°; t(11) = 1.960, p = .076) (Figure 2). Differences between males and females were noteworthy as well, with males showing greater increases in ROM (Table 1). In relation to the number of times participants executed their prescribed stretching exercises, the difference between the PNF group and the static group showed that those who participated in the exercises four times or more per week displayed greater increases in ROM, especially those in the PNF group, whose improvements were, on average, greater than those in the static group (Table 2). Finally, tests were conducted in order to see if any sort of correlation between ROM improvements and year in sport presented itself. Those who were freshmen and sophomores showed greater increases in ROM than those who were juniors and seniors, especially those in the PNF group, although not statistically significant (Table 3, Figure 3). Based on the statistical evidence, I must reject the null hypothesis that states that post-workout PNF contract-relax stretching will not yield more significant gains in flexibility than post-workout static stretching.

**Discussion**

This present research began with a hypothesis stating that PNF stretching in the cool down phase of exercise would yield more significant increases in ROM than static stretching in the cool down phase of exercise. Foehrkolb (2013) discussed the advantages and disadvantages of static stretching, with one of the advantages discussed being the apparent increase in flexibility that is displayed if it is performed on a regular basis. Further, Foehrkolb also supported the notion of using static stretching as a primary means to generate an increase in flexibility over time. While the static stretching group did show increases in ROM, supporting Foehrkolb, it was not statistically significant. In comparison, the PNF stretching group showed very significant increases in ROM as seen in Figure 1.
PNF stretching has shown itself to be highly effective in producing gains in flexibility. Osternig, Robertson, Troxel, and Hansen (1990) found that the antagonist contract-relax (ACR) technique produced significant increases in hamstring electromyography (EMG) activity: 89% - 110% more in participants, while also producing 9% - 13% greater ROM in the knee before the participant communicated a sensory end point of restriction.

Additionally, Mayer, Pederson, and Simons (2005) performed a study on PNF stretching, specifically the contract-relax (CR) technique, with 20 female soccer players who were separated into a control group that performed self stretching or into the experiment stretch group that performed prescribed PNF stretches three times per week for three weeks. Mayer et al. (2005) found a significant increase in flexibility and ROM in the experimental stretch group when compared to the control group, which actually displayed a decrease in average flexibility and ROM.

The present research methodology utilized a submaximal contract-relax technique for the PNF group, similar to that of Feland and Marin (2004) and, Sheard and Paine (2010), whom also utilized a submaximal contract-relax technique. Feland and Marin conducted a randomized controlled clinical trial in which they recruited 72 college-aged men who were deemed healthy, but did display qualities of overly tight hamstrings. Feland and Marin (2004) found that submaximal contract-relax PNF stretching displayed the most gains in flexibility when compared to a maximal contract-relax group. Additionally, Sheard and Paine found that the peak positive change in ROM occurred at about 65% of the participants’ maximal voluntary isometric contraction. The contraction of around 65% elicited an increase of participants’ ROM by an average of 13.3 degrees. Once 65% of the participants’ maximal voluntary contraction was surpassed, positive change in ROM began to gradually decrease. In fact, participants who exerted
100% of their maximal voluntary isometric contraction experienced a negative change in their ROM by an average of about 6 degrees. It should be noted, that in the present research, the force of the participants’ contractions were not quantitatively measured throughout the trials; although participants were instructed to perform a contraction of what they believed was near 50% of their maximal contraction, it cannot be assured that the goal of 50% was accurately performed. Similar to Feland and Marin and Sheard and Paine, the participants elicited strong increases in ROM when they performed submaximal contractions throughout the contract-relax cycles.

Additionally, for this present research, the stretching exercises were performed strictly in the cool down phase of vigorous exercise. Although further study is necessary, it is believed that performing active contract-relax PNF stretching in the cool down phase of vigorous exercise, while the muscular tissue is still in a state of plasticity, will yield the greatest results in terms of ROM.

However, it should be noted that too much flexibility can be detrimental to performance. Decoster, Bernier, Lindsay, and Vailas (1999) performed a study in which they examined hypermobile lacrosse athletes and non-hypermobile lacrosse athletes across over the duration of an entire competitive season. Although no statistically significant data presented itself, they did see a higher rate of ankle joint injuries in the hypermobile athletes and a higher rate of muscle strains in the non-hypermobile athletes. These results, although not statistically significant, point to the notion that there is a fine balance between overly tight muscles resulting in strains and hypermobility resulting in joint-instability related injuries. It is necessary for more research to be done in this area to reach a solid conclusion.

Additionally, as displayed in Table 1, there was a slight difference between males and females. Although not statistically significant, the males in the PNF group did show slightly
greater increases in ROM than females in the PNF group. What is particularly interesting is the stark difference between the males’ increased overall ROM in the static group and the females’ decreased overall ROM in the static group (males = +10.66°, females = -1.66°). However, it should be noted that three of the male participants leisurely shot baskets for 10-15 minutes immediately prior to their post-trial testing. Whether this was an anomaly or not is unclear. What is clear is that more research regarding the gender differences in stretch preference is necessary.

Furthermore, tests were conducted to draw out any correlation that could be seen between the frequency of executing the prescribed stretches and an increase in ROM. As displayed in Table 2, participants who executed the prescribed stretching exercises at least four times per week showed the greatest increases in ROM. While the static stretching group displayed an average increase in ROM of 6.51° for participants who executed the stretching exercises at least four times per week, the PNF group displayed nearly double that with an average increase in ROM of 12.83° for participants who executed the stretching exercises at least four times per week. Even the participants in the PNF group who participated only 2-3 times per week showed drastic increases in ROM, displaying an average increase of 11.42°, while the participants in the static group that performed the stretching exercises only displayed an average increase of 2.01° ROM.

Furthermore, the relationship between the increases in ROM and the year of participation in sport the participant was currently in is noteworthy. As displayed in Table 3, freshmen and sophomores displayed the most significant increases in ROM. While juniors displayed less of an increase, although moderate, the seniors displayed the least increase in ROM. This could be due to the number of participants in the senior category, or it could be that juniors and seniors are much closer to reaching a maximal increase in ROM over the span of their collegiate careers.
than their underclass counterparts. Equally noteworthy was the fact that the seniors in the static stretching group displayed a greater increase in ROM than the seniors in the PNF group, which is contrary to evidence in every other category. However, an accurate explanation of this will require further research.

**Limitations**

Throughout the duration of the present study, a number of things presented themselves as being potentially unstable in regards to the methodology and procedures. The first limitation that needs to be addressed is that athletes need clear, firm instructions about the proceedings of pre- and post-testing trials. For example, three of the male participants leisurely shot baskets for 10-15 minutes prior to their post-testing trial. Although this didn’t make a *significant* difference in the outcome of the data, it certainly changed what their original degree of ROM would have been. Thus, clear communication of instruction in regards to the proceedings of pre- and post-trials is absolutely necessary in order to ensure the most accurate data is recorded.

Additionally, it would have been highly preferable to have a form of computer-mechanized measurement to record the degrees of ROM. Although the recruitment and use of a goniometer sufficed, it could not provide the most accurate recording of ROM. Additionally, a more reliable process for ensuring the angle of the hip maintains a 55° state of flexion is needed. While the use of a stiff band sufficed in recording fairly accurate data, it would have been much more preferable to have a mechanism that would ensure a constant state of both the pelvis and the hip that would enable the investigators to record very accurate data.

Finally, the ability to accurately measure 50% of the participants’ maximal contraction of the hamstring would have been beneficial. Telling the participants to elicit a 50% maximal contraction without being able to measure the force they are exerting is not precise enough.
Thus, the study is unable to support that 50% of a maximal contraction is preferable to 75% of a maximal contraction while performing sub-maximal contract-relax PNF stretching exercises.

**Conclusion**

This present study has produced evidence showing that just four weeks of submaximal PNF stretch training will have significant effects on improving ROM. While it is unclear whether a neurological sensory end point is being trained or the muscle is indeed gaining extensibility, levels of ROM have improved vastly for the participants within the experimental group of the present study. Finally, the evidence has presented a clear conclusion that submaximal contract-relax PNF stretch training is highly preferable to traditional static stretch training in regards to ROM improvements.

Introduction

Once viewed among educators as a lifelong learning process with the purpose of improving instruction, professional skills, organizational functioning, and personal growth, professional development has become somewhat synonymous with organizational development and increasingly viewed as an investment with expected returns (Sandford & McCaslin, 2004). With the current emphasis
on data-driven decision-making and accountability, teacher professional development programs are considered fundamental to improving the quality of education, and there is a great deal of literature available that focuses on; designing and implementing high-quality, comprehensive programs (Bergquist & Phillips, 1975; Gardiner, 2000; McLean, Cilliers & Van Wyk, 2008; various types and combinations of delivery systems (i.e., peer coaching, communities of practice, action research, workshops, seminar series) (Steinert, Mann, Centeno, Dolmans, Spenser, Gelula, & Prideaux, 2006); and a seemingly endless range of content related to teacher professional development including subject specific content and curricula, various instructional practices and strategies, pedagogical theories, and technological applications (Desimone, 2011, St. Cyr, 2009; Davis, 2004; Davis & Krajcik, 2005; Cummings-Hlas & Hlas, 2012; Othman & bin Dahari, 2011; Mundy, Kupczynski, Ellis, & Salgado, 2012). While there may appear to be an extensive body of research literature on professional development initiatives in higher education, there is in fact, “a paucity of research demonstrating the effectiveness of faculty development interventions” (Steinert et al, 2006, p.498).

This paper offers an appraisal of the merits and limitations of using one of the most popular models of evaluating training in education —Guskey’s (2000, 2002) Professional Development Evaluation Model (PDEM) — for evaluating a faculty professional development program at a comprehensive multi-campus community college system. While the merits and limitations have been identified based on data derived from a community college setting, they have broad implications to a wide range of higher educational institutions.

Overview of the initial research design

In 2013, a comprehensive study was conducted investigating faculty perceptions of the perceived effectiveness of the Institute for faculty Excellence (IFE), a multi-year professional development program at a large, urban, Midwestern multi-campus community college system. Implemented in the fall semester of the 2007, the IFE featured a collection of essential, research-based and readily applicable strategies, techniques, and theories to help faculty members engage and encourage students and foster student academic success. Five years later, when the comprehensive study began, approximately 600 community
college faculty members had participated in the program.

The study was designed as a single evaluative, instrumental case study in conjunction with the completion of the doctoral dissertation *A culture of excellence: Professional development as an instrument of change* (Williams-McMillan, 2013). The six research questions included the following: To what extent do the faculty participants understand and apply the training concepts? What is the frequency and extent that the faculty participants employ specific pedagogical techniques during their instruction? What impact has the [training] had on the classroom instructional practices of the participants? What is the subsequent impact of the [training] on the academic performance outcomes of students’ taught by the faculty participants? What are some benefits that participants identify related to the program? What recommendations do the participants offer for improving the program?

A mixed methods research paradigm was implemented and data was collected through the use of individual and focus group interviews with administrators and faculty from each of the seven individual campuses; surveys; classroom observations; and training evaluations submitted by participants. An in-depth analysis of various program and institutional materials was also performed. Guskey’s (2000) adaptation of Kirkpatrick’s (1994, 1996) model of program evaluation, the *Professional Development Evaluation Model* (PDEM) was used to guide the inquiry and contextualized the study’s findings in relationship to the literature. Theory-building was not intrinsic to the design of the study; however, the findings from the study provided a basis upon which to offer opinions, judgements, and recommendations for future program planning, implementation and evaluation.

**Assessing faculty professional development**

For nearly four decades, the most popular approach to evaluating business and industry training programs has been Kirkpatrick’s (1996, 2006) model, in which four levels of training outcomes were delineated: reactions, learning, behavior, and results. It has been the foundation for evaluating training in business and industry for more than four decades. Its overwhelming popularity is a result of its capacity to: simplify the complex process of evaluating training; address the evaluation process in a systematic way; provide a clear and simple guide to determining which criteria would be appropriate; formulate
relevant and specific questions; and offer a straightforward, common language for discussing objectives and outcomes (Kirkpatrick & Kirkpatrick, 2006). Furthermore, because it focuses specifically on the four categories of outcome data that are generally collected after the training has been completed, the need for pre-course measures of learning or job performance measures was greatly diminished. In effect, Kirkpatrick’s model eliminated the need to measure or account for a complex network of factors that surrounded and interacted with the training process and evaluated training effectiveness by focusing entirely on outcome measures.

Refining and adapting Kirkpatrick’s (1974) model so that it can be used to evaluate adult education programs, Thomas Guskey (2000, 2002) categorized five levels, and hierarchically arranged them in critical stages, from the simplest to more complex, each higher level building on the ones that came before. Called the Professional Development Evaluation Model (PDEM), it not only focused on reactions, learning, behavior, and results, but also considered organizational support and change. The following is a brief description of the merits and limitations of evaluating a faculty professional development program using the five stages of the PDEM.

**Merits of the PDEM in determining a professional development program’s success**

The goal of stage one is to identify the level of participant satisfaction with the training. Guskey (2000, 2002) contends that “measuring participants’ satisfaction with the experience provides information that can help improve the design and delivery of programs and activities in valid ways” (p. 4). To accomplish this, he suggests asking questions such as: “did they like it? Was their time well spent? Did the material make sense? Will it be useful? Was the leader knowledgeable and helpful? Were refreshments fresh and tasty? Was the room the right temperature? Were the chairs comfortable? He also suggests using questionnaires provided to participants immediately at the end of their training to collect this information.

Stage two determines whether or not participants acquired the intended knowledge and skills. Here documents such as the program’s registration forms, training manuals and supplemental materials, and the goals outlined in the program’s mission and/or vision statements can be used to create indicators
of successful learning. Stage three “focuses on the organizational characteristics and attributes necessary for success” (Guskey, 2000, p. 6) such as time, effort, and resources invested. At this stage, success may be determined from specific types of questions such as:

- Was the advocated change aligned with the mission? Was change at the individual level encouraged and supported at all levels? Was administration support public and overt? Were problems addressed quickly and efficiently?
- Were sufficient resources made available, including time for sharing? (Guskey, 2000, pg.6)

Not only will asking these types of questions provide extremely important insight about a program where no clear documentation of the proposed mission, vision, or goals are available, but they will also provide insight into organizational climate and knowledge at the time the program was implemented.

The goal of stage four is to determine whether or not specific strategies and techniques taught in the training are transferred to the classroom, and how frequently they are implemented. Guskey (2000, 2002) suggests using questionnaires and classroom observations to determine the extent to which the things that faculty say they were doing are indeed, what they actually do. Observations allow researchers and evaluators to gain first-hand evidence of when, how often, and for how long, the practices taught and encouraged by the training actually occur within an authentic instructional setting. To gain consistent and reliable information, a standardized instrument such as a check list, outlining the specific criteria under observation, must be used during every classroom observation.

The fifth and final stage of Guskey’s (2000, 2002) PDEM focuses on the “bottom line” in education—the impact of the program on the academic performance outcomes of students. Guskey suggests perusing academic records of the students of “trained” faculty members to determine improvements in student learning. Much of this information is readily available as most institutions gather this type of data for public papering purposes.

**Limitations of using the PDEM to determine success**

Undeniably, achieving program goals are essential, and the PDEM provides information that
Guskey (2000, 2002) contends is “sound, meaningful, and sufficiently reliable for making thoughtful and responsible decisions about professional development processes and effects” (Guskey and Sparks, 1991, p.34), but there are a number of drawbacks to relying on information gained solely through the PDEM. First, the model itself is not necessarily designed to elicit the perspectives of various stakeholder groups other than those of the program’s originators and administrators. Given the opportunity — and only when other theories and analytical techniques are incorporated into the evaluation — separate and distinct perspectives espoused by different stakeholder groups will emerge. Document and data analysis associated with the study revealed that there was no system plan to gather, analyze, or incorporate in perspectives of various stakeholders involved in the planning, implementation, and evaluation of the IFE (Williams-McMillan, 2013). Moreover, the differences in faculty status, rank, and interests were not included in the IFE design. For example, as this study revealed faculty members are not a homogenous group. Faculty may be full-time or part-time, tenured or tenure-track, and non-tenure-track. Even among tenured faculty, there may be potent differences in their professional development needs and interests. To illustrate, a newly full-time tenure-track faculty member may find professional development programs that provide opportunities to learn teaching and assessment strategies valuable. These same programs may provide opportunities for new faculty to meet and collaborate with other faculty members. A full-time tenure track faculty preparing for tenure and promotion may have very different professional development interests and needs. She or he may be more interested in professional development programs that focus on very specific pedagogical issues or that enhances research and scholarship opportunities. Full-time tenured faculty may have yet again, different professional development interests and needs, as in the case of a tenured faculty considering promotion to full professor. Typically exempt from the pressure to provide scholarship, part-time faculty may have very different professional development interests and needs altogether from their full-time faculty colleagues. Given the complexity in the array of different roles of faculty members, not to mention the differences in the stages of their careers, the PDEM may not provide an adequate means to discriminate among the multitude of individual needs and interests.

Another drawback of the PDEM is that the model assumes that faculty members have no prior
understanding of the information to be presented; that participants will learn the information at a similar rate and quantity; and that once acquiring this new information, they will eagerly implement it in its entirety in the classroom. The focus group interviews with faculty members in this study revealed a wide range of faculty pedagogical expertise and motivation. This study confirmed that the motivating factors that faculty participants consider when deciding if, and how to use their new knowledge in the classroom is consistent with the literature on conceptual change, which states;

It is not the professional development per se, but the experience of successful implementation that changes teachers’ attitudes and beliefs. . . . Change is primarily an experientially-based learning process for teachers . . . . [and] research demonstrates that experienced teachers seldom become committed to a new instructional approach or innovation until they have seen it work. (Guskey, 2002, pp. 383, 388.)

Furthermore, the model does not explore unintended consequences of training such as; how concepts, training materials and techniques included in the program might be modified and adapted by participants in ways not foreseen by curriculum designers; or how the experience of completing a program might create or transform organizational culture. One such unintended consequence revealed in the Williams-McMillan study (2013), was that the Institute of Faculty Excellence (IFE) the college’s signature professional development program was valued among full-time, tenured faculty as a rite of passage; an indispensable mechanism for orienting and socializing new and part-time faculty. As these new faculty members progressed through the program, they were exposed to, and given an opportunity to absorb and assimilate the culture and customs of the college. They learned the preferred ways of planning and delivering instruction; and experienced shorter learning curves and fewer blunders in understanding and following implicit and explicit college policies. They also formed stronger, more productive mentorships with experienced faculty members which helped them more quickly become an integral part of the college.

Lastly, using program objectives as the only indicator of program success may be result in incomplete or strongly biased information. For example, a program objective might be; by the end of the
course, participants will have a fundamental understanding of active learning; course objective and student learning outcomes development; and assessment of student learning outcomes at three levels — i.e., the individual course; the program; and at the institutional level. The data gathered from the PDEM would either prove or disprove that participants have achieved this outcome, but would not adequately take into account how faculty might manage the differences in student ability levels, learning styles, or differences in academic discipline as they attempt to implement these strategies in the classroom (Opfer & Pedder, 2011). The analysis of the focus group data associated with the study revealed that faculty members have a very complex set of understandings and expectations associated with meaningful program evaluation beyond the scope of established program objectives.

Conclusion

Professional development programs may vary widely in their content and format, but most high-quality programs share the common purpose of systematically bringing about change in the attitudes and beliefs of teachers, their instructional practices, and in the learning outcomes of their students (Guskey, 2000, 2002). To this end, there is value in using the hierarchical PDEM and the information it helps to gather in the various stages of planning, implementation, and evaluation. The resulting information would be invaluable to program designers and administrators who need to make thoughtful and responsible decisions about their program’s processes and effects. However, in order for the PDEM to be used most effectively in faculty professional development programs in higher education, the complex array of different faculty roles and the differences among faculty members related to their interests and needs, must be carefully and systematically considered.

Incorporating broader measures of success and the mechanisms needed to gather and analyze feedback from diverse stakeholder groups, including faculty participants, trainers, curricula designers, and administrators, will enable multiple and equally valid perspectives to emerge. This great diversity of perspectives would provide for a fuller, much more comprehensive understanding of the professional development experience, and degree to which it may be deemed successful. Moreover, incorporating systematic methods of gathering and analyzing both the qualitative and quantitative data associated with
the application of the professional development content in practice is an essential, yet often
underappreciated element of successful professional development. After all,

“[These] professionals are not naïve consumers of professional development, but bring
their professional identities and knowledge to bear on considering transfer” and in
particular that “teachers are professionals who use their understanding of innovations,
their classroom, and their personal goals to impact transfer from professional
development to the classroom” (Van Duzor, 2011, p. 364).

Top-Down Teaching of C++ And Other Programming Languages

Topic Area: STEM Education
Presentation Format: Paper Session

Description: This paper proposes a new way to teach students how to write computer programs. Instead of teach individual programming commands this approach follows a top-down approach. Students begin by designing the components of a program and leave the actual coding until the end of the course.

Abstract. In this paper we propose a new and top-down approach to instructing computer languages, specifically C++. Instead of learning from the basic language syntax, and moving from this to creating small insignificant programs, we start instead with a fully functioning and nontrivial software program. The instructor explains the adopted program design, and works downward from there to the individual line items of software code and syntax. Students are then challenged to understand and modify the code in order to optimize it in competition against other groups of students from the class.

I. Introduction

A frequent complaint of students taking computer language courses is that they are tedious, boring, and overly challenging [1]. Attrition in these types of courses is typically high. Many students are forced to change majors or be dropped from the program as a result of this situation [1]. We are striving to create a new instructional approach that will improve the results, and motivate students to put in more time to learning the language and becoming possibly professional software developers. This approach we are calling Top-Down Language Instruction (TDLI).

II. Current Instructional Practice

Current instructional practice for most computer languages, including C++, is to teach the language from the bottom up [2]. Starting with the most basic variable declaration and syntax, very simple programs, usually starting with the ubiquitous "Hello World" program, are gradually built up into more
sophisticated constructs, later germinating into object-oriented programming, user interface, and software engineering principles [3]. This has been common practice since the origin of high level computer languages in the 1950s [4, 5, 6, 7, 8].

Prior to high-level languages, typically no formal instruction even existed — programmers were largely self-taught and relied on trial and error experience to build simple (by today's standards) assembly language programs [9]. As a result, this practice of bottom-up instruction and learning has become deeply ensconced in the computer science and IT communities globally. It is taken as a given that you learn the low-level concepts first, and gradually build up on top of those higher-level knowledge and practice [10, 11, 12].

Surprisingly, very little innovations on this established practice have been proffered or experimented with over the last 50 years [13]. Students typically find programming language courses extremely challenging, many find them a bit tedious and boring [1], and a huge amount have probably changed majors or avoided a major with computer programming courses because of the hurdle of programming language courses [14, 15].

Students successfully completing introductory computer language courses normally are not properly equipped to comprehend or to write industry level software, and many forget what they have learned very quickly and do not come back to programming [2, 3]. They have not hit a critical mass of competence to independently create, test, and release software [16, 17, 18].

This would be analogous to learning a foreign language; the critical mass occurs when one can freely converse with individuals in the new language — that is when the payoff occurs. Otherwise the effort may have been largely wasted. For too many students learning a new computer language, this is often the case. How can we improve computer language instruction with long-overdue new ideas?
III. Proposed Instructional Practice

Overview of Approach

We propose teaching the C++ computer language using a top-down approach instead of a bottom-up approach. The keywords and syntax of the language are taught as the details of a higher level program, iteratively starting with the high-level design of the program and working downward repeatedly to the code to implement the necessary features and requirements including user interface, classes, subroutines, and functions.

As a foundation for the course, the starting point would be a largely complete and functioning non-trivial software system, created by the instructor specifically for the goals of the course. The level of sophistication of the software program can be carefully chosen based on the interest, capability level, and goals of the student body taking the course.

For example, for students with an emphasis on computer gaming, a complete computer game with source code could be presented to the class on the first day. One challenging example could be a computer chess AI program with user interface. Gradually less challenging implementations could be functioning Tetris, Suduko, checkers, blackjack, pong, or tic-tac-toe.

Detailed Description

Naturally for many students, their interest level would be increased dramatically by the possibility of working on and experimenting with a functioning game very quickly. For engineering students, simulation software typically used in their profession may be extremely useful — stress analysis for civil engineers, circuit analysis for electrical engineers, etc. Code commenting would be based on the needs of the students to understand components of lines of code for the purposes of the course.

The second step in the proposed instructional practice would be to identify, demonstrate, and explain the requirements for the game or other software including: user interface and response to input events, implementing the rules of the game (chess would require referring to the international rule book for
example), AI required, and any other obvious goals such as the ability to store scores between sessions and so forth.

Once user interface and other requirements were identified, the next step would be to delineate likely functional areas necessary in the implementation. This would be the beginning of introducing basic software design and architecture concepts that students could intuitively understand and comprehend, despite lack of software language knowledge. In the chess example, we could group functional areas into: 1. user interface, 2. rules implementation, 3. representing the board, and copies of the board, internally, 4. representing the pieces internally, 5. AI algorithm (primarily min-max) and support for scoring the next move, 5. finalizing and implementing move results.

At this point it would be possible to drill down from the major functional areas to individual subroutines and functions, starting with the simplest groupings such as responding to a button click. This would be gradually expanded to larger and more complicated routines that would be required, such as calculating the min-max algorithm move score, which demonstrates quite sophisticated recursion techniques. Note that the notion of recursion would be initially presented and discussed without the presentation of any specific programming language syntax, variables, or keywords. It would be a general pseudocode representation initially.

Given the theoretical understanding of the whole program overall architecture and design, at this point it would be possible to drill down into the innards of a single necessary simple keyword – such as how to specify a constant in C++. Generally piece values are assigned using a global constant in computer chess. After explaining this and some other low-level details, a single function could be stepped into line by line and frequently used C++ operators, declarations, and statements could be explained. To keep things as simple and straightforward as possible, a comprehensive C++ Quick Reference document, such as the one located [here], could be referred to frequently and would list the major language features. By referring to this frequently, through the use of repetition, students would more quickly memorize the most valuable aspects of the C++ language. The quick reference card/document listed above is 4 pages long and has preprocessor directives, literals examples, declarations, statement examples, common functions and
expressions, class specification details, and basic I/O syntax. Controversial issues such as pointers and utilizing memory addresses should be skipped over and strongly discouraged at this point. Ideally these would constitute optimizations that could take place later when students are encouraged to tweak and modify the code on their own.

Coursework

Iteratively in lectures, the instructor would visit various code internals throughout the program, in a gradually increasing level of complexity, and gradually decreasing level of frequency of access in program operation. Stepping through each function or subroutine line by line, instructor would explain what each line did and how it interacted with other aspects of the code. Details like preprocessor header files required by the program, instead of being covered first like they commonly are, would be covered near the end of the code presentation. Program operation, in other words, is covered first before program environmental requirements, such as access or shared libraries. Last of all, details on the specific IDE in use in compiling the source code would be discussed. As a result of this the focus would be on firstly: program design and understanding good design, C++ language features, and finally issues such as IDE manipulation, header files, and compilation.

Students as mentioned earlier have access to the complete source code and can study it both in class and at their leisure. They will need to be doing this, because they have the opportunity to modify and optimize the code, and contest against other students in a competition of sorts!

With the tremendous emphasis on project learning, group interaction, and team competitiveness in higher education degree requirements presently, rigorously implementing these qualities in a computer programming language course is a daunting prospect indeed. Since the code is already in a fully functional and debugged end product, students do not have to waste any time debugging awkward code they may have managed to write, or studying code poorly written in the first place. They already have a solid example starting point, and if any changes they make "break" the code they can quickly go back to the starting point. As a result, this increases learning efficiency: it minimizes useless time debugging, and maximizes the scrutiny and understanding of functioning code.
At a certain point in the course where a critical mass occurs where students are becoming proficient at not only understanding but modifying the code to some extent, team groups could be formed. The idea at this point is to encourage the students to understand and modify the code enough to result in certain specific improvements — in competition with the other groups in the class.

**Specific Example**

Using the example of computer chess, student groups could implement any number of the myriad of AI improvements and implementations displayed on thousands of locations on the net, and compete in a chess competition with the other groups in the class.

Whichever group's AI works the best (not to mention whichever groups program's UI or other code does not crash in the middle of a game) would be the champion, and to some extent the final course grade would be based on the competition.

The instructor would outline some of the common optimizations and improvements to AI typically made for computer chess programs, and then encourage students to pursue whichever line of program development seemed the most promising for their team. Some source code examples of some of the optimizations could be provided for their review. TA's would be enlisted to monitor outside of class informal and formal competitions leading up to the class group champion.

In combination with the grading using game challenge or competition results, we propose a new examination format where students are presented with 20 to 30 line blocks of code and are required to write coherent essays explaining from start to finish what the code does generally, and how it functions line by line. This would be referring to line number. The realistic expectation here is that as developers in the professional environment, they will never be called upon to answer multiple-choice questions regarding the C++ language, but will be frequently required to review existing code and quickly understand what it does as a whole and line by line. They will need to do this for their own benefit, but also to explain to other developers and managers what they are seeing clearly and succinctly.

**Conclusion**
We envision by the end of the class students will be more enthusiastic and fulfilled than when they started, they will be able to see the fruits of their results of studying a new computer language, and in addition to learning syntax and keywords, will also learn program architecture, object-oriented development, AI techniques and algorithms, and working in groups on software code. They will be prepared to study and modify code on their own, and hopefully by the end of the course will have spent countless hours modifying and testing operational code for the benefit of their team competition. Any code they write functions within the whole of a nontrivial program, making their experience completely realistic and not functioning in isolation.

Instead of being exposed to the language in isolation, they would be getting much more of the flavor of what it means to be a professional software developer. "Hello world" could be relegated to history as tedious and boring. In its place is what students are used to seeing: functioning software, and on the first day of class. They start from what they know already from a lifetime of interaction and work downward. Students bridge the gap from their existing knowledge base to what they do not know, instead of the other way around.

**IV. Software Examples**

Some examples of baseline software provided at the beginning of class include:

1. Pong clones
2. "2048"
3. Tetris
4. Sudoku
5. Checkers
6. Computer chess
7. An engineering application (possible optimization competition could be for speed or efficiency here)
Figure 1. Examples of programs we have used for teaching: Pong clone, "2048" clone, and computer chess. 2048 is a 2D puzzle game that is a hit with young students: http://gabrielecirulli.github.io/2048.

V. Comparison Between the Methods

Typical practice for computer language instruction works up bottom to top in the following sequence:

1. IDE installation
2. Compilers
3. Hello world (basic language syntax)
4. Functions
5. Routines
6. Classes
7. Object-oriented programming
8. Higher-level design
9. Program architecture
10. Program Requirements/UI

We propose basically reversing this process into the following sequence, and starting with the fully complete and functional source code baseline for the program in use. For the initial coverage of object-oriented programming, classes, routines, and functions — all this will be done at a theoretical level without discussing language specifics.

1. First day of class: showing the UI and discussing the requirements
2. Program architecture (explanation of how and why the architecture exists)
3. Higher-level design (discussion of trade-offs of different design possibilities)
4. Object-oriented programming (the complete set of classes already exists and is discussed)
5. Classes (implementation details)
6. Routines (the benefit here is that the routines already are working can be studied)
7. Functions (the line by line commenting informs the student what they need to know)
8. Basic language features and syntax (presented in order of frequency and importance)
9. IDE issues/compilation (typically, weeks are lost while students struggle to set up their IDE. This persistent problem is put off here until last.)

For the presentation of basic language features and syntax, we propose the following presentation, delivered initially in a single carefully prepared lecture (basically summarizing the reference card in use):

1. Description of variable types
2. Variable declarations, including arrays
3. Mathematical and other operators
4. Decision statements including if/then and select case
5. Looping structures including do and for-next loops
6. Explanation of functions and subroutines
7. User defined type structures
8. Classes: theory/declaration/initiation/manipulation/termination
9. Calling APIs and other code not within the program

One of the purposes of covering virtually the entire language in a single lecture is to clearly demonstrate to students learning a programming language may not have been as difficult as they thought, as long as they do not get bogged down with confusing details and too many examples, over too long of a time period. Since repetition is one of the most effective forms of boosting retention, students can review the lecture in a recorded video frequently over the semester. That way they will get multiple exposures to each of the major concepts, in a single place.
VI. Advantages and Disadvantages

Both the traditional and proposed methods have advantages and disadvantages. It is our belief that for a vast majority of students the proposed method is better. We do outline the advantages and disadvantages of both methods based upon the literature and our personal experiences.

Advantages

Proposed Method

- IDE issues are put off until later in the class, saving students time and improving their learning efficiency.
- Students are presented with a large body of functioning code on the first day of class that they can study.
- Groups, and group teamwork are encouraged.
- Enthusiasm is increased by having the opportunity to work on functioning game or engineering code.
- After the class is over students can continue to study, modify, and improve the code.
- The software program utilized can be chosen to coincide closely with the students major or emphasis of study.
- The programming language in use in the class can be more easily swapped out. For example Java could be substituted for C++ at the lowest level, most of the concepts remain the same at higher levels.
- The study of the course more closely resembles what professional software developers do in industry.
- The questionable practice of forcing students to spend hours tediously debugging poorly written textbook source code is dispensed with.
- The investigation of optimizations outside of class is strongly encouraged, for example students of superior ability and interest can spend more time researching chess AI optimizations, with the results that it will directly improve their grade and competition results.
- This approach may obviate the need for expensive textbooks.
- Greater enthusiasm should be generated compared to that from Hello World, or cat and dog OO classes.

Traditional Method

- Less motivated students may be more amenable to this method as it builds up in very small steps. This is as opposed to forcing the student to take an active role and initiative in their learning.

Disadvantages

Proposed Method

- It is a requirement upon the instructor to complete the necessary source code, and to fully understand it, prior to the first day of class. For non-trivial application, such as that of computer
chess, this is a large time requirement.

- Significant outside of class faculty supervision may be required, such as that for informal and formal chess challenge competitions.
- Students will need much more individualized group support and guidance in this approach.
- Ideally this approach will work well with more motivated and high capability students, compared to less capable are well-motivated individuals.

**Traditional Method**

- Traditional methods have students struggling with IDE installation issues that may last for weeks right at the beginning of class, hampering their learning process.
- Very little group interaction or learning takes place using this method [19].
- Highly motivated and capable students may be insufficiently challenged and become bored through the class, as they are dragged down by slower moving students.
- Real-world programming of functional applications is normally not studied at all — the largest and most sophisticated program may be less than 50 or lines of code through the entire semester.
- Program design and architecture is insufficiently studied.
- Students must bridge the gap from what they do know (working software) to what they do not know (language syntax) and close the gap from outside in — resulting in a larger mental hurdle.
- Students spend far too much time trying to write code they do not yet even understand, and debugging poorly written code examples both from the textbook and what they have written themselves. Countless hours are wasted.
- Exams are unrealistic from programming practice — students will never be required to answer multiple-choice questions on software code in industry.
- Switching to a different programming language becomes difficult or impossible learning from the bottom up — just the opposite is true from the top down, only the syntax is swapped out at the bottom.

**VII. Additional Practices**

We propose the adoption of several additional practices in introductory C++ programming language courses. Pointers should be avoided, except as independent student optimizations. Carefully timed repetitions at intervals would be performed: most frequently utilized syntax should be revisited frequently throughout the course lectures. Each repetition in turn increases the likelihood students will remember it weeks, months, and years into the future. Frequency can be calculated based on statistical studies of existing software source code bodies, items like variable declaration and select case statements will score much higher than obscure functions such as mapping from string to integer. If professional software developers are using it frequently, it should be taught, otherwise it should be left to students to learn on
their own if necessary. Students should also be presented with basic testing practices so that they can test their builds as a group prior to their software being used in competition.

As mentioned earlier, a new format for periodic examinations would be for essay questions. Students will be presented with a routine of 20 to 30 lines, and would explain what it does, how each line functions, and what the output or result would be.

Each semester, preliminary software source code body could be improved based on what was learned in the previous session. The best student group optimizations, the winner of the last competition, could be maintained as a benchmark for the new group champion to play against to try and beat the "all-time high score".

Students could be required to contribute to a software wiki that discusses lessons learned — this wiki would expand gradually session to session with a corpus of information based on students learning and problem-solving experiences. Students from prior sessions could return as mentors or TA's, and would be well-versed on the internals of the software, to help improve on the team's optimizations and competition results. Eventually interschool or intersection competitions could be envisioned.

VIII. Conclusion

In this paper we have presented a novel approach to teaching introductory C++ computer language courses, that can also be utilized for teaching other language courses in a more challenging and rewarding fashion. However, in this approach much more work would be incumbent on the instructor in writing the preliminary software and understanding it extremely well. At the same time students would be greatly challenged to spend out of class hours modifying the software and working with their team group, as well as testing out their software and competing with other groups to see which team can add the most functionality. We envision that this top-down approach will be a better fit for young students based on their previous experiences of using working software, than from previous generations of programmers that work from the bottom up using assembly language code or other low language code.
In previous times functioning software programs were of a much smaller size and sometimes could be written in a matter of weeks. As a result studying computer languages from the bottom up sufficed. Programs today, specifically computer games, are magnitudes more complex and focus more on the user interface than on the low-level code [20, 21]. Teaching from the top down the language is a better fit we feel in this regard.

**IX. Future Research**

We plan to implement this approach in an introductory C++ programming course with students of moderate capability and enthusiasm. Student results and feedback will be investigated and statistics compiled. We will try to gauge the difference between top-performing groups for versus low performing groups, and how much each learned respectively. Students’ enthusiasm for programming careers in the future will be gauged, based on the course design that they were involved in. As a result of this information, we hope to derive information that will not only improve our proposed approach, but demonstrate conclusively that teaching computer languages in the future will be much different than how it has been for the past 50 or more years.

Electromyographic Analysis of the Upper Trapezius, Pectoralis Major, and Latissimus Dorsi During Shoulder Exercise

Kinesiology and Leisure Science

Paper Sessions: This presentation will include literature review on the topic of EMG, Postural Restoration Institute methods, and the findings of the current study. Some examples will be given for the audience and future possible research discussed.

Abstract

The purpose of this study was to determine if postural restoration exercises effects shoulder range of motion and position through an increase in maximal electromyographic (EMG) activity through electromyographic analysis. The human body is not symmetrical. The Postural Restoration Institute state that posture is a reflection of the position our body through the many systems it regulates. Due to this, limited functional patterns are created faulting our ability to either breathe, rotate, or rest in a symmetrical state. These limited functional patterns refer to a restriction of movement in certain directions or normal functional range. METHODS: 4 adolescent males (19.425 ± 0.2) years attending the university participated in this study. Maximal EMG testing was completed. Maximum Voluntary Isometric Contraction (MVIC) was used to determine a standardized method for muscle strength. MVIC and maximum EMG data were collected from 3 muscles; upper trapezius pectoralis major and latissimus dorsi. Maximum EMG analysis was recorded with subjects sitting in a chair with the right arm placed at 90 degrees of humeral abduction; and the elbow placed at 0 degrees of horizontal abduction, externally rotating the humerus to 90 degrees. Three trials were given to each subject. After the initial test, the postural restoration corrective exercise; 90/90 hip bridge with ball and balloon was given. The exercise was chosen to enhance both posture and stability in order to improve function and/or decrease pain. 5 sets of 5 breathes (maximal inhalation, and exhalation) were given to each subject. 3 final trials were given to each subject to determine if maximum EMG activity has increased. RESULTS: A change in Maximum EMG activity will be measured with paired sample t test. There was an increase in EMG activity post postural restoration corrective exercises for each of the three muscles, with the Upper Trapezius increasing to statistical significance. Maximum Upper Trapezius EMG (pre = 713.598 ± 206.435mV; post = 1339.750 ±
ELECTROMYOGRAPHIC ANALYSIS OF THE UPPER TRAPEZIUS, PECTORALIS MAJOR, AND LATISSIMUS DORSI DURING SHOULDER EXERCISE

84.240mV; \( t(3) = 4.308, p = .023 \). Maximum Pectoralis Major EMG (pre = 227.5350 ± 12.21800mV; post = 299.9900 ± 51.78800mV; \( t(3) = 2.264, p = .109 \)). Maximum Latissimus Dorsi EMG (pre = 207.1936 ± 300.40960mV; post = 249.4150 ± 241.59600mV; \( t(3) = 1.436, p = .247 \)).

CONCLUSION: Due to the natural asymmetry in our body, over dominance can occur. Reciprocal function is needed to maintain balance throughout the entirety of the body. The results of maximal EMG activity increase may be the cause of reduced system unilateral overuse and increase in balance needed to maintain proper muscle contraction.

**Literature Review**

**Introduction**

The human body is not symmetrical. The Postural Restoration Institute and Ron Hruska (2015) state that posture is often a reflection of position through the many systems our body regulates. Limited functional patterns are created through our ability and inability to either breathe, rotate, or rest in a symmetrical state. These limited functional patterns refer to a restriction of movement in directions or certain normal functional range. Polyarticular chains make up the structures of our asymmetrical patterns in our body. Francoise Mezieres (2015) describes polyarticular chains as a chain group of overlapping muscles running in the same direction with no break in their continuous structure that are dependent on their function. Over dominance can cause one side of the body to develop system unilateral overuse. Reciprocal function is needed to maintain balance throughout the entirety of the body.

**Asymmetry in the body**

There are two normal patterns of asymmetry in the human body. The left Anterior Interior Chain (AIC) which consists of the diaphragm, iliacus, psoas, tensor fasciae latae (TFL), vastus lateralis, and bicep femoris. The right brachial chain (BC) pattern is consisted of the
ELECTROMYOGRAPHIC ANALYSIS OF THE UPPER TRAPEZIUS, PECTORALIS MAJOR, AND LATISSIMUS DORSI DURING SHOULDER EXERCISE

sternocleidomastoid, scalenes, sibson’s fascia, deltoïd-pectoral, anterior-lateral intercostals, triangularis sterni, and diaphragm (2011). These two patterns orient the pelvis to position the lumbar spine and the diaphragm toward the right side while the thorax and rib cage sitting above the diaphragm rotates to the left. The left AIC pattern is the dominant lower body pattern that is driven by an overactive left psoas and iliacus, right hemidiaphragm, left (TFL) and vastus lateralis, right biceps femoris and adductors. In the upper body, the right BC is the dominant pattern of the two that consists of an overactive right hemidiaphragm, left pectoralis, right triangularis sterni, and right abdominal obliques. Our anatomical structure causes an occurrence of dominance in these chains promoting dysfunction in our body (2005).

The Role of the Trapezius

The trapezius consists of three types of fibers; upper, middle, and lower. The upper fibers which originate from the spinous processes of C1-C7, the occipital protuberance, the superior nuchal line of the occipital bone, and the ligamentum nuchae. The fibers then attach and insert into the posterior border of the lateral third of the clavicle. The middle fibers; originate from the spinous processes of C7-T3 and insert medially into the acromion and posterior border of the scapula. The lower fibers originate from the T4-T12 and insert upward and laterally towards the scapula, and also insert medially at the end of the spine. Functions of the trapezius include upward rotation and elevation of the scapula for the upper fibers, adduction (retraction) of the scapula for the middle fibers, and upward rotation and depression of the scapula for the lower fibers (Paine & Voight, 1993).

The Role of the Pectoralis Major

The pectoralis major consists of two heads; the clavicular head, and the sternal head. The origin of the clavicular head starts from the anterior surface of the clavicle, and inserts into the
lateral bicipital groove of the humerus the anterior surface of the sternum. The sternal head of the pectoralis major originates at the upper costal cartilages and the aponeurosis of the external oblique, while inserting in the crest of the greater tubercle of the humerus. The clavicular head flexes the arm at the glenohumeral joint. The sternal head extends the arm at the glenohumeral joint from a state of flexion. When both heads work together, they medially rotate the shoulder, and adduct the arm at the glenohumeral joint (Brown, Niehues, Harrah, Yavorsky, & Hirshman, 1988).

The Role of the Latissimus Dorsi

There are five places the latissimus dorsi originates; spinous processes of T7-L5 vertebrae, iliac crest of the sacrum, thoracolumbar fascia, inferior angle of the scapula, and the lower three ribs. They all insert at the floor of the bicipital groove of the humerus. Brown (1988) state that the latissimus dorsi it is responsible for extension, adduction, and horizontal adduction of the shoulder, flexion from a position of extension, and internal rotation of the glenohumeral joint. It is also plays a part in extending and laterally flexing the lumbar spine.

Muscle Patterns Affecting Posture and Position

In the left AIC and right BC pattern, the ribs move on the right side during an exhaled state of internal rotation (IR) which then creates a right posterior thoracic rib hump. At the same time the ribs on the left side go into a state of inhaled external rotation (ER) which creates a left anterior rib flare. Due to the downward position of the right anterior ribs, and the exhaled state of the right side, the right transverse abdominus (TA) shortens (2011). The left upper trunk rotation shortens the right internal obliques (IO). Due to the superior attachment, the right IO is moving closer to the inferior attachment on the right oriented pelvis. The upward position of the left anterior ribs and the inhaled state of the left side, the left TA lengthens. Because of the left upper...
trunk rotation lengthening the left IO the superior attachment of the left IO is moving further away from the inferior attachment on the right oriented pelvis (2005)

**Zone of Apposition**

The left AIC and right BC patterns represent dysfunctional polyarticular chains lacking muscle cohesion causing over dominance in our anatomical structure. In order to achieve proper positioning of these polyarticular chains, rehabilitation of better positioned Zone of Apposition (ZOA) should occur first. The Zone of Apposition (ZOA) described by Boyle (2010); is the area of the diaphragm that surrounds the cylindrical area of the diaphragm (the dome) which then relates to inner portion directly apposed to the inner aspect of the lower rib cage. The ZOA has a high importance as it is controlled by abdominal muscles and directs diaphragmatic tension. A decrease in ZOA causes negative consequences which include inefficient respiration (there is less air in and out) and diminished activation of the transverse abdominus. Due to a smaller ZOA, the transdiaphragmatic pressure is reduced causing less inspiration of the diaphragm on the rib cage (2015). Optimizing the Zone of Apposition should allow for reciprocal pelvic and thoracic activity during gait with a balance of respiratory activity to minimize the negative influences to achieve postural restoration. Restoring the ZOA will support a right-oriented spinal position and a torso that rotates to the left. This will orient the pelvis, spine, and diaphragm back towards the left, while establishing the left acetabular-femoral (AF)/femoral-acetabular internal rotation (FA-IR) strength (2015).

**Left Anterior Interior Chain**

With the pelvis orienting the position of the lumbar spine and the diaphragm towards the right, the upper thorax and rib cage are countering to the left, while the thoracic spine still remains oriented to the right of the midline in the transverse plane (Hruska, 1998). The thorax
will continue to rotate to left with the scapula rotating into internal rotation on the right and external rotation on the left. In this current state, the right lower trapezius lengthens as the right scapula continues to move into internal rotation and moves away from the spine. At the same time, the left low trapezius shortens as the scapula continues to rotate externally towards the spine. With the spinal attachment shorter on the left side, this continually feeds the pattern of the left AIC turning the spinal orientation to the right (2015).

**Right Brachial Chain**

The upper thorax and rib cage above the diaphragm rotate back towards the left, while the ribs on the right side are being rotated back into an exhaled state of internal rotation. This can also lead to an overactive scalene, as the muscles in the neck attempt to overcome airflow restriction on the right side (2015). The scalenes then pull the right upper ribs into external rotation, which will then lead the ribs into an elevated state, lengthening the anterior attachments of the upper right part of the serratus anterior. The lower part of the ribs remain in exhalation (IR) lengthening the anterior attachments of the lower part of the right serratus anterior. The restricted thorax oriented to the right rotates the scapula internally, with the medial border of the right scapula moving posteriorly. The scapular attachment of the right serratus anterior causes both the scapula and serratus to be challenged functionally (2015).

**Repositioning and Muscular Activation**

It is essential that muscle facilitation and inhibition occur in a consistent pattern. Boyle (2010) states that activation should occur in the sagittal plane first, frontal plane second, and traverse plane last. The sagittal plane takes priority because the pelvis and the thorax need to be repositioned first. Subjects need to have a balanced ratio of flexion to extension. Next, the frontal plane will allow for optimal
ELECTROMYOGRAPHIC ANALYSIS OF THE UPPER TRAPEZIUS, PECTORALIS MAJOR, AND LATISSIMUS DORSI DURING SHOULDER EXERCISE

joint centration and abduction/adduction control. Finally, the transverse plane will allow for movement through tri-planar movements. Moving from sagittal to frontal to transverse will allow the brain to establish motor control in safer ranges before moving to something complex.

**Measurement Tools**

Electromyographic analysis is a method used for evaluating and recording the electrical activity of skeletal muscles in response to a nerve stimulus. Electrical activity is recorded by a needle of an electrode inserted into the muscle and connected to an electromyograph. The activity produced by the muscle is known as an electromyogram. Reinold (2004) states that an EMG can detect if a specific muscle is responding properly to the stimulus provided by the EMG or whether the muscle remains dormant when stimulated. An understanding of muscle interrelationship during shoulder activity has helped develop preventative corrective exercises and rehabilitation protocols. Comparing normal EMG analysis to a pathological state of analysis could suggest new ideas to pathomechanics of the body. Bradley & Tibone (1991) suggest that integrating EMG and motion analysis will also help propose new treatment and rehabilitation plans (Bradley & Tibone, 1991).

**Research Question:** Determine if posture effects shoulder range of motion and position through electromyographic analysis through postural restoration exercises.

**Null Hypothesis:** Postural Restoration corrective exercises will not improve shoulder range of motion and position of glenohumeral external rotation through electromyographic analysis.

**Alternate Hypothesis:** Postural Restoration corrective exercises will improve shoulder range of motion and position of glenohumeral external rotation through electromyographic analysis.

**Objectives:** Assess subjects through glenohumeral external rotation tests through electromyographic analysis. Based on subject’s current state of range of motion and position,
Postural Restoration corrective exercises will be given in order to achieve full range of motion and proper position. A run through of all the tests will be given at the end of the assessment to compare the before and after measurements of each client.

Methods

Study Participants

Four healthy university male students volunteered to participate in the experiment. All were assigned to the same procedure. In this study, informed consent was obtained from all participants. The average age for each participant ranged from 19.425 ± 0.2, showing that each participant was in the stage of pre-adolescence. The standard deviation ranged from 1.436 to 4.308 (Table 1).

Testing

Participants started with 0 degrees of humeral abduction and 90 degrees of horizontal abduction of the arm. Electrodes are placed on the upper trapezius, pectoralis major, and latissimus dorsi. The participants rotated the arm to 90 degrees of external rotation. Three initial tests are given to measure the electromyography of the muscles. Participants are then given a Postural Restoration corrective exercise known as the 90-90 hip lift to ensure optimal respiratory and postural function. Three final tests runs were given to see if changes in maximum EMG activity had increased.

Statistical Analysis

Statistics were run using SPSS software, version 23. A paired sample \( t \) test was used to determine an increase in Pre-Testing and Post Testing EMG Analysis. Statistical significance was tested at \( \alpha = .05 \).

Results
A change in Maximum EMG activity will be measured with paired sample $t$ test. There was an increase in EMG activity post postural restoration corrective exercises for each of the three muscles, with the Upper Trapezius increasing to statistical significance. Maximum Upper Trapezius EMG, Maximum Pectoralis Major EMG, Maximum Latissimus Dorsi EMG mean were reported Pre-Testing and Post-Testing respectively (Table 1).

**Discussion**

Cook (2010) proposes that the musculoskeletal system will migrate toward the least resistant patterns of movement in response to either pain or muscle imbalance. Hruska (1997) also explains the prevalence of altered movement in individuals is due to faulty breathing mechanics. Hruska (1997) states that the existence of thoracic dominant breathing results in hypertonicity of the muscles associated with breathing. This leads the diaphragm in a restricted state to return to its full optimal respiratory resting position. Hruska (1997) also states that due to the faulty diaphragmatic position, it challenges motor patterns that control trunk stability, causing imbalance and eventually having a negative effect on body mechanics. Normal movement can be achieved through a balance of mobility and stability. Changes in trunk stability could lead to dysfunction. This was found in the pre-testing of EMG analysis on each subject.

The use of the 90-90 hip lift targets a variety of patient population, however there is little data published on the effects of the exercise. O’Sullivan (2002) reports that the need for lumbar-
pelvic stability come with proper integration of the diaphragm, deep abdominal muscles and pelvic floor. There is lacking evidence that shows the need for these in order to obtain pelvic stability. The 90-90 Hip lift is an example of an exercise that is useful for integrating co-activation of the deep abdominal muscles, diaphragm, and pelvic floor during neuromuscular training. Post-Testing results showed an increase in all three muscles. Curvature and length of the diaphragm, and the size of ZOA will influence efficiency and power. Upper trapezius showed an increase due to the influence of ZOA size. A decrease in Transdiaphragmatic breathing has consequences such as; postural stability and optimal respiration. Roussel (2007) showed that individuals who had low back dysfunction demonstrated faulty breathing mechanics during movements where the deep abdominal muscles were challenged.

Lando (1999) conducted a study of 25 subjects with chronic obstructive pulmonary disease to investigate surgical influence of lung volume reduction during breathing. Lando (1999) reported that the subject’s ZOA increased after surgery which will result in better breathing capacity. The 90-90 hip lift is an exercise intended to assist patients in obtaining optimal respiratory function (diaphragmatic breathing (ZOA) and posture (lumbo-pelvic stability)). However Postural Restoration and the 90-90 hip lift has not been studied or tested.

Limitations

Firstly, reliability of the 90-90 hip lift was examined in a study, but further studies have yet to be done. The 90-90 hip lift has been observed by Boyle (2010), the evaluation method remains to be examined. Secondly, all subjects were examined by the same observer, which could potentially lead to biased data scoring. Lastly, the position of the subjects during the 90-90 hip lift could have affected the outcome.

Conclusion
Due to the natural asymmetry in our body, over dominance can occur. Reciprocal function is needed to maintain balance throughout the entirety of the body. The results of maximal EMG activity increase may be the cause of reduced system unilateral overuse and increase in balance needed to maintain proper muscle contraction.

ELECTROMYOGRAPHIC ANALYSIS OF THE UPPER TRAPEZIUS, PECTORALIS MAJOR, AND LATISSIMUS DORSI DURING SHOULDER EXERCISE

Abstract
This study set out to examine the influence of Industrial Design-themed English for Specific Purposes (ESP) instructional materials on the classroom engagement of Japanese engineering students learning English as a Foreign Language (EFL). It examined both general attitudes towards class content and engagement in a particular design activity. Data were collected via an open-ended item questionnaire administered in the final week of the semester, and a post-activity Flow State Scale. Results indicated an overall positive endorsement of learning of English through industrial design-themed instructional materials due the interest and enjoyment the content invoked, and the positive experience of designing and sharing original designs. The short Flow State Scale was positively endorsed overall with results indicating that the autotelic, time transformation, task concentration, and goal orientation characteristics of the design tasks within the materials contributed to a state of flow in the EFL classroom.

1. Introduction

One of the greatest challenges facing foreign language educators is the production or selection of instructional materials that engage learners. For most instructors, instructional material selection is an intuitive endeavor, informed by both their past experiences and the inferred characteristics or needs of a particular cohort of learners (Spratt, 1999). Selection of instructional materials is of particular importance to foreign language learning as such materials have been demonstrated to have both motivational and demotivational influences on learners in the classroom. In particular, studies have shown Foreign Language Learning (FLL) motivation to be hampered by materials that are perceived to be poorly designed, inappropriate, or uninteresting (Arai, 2004; Falout & Maruyama, 2004; Falout, Elwood & Hood, 2009; Hamada & Kito, 2008; Ikeno, 2002; Kojima, 2004; Tsuchiya 2006). In contrast, instructional materials that are carefully designed, contain relatable or unique content, have a degree of perceived learner control and personalization, and clearly outline goals and processes have been shown to encourage learner engagement (Davies, 2006; Hart, 2002; Stott, 2004).

Language learning materials have also been demonstrated to contribute to particularly high states of engagement and satisfaction in the FLL classroom. Drawing on Bloom’s (1982) concept of Peak Experiences where learning experiences contribute to a state of high affective and cognitive fulfilment, Matsumoto (2007) revealed that particular types of authentic materials contributed to states of peak learning in tertiary foreign language classes. Similarly, instructional materials have also been demonstrated to contribute to a state of “flow” in learners.
Flow has been described as “the way people describe their state of mind when consciousness is harmoniously ordered, and they want to pursue whatever they are doing for its own sake” (Csikszentmihalyi, 1991 p. 6). Such moments generally occur whilst an individual is engaged in artistic, athletic or spiritual pursuits, but are also evident in peak language learning experiences (Egbert, 2003; Schmitt & Savage, 1992, Schmidt, Boraie & Kassabgy, 1996), particularly when attention is paid to content which is of particular interest to learners (Grabe & Stoller, 1997). In learning, flow has been described as the highest state of intrinsic motivation, achieved only when a number of factors dynamically align (Ceja & Navarro, 2009). Due to its elusive and transitory nature, flow is difficult to maintain and cannot be expected to be a permanent state in class (Brophy, 2004). Rather, it is something that should be aspired toward through attention to learners’ goals, interests, learning needs, and through giving learners control over activities (Egbert, 2003).

Drawing on this past research linking instructional materials with motivation, peak learning, and flow states, this study set out to examine how an Industrial Design-themed ESP class would be received by Japanese engineering students learning EFL. This is a population of learners that has been identified as being reluctant toward EFL learning (Nishizawa, Yoshioka, & Fukada, 2009), and a new curricular approach was viewed as one possible means to promote positive attitudes towards learning English and encourage classroom engagement. Industrial design was chosen for class content as it is a subject which underlies the practical commercial output component of engineering and the hands-on nature of design was thought to align well with engineering students’ leaning styles and preferences (Ehrman, 1996).

2. Methods

2.1 Participants

The participants in this study were all sophomores at an engineering university in Northern Japan. There were a total of 47 (N=47) participants of which 36 (N=36) were architecture and civil engineering majors, and 16 (N=16) were information technology, systems engineering, and computational intelligence majors. The two groups were enrolled in separate General English classes, a four-skill elective English class offered as part of the foreign language breadth requirements within the engineering program at their university. The proficiency level of the participants ranged from high beginner to intermediate.

2.2 Data collection and analysis
Data were collected via a Class Evaluation Questionnaire and the Short FLOW State Scale (SFSS) (Jackson, 2009). The purpose of the Class Evaluation Questionnaire was to gather student’s over impressions of the class and its specific units. It included open-ended items asking students their overall impression of the course, which units they liked and disliked and why, and solicited suggestions for design themes students though might be of interest to future class participants. The questionnaire also asked students to nominate their five most preferred, and least preferred, design units, and provide explanations where possible. The Class Evaluation Questionnaire was administered in the fifteenth and final week of the semester and took participants approximately 15 minutes to complete. Data collected from the questionnaire was recorded and open-ended items were coded and analyzed using two-step content analysis to establish broad initial themes then more refined response categories.

The SFSS consisted of nine Likert scale items measuring dimensions of flow after a specific activity. Specifically, the nine items measured: challenge and skill balance, merging of action and awareness, clarity of goals, unambiguity of feedback, concentration on the task at hand, sense of control, loss of self-consciousness, transformation of time, and autotelic experience. The SFSS was completed in the tenth week of the semester following the final portion of the class where students developed their own original designs and shared them with their classmates. As this is an instrument measuring flow state at a specific time, as opposed to more general dispositional measures, its focus was on information pertaining to participants’ flow state at the particular time they took part in a particular design activity.

2.3 Class procedure and design

The Industrial Design-themed ESP class was taught over a fifteen-week period. Each class followed a similar procedure developed around a distinct industrial design theme. Classes began with a schema setting general warm-up activity to activate prior knowledge of the topic, and then proceeded to a “Thinking about design” warm-up activity in which students could consider some general characteristics of design related to that week’s theme. This was followed by technical vocabulary activities to familiarize learners with words necessary to understand a subsequent mini lecture on that week’s design theme. The lecture was followed by comprehension questions, expansion activities, and additional technical vocabulary work with diagrams to provide learners with the lexicon necessary to describe related products within the genre of design being explored. Classes culminated with a design task in which students were provided time to sketch and label an original design which they later described in English to classmates in pairs or small groups.
3. Results

Responses from the first item of the Class Evaluation Questionnaire indicated that learners endorsed the class positively overall. A total of 63 comments were collected from participants of which 88.8% (n=56) were categorized as positive and 11.1% (n=7) were mixed. No expressly negative responses were provided by participants. Across academic major, architecture and civil engineering major comments were 80.6% (n=25) positive and 19.3% (n=6) mixed, while information technology, systems engineering, and computational intelligence majors’ comments were 96.8% (n=31) positive, and 3.1% (n=1) mixed.

The three most frequently cited reasons for positive endorsement of the class across both cohorts of learners was the overall enjoyment students experienced, the design task associated with each lesson, and the over interest the class generated (see Table 1 and Table 2). Examples of these responses came from one student who responded, “I enjoyed every time, it
was different from any English class I have ever taken, for me, English is interesting now” (Student K4). An additional student explained, “it was enjoyable to design on your own, I learned about many new designs, I’m glad I took this class” (Student K9). Also highly endorsed were learning about design and learning English through design content. An example of this type of response was “studying English through learning about design was really interesting. I liked learning about designs and making my own designs” (Student J12). The most frequent type of mixed responses came from students who thought that the class was somewhat difficult, but also positive in particular ways. For example, one students commented “I thought it was hard at the beginning, but even if I wasn’t really interested in a topic, I enjoyed designing and learned a lot of new things, it was interesting” (Student J3). Another student similarly thought it was difficult but enjoyed designing and sharing designs with others, “I enjoyed thinking about my own designs, but it was difficult, then I enjoyed seeing other students’ designs” (Student K13).

Figure 1: Overall preferences across design theme units

Overall preferences of units shared both similarities and differences across majors (See Figure 1). The top 5 preferred unit topic for architecture and civil engineering students
were units 6 (snack design), 10 (character design), 3 (robot design), 5 (recycled homes), and 8 (tower design), while for information technology, systems engineering, and computational intelligence majors the most preferred topic were: 5 (recycled homes), 3 (robot design), 9 (vending machine design), 7 (cell phone design), and 10 (character design). The findings indicate that two of five units were directly related to the civil engineering / architecture major, while three out of five information technology preferences were related to their major.

Results of the Short Flow State Scale were quite similar across majors. The overall mean for all combined items for the architecture and civil engineering group was 3.9 (m=3.9), and the top four endorsed items were time transformation (item 8) (m=4.51, SD=0.80), autotelic experience (item 9) (m=4.37, SD=0.92), loss of self-consciousness (item 7) (m=4.07, SD=1.03), and task concentration (item 5) (m=4.03, SD=0.85). The overall mean for the IT, systems engineering and computational intelligence class was 4.03 (m=4.03) with the four most highly endorsed items being time transformation (item 8) (m=4.86, SD=0.35), autotelic experience (item 9) (m=4.73, SD=0.45), task concentration (item 5) (m=4.66, SD=1.33), and goal clarity (m=4.06, SD=0.72).

Figure 1: Results of the S-FSS

4. Discussion

Recent research conducted by the author (Johnson 2012, 2013, 2014, 2015), and others (Gilmore, 2004, 2007; Guariento & Morley, 2001; Henry, 2007; Jarvis & Szymczyk, 2009) have indicated that learners respond to different instructional materials in distinct ways. Results of this particular study are encouraging as they seem to indicate a number of positive outcomes can be associated with the instructional materials examined, in particular industrial design-themed ESP materials, and their use with Japanese engineering students learning EFL.
The overall positive reception of the materials in terms of appealing to student interests and preferred learning styles is encouraging. These positive attitudes were reflected in comments by such as “It was my first time to learn about design in class, I enjoyed making my own designs each week, I enjoyed every week” (Student J14), and “it was very good thinking and designing while learning English” (Student K28). These comments reflect the importance of new or novel content as a means of stimulating interest and promoting positive attitudes towards learning (see Stott, 2004). In terms of learning style preference, student responses elucidated the power of design in promoting English learning, as one student commented, “more than a power point or lecture, through design I could get a feeling for English” (Student K3). Engineering students have been demonstrated to be more actively-oriented learners and to have more kinesthetic-oriented learning styles (Ehrman, 1996), and as such, appear to have embraced these characteristics of the design class. Students also commented that they enjoyed using their own ideas in creating their own designs. This aspect of the materials provided learners an element of control over the lesson content, something that has been further demonstrated to promote engagement (Egbert, 2003; Hart, 2002).

The strong positive endorsement of the S-FSS scale items indicated that the design task measured promoted a state of flow in the classroom. The particularly high endorsement of time transformation, autotelic experience, and loss of self-consciousness indicated that the students found the task both absorbing and intrinsically rewarding. Data collected from the open-ended items of the Class Evaluation Questionnaire support the notion that positive attitudes towards the design content and the nature of the design tasks themselves likely contributed to the high levels of affective and cognitive engagement demonstrated in the S-FSS results. In order for activities to promote a state of flow they must achieve a skill and challenge balance where the individual feels they are optimally challenged (Csikszentmihalyi, 1991). Activities that are either exceedingly difficult, or too easy, fail to meet the optimal challenge condition. In the two classes examined in this study there was a range of proficiency levels, and some student stated that they found class perfectly challenging, while other stated it was too difficult. Finding an optimum proficiency level and task difficulty balance in mixed level classes is certainly difficult. However, instructors who are aware of this condition and the characteristics of their particular learners should strive to challenge learners appropriately to promote flow experiences in the language learning classroom.

5. Conclusion
The goal of this study was to examine the potential utility of industrial design ESP instructional materials on the EFL learning motivation and attitudes of Japanese engineering students. The overall positive endorsement of the class, and positive results of the S-FSS following a design task, indicate that the class design and content appealed cognitively and affectively to the target population of learners. Examination of a wider array of themes within the suite of materials, as well as other engineering majors’ engagement, is necessary to validate and expand upon the preliminary results reported here. It is hoped that this research will ultimately promote the development of Japanese engineers who are more globally-oriented and who positively embrace English as an engaging and necessary tool for their careers.

Agglomeration and inequality of educational outcomes:

an initial investigation

Carlos X. Lastra-Anadón

Harvard University

0. Abstract

Is the distribution of the population across space related with the quality of the delivery of government services? In this paper, I explore the hypothesis that the density of the population in a geographic space has an effect on the inequality of school outcomes and find a robust positive relation. By looking at within-commuter zone inequality, I find that denser commuter zones have greater levels of between-district inequality. There are driven by much smaller positive effects of density at districts at low proficiency levels, compared to high proficiency districts. This is consistent with a separating equilibrium where agglomeration allows certain parental groups to benefit more than others. I hypothesize and find support for a mechanism that potentially contributes to this relation: different perceptions and increased pressure for reform from citizens about schools in denser areas.

I am grateful to Fundación Ramón Areces and the Tobin Project for support in this project and to audiences at Harvard, the Tobin Project, the Association of Public Policy and Management Fall conference and the Hawaii International Conference on Education for helpful feedback.
1. Introduction

Much of the literature on educational policy focuses on the impact of school inputs such as teacher quality, class size, mode of delivery of instruction. In addition, it is well-known that schooling interacts with the social context and the socioeconomic status of students and their families. Card (1999), Hanushek (2015) or specifically for graduation rates, Murnane (2013) surveys these literatures. Another literature studies the consequences of organizational and governance mechanisms such as charters (Epple et al. 2015), school finance (Hanushek and Lindseth, 2009, Jackson et al., 2015), use of vouchers (Chingos and Peterson, 2015) or accountability mechanisms (Deming et al. 2015).

Less explored are the consequences of the spatial distribution of the population and the mechanisms that may relate them to outcomes. Yet, we know that agglomeration economies and more broadly spatial distribution can affect levels of economic growth, subjective well-being, entrepreneurship levels or the quality of hospital care (Glaeser and Gottlieb, 2009 and Glaeser, 2010). The reduction of transportation and information costs (agglomeration economies) that these studies document, however, arguably have an effect on the level of performance of the delivery of government services. However, there surely are countervailing forces, as it is known that many of the most challenged school districts in the United States are urban ones. In related work (Lastra-Anadón, 2017), I study the relation between the density and student performance in standardized test scores using a variety of specifications in an effort. I find that there is a robust relation between density levels and the quality of school performance.
In this paper, I look at whether the spatial characteristics of jurisdictions (for short, the jurisdiction's *geography*) affects the distribution in educational outcomes and hence whether they may affect inter-generational mobility. I find that in fact, metropolitan areas that are more densely populated have greater average levels of performance but also higher inequality levels across different groups. I test a mechanism that may be driving this through the greater accountability afforded by facilitating the flow of information, which in turn would ensure greater responsiveness from the public entities in charge of the delivery of services. I also find some evidence for the view that policy preferences are different in denser areas, in accordance with the accountability view. Moreover, denser metropolitan areas are also ones with more choice of school districts for parents and greater density also facilitates the sorting of families between some high accountability/high information ones and the rest. I find support for the hypothesis that denser commuter zones are in fact ones with, as a result of the simultaneous greater choice and greater inequality.

The role of information and accountability potentially provides part of the explanation of the origin and upholding of high performing districts and results in a separation of districts between high performing and lower performing districts.

2. Theory and main predictions

My hypothesis is that density may be related to education levels but also responsible for higher levels of inequality across districts. Denser commuter zones will have more sorting among schools, through a larger number of schools and
possibly districts and may result in more sorting across districts. This is motivated by the fact that denser commuting zones or metropolitan areas allow for more choice of districts for families, since given an anchoring job or set of jobs there are more districts within driving distance from it. Moreover, under the mechanism of information and accountability here postulated, even if overall higher density levels have a positive effect, the costs of being disconnected may also rise. Certain districts within denser commuter zones may be initially highly effective for exogenous reasons. Limits to school sizes necessarily restrict the availability of high performing districts. This then may result in the sorting within the commuter zones or metropolitan areas of more involved and informed parents and a group that does not hold schools equally accountable or have the same amount of information areas to choose and join better schools.

If these interactions are indeed a first order driver of outcomes, we would expect then that geographic density to be positively associated with student outcomes. But since denser metropolitan areas or commuter zones are also ones with more districts accessible from a central location, this information and accountability mechanisms may lead to inequality across school districts, given the effort that is still required to obtain information or exercise accountability. While there may be some benefit from the lowering of costs of information or accountability that is common to all districts, the presence of important information and accountability mechanisms that favors some districts, would lead to an overall increase in inequality. In summary, those parents who exerce effort reap a large share of the
benefits of better outcomes and, inequality in outcomes is thus generally increasing on the density of commuter zones.

3. Data and empirical strategies

Data and empirical strategy on density and district outcomes

I take as my primary independent variable of interest the density of enrollment, i.e. the enrolled K-12 students per square kilometer. This continuous variable is used as a convenient proxy of the relation we are trying to get at where parents drive schools. This is akin to the standard measure of agglomeration used in the urban economics literature, which uses population density or labor force density as a primary measure of agglomeration of population (see e.g. Glaeser (2010), Introduction). Alternative specifications with the US census-defined bins of urban, suburban and rural districts are possible and carried out, as well as the same analyses using alternative variables such as population, geographic area or distance to capital city.

Using data from school districts in the United States, I study whether these density measures are systematically related to performance in 8th grade standardized tests in math and reading, using No Child Left Behind (NCLB) mandated state tests that all students have to take, adjusted by a measure of relative difficulty of the state exams. The outcome data comes from Greene and McGee’s George W. Bush Institute’s Global Report Card (Greene and McGee, 2011). They do a crosswalk between NAEP and state tests report the relative standing of districts on a national scale.
In order to test this relationship more systematically, I firstly study the relation at different deciles of the distribution of districts within commuting zones, noting that there are an average of 14 districts by commuter zone. We use quantile regression, which allows us to estimate the effect of commuter zone density at different deciles of the distribution of performance. In essence, the quantile regression estimator weighs the observations centered around the specified quantile in a regression framework and linearly decreasing away from the center, introduced by Koenker and Bassett (1978).

In regression form, the link between student density in enrollment and outcomes, by running a series of regressions of the form at two different levels:

\[ Y_{\theta i} = \alpha \log d_i + \beta X_i + \text{State}_s + \varepsilon_{is} \]

Here \( d_i \) is the enrollment density variable and indicates enrollment in K-12 education per square kilometer in the commuter zone, \( X_i \) are district level controls and \( \text{State}_s \) are state fixed effects. I run this for the 2009 cross-section of district level student outcomes (the \( Y_i \)), the latest one for which data is available from the Green et al. dataset. Error terms are clustered at the state level. \( \theta \) is the quantile level of performance.

*Data and empirical strategy on the accountability and information mechanisms*

In order to assess mechanisms, we introduce an additional dataset of dependent variables. I use the PEPG EdNext survey, a nationally representative survey on

---

2 For an analysis of the effects of density on district finances and efficiency of the delivery of services, please see the companion paper, Lastra-Anadón (2017).
issues of education, with oversamples for teachers and parents and done via computer, with data for each year in 2007-2015.

Analogously to the analyses of student outcomes and log-density, I implement regressions of the following form:

$$\text{Outcome}_i = \alpha \log \text{density}_{cz} + \beta X_i + \gamma Y_d + \text{year}_y + \varepsilon_{kzy}$$

4. Results

Inequality: reduced form

In the specifications reflected in Figure 1 at the commuter zone level that relate the commuter zone (CZ) density to the level of inequality in outcomes between districts within the CZ, we observe that density is positively associated with rising inequality and especially to greater differences between the top and bottom school districts. In so far as I associate the finding with a mechanism of differential information flows, it may contribute to explain the sorting observed even when controlling for funding differences.

Figure 2 plots the coefficients from a series of quantile regression and shows that the increased inequality is the result of the different effect of density at different levels of the performance distribution, increasing in the position of the distribution. In particular, we see a positive effect of density throughout and higher as we move up in the distribution of outcomes. It is more than twice as large at the 90th compared to the 10th percentile.

Attention levels, support for reform and information levels
We find the following associations that are broadly consistent with a differential attitudes and perception levels in denser commuter zones from the rest:

**Perception of school system:** In Figure 3, we see that perceived spending (overall and salaries) is much higher for denser districts, but similar to the real spend difference. However, in Figure 4, when respondents are asked about the quality of the schools on an A-F to scale, there does not seem to be a significant effect. Local schools are perceived to be roughly the same as in less dense districts, either in absolute terms or adjusting by their quality in terms of their performance in standardized tests in math and reading. They also do not perceive national schools to be significantly different.

**Support for school reform:** consistently, as shown in Figure 5 respondents in denser districts are significantly more likely to support vouchers, charter schools or variable pay for teachers. No significant effect is apparent on other indicators of school, such tenure and teacher pay increases. A summary index of reform also captures this positive association of density, which is even more pronounced for the measures that would more visibly change the educational opportunities of respondents, such as the use of vouchers and charter schools.

**Voting behavior and attention paid to education:** in Figure 6, we see that there is no significant effect on voting (although the association is negative) or on attention paid to education issues.

5. Conclusion
I have presented an initial exploration of the relation between the agglomeration of school-age children and inequality of school outcomes. While a fairly strong and robust positive relation holds at both at the district and the commuter zone level between density and average outcomes, I document that density is associated not only, on average, with better outcomes but also with greater inequality in those outcomes. This seems to be driven by greater beneficial effects of density for higher performing districts within commuter zones: while density is associated with higher performance throughout the distribution, high performing districts seem to benefit more. Districts at the 90th percentile of performance gain from increases in density about twice as much as those at the 10th percentile. There is some evidence that the views and attitudes towards the school system of citizens are different. Since we can expect that reaping this information and acting upon it requires some effort on the part of parents and that this will be differ, if a principal channel of the relation between density and outcomes are indeed attitudes and information or perception of schools, we would expect the results to be consistent with density being both positive for outcomes on average and inequality-increasing. This constitutes the beginnings of a potentially fruitful research agenda that roots education inequality on persistent jurisdictional characteristics, such as geography, which have been largely overlook from the literature.

**Abstract**

Placing learning first requires faculty and staff to work side by side developing similar goals and objectives to create a maximum learning environment. Learning communities and orientation courses are known as “Best Practice” in higher education. This article describes a linked learning community organized alongside a living learning community composed of students, faculty, and staff at a small private college in the Midwest. The purpose of the article is to describe a brief history of a Midwest private college’s current learning communities and examine the student’s perceptions and assessments of their experiences. Recalling the work of early proponents of experiential learning, and
employing an engagement scorecard, this piece illustrates the use of embedded, spiral curriculum in an undergraduate liberal arts program and its attempts to quantify student learning and codify engagement using a campus-specific engagement “scorecard.”
Abstract

In recent years, there has been an emphasis placed on the academic language and vocabulary used in the classroom. Vocabulary and syntactic knowledge in oral and written language embodies specific skills that allow students to meet academic demands across the curriculum. Academic language often represents a range of knowledge of word definitions, understanding of word parts, and the nuances of vocabulary meanings. Proficiency in academic language helps students acquire new vocabulary and comprehend academic content material. In order for students to be properly exposed to academic language and vocabulary in the classroom, teachers must have a sophisticated ability to teach academic language and vocabulary. This means teacher preparation programs must be preparing pre-service teachers to handle the complex and dynamic demands of teaching academic language and vocabulary.

Introduction

The number of students entering college underprepared to handle complex text continues to rise (Baker et al., 2015). Many students lack strong reading-comprehension skills due to a deficit in vocabulary knowledge and understanding of academic language structures, which can ultimately impact success in academic settings and professional workplaces (Baker et al., 2015). Vocabulary and syntactic knowledge in oral and written language embodies specific skills that
allow students to meet academic demands across the curriculum. Academic language often represents a range of knowledge of word definitions, understanding of word parts, and the nuances of vocabulary meanings. Proficiency in academic language helps students acquire new vocabulary and comprehend academic content material. The characters of academic language, include:

- Morphologically complex words (words with multiple parts, including prefixes and suffixes) e.g., prediction, underlying, strategically
- General academic words that are high frequency and may be abstract or have multiple meanings, e.g., response, provide, focus, incorporate
- Discipline specific words e.g., inference, schema, analyze

Many students struggle because they are unable to use academic language successfully in school settings, often leading to early dropout or failure (Zwiers, 2014). Academic language is often composed of sophisticated vocabulary. Students who master academic language are more likely to be successful in academic settings and professional workspaces. Vocabulary knowledge, specifically academic vocabulary knowledge is critical to ensure students are college and career-ready. The College and Career Readiness Anchor Standard (National Governors Association Center for Best Practices & Council of Chief State School Officers [NGA & CCSSO], 2010) states students must “acquire and use accurately a range of general academic and domain-specific words and phrases sufficient for reading, writing, speaking, and listening at the college and career readiness level; demonstrate independence in gathering vocabulary knowledge when encountering an unknown term important to comprehension or expression.”

Vocabulary plays an important role in students ability to understand the language used in academic readings and assessment. Most people tend to infer teachers have the knowledge and capacity to properly teach academic language, including academic vocabulary. Independent use of academic language requires teacher support and gradual release of responsibility so students
learn how to use academic language independently. However, many pre-service teachers have not had adequate exposure or preparation to acquire and in turn teach academic language, even though academic language has been identified as a critical element associated with academic success (Neal, 2015, as cited Zwiers, 2008). Therefore, the purpose of this study is to examine the knowledge, attitudes, and perceptions pre-service elementary teachers at Auburn University have toward academic language and vocabulary.

**Academic Language**

Academic language is language that is used in the classroom and workplace, it is the language of context, text, discourse, and assessment. Academic language is the ability to not only understand content vocabulary, but also be able to understand the discourse, syntax, and structures involved when reading complex text or participating in academic conversations. Zwiers (2014) defined academic language as “the set of words, grammar, and discourse strategies used to describe complex ideas, higher-order thinking processes, and abstract concepts.” Vocabulary then, is only one component of academic language. Academic language is crucial for success in reading comprehension, which transfers to success in all areas of literacy. Knowing learning happens when the academic language needs of students are being met, makes it crucial for pre-service teachers to understand the importance of examining academic language and the functional use of academic language within each lesson, assignment, task, and discussion. Lucas et al. (2008) postulated pre-service teachers need to have the “willingness and the skills” to examine academic language and identify that language and learning cannot be separated. It is ongoing, systematic instruction used to expand academic vocabulary.
**Academic Vocabulary**

Vocabulary knowledge is our ability to understand and comprehend the meaning of words. Vocabulary knowledge plays an important role in the student's ability to understand and apply the language used in academic settings. Academic vocabulary refers to the knowledge and understanding students have of words in order for them to successfully engage with and have discussions around text (Brozo & Simpson, 2007). Beck (2013) refers to these as Tier two and/or Tier three words. Beck, McKeown, & Kucan (2013) positioned the organizational framework for categorizing words into three separate tiers. Tier one words contain words used in everyday speaking and should not require explicit teaching when students begin school. Tier one should be part of students everyday vocabulary. Tier one are words used in everyday conversation. Tier two words are more complex vocabulary; words students are most likely to see more frequently across content areas in various texts. These words are crucial for students to learn in order to develop academic success. Tier two words are general academic words which have a high utility across a multitude of topics. For example, *justify* or *predict* can be used in reading to predict the outcome of a story or to justify word choice. Whereas in science predict is a quantitative statement in which one might predict what might happen under certain circumstances and then justify why. Tier three words are extremely complex and domain specific vocabulary. They are often specialized words that appear in specific fields or content areas. Students would only need to know these words when studying a specific content. An example would be the word, metacognition. Pre-service teachers would require vocabulary knowledge of metacognition as they plan and develop lessons for their students (Beck, McKeown, & Kucan, 2013).

Beck (2014) explains the only criteria for teaching complex vocabulary is the student must know the underlying concept of the word. For example, if pre-service teachers know the vocabulary word *support*, they can be taught the more complex term *scaffolding*. According to
Beck (2014), teachers must be able to explain the word in everyday English, using words that are less complex than the word being taught. This is increasingly more difficult as pre-service teachers must acquire the language in a brief period of time (one semester), take ownership of the academic vocabulary (academic discourse), and use it as a complex term (professional writing) and be able to explain the word in simpler terms for students (lesson plans). It is important to understand the vocabulary gap and, not only why vocabulary should be used but what vocabulary words should be taught. In order to adequately address the academic vocabulary students need to encounter to be successful in school, pre-service teachers need to have a strong foundation in their preparation of academic vocabulary, so they are able to apply this knowledge when they enter the teaching profession.

**Literature Review**

Student vocabulary skills are directly linked to economic backgrounds (Hart & Riley, 1995). Therefore, teachers must advocate for equity. The vocabulary gap can no longer be ignored. This is a critical aspect of literacy for students who have fallen behind in the conceptual development of language. The Common Core State Standards (National Governors Association Center for Best Practices & Council of Chief State School Officers [NGA & CCSSO], 2010), recognized the importance of academic language and vocabulary postulating “Closely related to text complexity and inextricably connected to reading comprehension is a focus on academic vocabulary: words that appear in a variety of content areas (such as *ignite* and *commit*)” (n.a.). Consequently, these standards are expected to be met by all students, making it difficult to ignore the importance of teaching academic language and vocabulary in the classroom. For this reason, teachers must have a strong working knowledge of the complex language demands and content-specific vocabulary students need to engage with to find success in education. This means
teacher preparation programs need to be diligent and successfully produce pre-service teachers who can meet the instructional demands of the classroom.

Using a variety of research based teaching methods such as concept maps, read alouds, and word learning strategies will help to advance educational equity. Therefore, preparation is critical in teacher preparation programs. Pre-service teachers need a variety of research based teaching methods to support and scaffold the acquisition of new vocabulary. Pre-service teachers need to know the best instructional techniques for teaching academic language and the corresponding vocabulary, especially interventions for the lower-performing students, if we are going to see a change in the current trends.

In a recent article, Galguera (2011) stated fluency in Standard English does not equate to academic success. The article also explained the challenges of students needing to be able to recognize and use the features and functions of academic language in order to be successful. Galguera (2011) continues to express the need for teacher preparation programs to emphasize teacher’s knowledge and understanding of teaching techniques needed for the expansion of language development and the academic purpose of language in all forms.

Studies are showing lower performing students are starting kindergarten so far behind their average-to-high performing peers that not only are they unable to “catch up”, they are falling further and further behind (Biemiller, 2003; Biemiller & Slonim, 2001). According to Biemiller (2003), considerable differences in the amount of words students know, is apparent by the end of second grade. In one of his many studies on vocabulary acquisition, high performing students knew an average of 7,100 root words by the end of second grade (Biemiller, 2003). In contrast, the low-performing students knew an average of only 3,000 words- a difference of about 4,000 words less than their high performing peers (Biemiller, 2003). Consequently, by the
of end of fifth grade, the lower-performing students had still not learned 7,100 root words—the amount of words already reached by high-performing children at the end of second grade (Biemiller & Slonim, 2001).

There is potential for the vocabulary gap to become disastrous for students who are missing the foundational word knowledge necessary to find success when encountering complex curriculum (Flanigan, Templeton, & Hayes, 2012). Some suggest this “gap” between lower-performing students and higher-performing students must to be addressed and corrected before third grade for students to find success throughout school and their future careers.

Neal (2015) claims students enter college with language resources that have sufficiently gotten them through past educational experiences and various social situations. Neal goes on to write that many of these students are not prepared in terms of academic language proficiency for the vast majority of disciplines they will begin to encounter (Neal, 2015). This is important to consider in the education field because pre-service teachers will need to have proficient academic language knowledge to find success in teaching. Additionally, making the matter more complex, pre-service teachers will also need to be successful at teaching academic language.

Teachers must be creating settings to prepare students for the future and the classroom should create an environment which engages students in problem-solving, creative activities (Boyd-Batstone, 2013). In order to ensure teachers are able to meet the instructional demands needed to teach academic language and vocabulary, it is imperative teacher education programs are preparing pre-service teachers in these areas.

Theoretical Framework

Bruner (2006) believed learning was an active process from which humans built new knowledge from their current and past knowledge. This theory relied heavily on the idea that
complex cognitive structures provided the schema, experiences, and awareness humans needed to construct meaning. This active construction of meaning leads to new learning and new ideas.

For the purpose of this study, knowledge of academic language and vocabulary will be looked at through the lens of how pre-service teachers are able to construct new levels of knowledge about the complex language structures based on current and previous knowledge. As pre-service teachers engage in the active process of learning complex language structures and content-specific vocabulary they should be actively constructing knowledge rather than passively acquiring words. As Bruner (2006, p.175) theorizes, it is “the art or science of arranging cultivated knowledge so that it may more easily be grasped and more easily be used in thought” which drives the pre-service teachers’ contextualization of learning academic language, including academic vocabulary.

Over the course of the semester, pre-service teachers are expected to acquire complex language structures in order to effectively engage in academic discourse, including being able to use this knowledge to engage in academic writing. They must also take this one step further and transfer their knowledge of academic language and vocabulary to a classroom setting, where they appropriately scaffold the language to meet the needs of their students, while also providing opportunities for their students to engage in academic conversations using the complex language structures and content-specific vocabulary. The actions described are grounded in Bruner’s theory of constructivism. Bruner (2006, p. 115) writes in his collection of essays titled, “In Search of Pedagogy:

“It is only in a trivial sense [he wrote in 1965] that one gives a course to ‘get something across,’ merely to impart information. There are better means to that end than teaching. Unless the learner also masters himself, disciplines his taste, and deepens his view of the world, the ‘something’ that is got across is hardly worth the effort of transmission.”
This study sought to explore the knowledge, perceptions, and attitudes of pre-service teachers in order to better understand how pre-service teachers are acquiring and mastering the academic language of their field and deepening their view of how to engage students in the complex academic discourse needed to be successful in academic and professional settings.

**Methodology**

This study used a mixed method case study methodology (Stake, 1995) to identify and describe the changes that took place over the course of a teaching semester as pre-service teachers developed academic language and academic vocabulary for professional writing assignments, academic discourse and the construction of lesson plans. The participants for this study were pre-service teachers in their second reading course in the Elementary Education Program in the Southeastern United States. Participants were predominantly female, with one male pre-service teacher. All pre-service teachers maintain academically sound grade point averages and were expected to meet the expectations of their program, including all coursework assigned by their professor, which were examined for this study. Pre-service teachers signed consent forms to participate and had the option to withdraw at any time during the course of the study.

Our analysis of data indicated a wide range of academic language and vocabulary typical of many pre-service teachers. Hannah, Lillie, Sophia, Cindy, and Holly (pseudonym) served as case studies within a larger teacher development research project. These five pre-service teachers represent a broad sampling of the larger population (n=38). Data collection for this research project includes the following: Pre and post surveys, lesson plans, discussion postings, and analysis of student learning writing assignments.
Our data analysis consisted of three iterations. First we focused on identifying pre-service teacher’s perceptions and attitudes toward academic language and vocabulary. We sought to see what changes, if any, could be identified over the course of a semester. We drew from the larger population (n=38) of pre-service teachers and then narrowed down our results to identify five students to tell a deeper story. Second we sought to identify levels of understanding as students acquired language and vocabulary to apply complex vocabulary and language within professional writing assignments, academic discourse and the construction of lesson plans. Third we sought to determine if there was any direct correlation between student attitudes and perceptions of academic language and vocabulary to the changes identified over the course of a semester.

The following questions were used to explore the relationship between student’s attitudes and perceptions of academic language and vocabulary and the changes that took place during the academic semester.

1. How do the knowledge pre-service teachers have of academic language and vocabulary change over the course of an academic semester?
   a. How do the perception pre-service teachers have of academic language and vocabulary change over the course of an academic semester?
   b. How do the attitudes pre-service teachers have of academic language and vocabulary change over the course of an academic semester?

Data Sources.

The data sources are designed to produce a snapshot or picture of pre-service teachers as they acquire the academic language and academic vocabulary. To determine attitudes and perception a survey was administered to gain a baseline to determine if there were any changes
over the course of an academic semester. Additional data sources included: lesson plans, discussion postings, and analysis of student learning writing assignments.

Results

Using the three iterations listed above we sought to explore the relationship between students’ attitudes and perceptions of academic language and vocabulary and the changes that took place during the academic semester. Throughout the study the researchers collected and evaluated artifacts and data to support change over the course of an academic semester. A pre-survey was administered to develop a baseline measurement of students’ knowledge, perceptions, and attitudes of academic vocabulary and language. The survey consisted of nine questions which included six Likert-rating scale questions and three open ended text-response. The Likert questions ranged from 1 being extremely uncomfortable to 10 being extremely comfortable. To show the overall tendency, statistical descriptions of the reported comfort levels, preparation to teach, and importance are shown in Table 1. The mean score (M) and the standard deviation (SD) of the overall responses of these six items are shown below.

</table>
To identify pre-service teacher’s perceptions and attitudes toward academic language we looked at the group as a whole and then focused on five individuals with varying perspectives. Overall 60.53% of students felt they were ill prepared to teach academic language and 60.53% of students felt ill prepared to teach academic vocabulary although they found both to be incredibly important. Pre-service teachers stated in the open ended questions of the pre-survey that "Academic Language is incredibly important “[it] is a broad overview that takes larger concepts and condenses them into content specific words” or it is “[the] professional language used in the classroom to facilitate learning and help students learn correct terms.” Overall the need for academic language and academic vocabulary was clearly articulated as important. Post survey results indicated an improvement in comfort and preparedness (see Table 2).

Note. M=Mean; SD= Standard Deviation; %= Percentage of scores 5 points or more

Comfort levels increased by 31.39% for comfort level of academic language and 48.14% for comfort level of academic vocabulary. In addition, preparedness increased the most with both academic language and academic vocabulary improving by 56.96% each. Overall student attitude and perception improved (see Table 3) over the course of the semester. Pre-service teachers improved in both comfort level and preparedness to teach both academic language and academic vocabulary. These statistics indicate a change in student perspective and attitudes and guide us in answering the following sub-questions.

a. How do the perception pre-service teachers have of academic language and vocabulary change over the course of an academic semester?

b. How do the attitudes pre-service teachers have of academic language and vocabulary change over the course of an academic semester?
How important is it to teach academic vocabulary? | 8.14 | 8.18 | 1.64 | 1.54 | 100% | 100%
---|---|---|---|---|---|---
How important is it to teach academic language? | 8.32 | 8.47 | 1.49 | 1.55 | 100% | 100%

*Note. Pre= Pre survey results; Post=Post survey results; M=Mean; SD= Standard Deviation; %= Percentage of scores 5 points or more*

To further expand on these two questions and to draw conclusion for our main question: How does the knowledge pre-service teachers have of academic language and vocabulary change over the course of an academic semester? We will look at five individuals of varying levels of both comfort level and preparedness. All five pre-service teachers were in their first methods course which means they were in their second semester of the education program. They range in age from 21-23 and are all Caucasian female from a southern region.

*Hannah.*

Hannah felt academic language was foundational to learning. She stated “it is important for me to consider that this task will be much more difficult without foundational knowledge of the subject-specific academic language included in the passage.” Reviewing her work samples and artifacts it was clear to see that Hannah not only felt it was important for students to develop academic language she also intentionally used academic language in her writing assignments. Pre-service teachers were asked to reflect upon how their understanding of their students’ prior academic learning and personal, cultural, and community assets guided their choice or adaptation of learning tasks and materials. They were asked to make connections between the learning tasks and students’ prior academic learning, and research and theory. The following is an extrapolation of Hannah’s reflection used to explore the academic language and academic vocabulary:

My decision to include the scavenger hunt in this lesson was informed by Lave and Wenger’s Situated Learning Theory (academic language). This theory (academic vocabulary) states that the acquisition of knowledge (academic vocabulary) is a result of
activity and the context in which it occurs. The scavenger hunt [was used] to look at informational (academic vocabulary) texts turns the content into an engaging activity (academic vocabulary) for the students. It is also a culturally relevant (academic language) task because the topic is focused on Auburn University and the historical value of Auburn, Alabama as a whole. The context of learning (academic language) occurs in Auburn, where many of the students are from; the informational texts (academic vocabulary) selected are rooted in the culture and values (academic language) of Auburn University. For example, the students will look at a menu from Toomer’s Corner and will analyze (academic vocabulary) its parts, such as the headings, prices, extra information, and historic background section (academic vocabulary). Looking at menus is something that is relevant to students’ lives, a task they will do. This decision was informed by the constructivist theory (academic language) that suggests students should be given time to explore (academic vocabulary) materials and make discoveries (academic vocabulary) on their own. By allowing time for predictions (academic vocabulary) the students will engage in critical thinking (academic vocabulary) and be making discoveries (academic vocabulary) and connections (academic vocabulary) both independently (academic language) and with their peers (academic language).

Evaluating the above paragraph for academic language and vocabulary, one can identify several instances as noted in the annotation in the paragraph above. Hannah clearly addressed all components of the assignment, identifying and strongly justifying a theory to support her academic decisions. Although Hannah displayed high levels of academic language and vocabulary her post survey scores for comfort levels for teaching academic language and vocabulary were a 5 indicating she is neither extremely uncomfortable or extremely comfortable about teaching academic language or vocabulary. In addition, her scores for how prepared she is to teach both academic language and vocabulary also were a 5 indicating she is neither extremely uncomfortable or extremely comfortable with the preparation she has received to teach academic language or vocabulary. Hannah did indicate on the survey the importance of teaching both academic language and vocabulary as she scored each one a 7 indicating a stronger importance. Hannah was a strong student who was very reflective and intentional with language and vocabulary. As noted above Hannah has an equal balance of both academic language and vocabulary.
After reviewing Lillie’s work samples and artifacts it was clear to see that Lillie often uses simplistic vocabulary and simplistic language although she felt both academic language and academic vocabulary are extremely important. She indicated a score of 10 for how important do you think it is to teach academic language and a 10 for how important is it to teach academic vocabulary. Lillie stated “Academic language is the language students must have in the classroom to succeed, while academic vocabulary encompasses the words in texts students read that help them further their content knowledge and can be more challenging to acquire.” It is also the academic language and vocabulary needed for our pre-service teachers to succeed.

Reviewing an assignment submission there is evidence of simplistic vocabulary in her writing as indicated in the following artifact:

Students will analyze multiple texts (academic language) throughout the week and there is a specific day when videos on the civil rights movement (academic vocabulary) will be presented. While they are being presented, the students are having to write down what they believe to be similar as well as different between the two. I think throughout this activity, the students have to ask themselves “how do these subjects connect?”, “where in this text is there a supporting statement (academic vocabulary) in another text?”, etc. To make these connections (academic vocabulary) and to thoroughly find the blend between the multiple sources (academic vocabulary), the students have to generate questions (academic vocabulary) and think outside of the standard box.

To expand her academic vocabulary there are several areas in which she could look at academic language and the development of more specific academic vocabulary. For example: While they are being presented, the students are having to write down what they believe to be similar as well as different between the two. In this statement taken from her assignment submission Lillie could have used the academic vocabulary or language as follows: While students are analyzing multiple text and or videos, students will identify similarities and differences across multiple text. To make these connections and to thoroughly find the blend between the multiple sources,
the students have to generate questions and think outside of the standard box. Students will analyze multiple text as they look for textual evidence to support similarities and differences. These simple changes would increase the intentional use of academic vocabulary and language. Lillie identified academic language stating “Academic language is the syntax, vocabulary, grammar, etc. that students must acquire to have success in the classroom.” and “Academic vocabulary is the word usage in academic texts that students need to have to understand a text.” In her post survey Lillie stated she felt less comfortable teaching academic vocabulary (scored a 4) then teaching academic language (scored a 5). She also indicated on her post survey that she felt extremely prepared to teach both academic language and vocabulary (scored each a 9). Although Lillie felt prepared she really wasn’t comfortable using the language in her own writing. Pre-service teachers were asked to reflect upon how their understanding of their students’ prior academic learning and personal, cultural, and community assets guided their choice or adaptation of learning tasks and materials. They were asked to make connections between the learning tasks and students’ prior academic learning, and research and theory. The following is an extrapolation of Melissa’s reflection used to identify the use of academic language and academic vocabulary in her writing:

Grasping the diverse needs and learning styles (academic language) of the students in my classroom, I rooted my instruction in the educational theory of constructivism (academic language). Constructivist teaching (academic vocabulary) is based on the belief that learning occurs as learners are actively involved in a process of meaning (academic language) and knowledge construction (academic language) rather than passively receiving information (academic language), in other words, students are the makers of meaning and knowledge (academic vocabulary). My students’ learning needs are embedded in their backgrounds, experiences and practices (academic vocabulary) and my goal was to select materials and learning tasks that met the students at their roots and enhanced their learning. I took note that some of my students were visual, active, kinesthetic (academic language) learners while others adapted to literacy strategies (academic language) that were centered on intrapersonal and spatial styles of learning (academic language). To meet the objective, I selected a graphic organizer (academic vocabulary) the students were responsible to create themselves. After analyzing
I wanted to modify my lesson to enable all my students to turn into active participants that comprehend the information presented from the multitude of nonfiction texts they looked at this week, rather than being a passive recipient. Knowing this, I selected the organizer so that students could see the main targets used in the creative lesson, to encourage metacognition and enhance collaboration between students as well as teacher and student.

Evaluating the above paragraph for academic language and vocabulary there are several instances of academic language as noted in the annotation in the paragraph above. Lillie responded to this assignment using academic language. The academic vocabulary used is minimal and often disconnected to the academic language. The above paragraph displays an attempt to make some connections between her academic language and vocabulary but often relies heavily on the simplistic academic language that is often generic rather than content specific.

Sophie.

Sophie originally defined academic language as “the broad concepts that encompass all the different concepts and ideas using content specific words.” She revised her definition after the semester to define academic language as consisting “of content specific terms that should be used in professional speech and lessons.” This shows development of the understanding of academic language, but still lacks a clear, concise definitional use of the term. From the very beginning of the study, Sophie showed understanding of academic vocabulary being the content-specific terms needed to teach a lesson. Reviewing her work samples and artifacts it was clear to see that Sophie has the capacity to use academic language in some areas of her writing, but does not seem to consistently use the academic vocabulary commonly used in the teaching profession. For example, she often writes about adapting her lessons when many educators would use the word scaffold. Pre-service teachers were asked to reflect upon how their understanding of their
students’ prior academic learning and personal, cultural, and community assets guided their choice or adaptation of learning tasks and materials. They were asked to make connections between the learning tasks and students’ prior academic learning, and research and theory. The following is an extrapolation of Sophie's reflection:

While working with student 1 I noticed that he is a very dedicated, capable student; however, he often asks for help even when he understands the concept at hand. This could potentially coincide with a semblance of learned helplessness (academic language). I pushed this student to work independently, and to embrace productive struggle in order to see academic growth.
While working with student 2 I noticed that he is very disengaged in activities that he does not want to do. He exhibited incredible intelligence; however, keeping him on task proved to be nearly impossible. I had to adapt my lesson in a way that kept him engaged, even when participating in activities that he would rather not take part in.
While working with student 3 I noticed that he is a very active student. Providing him with hands-on activities (academic vocabulary) gave him an outlet to exhibit his intelligence while also enjoying the work at hand. These hands-on activities were an adaptation (academic language) to my lesson based on research showing that many students learn better when they remain actively engaged (academic language) throughout.

Evaluating the above reflections there is little evidence of depth of either academic vocabulary or vocabulary, many statements are I statements which indicates a focus on her perception rather than a focus on student’ prior academic learning connected to research and theory. Her reflection shows some semblance of academic language yet it is often simplistic and content generic. Her reflection lacks connections between the learning tasks and students’ prior academic learning, and research and theory.

Sophie showed little change in her answers from pre-survey to post-survey in terms of her comfort level teaching academic language and academic vocabulary. However, she did show a change in her perception of the importance of teaching academic language. In the pre-survey, she rated both the importance of teaching academic language and academic vocabulary with a 9, indicating she felt it was fairly important to teach academic language and vocabulary. In the
post-survey, she felt academic language was neither extremely important to teach nor was it not important to teach at all, scoring this question a 5. She also dropped the importance of teaching academic vocabulary down from a rating of 9, to a rating of 8. When examining Sophie’s work, the lack of academic language and vocabulary is apparent. However, Sophie did change her rating from a 5 (neither extremely prepared or extremely prepared) on the pre-survey to a 7 (closer to extremely prepared than not prepared) on the post-survey when asked to rate how she felt the elementary education program at Auburn University prepared her to teach academic language. This indicates that while she feels more prepared although she sees the importance in teaching academic language, or vocabulary she is not taking ownership or application of this skill in her own work.

Cindy.

Cindy originally defined academic language as, “Academic language is a broad term that encompasses content specific words called academic vocabulary” Her definition focused mostly on vocabulary and lacks clear understanding of the structure, discourse, or syntax included in academic language. Cindy’s original definition of academic vocabulary was, “Academic vocabulary are content specific words.” On her post-survey, Cindy defined academic language as “Language needed to do well in school, work, and life” and academic vocabulary as “Words that are not common in casual setting but commonly used in professional or academic setting.” Her post-survey results indicated she felt comfortable in both academic language and academic vocabulary (scored 8 on both) and on the post-survey when asked to rate how she felt the elementary education program at Auburn University prepared her to teach academic language she scored a 7 related to academic vocabulary and an 8 for academic language. This shows only a slight change in perception as she originally scored these both of these items with a score of 6.
These scores indicate that she feels prepared to teach academic language and academic vocabulary although she gave no written response when asked to differentiate the difference between academic language or academic vocabulary. This is interesting considering her original definition in the pre-survey was, “Academic language is a broader term that covers academic vocabulary. Academic vocabulary is content specific and are words students need to know in order to learn.”

Pre-service teachers were asked to reflect upon how their understanding of their students’ prior academic learning and personal, cultural, and community assets guided their choice or adaptation of learning tasks and materials. They were asked to make connections between the learning tasks and students’ prior academic learning, and research and theory. The following is an extrapolation of Cindy’s reflection:

After being exposed to my students’ prior academic learning (academic language) and personal, cultural, and community assets (academic language) I was able to measure their academic reading level. While working with focus student 1 I was able to see that he is very interested in being active, so I was able to incorporate more active learning to keep him engaged. When I was working with focus student 2 he was a very eager student, but he really wanted help from a teacher at all times. He thrived on reassurance and was not confident in his ability to solve problems (academic language) on his own. As I worked with him I did my best to reassure him on his work as well as to not just give him the answers. Through working with student 3 I noticed that she was very excited and wanted to be heard. Throughout playing the board game I tried to allow everyone to voice his or her thoughts on what the answer was so that she was able to say what she wanted while staying engaged (academic language).

After reviewing her work samples and artifacts it was noted Cindy attempts to use academic language, although the language chosen is often generic in terms (i.e., engaged, academic learning, and solve problems). Cindy placed a high level of importance on both academic language and academic vocabulary but often lacked usage in her own writing.
One interesting finding when examining Cindy’s surveys was the importance she places on teaching academic language and academic vocabulary. On her pre-test she rated both areas with a 10 indicating a high level of importance. On the post-survey, she dropped both of her scores on the importance of teaching academic language and academic vocabulary to an 8. While Cindy felt more comfortable and more prepared to teach academic language and vocabulary by the end of the semester, she actually felt it is less important to teach academic language and vocabulary.

Holly.

Holly began with a very weak definition of academic language, “Academic language is the vocabulary that is used in a classroom to promote learning and further thinking among students in the classroom.” Her definition focused on the need for academic vocabulary as the only component in academic language. Throughout the semester Holly worked on both academic language and academic vocabulary and often tried to apply it within her own writing. Toward the end of the semester Holly modified her definition of academic language substantially showing growth in her understanding. Her end of semester post-survey definition defines academic language as, “Academic language is the language students need in order to perform well in school. This includes domain specific vocabulary, grammar, and other language conventions.” Her definitions grew from only including vocabulary to including domain specific vocabulary, grammar, and other language conventions. Holly does not show this same growth in her definition of academic vocabulary. Originally, Holly defined academic vocabulary as, “Academic vocabulary is specific words that are used in a classroom that help students receive a better understanding of the material they are learning.” Her pre-survey definition is much weaker than her final definition of academic vocabulary. However, her final definition is lacking academic language structure. On the post-survey, Holly defines academic vocabulary as, “The
words that aren't normally used in casual conversation, but rather used in an academic environment or context.” When distinguishing between academic language and vocabulary, Holly originally wrote, “I am not sure on the clear difference between the two except for the fact that language promotes further learning while vocabulary helps students understand concepts.” Holly herself, admits confusion surrounding the two concepts. Her explanation of academic language at the end of the semester was “Academic language is a broad category, and then academic vocabulary falls within it.” This distinction is more clear than her original response, but it seems she is still not fully able to distinguish between the two. Interestingly, reviewing her work samples and artifacts it was clear to see that Holly was still struggling with the written expression of academic language but was able to use the academic vocabulary of the topic with more ease. It is evident Holly is knowledgeable about the concepts in her assignment. Pre-service teachers were asked to reflect upon how their understanding of their students’ prior academic learning and personal, cultural, and community assets guided their choice or adaptation of learning tasks and materials. They were asked to make connections between the learning tasks and students’ prior academic learning, and research and theory. The following is an extrapolation of Holly’s reflection:

Some of these students are rising fourth graders, while others are rising fifth graders. This means that my students will have very different academic backgrounds and experiences. After familiarizing myself with the Alabama State Standards, I know that the rising fifth graders will have already been introduced to the Civil Rights movement; however, this topic will be brand new for rising fourth graders unless they have been taught about the subject away from school. It is this reason that we decided to focus on just two civil rights activists for the student’s final project. My co-teachers and I will also evenly distribute the fifth graders among the two project groups to be leaders. My overall goal is to provide my students with a lesson, which is at their zone of proximal development (Vygotsky) (academic language). This means that the tasks they are asked to perform will provide them with a challenge they will need additional support to overcome. I hope to promote productive struggle (academic vocabulary) as the students learn how to apply the FQC and Tackle the Text strategy on their own.
Since this class has a very diverse student population, I hope to lead discussions that make all students feel safe to share their unique cultural perspectives (academic vocabulary) on the movement. I also will try to include Asian Americans into the discussion, asking them questions such as “why do you think they segregated (academic vocabulary) white people and black people if those lines are blurry and the U.S. had other nationalities (academic vocabulary) as well”? I aim to embrace the diversity of our class as we dig into the topic of the Civil Rights movement as well as make sure that each student knows this historical movement impacts each of them in many ways today in regards to how they treat others.

In the same way, Lave & Wenger’s Situated Learning Theory (academic language) claims that the attainment of information (academic vocabulary) is a product of the activity, context, and culture in which it is presented. With this knowledge I have chosen learning materials that have engaging content that is relevant to my students’ lives, and which reflect their individual cultures.

Since these students are in elementary school, they fall into Erikson's Industry vs. Inferiority stage of development (academic language). During this Latency stage (academic vocabulary), children are capable of learning, creating, and achieving various new abilities and understanding, therefore developing a sense of industry (academic vocabulary). This is also a quite social stage of growth, and if school-age children experience unsettled feelings of insufficiency and inferiority among their peers, they can suffer serious problems in regards to academic and personal capability and self-esteem (academic language and academic vocabulary). Having this knowledge, I chose to explain and model each strategy for the students before having them try them on their own. Easing them into independence like this will give them confidence and a sense of understanding. For the FQC strategy I will even show them the sticky notes that I wrote all my facts, questions, and connections on prior to reading it to them. This way the students will feel comfortable sharing their thoughts during the read-aloud since I have already shared some of mine.

Gardner’s Multiple Intelligence theory (academic language) which suggests that different people have different ways of thinking and processing [9 intelligences] also guided my choice of learning tasks and materials for this lesson. The FQC hand gestures and color-coding will help kinesthetic learners (academic vocabulary), while the read-aloud and class discussion will cater to auditory and linguistic learners (academic vocabulary). The independent practice caters to those learners who are intrapersonal (academic vocabulary), while the small group activities and turn and talks will accommodate the interpersonal learners (academic vocabulary). The video sources, document camera, and color code will help the students who learn best visually.

It is evident in Holly’s writing, she is developing her academic language, while she has a strong use of academic vocabulary. Much of her weakness comes in the structure of her writing. In her pre-survey comfort levels teaching academic language and vocabulary, she rated herself fairly low with score of 3 on academic language teaching comfort and a score of 4 on academic
vocabulary teaching comfort. Holly rated her post-survey feelings of comfort teaching academic language and academic vocabulary with a score of 7 for both, indicating she feels more comfortable than not, teaching academic language and vocabulary. While this does show growth, she still does not feel extremely comfortable. Holly began the semester with the perception of feeling fairly low preparedness in her course work at Auburn University to teach academic language (rated a 4) and academic vocabulary (rated a 3). By the end of the semester, she showed changes in her perception of preparedness rating teaching academic language preparation at Auburn a 7, and teaching academic vocabulary preparation at Auburn an 8.

Holly’s use of academic vocabulary is evident in her writing. Holly’s greatest change in her attitude toward academic language and vocabulary occurred in her ratings of the importance of teaching academic language and vocabulary. In the pre-survey, Holly rated both the importance of teaching academic language and vocabulary with a 6. This indicates she felt it only slightly important. However, by the end of the semester, she rated both academic language and vocabulary with a 10. Her attitude at the end of the semester indicates she feels academic language and vocabulary are extremely important to teach.

Limitations

Although this research brought to light some key findings and insights, several limitations have been identified through the course of this study. One limitation is the lack of current research focusing on teacher preparation programs in connection with the academic language and vocabulary needed for pre-service teachers to be successful in the classroom. This creates a need for further research in this area in order to prepare teachers for the academic language and vocabulary demands needed to be successful in the classroom. Another limitation of the study was the sample size of the participants. At this time, the classes consisted of almost
completely female students, in their junior year of college. For the purpose of this study, the small sample size was adequate to provide enough information about the general knowledge, attitudes, and perceptions of pre-service teachers. Further research on this topic is warranted.

Finally, another limitation in the design of the study was the time frame of the summer semester. The summer semester was much shorter than a fall or spring college semester, so showing changes or growth over time may have been impacted. Future studies should be done over the course of an entire semester or the entire degree program to gain more understanding on this topic.

**Conclusion**

Academic language and vocabulary are complex systems in which sophisticated language, skills, and grammar structures are derived to develop a deeper level of learning. This research identified several layers of knowledge, perceptions and attitudes toward academic language and vocabulary. What we found are classrooms that support the acquisition of academic language and vocabulary prepare students to address the complexities of the English language. Our classrooms provided pre-service teachers the opportunities to practice the language used in the context of learning to prepare and scaffold academic success. We found that students who master academic language are often more likely to be successful in academic professional settings. Whereas students who struggled with academic language and or vocabulary struggled academically to convey professional discourse in their writing. We found preparation increased confidence and impacted perception of both concepts. Pre-service teachers were given multiple opportunities to practice both academic language and vocabulary honing in on both skills. Pre-service teachers (most) needed ongoing systematic instruction in both academic language and vocabulary to increase their confidence and comfort level of application.
of academic language and academic vocabulary. By the end of the semester, there were
significative differences in students pre and post perceptions of preparedness to use, apply and
teach both academic language and vocabulary.

ABSTRACT

The Effectiveness of Compensatory Cognitive Training for Patients with Breast Cancer Undergoing Chemotherapy

Purpose: Chemotherapy-related cognitive impairment is an adverse effect experienced by some patients during and after chemotherapy treatment for cancer. It is characterized by difficulty with thinking, remembering, concentrating and word retrieval. Chemotherapy-related cognitive impairment can have a significant impact on quality of life. Although compensatory cognitive training for patients with cognitive dysfunction has been developed, few studies on the subject have focused on cancer patients. This study was attempt to
determine the effects of a compensatory cognitive training in improving cognitive function for breast cancer patients receiving adjuvant chemotherapy.

Methods: The participants were 54 patients who were assigned to a compensatory cognitive training or control group. The participants were assessed at the baseline (T1), the completion of the 12-week intervention (T2), and 6 months after completion of intervention (T3). Outcomes were assessed with the standardized neuropsychological tests and the Functional Assessment of Cancer Therapy-Cognitive Function (FACT-Cog) version 3. Data were analyzed using repeated-measures ANCOVA with adjusting for age, intelligence, depression, and treatment.

Results: The results showed that the intervention group improved significantly over time compared with the control group on objective measures of attention (p=.026, d=0.29), immediate memory (p<.001, d=0.91), delayed memory (p=.008, d=0.61), verbal fluency in category (p<.001, d=0.74), and verbal fluency in letter (p=.001, d=0.38) at T3. The intervention group also significantly improved on total FACT-Cog (p=.044, d=0.59) and perceived cognitive impairments (p=.006, d=0.72) at T3.

Conclusion: Results suggest that compensatory cognitive training has the potential to improve not only objective cognitive function, but also subjective cognitive function and quality of life in patients with breast cancer. Because this study is small study, further research in a larger sample and over longer follow-up periods is needed.

Armstrong State University

ABSTRACT

This paper is a relevant and recent review of the literature that attempts to explain and document the literature on the flipped classroom. It examines 49 studies that explain the flipped approach in the classroom. This paper, particularly, delineates the history, the theory, benefits, criticisms, recommended practices, and what the research on flipping reveals. After reviewing the literature, the author concluded that there is a resurgence in the use of the flipped classroom. This body of information representing the work of teachers, principals, and college professors will serve as a useful source in deciding whether or not to execute the flipped classroom as a viable teaching methodology.

Keywords: benefits of flipping, recommended practices in flipping, flipping research, flipping history, Khan Academy and flipping, criticism and flipping
INTRODUCTION

The flipped classroom is experiencing the most successful resurgence of any method for delivering content in the classroom (Hennick, C., 2014; Strayer, J. F., 2012; Kim, M.K., Kim, S. M., Khera, O., & Getman, J., 2014; Sparks, S. D., 2011)). There is certainly a renewed interest in implementing this digital approach for teaching today’s students. Khan Academy has been at the forefront of this overnight sensation (Hennick, C., 2014; Sparks, S. D., 2011)).

PURPOSE

The purpose of section one of this paper is to examine a definition, some history, and the theoretical basis for the flipped classroom. Other areas located in section two will examine the lecture method, today’s students, and teaching pressures. The third section of the paper discusses the benefits, advice, criticisms, and the research. There is a summing up section and finally it concludes with a closing.

SECTION ONE- Definition, History, and Theory

The flipped classroom can be described as individual video-based learning outside the classroom and group learning inside the classroom (Bishop & Verleger, 2013). The classic definition is about videos taking the place of direct teaching with more individual time for students during class time. Homework is no longer done at home, but in class, thus the term flipped or inverted classroom (Bergmann, Overmyer & Wilie, 2013).

The flipped classroom should not be described as a series of online videos that take the teacher’s place and leave the students with no sense of direction (Bergmann, Overmyer & Wilie, 2013). Flipped classrooms that are successful embody these traits (Bennett, Kern, Gudenrath & McIntosh, 2012; Cohen & Brugar, 2013):

1. Students lead discussions in class of outside content studies and gain more knowledge.
2. Students demonstrate high order thinking skills.
3. Students apply content to contextually real situations.
4. Students mentor and collaborate with one another and own the learning and can review videos as needed.
5. Students ask deep questions and motivate one another and get to really build a relationship with the teacher.
6. Students engage in active learning and move from just sitting.

The idea of flipping the classroom has gleaned lots of media attention from USA Today, The Globe, Washington Post, and CNN, though it has been around for over a decade (Johnson, 2013). The Khan Academy has been useful because of its free offerings of materials (Baker & Settle, 2013). The academy is about the work of Salman Khan who created a collection of online videos covering a plethora of subject areas known as the Khan Academy. Salman Khan was a hedge-fund analyst who quit his job in 2006 and has since received backing from Bill Gates and Google. Many people partially credit him with the popularity of the flipped classroom (Ash, 2012). The term flipped actually came from a man called Karl Fisch, teacher and technology expert, who first called it the Fisch flip but he credits Bergmann and Sams with it all (Sams, 2011). Some view flipping as an exchange of classwork for homework. It is also called backwards classroom, reverse instruction, flip teaching, and reverse teaching (Siegle, 2014).
There is no one way to flip and some describe as a mind-set or an ideology but not a method (Siegel, 2014).

Two rural secondary teachers of chemistry, Jonathan Bergmann and Arron Sams are considered as the ones who popularized the flipped classroom (Handen, McKnight, P. McKnight, K. & Arfstrom, 2013; Siegle, 2014). Apparently, they noticed that students were missing class to attend competitions, games, or other student activities, and there were other students who had trouble with certain concepts which hindered completing homework until they got help in class the next day. This led to using videos to record lectures, demonstrations, and presentations that they decided to post on YouTube for students to view (Handen et al, 2013; Siegel, 2014).

Bergmann and Sams started a non-profit Flipped Learning Network (FLN) in 2012. It is known as the FLN Ning which is a free website offering information, resources, and what one needs to know when flipping a classroom. It has now reached 12,000 educators (Handen et al, 2013). Since the growth is expanding, the researchers at George Mason University with the Support of Pearson wrote a white paper to further explain the model (Handen et al, 2013).

In 2012, Jonathan Bergmann and Aaron Sams introduced their book, *Flip your classroom: Reach every student in every class every day*. The book is useful in that it is a non-traditional way of teaching (Hantla, 2014). The authors, for instance, recommend that teachers create their own content videos. These teacher-made videos should contain humor, fun, and animation. Having another co-worker teach on the same content topic is recommended. The authors have moved away from the laborious lectures but instead recommend short videos with an offering of many ways to assess student learning. They discuss how paper work for teachers can be cut in half. There is a section of the book for experienced flippers who need additional challenges. The importance of following the guidelines for copyrighting is discussed.

Social constructivism is at the root of the flipped classroom (Jarvis, Halvorson, Sedeque & Johnson, 2014). The flipped classroom is often linked to problem solving, inquiry learning, and active learning plus interpersonal communications (Jarvis, et al, 2014). In the flipped classroom, students learn new knowledge that they must connect to past learning, and this causes them to realign their view of the world. They converse with peers in the classroom that ultimately lead to deeper learning. The process of learning as Piaget and Vygotsky explain it, is apparent. But isn’t that what an education should do, push us to probe and compete with others while adapting to the world around us and simultaneously being influenced by parents and friends in our immediate circle? The social constructivist theory undeniably fits with the benefits of the flipped classroom.

**SECTION TWO- Lecture Method, Today’s Students, Teaching Pressures**

The lecture method is still number one in most classrooms (Roehl, Reddy, Shannon, 2013). Educators need to get beyond memorized learning to higher-level thinking processes, thus the flipped classroom, which offers active learning. Active learning approaches include small groups, individual, and cooperative groups where students collaborate, brainstorm, role-play, peer-tutor, map, or produce projects (Roehl et al, 2013). The lecture method is described as a scripted speech to students with the hope that the learning of all the information will be regurgitated (Mazur, Harvard Professor, 2012).

Donald Clark (2007), an educational blogger, described the lecture in negative terms as one that creates passive students who are dependent on writing good notes when their attention
span is lost after 10-20 minutes. He goes on to explain that lectures deliver too much content for students to process. He questions why they are presented on a specific content area at only one specific time and place. Often, when presenters are boring, it is because they are not trained in how to keep and maintain the attention of the audience. He concludes with a note of hope when he says that lectures can be worthwhile if they are timely and if the presenter can get students engaged in the delivery.

Students of today have been referred to as digital natives or millennial students (Prensky, 2001). They have experiences with technology at an early age unlike other students in other generations (Prensky, 2001). These students learn differently because the social media that they use often is a way of life (Roehl, Reddy, Shannon, 2013). They need collaborative learning experiences (McMahon & Pospisil, 2005). Mark Prensky (2001) discussed how these digital natives learn differently than those before them. They have different desires and not the same kind of patience with learning (Prensky, 2010) They have information at hand and are familiar with participating in environments calling for involvement and reaching out to peers (McMahon & Pospisil, 2005). Through the internet, they can ultimately connect with others around the world (McMahon & Pospisil, 2005). Flipped classrooms emphasize students as the center for learning and not the teacher as the lead act on stage but a facilitator in the background (Siegle, 2014).

In training pre-service teachers, faculty is highly encouraged to teach pedagogical methods utilizing technology because their future students will be digital natives (Vaughn, 2014). Pre-service teachers will need to prepare to teach students who have already participated in online learning and using technology daily (Vaughan, 2014). Statistics report that 97% of classrooms have computers and 93% have the internet available in classes daily (U.S. Department -National Center for Educational Statistics, 2011). Meanwhile, universities and school systems are looking for ways to save money on strained budgets (Berrett, 2012). In larger research universities the lecture method is not going to cease. Economically, it is more practical to have larger bodies of students in a course with one instructor (Berrett, 2012). The flipped classroom can be a more productive way to teach to large class loads (Berrett, 2012 p.2). Faculty members could use their time differently and serve as part of the new transition in teaching and learning (Berrett, 2012). Flip classrooms utilize video lectures from renowned educational speakers. Politicians, policy persons, and other groups want to see how technology is tied to the education of students in colleges. After all, Noam Chomsky, an American linguist and philosopher, was accurate when he retorted that education’s purpose is to train students to grow to the stage where they can learn on their own (Elets News Network, 2014).

SECTION THREE– Benefits Using Specific Cases, Advice, Criticisms of the Method and the Implementation, and the Research

There is a wide spread degree of curiosity about using the flipped classroom (Hennick, 2014). It is an approach implemented in Spanish, science, math, elementary, middle, high school, and it is used with older adults (Patel, 2013). It is imperative that possible benefits are explored here. Morgan (2014) declares that the flipped classroom allows for self-pacing yet students are assured of feedback from the teacher thus keeping the teacher aware of any misunderstanding of the content. Other advantages include students having access to the video to view whenever they need to. Another aspect deals with the fact that the teacher is free to create videos that can be challenging and can involve other co-workers with whom they can exchange views.
Parents can view the videos and can help with homework. At Byron High School in Minnesota, the district was able to save some money on textbooks when flipping started (Morgan, 2014). Teachers created lessons and posted to You Tube with the creation of a free Moodle site. Students also showed improvements academically and others wanted to partake in the flip, for example science, social studies, and language arts faculty (Morgan, 2014). Byron High was able to attract an even better caliber of educators and received a national award in math called the Intel School of Distinction in 2011 (Fulton, 2012, April). The flipped classrooms used the Khan Academy videos created by a Harvard business school graduate who was trying to aid his cousin in math and decided to place steps on You Tube, which marked the beginning of the successful Khan Academy.

In Los Altos, California in 2010, the district experimented with math for 5th graders and utilized Khan Academy. With success of the program, they branched out to all 5th, 6th, and 7th grades. This program allowed teachers to keep up with how well students were doing and how many they got correct or not correct and how much time was spent per problem. Teachers could see if students got the problems correct when hints were given.

Roehl, Reddy & Shannon (2013) explicated on how students got to reflect on their learning and how teachers gave immediate feedback. Teachers used voiceovers for videos, screen capture software and gave instructions with visual aids. Students asked questions at class sessions instead of interrupting a lecture. The class did not slow up because of students not attending due to sports, participation in competitions, or other extra-curricular activities. Teachers made changes to videos as needed.

There were 15,000 members surveyed through the National Center for Case Study Teaching in Science List-Serve which reported (Herreid & Schiller, 2013) that teachers could spend more time on research projects with students, teach science equipment, allow students to interact through activities (i.e., games, paragraphs, contests, problem solving). Students had time to think in and out of class. Students seem to enjoy participating in the flipped classroom. A physics teacher commented on how students viewed the podcast at home and when class sessions met, students did meaningful assignments applying what they learned from viewing (Herreid & Schiller, 2013). It seems that 86% of science faculty use lecture as main method for explaining (Gates & Mirkin, 2012).

Fulton (2012, October) discussed a survey from parents in the Byron School District in Rochester, Minnesota where 84% agreed that the flipped approach was number one method for teaching content. She continued with benefits such as how teachers could spend more time with what students did not comprehend. Teachers could provide many other sources for teaching and were able to chunk the content as needed and not overload students. It is important to note that there is no one way for classroom flipping (Jarvis, Halvorson, Sadeque & Johnston, 2014).

The advice or recommended practices offered here should help get the maximum out of this teaching strategy. First, educators must prepare motivating, in-class activities so students can use content information in real-life situations and will not waste class time (Spencer, Wolf & Sams, 2011). Second, educators who choose to record their own videos should choose a recording spot carefully, organize content ahead of time, record as though talking to students, and repeat as many times as needed for the course (Seigle, 2014). Teachers who choose to use available videos should select from videos, such as, Khan Academy, You Tube EDU, and PBS (Seigle, 2014). Videos should be short and simple and specifically connect to assignments (Patel, 2013).
Third, educators should prepare students for this process by discussing the benefits, making a list of what and why students need to know the content from the video; setting deadlines for students; offering a time for them to watch the video, and preparing worksheets, quizzes, questions to answer after watching the video (Siegle, 2014; Miller, 2012; Ash, 2012). Fourth, educators must give feedback that is immediate and on target while figuring out early which steps in the process are working for students (Berrett, 2012). Fifth, flipping does not replace the teacher but the teacher becomes more of a mentor or facilitator who still gets to experience the light bulb moment (Hennick, 2014). Teachers who create their own videos must make time for carrying out the process (McLean & White, 2009). Additionally, do not assume students are comfortable with the technology (McLean & White, 2009). A survey from Harrison Group 2006 (McLean & White, 2009) found that students spent more time downloading music, 85%, videos 10% and podcast and audio texts under 5%. Another important concern is that small schools often do not have the resources or power needed to integrate technologies as larger universities do (McLean & White, 2009).

Before transitioning to the research studies, it is essential that the criticisms of the method and the pitfalls in implementation are reviewed. Herreid, Schiller, Herreid & Wright (2014) criticize the method when students tend to resist this process and may attend class ill-prepared. This can be averted with the use of short online quizzes or in class quizzes or required assignments tied to information covered from reading or videos from the night before. Another problematic area may be locating quality videos.

In criticizing the implementation of the method, teachers must choose carefully when producing videos (Siegle, 2014). Siegle encouraged the use of Camtasia Studio, Papershow, or ShowMe software programs or apps on the iPad like Educreations and Explain Everything. Teachers should post videos on YouTube, iTunes U or Podcasts (Vodcasting) or management systems like Blackboard or Moodle. Creating classroom videos is extremely time-consuming (Siegle, 2014). Siegle (2014) recommends Jing as the most popular software program. Lectures and videos of no-cost are available on Apple’s iTunesU, YouTube, TedTalks and Screencast-o-matic website (http://www.screencast-o-matic.com).

Morgan (2014) takes issue with the method when he refers to the flipped method as a high tech method of the lecture unconcerned about how students really learn. Andrew Miller, ASCD Educational Consultant in Virginia, describes it as an old-fashioned approach or a better version of a terrible teaching strategy (the lecture). Khan Academy has encouraged inflated goals too exorbitant to accomplish because the problems of k-12 will not dissipate through digital transactions.

Talbert (2012) finds fault with the method because he uncovers students’ feelings of being alone in learning with a form of cultural shock at this opposite way of participating in a classroom. Instructors must ultimately collect numerous formative activity results to demonstrate student learning and to convince students of their progress. Instructors must diagnose and delineate areas of concern about what students are not learning as well. Handen, McKnight, McKnight & Arfstrom, (2013) digress on to a loss of the most loved, Socratic, in- your-face method of teaching. There is a fear of hiring poor, low-level teachers who would take the positions of the highest paid experienced teachers.

Some of the criticisms of the implementation are explained here. It is not fair to expect students to view videos for every class every evening. Videos must be short, 5 to 10 minutes for viewing outside of the classroom (Siegle, 2014). Teachers do not possess the skills to make all of the videos needed to teach the content for lessons. Educators will be forced to become more tech
savvy than ever before as technology continues to grow (Roehl, Reddy & Shannon, 2013). Bergmann and Sams, the founders, explained (Roehl, Reddy & Shannon, 2013) how they checked students’ notes every day from video watching the night before. Each student brought a question to class. They gave students time to adjust to the process and in time, saw improved questions brought to class. There was a change in thinking to a more deeply-fashioned as the school year progressed. There were financial considerations to ponder in the public schools and whether or not if students have the technology outside of school before deciding about this endeavor (Roehl, Reddy & Shannon, 2013).

Implementation presents problems because the method relies on online materials and will be problematic unless there is a suitable technology infrastructure (Sparks, 2011). This method is still in its early stages, still developing (Sparks, 2011). The top-down implementation (making it a requirement for all) will not work, but teachers who want to flip and believe in flipping will make a difference (Hennick, 2014). Labs may not be open after school for students to work in, but they will need this time. Flipping should be for certain classes. Berrett (2012) reminds us that professors must answer questions at a minute’s notice and this means additional preparation/planning time before class.

Education Next (2013) suggested that the flipped classroom method is problematic since it may only work for upper-income, suburban, or private schools. Parents are expected to provide the technology and it may cause students to get behind. Perhaps this will just highlight the inequities from district to district. It is questionable that the charter schools (KIPP, Rocketship, Alliance, and Summit) that demonstrate success for low-income students are not jumping on board with the flipping trend. This method will not likely result in massive improvements needed in learning in our country. Most students will continue to matriculate in the rectangular school houses that have adapted some form of technology for learning (Education Next, 2013).

Johnson (2013) sums up criticisms in the method with these points: 1.) It frees students from physically attending class. 2.) It is a showdown of division-those who have the technology and those who do not. 3.) It makes the teacher seem pretty much unnecessary. 4.) It does away with a real-life teacher bringing a good in-person lecture.

Now we examine the research available on this method. While there are limited empirical studies on the impact of the flipped approach on learning, there are research reports from teachers on the use of the approach. This section will summarize research from k-12 and higher education.

In Minnesota, at Byron High School (Fulton, 2012, June-July) the teachers decided to flip the curriculum in the math department. The teachers rewrote lessons, located materials on the internet, and created their own short videos, 10 or 15 minutes that students could watch at home. They saw a mastery from 29.9 percent in 2006 to 73.8 percent in 2011 on Minnesota Comprehensive Assessments and saw a rise on ACT scores from 2006 (21.2 on scale of 36) to 2011 (24.5). The school received the National Blue Ribbon School in 2010 by U.S. Department of Education. They were given the Intel’s School of Distinction Award in high school math in September 2011.

At Clintondale High School in Michigan where majority were inner city kids (Johnson, 2013; Handen, McKnight, McKnight & Arfstrom, 2013), the school decided to flip all of its ninth grade classes in 2010. They saw failure drop close to 33 percentage points and the number of discipline cased went from 736 in 2009 to 249 in 2010 to 187 in 2011-74% drop in two years (Green, 2011). Parental complaints dropped (200 to 7). The school went to a flipped model in fall of 2011.
Musallam in 2010 wanted to determine the use of screencasts (a video recording of computer screen) as a pre-teaching approach for instructing an AP high school chemistry course. In examining pre-and post-assessments, he saw an increase in performance on assessments (Johnson, 2013).

Strayer (2012) compared the traditional introductory statistics class to a flipped statistics course through the use of field notes, interview focus groups, and the University Classroom Environment Inventory. The flipped classroom students were less satisfied with the structure of the classroom but became more open to newer approaches to teaching. Leicht, Zappe, Litzinger, and Messner (2012) decided to flip an architectural engineering course of freshmen. The results on the Student Assessment of their Learning Gains (SALG) showed that the flipped class of students outperformed the traditional classes with higher final exam scores and overall success in the class. Comments on the survey revealed more interest in the course, less intimidation of chemistry, and how useful the videos and powerpoints were.

Day and Foley (Bishop & Verleger, 2013) used the flipped approach in a senior-level computer interaction course. In comparing the experimental and control group, the students in the experimental section scored higher on all homework assignments, projects, and tests. At the University of California at Irvine, an introductory biology course used the flipped classroom. The results showed an increase on the average of 21% better on exam questions that were usually taught through traditional lecture. Professors reported (Papadopoulos & Roman, 2010) that students in an electrical engineering class after using the flipped method moved faster and helped their peers with learning. The test scores were well above those in the traditional courses.

Summing Up

According to Handen, McKnight, McKnight & Arfstron’s Whitepaper (2013) there are few quantitative and qualitative studies on the flipped approach but there is research that substantiates student achievement after using the approach. Surveys from principals and superintendents interested in the model as well as positive comments from parents exist. The flipped classroom: A survey of the research (2013) authored by Bishop & Verleger concluded that students rate the approach positive but a few students are not happy with the model. It goes on to say that if a quiz is given after viewing videos, prior to the class meeting, it works best. In addition, students like face-to-face teacher lectures but prefer the activity-based class meetings. Also, students want short videos over longer ones. In higher education classes in the United States, Vaughn (2014) examined a number of studies that demonstrated improvements in student engagement, preparation, and achievement for the flipped approach. From participating in the writing of this paper three ideas for future studies were shared. Johnson (2013) shared in his dissertation a lack of studies on student perceptions of the flipped classroom. Jarvis, Halvorson, Sadeque, & Johnson (2014) discussed a need for a guide to best practices, and finally Vaughn (2013) discussed how little is known about the flipped approach and the infrastructure across university campuses.

Closing

The flipped approach is not for every class or every teacher. Teachers would benefit from training in how to actively get students involved in the approach. There must be a change in
thinking if this approach will work for teachers and students. What we can learn from this approach is how powerful active teaching is in the classroom. Trying to encourage students to come to class prepared is not a new battle for teachers because teachers understand the effect prepared students can have on how much can be learned. The most important feature in this approach is still the teacher who understands the learners and has a repertoire of many teaching methods. Bergmann and Sams, the founders, believe that teachers should use the videos they create and offer other sources as alternatives. In this digital age of differentiation, teaching will continue to evolve.

Abstract

As science grows in complexity, science teachers face an increasing challenge of helping students interpret models that represent complex science systems. Little is known about how teachers select and use models when planning lessons. This mixed methods study investigated the pedagogical approaches and visual models used by elementary in-service and pre-service teachers in the development of a science lesson about a complex system (e.g., water cycle). Sixty-seven elementary in-service and sixty-nine elementary pre-service teachers completed a card sort task designed to document the types of visual models (e.g., images) that teachers choose when planning science instruction. Quantitative and qualitative analyses were conducted to analyze the card-sort task. Semi-structured interviews were conducted with a subsample of teachers to elicit the rationale for image selection. Results from this study showed that both experienced in-service teachers and novice pre-service teachers tended to select similar models and use similar
rationales for images to be used in lessons. Teachers tended to select models that were aesthetically pleasing, simple in design, and illustrated specific elements of the water cycle. The results also showed that teachers were not likely to select images that represented the less obvious dimensions of the water cycle. Furthermore, teachers selected visual models more as a pedagogical tool to illustrate specific elements of the water cycle and less often as a tool to promote student learning related to complex systems.

Abstract

Figurative language is a concept that should be taught to all students, no matter the students’ ability level. However, this is not consistently happening in classrooms.

English language learners (ELL), and students with learning disabilities struggle with the abstract concept of figurative language. Rather than being ignored, figurative language needs to be addressed by teachers. Figurative language is a critical concept that all students need to be taught to be proficient readers and writers in the 21st century. This
paper discusses the research explored in a case study that focuses on four main ideas which included (1) figurative language in communication; (2) teaching exceptional learners; (3) challenges; and (4) processes. The purpose of this research is to explore how figurative language is taught to different students, including those who struggle understanding the concept of this complex type of language. The importance of figurative language in an individual's life, and how classroom teachers can help foster language development are crucial steps in a student’s understanding of communication. The study incorporated open-ended surveys, Iowa Core, and information-gathering interviews; allowing the researcher to gain insight about students’ learning experiences. The information gathered will enable others to modify education programs leading to more successful initial teaching experiences.
The Role of Motivation in Second Language Acquisition

ABSTRACT

Second language (L2) learning occurs for a variety of reasons, be it as a required subject in school, as a means of integration into a new environment after immigration, for work purposes, or as a matter of personal interest. Regardless of reason for why the learning of a second language is pursued, one of the most important factors for succeeding in L2 learning that must be present in the learner is motivation. The purpose of this research paper is to provide insight into the topic of language-learner motivation by defining the term, examining in some detail the three predominant phases of language learning motivation theories, and by outlining current research. The paper closes with a brief discussion of the implications language-learning motivation has on future research and application in the L2 teaching profession.

Keywords: education, EFL, ESL, higher education, language-learner motivation, motivation, second language acquisition
MOTIVATION DEFINED

Motivation as a contributing factor to second language learning has been variously defined as “the learner’s orientation with regard to the goal of learning a second language” (Norris-Holt, 2001, para. 1); the factor that “explains why people select a particular activity and how long they are willing to persist in it and what effort they invest in it” (Kormos, Kiddle, & Csizér, 2011, p. 496), and as the “primary impetus to initiate learning the L2 and later driving force to sustain the long and often tedious learning experience” (Dörnyei, 1998, p. 117). Dörnyei (1998) writes that while the term is frequently used in second language learning research and researchers largely agree that motivation is the driving force behind human behavior by providing direction, there is little agreement on how exactly motivation works. As a result, numerous language learning theories have sprung up over time, the perspectives of which can be roughly divided into three main phases: The social psychological period, the cognitive-situated period, and the process-oriented period.

This research paper will examine the three traditions in some detail, with preferential treatment being given to Gardner’s socio-educational model. While for the expert of the field, readings on the social psychological period, which was dominated by Gardner’s work, is likely to elicit feelings of nostalgia at best and boredom at worst, this paper, which is primarily aimed at those new to the field of language learner motivation, seeks to provide the foundation and background on which to build upon - not unlike the many researchers who, while voicing criticism over Gardner’s model, nonetheless utilized its core tenets as the foundation for their own frameworks.

LANGUAGE LEARNER THEORIES: THE SOCIAL PSYCHOLOGICAL PHASE

The first phase, the so-called social psychological tradition, saw its beginnings with the research Robert C. Gardner conducted for his Masters thesis with the help of his colleague, Wally Lambert (Gardner, 2009). Gardner, who was to a large extent influenced by the American psychologist Orval Hobart Mowrer, developed what is now known as the Socio-educational Model of Second Language Acquisition in Canada, where English and French speaking communities exist side by side in the socio-political context (Norris-Holt 2001; Apple, Da Silva, & Fellner, 2013).
In the original model, Gardner established connections between four predominant aspects of second language acquisition: The “social and cultural milieu of the speaker,” “individual learner differences,” “the context in which learning takes place,” and “linguistic outcomes” (Norris-Holt, 2001). Built on a foundation of empirical research conducted solely in the L2 classroom environment, the socio-educational model’s “central theme” is the notion that the cultural environment of the learner determines to a substantial degree how successful he will be in acquiring the L2 (Gardner, 1985). For example, in a setting where second language learning is highly encouraged and valued, L2 learners can be expected to be more successful with their learning outcomes than in a community where learning a second language is perceived as difficult or even a waste of time. The second theme of the model addresses individual differences, which Gardner (1985) divided into the four types (or classes) of “intelligence,” “language aptitude,” “motivation,” and “situational anxiety.” Each of the four classes, so Gardner (1985) explains, are important for different, unique reasons; however, they have in common the fact that they play an instrumental role in influencing learners anytime they engage in learning about or working on becoming more proficient in the chosen L2. These learning/acquisition contexts are unique to each learner but can, according to Gardner (1985), be divided into the two general categories of “formal language training” and “informal language experience” – albeit with the caveat that it is not always possible to definitively place a learning context into one of the two categories. The final component of Gardner’s original socio-educational model is divided into two outcomes that are the result of learning a second language: Linguistic and nonlinguistic outcomes. Elements of the former revolve around L2 proficiency, while those of the latter refer to the speaker’s “attitude and values, etc.” that are likely to form as a result of engaging in learning a second language (Gardner, 1985).

Gardner’s socio-educational model, over time, underwent a number of revisions. In 1985, Gardner further sub-divided the individual differences class of motivation into what Liuolienė and Metiūnienė (2006) describe as two “distinct orientations” for language learning: Integrative and instrumental orientation. “Goal-directed,” the two orientations are “part of the learner’s motivation at the goal level and affect the learner’s core motivation” (Liuolienė & Metiūnienė, 2006, p. 94). A third orientation in this sub-division comprises attitude, with Gardner (1985) stating that a learner’s positive attitude towards language learning is likely to result in a positive outcome (Liuolienė & Metiūnienė, 2006). Essentially, where motivation is concerned, Gardner
reoriented his model to place the focus on the integrative motive, that is, the degree of influence of (a) the students’ desire to learn, (b) the intensity of effort exuded in doing so, and (c) the attitude towards the L2 has on the students’ interactions with the L2 community (Apple, Da Silva, & Fellner, 2013). In order to be able to continue the path of empirical research the original model had set out on, Gardner developed the *Attitude Motivation Test Battery* (AMTB), which allowed for the measuring of the four individual differences and their sub-categories, and comprised “11 scales measuring five constructs” (Gardner, 2009).

While Gardner’s socio-educational model stood, for nearly 30 years, at the forefront of research into second language learner motivation, it has not been free of criticism. Early critics such as Oller in 1981 and Au in 1988 addressed specific aspects within Gardner’s model, and in the first half of the 1990s, three publications criticized Gardner’s model itself (MacIntyre, 2002). Crookes and Schmidt’s 1991 paper argued that Gardner’s model was, for the longest time, so dominant that most researchers did not consider spending time to explore in depth other research approaches to motivation, such as, for example, Clement’s concept of *Linguistic Self-confidence*, Giles and Byrne’s *Speech Accommodation Theory*, Schumann’s *Acculturation Model*, or Krashen’s *Monitor Model* (MacIntyre, 2002, Dörnyei & Ushioda, 2011). Thus, this persistently “unbalanced picture” resulted, over the long term, in an understanding of motivation that was much narrower than it could have been had other research avenues been explored alongside Gardner’s model (McIntyre, 2002).

In 1994, Dörnyei expanded upon Crookes and Schmidt’s criticism by stating that Gardner’s distinction between integrative and instrumental orientation was largely due to the bilingual Canadian environment in which all of Gardner’s research had been conducted and thus proved to be too limited in scope (McIntyre, 2002). In the same year, Oxford and Shearin also wrote about the need to expand the socio-educational model, adding four conditions that hinder researchers from gaining a full understanding of motivation: A lack of agreement amongst the research community on how to define motivation, the fact that there are marked differences between second and foreign language situations, “key motivational variables that are missing from the various models,” and “teachers’ inability to understand students’ actual motivation for L2 learning” (McIntyre, 2002, p. 53).
LANGUAGE LEARNER THEORIES: THE COGNITIVE-SITUATED PHASE

Above-described criticisms and resulting research brought on a paradigm shift, leading to a new phase, the cognitive-situated period. According to Apple, Da Silva and Fellner (2013), in this second period, which arose in the early 1990s, researchers focused on placing the motivational features Gardner and his associates had observed in the L2 classroom environment into practical context. Doing so, it was argued, would allow those teaching second language learners to better understand how to motivate their students (Apple, Da Silva & Fellner, 2013).

Apple, Da Silva and Fellner (2013), referring back to Dörnyei’s 2005 work The Psychology of the Language Learner, state that the cognitive situated period can be broadly divided into the cognitive perspective and the situated perspective. The cognitive perspective, according to Apple, Da Silva and Fellner (2013), examines how motivation is affected by the learners’ belief in their own abilities, potentials, and limitations; past performance in similar tasks; and perception of how the various learning tasks the learners are being presented with can help them achieve their learning goals and outcomes. The situated perspective on the other hand investigates the influences the learner encounters in the classroom environment, including the teacher, the learning materials provided, the overall curriculum, and fellow L2 students (Apple, Da Silva & Fellner, 2013).

According to Dörnyei and Ushioda (2011), the two interrelated trends, with their focus on motivation in the actual classroom setting, sought to address the concerns of second language teachers who had felt that the research that had come out of the social psychological period did not provide them with sufficient practical relevance. The latter was largely a response to the criticism of Gardner’s work, which, as briefly discussed above, had by the early 1990s begun to be seen as too limited in scope and content. However, rather than outright dismissing or drastically altering the socio-educational model, during the cognitive-situated period, researchers expanded upon Gardner’s model by incorporating what Dörnyei and Ushioda (2011) call “cognitive motivation concepts.” The resulting shift in focus, so Dörnyei and Ushioda (2011) explain, brought a “wider vision of motivation” (as cited in Tremblay and Gardner, 1995, p. 505) and saw the addition of a number of additional variables the various researchers had derived from cognitive psychology.

Gardner responded to these and related criticisms by expanding, together with Tremblay, his original model with “three concepts from expectancy-value [...] and goal theories [...] as
mediating variables between attitudes and behaviour on the language attitudes → motivational behaviour → achievement sequence:” Goal salience, valence and self-efficacy, each of which was in turn further broken down (Dörnyei & Ushioda, 2011, p. 48). Goal salience was thus subdivided into the categories of “goal specificity” and “goal frequency,” addressing, respectively, the learner’s individual goals and the frequency of the learner’s use of goal strategies. Valence, subdivided into what Dörnyei and Ushioda (2011) call the “traditional scales” of desire to learn a second language and the attitude the learner exudes towards the L2 learned, was used as a means to evaluate the value the learning of a second language has for the learner. Self-efficacy, subdivided into “L2 use anxiety” and “L2 class anxiety,” addressed learners’ worries about L2 use and performance in the classroom, while a third sub-category, “performance expectancy,” looked at what the students expected to be able to achieve with the amount of L2 learned by the end of the course (Dörnyei & Ushioda (2011).

As can be gleaned from the above summaries of only a few salient points, the growing desire of researchers to expand and build upon Gardner’s socio-educational model during the cognitive-situated period resulted in the development of a large number of increasingly complex and expansive theoretical models and frameworks, with many of them explicitly focusing on the classroom setting. Even a brief description of each of the more prevalent theoretical models would go beyond the scope of this paper; thus, the overview of the predominant frameworks of this period shall be restricted to Dörnyei’s Three-level Framework of L2 Motivation, Williams and Burden’s Social Constructivist Model, and Noel et al.’s model of language learning motivation, which was based on Deci and Ryan’s Self-determination Theory (Dörnyei & Ushioda, 2011; Apple, Da Silva, & Fellner, 2013).

Dörnyei based his framework on Crooke’s and Schmidt’s examination of L2 learner motivation, dividing his concept of L2 motivation into the “three distinct levels” of language level, learner level, and learning situation level (Dörnyei & Ushioda, 2011). This rather elaborate framework attempted to “synthesize various lines of research by offering an extensive list of motivational components categorized into [the] three main dimensions” listed above (Dörnyei, 1998, p.125). Among the three dimensions, the learning situation level, which is primarily based on research conducted in the field of educational psychology, proves to be the most complex, largely due to the fact of having been broken down further into course-specific motivational components, teacher-specific motivational components, and group-specific
components. To complicate matters further, each of these components received their own subdivisions.

Returning to a bird’s eye view of the *Three-level Framework of L2 Motivation*, Dörnyei’s rationale for separating out and sub-categorizing the three levels of motivation was rooted in his belief that while the three levels undeniably had an impact on learners’ motivation they did so independently from one another (Dörnyei & Ushioda, 2011). As a result, so Dörnyei and Ushioda (2011) write, “each [of the three levels] has sufficient power to nullify the effects of the motives associated with the other two levels” (p. 53).

Looking back, Dörnyei, in 1998, reflects on the usefulness of his 1994 model, stating that it allowed for bringing to the fore the many dimensions of second language learning motivation, pulling together individual research efforts, and “providing an elaborate enough specification of relevant motives for the purpose of in-depth analysis of particular learning situations and design of intervention techniques to enhance them” (Dörnyei, 1998, p. 126). In the same publication, Dörnyei (1998) also addresses criticisms of his model, conceding that as a result of a lack of apparent connections between the individual components of the model, and the components themselves being too varied in nature to lend themselves easily to empirical testing, the *Three-level Framework of L2 Motivation* “cannot be seen as a motivation model proper” (Dörnyei, 1998, p. 126). Dörnyei (1998) continues his self-criticism by stating that the framework lacks “the goal component” and neglects to take into consideration elements of the then contemporary findings of Deci and Ryan’s *Self-determination Theory*. He concludes the critical analysis of his own framework with the observation that the “integrative/instrumental motivational dichotomy at the language level is obviously misleading in providing a simplification of the intricate processes determining the social dimensions of L2 motivation (Dörnyei, 1998, p. 126).

In similar fashion to Dörnyei’s work, Williams and Burden’s *Social Constructivist Model* also sought to summarize the numerous motivational components that were perceived to be relevant to second language learner motivation in the classroom setting during the cognitive-situated period (Dörnyei & Ushioda, 2011). First published in 1997, Williams and Burden’s model is, in accordance with its title, based on a “social constructivist approach” and one of the few frameworks that includes a detailed definition of motivation, which, due to being a “rarity” in the field, shall be reproduced here in its entirety from Williams and Burden’s 1997 work *Psychology for Language Teachers*: 
Motivation may be construed as a state of cognitive and emotional arousal, which leads to a conscious decision to act, and which gives rise to a period of sustained intellectual and/or physical effort in order to attain a previously set goal. (or goals) (p. 120)

And,

A constructivist view of motivation centres around the premise that each individual is motivated differently [...]. However, an individual’s motivation is also subject to social and contextual influences. These will include the whole culture and context and the social situation, as well as significant other people and the individual’s interaction with these people. (p. 121)

When compiling their comprehensive summary of existing motivational components, an undertaking that, so Dörnyei (1998) points out, was actually “part of a larger overview of psychology for language teachers” (p. 126), Williams and Burden made every effort to include a number of “environmental variables” in their extensive framework, which, at the top level, were divided into the two categories of internal factors and external factors. These variables were subsequently tested for their “motivational impact” in a classroom setting that included teachers and curricula, leading Williams and Burden to conclude that teachers seek to create a positive classroom environment that is conducive to confidence building, allows for mistakes to be seen as a normal part of language learning, and successfully conveys to the students that tasks and assignments are vital to the success of L2 learning (Apple, Da Silva, & Fellner, 2013).

As a detailed discussion of each of the factors and their sub-factors is far beyond the scope of this essay, the table below shall act as means to provide rudimentary insight. The reader interested in further exploring Williams and Burden’s framework of motivation in language learning is directed to Williams and Burden’s 1997 book titled Psychology for Language Teachers.
Fig. 1 Williams and Burden’s (1997) Framework of Motivation in Language Learning (Dörnyei, 1998)

As can be expected, Williams and Burden’s framework is not free of criticism. Due to its similarities with Dörnyei’s *Three-level Framework of L2 Motivation* (in the sense of attempting to bring together multiple lines of research on motivation), it too lacked “directional relationships” between the components/variables listed (Dörnyei, 1998). Furthermore, rather than relying on second language learning theories, the authors resulted to utilizing resources that were primarily based on mainstream theories, a choice that situated their work “very much in line with the ‘paradigm-seeking spirit’ of the reform movements of the 1990s” (Dörnyei, 1998, p. 126).

Before leaving the cognitive-situated period behind, this essay shall take a brief look at one more important language learning motivation model: Kim Noels et al.’s model of language learning motivation, which is based on Deci and Ryan’s *Self-determination Theory*.

Characterized by Deci and Ryan as a “meta theory,” *Self-determination Theory* (SDT), in its broadest scope, focuses on *intrinsic* and *extrinsic motivation* (Self-Determination Theory, 2015). Apple, Da Silva, and Fellner (2013) explain that when L2 learners develop intrinsic (that is, “more self-determined”) motivation, they enjoy the learning process and associate success with the act of learning itself. Where extrinsic (“less self-determined”) motivation is concerned, learners’ reactions are the result of external signals such as “reward” and “punishment” (Apple, Da Silva, & Fellner, 2013). Deci and Ryan tie in the two types of motivation with three “basic human needs” of *autonomy, competence, and relatedness*, which, when fulfilled, serve to
enhance intrinsic motivation (Apple, Da Silva, & Fellner, 2013; Busse & Walter, 2013). On the other hand, so SDT proposes, “the degree to which any of these three psychological needs is unsupported or thwarted within a social context will have a robust detrimental impact on wellness in that setting” (Self-Determination Theory, 2015). Based on SDT concepts, Noels and her colleagues constructed their self-determination oriented framework and, after extensive research, devised the Language Learning Orientations Scale, a thorough questionnaire that allowed for the measuring and subsequent assessment of L2 learners’ intrinsic and extrinsic motivation orientations (Dörnyei & Ushioda, 2011). The research results showed that self-determined students who are driven by intrinsic motivation are “more persistent and exhibit greater motivational intensity” but also revealed that some intrinsic motivation factors like interest in and enjoyment of L2 learning may, by themselves, not be sufficient to keep the learner motivated over longer periods in time (Apple, Da Silva, & Fellner, 2013, p. 95). As such, “personal value and importance of learning the language” may be of greater importance in this context (Dörnyei & Ushioda, 2011, p. 57). Overall, so Dörnyei (1998) writes, Noels et al.’s framework proved useful for the organization of the growing number of “L2 learning orientations,” and the extensive research conducted provided “empirical evidence that the motivational complex of language learners could be validly described using the intrinsic/extrinsic subtypes” (p. 124).

While criticism of individual research, frameworks, and models was not uncommon during the cognitive-situated period, towards its waning years, the critical focus shifted to a broader view. Dörnyei (1998), for example, points out that the amount of research conducted in the relatively short cognitive-situated period led to an overabundance of motivational theories that were rooted in or related to aspects of cognitive psychology. This, so Dörnyei (1998) continues, led to confusion and, in many cases, to a merely “superficial representation of motivation in the L2 literature – for example, when the results of a few questionnaire items are equated with ‘motivation’” (p. 118). Busse and Walter (2013) elaborate on this critique by stating that while most motivation theories and frameworks of the cognitive-situated period include “important components” such as “goals, emotional arousal, and self-related beliefs,” many of the models merely list and define them, but only a few researchers “actually described in detail how these motivational constructs interact” (p. 498). Furthermore, even where interaction between the motivational constructs is considered, said constructs are “placed on
different stages of the motivational system,” leading researchers to arrive at “contradictory assumptions as to how they influence motivated learning behavior” (Busse & Walter, 2013, p. 498). This, so Busse and Walter (2013) conclude, is the result of the “inherent difficulties involved in examining motivation in quantitative research” where the researchers are forced to “restrict and simplify the number of factors that can be analyzed within a single study” (p. 498).

LANGUAGE LEARNER THEORIES: THE PROCESS-ORIENTED PHASE

The process-oriented period focused on the “dynamic character and temporal variation” of motivation (Dörnyei, 2005, p. 83), an aspect that, until then, had gone largely unnoticed -- mostly due to the fact that it had been difficult for researchers to adequately describe the “temporal organization of motivation,” that is, to “portray motivational processes as they happen in time” (Dörnyei & Ushioda, 2011, p. 60). During this phase, Williams and Burden, as well as Ushioda, conducted important work on the temporal aspect of motivation but overall, the process-oriented period was dominated by Dörnyei and Otto’s Process Model.

Language learning is a process that can only occur over time and invariably includes phases during which the L2 learner experiences fluctuations in their level of motivation. Thus, so Dörnyei (2005) writes, motivation is not a static concept, but rather a “dynamic factor that displays continuous fluctuation” (p. 83). Williams and Burden, in 1997, made the “conceptual distinction between motivation for engagement and motivation during engagement” (Dörnyei & Ushioda, 2011, p. 60), and “separated three stages of the motivation process along a continuum: ‘Reasons for doing something’ ---› ‘Deciding to do something’ ---› ‘Sustaining the effort, or persisting’” (Dörnyei, 2005, p. 83). The first two stages, so Dörnyei (2005) explains, are concerned with “initiating motivation” while the third stage revolves around “sustaining motivation.” In similar fashion to Williams and Burden, Ushioda (2011) points out that motivation is in flux rather than static, and especially so where institutionalized learning is involved. Ushioda subsequently conducted qualitative research, the analysis of which resulted in her “theoretical framework of motivation from a temporal perspective” and let her to conclude that the “notion of a temporal frame of reference shaping motivational thinking integrates the phenomenon of evolution over time, which seems central to the learners’ experience [...]” (as cited in Dörnyei & Ushioda, 2011, p. 63).
Dörnyei and Otto’s *Process Model* constitutes, in Dörnyei’s own words, “the most elaborate attempt to model the process dimension of L2 motivation” (Dörnyei & Ushioda, 2011, p. 65). The extent and complexity of the model may be best understood when reading Dörnyei (2005)’s description thereof:

This model and its further elaboration (Dörnyei, 2000, 2001) broke down the motivational process into several discrete temporal segments, organized along the progression that describes how initial *wishes* and *desires* are first transformed into *goals* and then into operationalized *intentions*, and how these intentions are *enacted*, leading (hopefully) to the accomplishment of the goal and concluded by the final *evaluation* of the process. (p. 84)

Based on Heckhausen and Kuhl’s *Action Control Theory*, the motivational process described by Dörnyei (2005) is broken down into the three “distinct” phases of *preactional stage*, *actional stage*, and *postactional stage* (Dörnyei, 2005; Dörnyei, & Ushioda, 2011). During the preactional stage, “which roughly corresponds to Heckhausen and Kuhl’s *choice motivation*,” motivation must first be generated before a goal can be set (Dörnyei, & Ushioda, 2011, p. 65). During the actional stage, which in Heckhausen and Kuhl’s theory is termed *executive motivation*, motivation is actively maintained and protected from a number of distracting influences that could prevent the learner from continuing to learn. During the postactional stage, or *motivational retrospection*, the learner then critically evaluates his learning experience (Dörnyei, 2005).

The key factor to consider when examining this model is the fact that during each of the three stages, learners are affected by different motivational influences. This provided Dörnyei and Otto with the opportunity to group the different components of motivation research they had seen over time into the three distinct phases. The advantage of this approach, so Dörnyei (2005) points out, is that it is no longer necessary to keep the different motivation research approaches separated from one another, so long as they do not intersect. Dörnyei (2005) names Gardner’s socio-educational model as an example and states that he believes that the model is “effective in explaining variance in choice motivation but [that] to explain executive motivation, more situated factors need to be taken into account” (Dörnyei, 2005, P. 86). As above-presented account of Dörnyei and Otto’s *Process Model* has barely scratched the surface, the interested reader is directed to Dörnyei and Ushioda (2011) for a more comprehensive summary of the model.
Dörnyei (2005), stoutest critic of his own work, writes that while the Process Model presented a good start into the research of the temporal organization of motivation, it fell short in two ways, both related to the actional process portion of the model. Firstly, so he states, it is implied that the “actional process in question is well definable and has clear-cut boundaries,” and secondly, “the actional process does not occur in isolation, without any interferences from other ongoing activities the learner is engaged in” (Dörnyei, 2005, p. 86). Where the former is concerned, the question must then be, “where exactly does the action start in an educational context?” and where the latter is concerned, Dörnyei (2005) concludes that hardly any research has been conducted on “how people deal with multiple actions and goals, [and] how they prioritize between them” (p. 87). To be able to answer these and other prominent questions relating to the changing nature of motivation research, Dörnyei subsequently developed the L2 Motivational Self System, which will be discussed as part of the socio-dynamic perspective outlined below.

CURRENT LINES OF RESEARCH: THE SOCIO-DYNAMIC PERSPECTIVE

While oftentimes, Dörnyei’s Motivational Self-system of L2 Learning is considered part of the process-oriented phase, Dörnyei states that his model is part of a new phase, which he and Ushioda termed the socio-dynamic period (Dörnyei, & Ushioda, 2011). At the beginning of the socio-dynamic period, a new direction in motivation research led to a rethinking of the theories developed during the first three phases, and resulted in a shift from “external to internal processes of identification” (Ushioda, 2011, p. 201). One major factor that contributed to this change was the realization by researchers that by the 21st century, English had become the world lingua franca. Examining this development, questions arose about whether or not the social psychological theory of integrative motivation could still provide valid explanations when in the new millennium learners choose English as their L2 because they see it as a basic skill needed to succeed in an increasingly international community; there is no single target community the learner can identify themselves with; and traditional geographical boundaries are being erased by rapidly evolving technological advances in online communication (Ushioda, 2011). While simplified, Ushioda (2011) aptly summarizes the shift in thinking about motivation by saying that “given the global nature of English language communication and of Internet use, our ‘integrative’ motivation to participate in these worlds may be better explained in terms of our
desired self-representations as de facto members of these global communities, rather than in terms of identification with external reference groups” (p. 201). No longer is the primary integrative goal of many English language learners one of wishing to integrate into the community of the target language, but one of “international posture,” which includes “interest in foreign or international affairs, willingness to go overseas to study or work, readiness to interact with intercultural partners...and a non-ethnocentric attitude toward different cultures” (Kormos, Kiddle, & Csizér, 2011).

Below, a brief overview of select research lines will be presented, followed by a more extensive discussion of Dörnyei’s *L2 Motivational Self System*.

**Global Changes in Motivation**

Global changes in motivation, that is, fluctuations in the level of motivation that are experienced by the learner over a prolonged period of time, have been investigated with a number of studies, with most of them consisting of survey instruments in the form of questionnaires. Chambers, in 1999; Gardner, *et. al.*, in 2004; Inbar *et. al.*, in 2001; Tachibana *et. al.*, and Williams *et al.*, in 2002, examined the level of motivation of L2 students at different points in time (Dörnyei, & Ushioda, 2011). The findings of these studies were consistent in that they revealed that over time, the motivation level of the students had declined, and especially so with upper level school students who saw themselves faced with increasingly difficult and demanding curricula (Dörnyei, & Ushioda, 2011). While these types of studies are limited in that they can only provide a broad picture, they are nonetheless useful for giving insight into the specific components of motivation that are most likely to fluctuate. Ushioda (2011) provides as an example Gardner’s study, which found that in university students learning French, “situation-specific motivation (attitudes towards the learning situation) was prone to much greater changes than integrativeness, and that such changes were associated with students’ ultimate success in the course” (p. 67).

**Motivation Across the Lifespan**

According to Ryan and Dörnyei (2013), much of the research conducted in and literature published on second language learning motivation revolves around young people learning a second language in the classroom environment. Age as a factor in L2 motivation has not yet been researched extensively but is starting to receive increased attention, largely due to the fact that L2 learning is no longer confined to the classroom of the youth but is by many adults pursued
either out of necessity or for pleasure. As such, research is seeking to understand how language learning motivation theories can help understand “language learning as a long-term pursuit” (Ryan & Dörnyei, 2013, p. 89). Heckhausen, Wrosch, and Schulz’s Motivational Theory of Life-Span Development is among the foremost frameworks of motivation concerned with how motivation changes over the lifetime of an individual. First proposed by Heckhausen and Schulz in 1995 as the Life Span Theory of Control, the theory focuses on the “role of the individual as an active agent in life-span development” (Heckhausen, Wrosch, & Schulz, 2010).

In this model, people have “two basic modes of behaviour control: primary control and secondary control” (Ryan & Dörnyei, 2013, p. 93), with primary control “enabling individuals to shape their environment,” and secondary control serving to “protect the individual against the threats to the self posed by failure” (Ryan & Dörnyei, 2013, p. 93). Since its inception, the original model has undergone numerous revisions and expansions, most notably the addition of the Model of Optimization in Primary and Secondary Control, which was developed by Heckhausen, Wrosch, and Schulz to “address how individuals choose goals in accordance with principles of development optimization,” as well as the Action Phase Model of Developmental Regulation, which “describes the sequential structure of goal-oriented action cycles [...]” (Heckhausen, Wrosch, & Schulz, 2010, p. 32). The synthesis of the original theory with the two models resulted in the Motivational Theory of Life-Span Development, the research focus of which revolves around the “capacity of individuals to optimize development across major changes in the life course” (Heckhausen, Wrosch, & Schulz, 2010, p. 54).

While many of the conceptual framework’s theories have been supported with empirical research, Ryan and Dörnyei (2013) state that the continued dearth of empirical research presents one of the “greatest impediments to a more complete understanding of the self-concept of adults and how it relates to learner motivation” (p. 94). DeKeyser (2013) raises similar concerns, stating that, “the effect of age on ultimate attainment in second language learning has been a controversial topic for years, mainly due to “conceptual misunderstandings” and “methodological difficulties” (DeKeyser, 2013, p. 52). It is important to seek answers, so DeKeyser (2013) continues, as the age effect on L2 learning is vital for second language teachers’ understanding on how to best develop and adapt curricula to different ages. Thus, in agreement with Ryan and Dörnyei (2013), DeKeyser (2013) calls for increased empirical
research that is based on better sampling, better instrumentation, but also leaves room for alternative approaches to research.

**Dörnyei’s L2 Motivational Self System**

At the forefront of the “conceptual shift to the internal domain of the self-concept” stood Dörnyei’s *L2 Motivational Self System* model, which, while having been firmly rooted in previous research on L2 motivation, ultimately grew out of two theoretical concepts: The L2 research that had been conducted on the concepts of integrativeness/integrative motivation as part of the second language field, and the research on the possible self within the field of psychology (Dörnyei & Ushioda, 2011; Ushioda, 2011). After the completion of a longitudinal study he conducted between 1993 and 2004 with more than 13,000 Hungarian students, so Dörnyei (2009) writes, he was “ready to move beyond integrativeness, and possible selves theory seemed to offer the most promising way forward” (p. 25). The study had included a variable which was initially identified as integrativeness but was, upon extensive analysis by Dörnyei, found to “tap into a broader dimension, the learner’s ‘ideal self,’ and thus a link was created with L2 motivation and future self guides” (Dörnyei & Ushioda, 2011, p. 86). This insight led to the creation of the *L2 Motivational Self System*, which comprises the three components of *ideal self*, *ought-to self*, and *L2 learning experience*. Ideal self represents the learner’s ideal of the self, that is, the learner sees himself as a person who would like to succeed in learning an L2. This image constitutes a powerful motivator in that it drives the learner to move from the current self to the ideal self. Dörnyei and Ushioda (2011) state that this component typically belongs into the category of the “traditional integrative and internalised instrumental motives” (p. 88). The ought-to self component is concerned with the types of attributes a learner believes he needs to have in order to meet the expectations of language learning and also to avoid failure. This component “corresponds to Higgins’s ought self and thus involves the more extrinsic (i.e. less internalised) types of instrumental motives” (Dörnyei & Ushioda, 2011, p. 86). The third component, L2 learning experience, is situational, that is, it is concerned with where learning happens and how the learner experiences the learning process in the classroom environment (Dörnyei and Ushioda, 2011).

The advantage of looking at language learner motivation from the perspective of Dörnyei’s reinterpreted *L2 Motivational Self System* lays in the opportunity to create new avenues for motivating L2 learners, and specifically so where the model’s first component, the
ideal self, is concerned. Based on the knowledge that the ideal self is a powerful motivator, those teaching second languages can thus structure a curriculum and classroom atmosphere that promotes the ideal self through “generating a language learning vision and through imagery enhancement,” that is, “possible future self-guides” (Dörnyei, 2009, pp. 32-33).

While the notion of ideal self and possible future selves has indeed led to a paradigm shift in L2 motivation research, it does not come without drawbacks. Dörnyei (2009) writes that a possible problem arises from the notion that to be successfully applied in L2 teaching, the student’s ideal self/possible future self must exist in the first place. Furthermore, not every student in a classroom will be able to create a vision of an ideal self to the same degree. It is thus of vital importance that the L2 teacher fosters awareness about the ideal self by guiding the students through various possible future selves they may have started to envision, and also by presenting role models for the students to emulate (Dörnyei, 2009). Assuming however, that students have the ability to create an ideal self to some degree, care needs to be taken to strengthen the vision. Here, so Dörnyei (2009) writes, previously conducted research into imagery enhancement from the fields of psychology, education and sports can be of much value in the L2 classroom due to the fact that “our capacity for imagery and fantasy can indeed give us a kind of control over possible futures” (p. 36). Strengthening the vision alone is not sufficient, however; it also needs to be substantiated in such a way as to be realistic, believable, and sustainable. Here too, Dörnyei (2009) points to the usefulness of approaches drawn from psychology research, such as Oyserman et al.’s “self-oriented training programme,” which encourages students to visualize, strengthen, and substantiate their ideal self/possible future self with in-class activities such as the creation of a “Possible Selves Tree” (p. 36). To keep the vision alive over the long term, Dörnyei (2009) points to the fact that many L2 teachers are already practicing a number of activities that can easily be modified to serve as reminders about the students’ ideal selves. Finally, “the ideal self should come as part of a package consisting of an imaginary component and a repertoire of appropriate plans, scripts and self-regulatory strategies” (Dörnyei, 2009, p. 37). According to Dörnyei, this is a feasible undertaking due to the fact that language learning motivation research and teaching methods overlap to a degree that allows for the inclusion of goal setting components in the language-learning curriculum (Dörnyei, 2009). To avoid failure at any one of the above-described stages of ideal self creation, teachers should regularly remind students about the limitations brought on by not learning the
L2, as well as “recurrently [prime] the learners’ ‘Ought-to L2 Self’ by highlighting the duties and obligations the learners have committed themselves to” (Dörnyei, 2009, p. 38). While this may, at first glance, appear to be counterproductive to the creation, strengthening, and sustaining of the ideal self, it is by and large human nature to focus on the positive and only consider the negative when all else fails. Thus, including regular reminders about possible negative consequences of failing to learn an L2 presents a more balanced view of the vision, a concept that was proposed by Oyserman and Markus in 1990 (Dörnyei, 2009).

Never one to shy away from criticizing his own work, Dörnyei (2009) concedes that no research has been conducted on how to “specifically develop an ideal language self” (p. 34), and that “very little is said in the literature about activating the ideal self” (p. 37). He also points out that, in accordance with the findings of “Zetner and Renaud (2007) [who] claim that stable ideal-self representations do not emerge before adolescence,” application of the self approach may not be appropriate in a pre-secondary student classroom (Dörnyei, 2009, p. 38). Lastly, Dörnyei (2009) clarifies that his reframing of L2 motivation research to a perspective of an ideal self/possible self is not meant to invalidate previously conducted L2 research, but that on the contrary, he believes that his research results “will come to life and receive a new meaningfulness within the self framework (p. 38).

**LANGUAGE LEARNING MOTIVATION: IMPLICATIONS FOR THE PROFESSION**

Thus far, this paper has concerned itself exclusively with the theoretical approach to motivation as it relates to second language acquisition. Due to the manifold approaches that have been discussed and developed, the remainder of the text will briefly examine how the theoretical findings of motivation research can benefit language teachers in the classroom environment. Restricted to more recent research and with primary focus on Dörnyei’s *L2 Motivational Self System*, the overall focus will be on how to motivate students, that is, how to continuously generate, enhance, and maintain students’ motivation, and how to protect it from distractions.

*Dörnyei’s Framework for Motivational Strategies*

Based on the *Process Model* developed by Dörnyei and Otto in the early 1990s, *Dörnyei’s Framework for Motivational Strategies* was introduced in 2001 in the effort to “organise the long list of relevant motivational techniques into separate ‘themes’” (Dörnyei & Ushioda, 2011). The model, so Dörnyei and Ushioda (2011) state, has the important advantage of
being comprehensive, thus providing teachers with guidance through the motivational process from start to finish rather than setting the focus on a single theme that is used throughout.

Dörnyei’s framework for a successfully organized motivational teaching practice involves four key units: (1) “Creation of the basic motivational conditions,” (2) “Generating student motivation,” (3) “Maintaining and protecting motivation,” and (4) “Encouraging positive self-evaluation” (Dörnyei & Ushioda, 2011, p. 107). As can be seen by the descriptive titles of the key units alone, Dörnyei’s Framework for Motivational Strategies is closely aligned with his L2 Motivational Self System. In fact, so Dörnyei and Ushioda (2011) point out, the L2 Motivational Self System and its emphasis on vision opened the doors to finding and creating new ways for teachers to motivate students. As the Framework for Motivational Strategies is discussed in detail in Dörnyei and Ushioda (2011), for the purpose of this paper, the model’s basic tenets are presented by means of the table below.

![Diagram of Dörnyei's Framework of Motivational Teaching Practice in the L2 Classroom](image)

Figure 5.1 The components of Dörnyei’s (2001a: 29) framework of motivational teaching practice in the L2 classroom

Fig. 2 Dörnyei’s Framework of Motivational Teaching Practice in the L2 Classroom (Dörnyei & Ushioda, 2011).
What above table does not show is the fact that each of the key strategies listed is further divided into key sub-strategies, many of which are expanded upon in turn. While certainly comprehensive, such an extensive model might, for some teachers, present the challenge of wanting to choose all of the strategies they believe would work best in their classroom with the result of selecting too many strategies, all of which they must then pay attention to alongside the day-to-day teaching and classroom management. To avoid such a conundrum, Dörnyei and Ushioda (2011) recommend that teachers start with a small set of strategies, such as the Ten Commandments for Motivating Language Learners, which were developed by Dörnyei and Csizér (1998) in the effort of providing teachers with a “core’ set of motivational strategies:

1. Set a personal example with your own behaviour.
2. Create a pleasant, relaxed atmosphere in the classroom.
3. Present the tasks properly.
4. Develop a good relationship with the learners.
5. Increase the learners’ linguistic self-confidence.
6. Make the language classes interesting.
7. Promote learner autonomy.
8. Personalize the learning process.
9. Increase the learners’ goal-orientatedness.
10. Familiarize learners with the target language culture. (p. 215)

While this list of “ten commandments” is certainly not applicable as a whole in every classroom, it nonetheless provides common-sense guidance for teachers seeking to enter into or expand upon existing motivation-sensitive teaching approaches. When considering above-listed core strategies, as well as others from Dörnyei’s model or related research, great care should be taken in considering whether the chosen strategies are appropriate for the students, the classroom environment, and the socio-cultural context in which the L2 learning takes place. Two practical concerns teachers need to consider in advance are the extent to which the consciously chosen motivational strategies are practiced in addition to already established “good or effective teaching practice,” and how to balance the fostering of students’ motivation with the learning goals and outcomes set by the curriculum” (Dörnyei & Ushioda, 2011, p. 135). Possibly the most difficult aspect of the latter lays in the “recognition that there is a critical difference between ‘motivating’ students and ‘developing their motivation’ -- that is, between creating unhealthy teacher-dependent forms of student motivation [...] and socialising and generating healthy forms of internally driven motivation [...]” (Dörnyei & Ushioda, 2011).
Breaking Away from Generalizable Models of Motivation: Learner as Person and Dogme Language Teaching

While in past research, language learning motivation has been sought to be distinct from motivation in other domains, Ushioda (2011) writes that in the more recent research the uniqueness of L2 motivation is no longer based on the learner’s “attitudes to the target language community and culture but on the fact that language is a medium of self-expression and a means of communicating, constructing and negotiating who we are and how we relate to the world around us – that is, of giving ourselves voice and identity” (pp. 203-204). Viewed from a pedagogical perspective, this means that teachers should instruct their students to see the L2 as a means of self-expression and self-development (Ushioda, 2011).

While deceptively simple on the surface, this “humanistic person-centred approach” requires, so Ushioda (2011) states, teachers to think of students as people rather than “types of learners” and to shift from using previously developed “generalizable models of motivation” to engaging “the uniquely individual people in their classroom” (p. 204).

One way of achieving this goal is to utilize Dogme Language Teaching, which originated with language education author Thornbury in 2000 and was, after having become a movement in English Language Teaching (ELT), developed into a fully formed methodology by Meddings and Thornbury by 2009 (Ushioda, 2011). Dogme Language Teaching focuses on the students’ interaction with the teacher by means of conversation, allowing for these interactions to be spontaneous, learner-driven and learner centered, instead of being restrained and controlled by the instructor’s pedagogy. As a result, students’ voices are heard, their interests realized, and their own identities established (Ushioda, 2011). Major drawbacks to Dogme teaching are the lack of empirical research to support the effectiveness of the approach, as well as Meddings and Thornbury’s insistence of “teaching unplugged” at a time and age where students are increasingly encouraged, and even required, to utilize computer technology inside and outside the classroom (Ushioda, 2011). Additionally, so Ushioda (2011) points out, Dogme Language Teaching has, for the most part, rejected widespread publication of materials and teaching resources, a fact that makes it difficult for teachers to comprehend and practice the approach. Nonetheless, Dogme teaching has retained its popularity to such a degree that proponents of the approach have begun to make concessions where “teaching unplugged” is concerned and are

CONCLUSION

This research paper has guided the reader through more than five decades of research on second language learning motivation. It outlined, in some detail, the three phases (or periods) the research on the topic can broadly be divided into, beginning with the social-psychological phase, followed by the cognitive-situated phase, and rounded out by the process-oriented phase. For each of the three phases, the predominant theories, frameworks and models were discussed with the use of relevant literature. The inclusion of criticism informed the reader as to how and why changes in thought led to shifts in theory and praxis over time. While the reader may find the treatment of the topic in this essay somewhat lengthy and much too theoretical, it de facto merely scratched the surface of a field of research that has never waned in popularity and continues to evolve at a fast pace. As a result, many concepts were only briefly addressed while others had to be left out entirely, leading to an incomplete, yet not superficial treatment of the topic.

As more than 50 years of research have revealed, much of what motivates L2 learners has yet to be discovered, with many questions remaining unanswered. To this day, little research has been conducted on the effect age has on L2 learning; the same holds true for the field of demotivation. As research into L2 learner motivation as it relates to the self continues, these two subfields, along with others, are likely to garner more attention. However, empirical research will likely prove difficult, as matters of age and demotivation are to a large part subjective.

The research on second language learning motivation will continue to see the emergence of many improved and new theories, frameworks, and models, such as the concept of Directed Motivational Currents, which was introduced by Muir and Dörnyei in 2013. It is the hope of this author that room will be made for the exploration of the more controversial approaches, such as Dogme Language Teaching. While the research into these areas may be snuffed by some or considered niche by others, they have the potential of finding practical application in new L2 teaching environments that are continuously emerging and evolving alongside the theoretical research. If nothing else, off-the-beaten path and controversial approaches will assure a lively conversation on why and how people around the world are motivated each day to learn – and keep learning – a second language.

Abstract:
While lectures can be crafted in a manner to cover course content, student attention begins to decline after 10-15 minutes. Active learning engages students in the learning process to think critically, work collaboratively, express ideas, explore knowledge, make connections, and reflect. Students remain engaged in the learning process when utilizing an active learning strategy and therefore learner retention is increased. Problem-based learning (PBL) is an active learning strategy not commonly incorporated in methodology courses outside of the STEM fields. This research explored the use of PBLs in reading and language arts methodology courses to increase active learning and learner retention. The research was qualitative with a grounded theory methodology. Extensive data was collected to develop a theory regarding the use of PBLs as an active learning strategy in reading and language arts methodology courses. The findings showed student retention of knowledge increased when using PBLs as an active learning strategy compared to a lecture format.
Student perspectives of using PBLs as a learning strategy were not as favorable. While using PBLs in reading and language arts methodology courses for teacher preparation is effective, further research is needed in understanding student perceptions. The grounded theory research project affords a roadmap of integration, increased participation, and recognized learner retention.
Title: Representation of identities: Social media and education

Abstract: The evolution of communication through the Internet has influenced shaping and reshaping the identities of social media users. Communication through online interaction involves the societies in understanding each other culturally and historically while the online information exchange has influences on the identity formation of individuals (Hall, 2003). The analysis of online interviews and Facebook interactions of this qualitative multiple case study revealed that there are tight restrictions in receiving proper education from many social topics which are considered “taboos”. Social media pages and channels provide the context of information sharing in order to fill the gap in these areas. The data in this study have been collected through individual synchronous online interviews with Facebook users and through the analysis of the participants’ Facebook profiles and activities over a period of six months. The data is analysed with an emphasis on the identity formation of participants through the recognition of the underlying themes. The exploration of online interviews is on the basis of participants’ personal account of identity, language use and social media use. The ‘interactions’ and ‘presentation of self’ have been considered in the Facebook analysis phase of research. It is hoped that this research will have implications for education contexts by offering an increased understanding of the role of online communities in constructing the identities of adult social media users.

6. Abstract:

Eating disorders (ED) is one of the most prevalent mental illness among adolescents (Fairburn, 2008). Most of them present high risk of ED while achieving their academic cursus, especially athletes (Sundgot-Borgen et al., 2013). School and teachers could help prevent ED but ED isn’t a problem of interest for education, even if they can have a negative influence on their academic success.
While the majority of studies about ED are focused on the person with ED or the significant other, this research wants to draw the picture of ED in a Canadian college with a double look: ED as lived by students and perceived by teachers. Three objectives were defined: identify the risk of ED among students, identify perceptions and beliefs about ED among teachers and finally compare the reality of ED with perceptions in order to see if there were any differences between the two.

Mixed methods were used in this research. First, students completed several questionnaires like the eating disorders inventory, then teachers and coaches completed a questionnaire about ED then participated in a focus group. Interview questions were determined using the results obtained with student’s questionnaires.

Preliminary and partials results show that students are presenting ED symptoms in the form of diets, bulimia, or excessive physical activity. Those symptoms are more prevalent among non-athletes than athletes. Teachers are not able to precisely estimate how many students may present ED symptoms. And they don’t know how to look for the right signs in order to help them.

Those results let us think about how knowledge of this characteristics among students and staff, may help in ED prevention in schools. It seems important to develop formation for the staff and help in early identification of ED, based on those findings.
Understanding the Role and Contributions of Instructional Staff in a Cohort Experience

Understanding the Role and Contributions of Instructional Staff in a Cohort Experience

Abstract

In the academic world of the 21st century, institutional administrators are faced with the need to be financially creative in managing large scale work environments that incur considerable costs at the same time as also ensuring the provision of high quality educational experiences. With the increase in popularity of undergraduate education, the need for viable programs to assist in the effective delivery of undergraduate courses and the support of the continued development of instructional excellence seems to be essential. Dyson and Hanley (2002) identified that the effectiveness of instructional delivery had started to become a point of considerable interest for administrators at higher education environments. This was particularly due to public demand for accountability and demands for reform. Such pressures resulted in a movement toward more learner-centered experiences (Doolen & Biddlecombe, 2014, Leisey et al., 2014) and, in recent years, an appreciation of the importance of developing learning communities (Cleveland-Innes, Garrison, & Kinsel, 2008, Lei et al. 2011). This is particularly important as community is identified as being essential when aiming to support collaboration and promote high levels of learning (Rausch & Crawford, 2012). Therefore, it is important for institutions to consider how programming experiences are structured in order to best support student learning opportunities. However, as much of the current research has focused on the student perspectives of learning communities, hearing and acknowledging the perspectives of instructors can enhance the overall understanding of this type of learning experience; it can begin to complete the circle of understanding. This paper addresses a research project that has begun to interpret and understand the experiences of a group of instructors who work with a student cohort learning community. This project has utilized action research as its methodology to investigate the role of instructional staff in a cohort experience. When applied to an educational setting, action research involves systematic inquiry to gather information about, and subsequently, improve the ways of operation, teaching, and how well students learn (Creswell, 2014). This approach has resulted in an understanding of the thoughts, practices, and needs of instructional staff when teaching in a cohort setting. Findings from the data attend to such issues as the importance of developing the potential of the cohort, fostering opportunities for communication and sharing between instructional staff, and recognizing the instructional team as a cohort.

Introduction

The 1980s witnessed the emergence of a business model approach in higher education at universities and colleges (Kerby, Branham, & Mallinger, 2014). This resulted in institutional administrators being faced with the need to be financially creative in managing large scale work environments that incur considerable costs at the same time as also ensuring that high quality educational experiences are provided to the students enrolled in its programming (Hickson, 2015). Due to the public demand for accountability and reform, Dyson and Hanley (2002) identified that administrators at higher education institutions began to look at the effectiveness of instructional delivery with considerable interest. This resulted in a movement toward more learner-centered experiences (Doolen & Biddlecombe, 2014; Leisey et al., 2014) and, in recent years, an appreciation of the importance of developing learning communities in higher education environments (Cleveland-Innes, Garrison, & Kinsel, 2008; Leisey et al., 2014) as community has been identified as being essential when aiming to support collaboration and promote high levels of learning (Rausch & Crawford, 2012).

With the continued increase of popularity of undergraduate education (National Center for Education Statistics, 2016), the need for viable programs to assist in the delivery of undergraduate coursework and the support of the continued development of instructional excellence seems to be essential in
order to ensure that effective learning opportunities for students are provided (Hickson, 2015). Therefore, how programming experiences are structured is a critically important consideration for institutions to address in order to best support student learning opportunities.

Review of Related Literature

Much of what is known of learning communities and cohort learning has been from research that has focused the perspective of students experiencing learning activities within a cohort group. This research has identified such benefits as increased learning, and feelings of belonging and cohesion, student retention and completion trends, and the organizational benefits.

Cohorts as Learning Communities

When students are placed in consistent groupings for their learning, such experiences are referred to as cohort learning (Lei et al., 2011). These communities of learning are characterized, according to Pemberton and Akkary (2010), as intentional groupings of students during a program of study for shared experiences, interactions, collective effort, and learning toward educational goals. Similarly, Rausch and Crawford (2012) also describe cohort experiences as a group of students who proceed through a common program of learning in a sequential manner.

Cohort models have been developed from the social cognition research base that indicates that learning is best achieved when students are actively involved in interaction with others and the sharing of experiences (Lei et al., 2011). Unzueta, Moores-Abdool and Donet (2008) suggested that theories in particular associated with group learning and cohesion provided the framework for the development of cohort education. As such, cohort experiences range from a flexible open-cohort through to a restrictive closed-cohort format (Pemberton & Akkary, 2010). The flexible open-cohort allows some freedom for students to move in and out of common learning experiences according to programmatic needs and student preference, while the restrictive format is characterized by a single group that shares all learning experiences together in the same sequence and at the same time.

Experiences with Cohort Learning Communities

Since the early 1990s, the practice of providing cohort-based learning has increased in colleges and universities (Rausch & Crawford, 2012). The adoption of the cohort approach to programming has been identified to provide a number of positive impacts both at the institutional and student levels.

Increased Learning. Cohort learning experiences can promote intellectual and academic stimulation (Seifert & Mandzuk, 2006). Unzueta et al. (2008) further reported that students believed that belonging to a cohort learning community positively impacted their learning due to all the students were working toward a similar goal and supported and motivated each other in that process.

Belonging. The cohort learning environment purposefully aims to access interpersonal relationships to enhance the learning process and create opportunities for support from fellow cohort members (Saltiel & Russo, 2001; Seifert & Mandzuk, 2006). Student feelings of belonging, unity, and support were also reported by Unzueta et al. (2008) and by Lei et al. (2011) who suggested that the literature indicates that students in a cohort learning experience appreciate the trust that is established between cohort members and the strong familial type of ties that develop between members.

Student Retention and Completion. The issue of retention of students in programming is something that all institutional administrators face. The impact of high rates of attrition of students can be a viewed in two ways. One view point is that attrition can indicate that there are high standards of performance required and successful students are considered or recognized as being well above
average. However, a second, and very different, view point can potentially result in serious implications for institutions. When students do not succeed and rates of attrition are high, it is often accompanied by critique of instructional and student development priorities and can centre on the question of the financial expense to students. While institutions need to be cognizant of academic rigour and standards of achievement, the notion of admitting students into programming knowing that a large portion will likely never finish does raise ethical questions for the institution and issues of value for the student. Therefore, the positive effect of cohort membership on student enrolment retention rate (Lei et al., 2011) is an important factor for institutional administrators to consider.

Organizational Ease. The administrative ease of design and delivery of a cohort program was identified by Nimer (2009) due to the use of a lock-step style of program scheduling. As administrators know the program from start to finish and the fact that all students require the same coursework, allows for administrators to know such things as registration numbers, class sizes, room needs, and even text book ordering requirements. From a student perspective, Unzueta et al. (2008) also suggested that there were also organizational advantages at the student level too, stating that students find cohort programming to be easier to: navigate; know and follow necessary procedures; and understand pre-determined programming.

Benefits and Drawbacks. Pemberton and Akkary (2010) in a review of cohort experiences and Lei et al. (2011) stated that there are numerous studies reporting positive findings but that there is also evidence of drawbacks of cohort community experiences. These drawbacks mainly centre on issues of tension, jealousy, and competition between members. However, despite the drawbacks, the literature demonstrating the benefits of cohort experiences in regards to organizational efficiency and student learning benefits (Lei et al., 2011) presents a compelling argument for the adoption of cohort programming in educational programming (Pemberton & Akkary, 2010) and membership of a cohort learning community outweighed any potential concerns (Lei et al., 2011; Pemberton & Akkary, 2010).

Recognizing Instructional Staff in Learning Communities

Although there are many positive results from students being part of a learning community through their cohort experiences, there may well be issues for instructional staff with the increase of student presence and voice. Therefore, understanding of the role of instructional staff in a cohort experience is of value to the full understanding of the cohort community experience.

Community of Inquiry. In discussing the notion of Community of Inquiry, researchers have identified three interdependent elements that are necessary to ensure a meaningful learning experience: social, teaching, and cognitive presence (Garrison, Anderson, & Archer 2010). In particular, the teaching presence element describes instructional staff as being critical for success and the modeling and facilitative role that instructors play as being vital for student retention and progress.

Instructional Staff Perspective. However, although instructional staff members are viewed as being a part of the overall success of such learning communities, little else is known about the specific role that instructors play in this success or their perceptions of their role. Unzueta et al. (2008) found that professors working with a cohort learning community identified student relationships, unity, and group dynamics as benefits. However, the research findings from Unzueta et al. focused upon the opinions of professors regarding what they observed of the student experience of being in a cohort community rather than their perspectives of their experiences as an instructor.

Therefore, due to the distinct absence of an understanding of the role of instructional staff in a cohort experience, research is required to add to the literature and provide new understanding on the cohort community from an instructional staff perspective. Such new understanding not only has
the potential to add to the literature, but also has the potential to provide benefit on a practical level too. Institutions have a responsibility to regularly evaluate programming to determine and understand its effectiveness and consider any potential need for change. As teacher education programming must be reflective of ever-changing societal needs, continual and evaluative action is a necessity.

**Review of Related Literature Summary**

The understanding of the experiences and perspectives of not only students but also instructional staff in cohort learning communities can be of significant importance and value both theoretically and practically, and has the potential to contribute to program understanding and effective implementation of learning community experiences.

**Background Information**

This two-year research study focused on a cohort learning environment established in a collaborative programming experience between a large research intensive university and a small regional college in northern Canada. Established in the late 1990s, this joint venture was constructed in a manner that allowed the program participants to take all the required undergraduate course work at a local regional college while attaining a Bachelor of Education degree from the larger university. The program was designed to achieve two major benefits: first it allowed students to continue to live in their home community and undertake their undergraduate degree coursework without the need to move to a larger centre and, second, it assists in creating qualified, potential employees with community ties for regional employers.

Due to the uniqueness of the program at the regional college, the students experience their programming as part of a cohort that Pemberton and Akkary (2010) would describe as a restrictive closed-cohort. As such, cohort members take the same courses as each other and in the same sequence; whereby following a common community style class schedule that is consistent amongst all of the students. Interestingly, this issue of community is further extended as a single classroom is used for the delivery location of the vast majority of the courses in the program.

**Purpose**

The purpose of this research study was to investigate and understand the perspectives of instructional staff members that teach students in a cohort learning community setting. As there is little research understanding of such perspectives, it is hoped that this research study will specifically add to the understanding of what the instructor experience is, whether instructors believe that they can contribute to the overall cohort experience of students, and if instructors ever become part of the cohort experience.

**Research Plans and Methods**

The discussion presented in this paper represents understandings from two years of study. Based on the identified lack of understanding of the cohort experience from the instructional perspective, the research study began with investigating and considering the following three research questions:

1. What are the experiences of instructors when delivering coursework to a cohort of students?
2. How can instructors positively contribute to the student experience?
3. In what ways can instructors become part of the overall cohort experience?
Research Design

The research study utilized action research as its methodology. Action research in education involves systematic inquiry to gather information about, and subsequently, improve the ways of operation, teaching, and how well students learn (Creswell, 2014). The study followed an outsider in collaboration with insider approach to the action research process (Herr & Anderson, 2005). This approach to action research requires that both the researcher and the participants to collaborate in order to understand issues and find answers to question(s) or problem(s).

As per the Action Research design, the research study had a series of repeated phases (initial, action, observation, reflection) with each phase consisting of a particular focus such as relationship building, the consideration and reflection on instructional practice, and planning future action. According to Mills (2011) action research data collection techniques can be categorized under three headings: experiencing (e.g. observations and field notes), enquiring (e.g. interviews and discussions), and examining (e.g. journals and personal reflections). Therefore, the research study utilized data collection techniques that fell under each of these categories.

The role of the researcher in this study has been both a participant observer and non-participant observer (Creswell, 2014). The participant observer role occurred during the planning, action, and reflection phases of the study. However, during the observation phases the researcher took on a non-participant observer role while taking field notes and recording observations. Consequently, the researcher met with participants, discussed their experiences, conducted individual informal interviews and small group discussion sessions, collected on-line individual reflections and compiled researcher notes throughout the research process. Throughout this process, probing style questions were posed by the researcher to clarify and seek elaboration of participants’ responses as suggested by Patton (2014). The specific probes were designed to help clarify the understanding and interpretation of the data being provided and develop a deep understanding of instructor perspectives of their experiences of teaching a cohort learning community.

To enhance credibility and trustworthiness, several sources of validity were considered. Process validity to examine the adequacy of the processes used in the different phases of the study was continually established through the triangulation of journals, observations and interviews. Democratic validity, ensuring that all perspectives were taken into account, occurred through data gathering from individual interviews, and dialogic validity was enhanced through the continued intentional sharing of findings with the participants.

Participants

All eight of the instructional staff members delivering the variety of courses to the cohort learning community were invited to participate in the study. From this total of eight, seven agreed to do so, providing a participant pool representing 87.5% of the overall instructional staff.

The instructional staff participants were all experienced educators. Their experience ranged from having spent several years of teaching in the K-12 school system through to having multiple years of experience at a college or university level teaching course work. All seven of the instructional staff participants had obtained at least a master’s degree and several had earned a doctorate. Of note is that the instructional staff participants had a range of previous experiences of teaching with cohort groups at the post-secondary level. In particular, one participant had taught in excess of 10 cohort groups, several had taught more than five cohort groups, one participant had taught a cohort group but at another educational institution, and another was completely new to the cohort experience and teaching to such a learning community of students. However, none of the participant instructors
reported that they had personally experienced being part of a cohort learning community as learners themselves.

**Ethical Considerations and Safeguards**

The research study was conducted according to the relevant Research Ethics Board requirements. Informed consent was obtained from all of the participants after being informed that their participation in the study was voluntary and that they could withdraw at any time without penalty.

**Data Collection**

Data was collected from a variety of sources. From this data it was possible to interpret and begin to understand the lived experience of the instructional staff members; their reactions to teaching in a program that involved cohort learning, and whether they considered their participation to be beneficial. The qualitative data collected were interpretationally analyzed. Analysis involved manual categorization through line-by-line coding of transcripts, interpretation of researcher interview notes, and participant reflections that identified salient meaning from the data. Such meaning was then grouped by content into themes (e.g., the importance of potential, recognizing the instructional cohort, etc.) As such, themes and patterns were identified to describe, draw conclusions, and explain the phenomenon being studied (Gall, Gall, & Borg, 2003).

**Results and Discussion**

The findings of the data collected from the instructional staff participants indicated that they believed that their experiences were most beneficial. Interestingly, they noted that these benefits were not only restricted to the student cohort community members but also applied to the instructors themselves.

In regards to the kind of benefits that the instructional staff members believed that the student cohort members experienced, they remarked that although there are always “…pockets of students…” that can challenge any teaching environment, they found that the cohort experience allowed students to “…do it together to extend learning…” and there was a “…power to the group…” that supported and aided student work habits. Comments were made that suggested that “…common goals…” resulted in opportunities for “…interactions for students with each other…” and that there was a “…shared motivation…” to achieve learning expectations or goals. These findings of increased learning opportunities and a supportive environment mirror the understanding gained by other researchers (e.g. Lei et al., 2011; Saltiel & Russo, 2001; Seifert & Mandzuk, 2006; Unzueta et al., 2008).

Overall, the instructional staff participants overwhelming supported the value of a cohort community experience and concluded that they believed that their own participation had also been most beneficial. As one participant remarked, “A really, really worthwhile experience. I have become a better teacher. I find that I need to not only consider what I need to teach but also consider how might I support other instructors and how can they support me…”

The data collected in this study has been rich and varied with many points of discussion. From this, three themes of experience for the participants were identified. The three themes identified were:

1. The importance of developing the potential of the cohort.
2. Fostering opportunities for communication and sharing between instructional staff.
3. Recognizing the instructional team as a cohort.
Theme: The Importance of Developing the Potential of the Cohort

In alignment with the strengths identified by others (e.g. Lei et al., 2011; Saltiel & Russo, 2001; Seifert & Mandzuk, 2006), participant comments collected in personal interviews and group sessions identified that the cohort experience provided a level of collaboration and comfort for the students that supported learning experiences. Hence, it was believed that students were prepared to risk and sought support from each other. Example participant comments:

“Cohorts can provide opportunities due to trust, allegiance, and loyalties.”
“Cohorts can present a different dynamic. There is a comfort to risk but also a concern to critique... collaboration is something that can be exploited with a cohort group.”

It was also remarked that it was critically important that the cohort members be given opportunities to learn how to function effectively as a group. In order to not limit the potential of the cohort, it was viewed as a weakness by the instructional staff to simply assume that students had this understanding. This was seen in such participant comments as:

“We cannot assume that students will become a cohort, we need to teach being a cohort...students need to learn to be in a cohort.”
“...need to set the tone for the group...you belong to a cohort so you have responsibilities to yourself, the cohort, program, and profession...you are part of a club!”
“...students are getting something special...we need to let them know...need to be deliberate in letting students know what being in a cohort is...”

These comments illustrate that the instructional staff participants believe that cohorts have considerable potential but such potential needs to be drawn out of the group rather than simply expecting for it to occur. That, according to the participants, is a key role that instructors can play; to support the realization and impact of the cohort.

Theme: Fostering Opportunities for Communication between Instructional Staff

Participants identified the importance for instructional staff to have the opportunity to meet as a group to discuss issues pertaining to cohort matters and their instructional practices. The instructional staff participants remarked that they believed that even though the students are adults, often times, they can require assistance to deal with learning issues or those things that occur in day-to-life outside of the learning environment. In 2011, Lei et al. suggested that the introduction of cohort learning experiences in further education was due to issues that included instructor isolation which can lead to a lack of effectiveness. The fostering of opportunities for communication between instructional staff could address such possible isolation and increase instructional effectiveness. As one participant remarked:

“Discussing issues with someone else is helpful...I think others are probably experiencing the same kind of issues as we share the same group of students.”

The data collected from the instructional staff participants indicated a belief that increasing communication could support them as a group, provide for a better student experience, and also illustrate to students that the instructional staff are a collective team. Example participant comments:

“Our teaching is not done in isolation...one body of students that we all share...as our paths do not always cross...be aware of issues...”

“Just knowing that there were others probably having to deal with the same issues or concerns with the same students is comforting.”

“When other instructors discuss what they were seeing or experiencing, I understand that I could learn from their experiences too.”
“...need to create connections for students...the instructional team needs to role model...we need to ensure that the instructional team speaks the same language.”
“Most of the instructors share the same office, the same student group; can we not arrange times for us to share other issues too?”

Similar to Pemberton and Akkary (2010) who suggested that cohorts provide opportunities for students to share experiences, the instructional staff participants also recognized the importance of sharing information amongst their own membership. As explained by one instructional staff participant:
“...students know more than we do, they all experience the same things each day...they know what is going on, where I come in once a week and know little of what has occurred since my last visit…”

Therefore, communication between the instructional staff could increase information and understanding in the instructional staff group and decrease the isolation identified by Lei et al. (2011). Such sharing could, according to the participants, provide a collective response to those students in need of support. This would negate the need for a student to inform a number of separate instructors the same set of information and create the possibility for having a collective, consistent response across all the members of the instructional team.

Theme: The Importance of Recognizing the Instructional Team as a Cohort

Interestingly, the instructional staff participants identified that they too needed to become a cohort; a need to provide opportunities for reflection as an instructor cohort. The opportunity to share instructional expertise and develop relationships was seen as important. Example participant comments:
“We need to think of ourselves as a cohort too. Not really part of the student cohort but something like a partner or a co-cohort, one that can intersect when necessary but has its own identity. How can we not think that way?”
“I think we are a cohort in many ways, our own cohort...we haven’t really formally acted like one in the past...in a coherent manner as such...but we have informally been one especially between certain instructors. Maybe we need to think of ourselves as a cohort of instructors much more than we normally do. I think that would have a lot of benefits for everyone.”
“We are (a cohort) whether we want to be or not as we have a common group of students.”

While there was a belief from participants that an instructional cohort may have occurred previously in an informal manner, it was suggested that there was a need to do so in a more formal manner. Such a move was viewed to have the potential of allowing instructional staff to share ideas, thoughts, and best practices and to ensure that the learning environment is informed from all those that contribute to the student cohort experience. This notion is highlighted in this participant comment:
“Perhaps it is just me but I have always wanted to be more than just an individual instructor...especially as we have a group of students that have common experiences. Surely, we need to talk to each other to ensure that we know what is going on in each other’s classes. Isn’t that good pedagogy?”

Participant remarks indicated that they believe that if the instructional staff members see themselves as a cohort, students would be positively impacted. This thought supports the work of Ford and Vaughn (2011) who suggested that a bond or connection between instructors and students is necessary for a successful cohort experience. Therefore, the purposeful creation of an instructional staff cohort that could operate separately from and also intersect with the student cohort could prove to be advantageous to the overall learning environment.
Conclusion

From the data collected from this research study, it is clearly evident that the instructional staff participants recognize and appreciate the uniqueness of the cohort experience and the benefits that it can bring for both students and themselves. They also have articulated that in many ways they see themselves as a possible cohort that can, at times, intersect with the student cohort group. It was mentioned on numerous occasions by the instructional staff participants that, by assuming a cohort identity, they could become more: aware of specific issues with the student cohort group; cognizant of integrating teaching ideas from each other; and supportive of each other.

Research Questions

In regard to the research questions, analysis of the data has provided evidence that can answer or at least partially attend to each of the three questions.

1. What are the experiences of instructors when delivering coursework to a cohort of students?

Overall, the participants believe that the experience is positive. While, teaching to any group is not an easy task, it is clearly seen to be an enjoyable experience. As one participant suggested: “Not having taught a cohort before I really didn’t know what to expect. I suppose some things were a surprise and others were what I expected. However, it has been really enjoyable. It is like being part of a family in many ways – there are ups and downs but generally it is much more personal than some of my other experiences.”

2. How can instructors positively contribute to the student experience?

The instructional staff participants indicated that not only do they believe that a cohort of instructional staff could have a personal benefit for themselves but suggest that it could have many positive experiences for students, and the cohort in general, too. For example, a participant remarked: “We need to be able to come together on a regular basis. That way, we can support each other and also be a better team for the students. I will not be asking them to think one way and someone else the opposite.”

3. In what ways can instructors become part of the overall cohort experience?

The instructional staff participants identified a need to create their own instructional cohort group or, at the very least, have opportunities to come together to discuss instructional and cohort issues. However, at this stage of the research study, this has not been enacted and is still an aim for further research. It is speculated that this group could operate separately from the student cohort or, at times, intersect with the student cohort. Further study will, hopefully, explore this notion and investigate if it is possible to achieve.

Concluding Thoughts and Planned Actions

This paper addresses a study that has occurred over a two-year time period. It is hoped to further examine the mentioned themes, any others that may be identified, and investigate how an instructional staff cohort might be created, as it is clear that the instructional staff participants in this study visualize a distinct role for instructors in the overall cohort experience by intentionally creating an instructional staff cohort. How such a cohort of instructors might operate and exactly what role and responsibilities it might require to be successful, are likely to be a major focus of potential future work. Time will need to be taken to examine if a cohort of instructors is possible to achieve, and to
determine whether instructional staff believe that it is beneficial to their teaching, the overall learning environment for the cohort learning community, and the program in general. Such an understanding will, hopefully, add to the connection between instructional staff and the cohort community membership and the overall understanding of cohort learning communities.

MAKING VISIBLE OUR INVISIBLE FACULTY: CONTINGENT ONLINE FACULTY MENTORING

Higher Education
Panel Session

Contingent faculties are increasing visibly as high education addresses challenges related to disinvestment of funding for universities and colleges. Results of a meta-synthesis of academic mentoring for contingent faculty teaching online courses are discussed.

**Introduction**

Institutions of higher education in the United States employed 1.5 million faculty members in the fall of 2013. Of this number, part-time faculty totaled 45 percent of all these faculty or 752,700 individuals working in universities, colleges, and community colleges, an increase of 104 percent from a decade prior (NCES, 2016). At the institution of one author, more than 75% of courses within an academic discipline are taught by part-time instructors (contingent faculty), geographically dispersed from the flagship campus and teaching online courses.

Though this surge in contingent faculties has exacerbated decades-old concerns, the hiring of these short-timers seems unlikely to stop with the challenge of disinvestment in higher education, especially state-supported institutions that also are experiencing the public’s contempt of institutional inefficiency and lack of accountability. Once seen as expendable, and almost always invisible, contingent faculties have found employment in teaching developmental classes, basic core curriculum, and general education courses sometimes unattractive to senior full-time faculty and in some cases serving a majority of part-time and weekend students.

Although there are disadvantages with hiring contingent faculties, institutions can best be served by supporting and mentoring this academic employee base. Improving the environment for contingent faculties can involve mentoring strategies or program that address both institutional and contingent faculty needs. In this study, contingent online faculty needs and experiences were explored based on a meta-synthesis of research concerning academic workplace mentoring.

**Study Background**

This paper provides insight on the impact of utilization of contingent faculty in U.S. institutions of higher education. As found in the literature, there are numerous effects of hiring teaching faculty on a part-time basis, not only for the institution but for the employees as well.
Because contingent faculty members are growing in numbers, geographically dispersed locations from flagship campuses and teaching online courses (Curtis & Thornton, 2013), this demographic will be studied. The authors were interested in accessing current contingent online faculty research to examine strategies and programmatic aspects of mentoring for reaching these part-time colleagues. Findings were reviewed to ascertain best practices and new ideas for a future mentoring plan at a publically funded state university.

A meta-synthesis of the most contemporary qualitative research (2000-2016) on mentoring programs and strategies in academe for part-time online faculty was completed. Upon individual study review, the findings were integrated into a transformed whole, providing future direction to the following question: “What mentoring strategies and programs address the needs and interests of contingent online faculty?”

**Changing Landscape of Teaching Faculty**

Higher education is changing rapidly in terms of student demographics, faculty statistics, and stakeholder demands and concerns. In turn, faculty who teach part time are fast becoming a new majority of teaching faculty in many departments and colleges. As noted in a report on the community colleges (Center for Community College Student Engagement, 2014), “… institutions’ interactions with part-time faculty result in a profound incongruity: Colleges depend on part-time faculty to educate more than half of their students, yet they do not fully embrace these faculty members” (p. 3). Contingent faculty are providing the base for which institutions stand, yet the culture of academe provides little encouragement, respect, and support while offering low pay, no benefits, and limited opportunities to advance (Maxey & Kezar, 2015).

Professional groups that conduct national research on the condition of faculty in higher education today (AAUP, n.d., New Faculty Majority, n.d.) have brought light to the ongoing plight of
contingent faculty. As researchers who study contingent faculty noted, they are still “missing from the institutional data picture” (Kezar & Maxey, 2012, p. 47).

Recruitment, job satisfaction, commitment, loyalty, and retention of those that work part-time in academe have not been studied as extensively as have employees in business and industry, where thousands of articles and books show clearly this subject is one of great interest. One can only wonder if much has changed from four decades ago when a front-page article in *The Chronicle of Higher Education* (Scully, 1975, p. 1) was entitled “Part-Time Teachers: Many Angry,” followed by the poignant comment, “They are, says one of them, marginal, expendable, underprivileged, underpaid.”

Contingent faculties have been described as part-time, adjunct, and associate, and titles have been used interchangeably in the literature, although universities and colleges have institutionalized meanings, criteria, and pay. Contingent faculty fulfill a professional teaching assignment in a community college, college, or university and have limited duration contracts with compensation that is determined on a per-course or hourly basis (AAUP, 2014; Biro, 2005). In this study, the authors used the term contingent faculty to encompass all teaching faculty who are not tenure track, have non-permanent short-term contacts, and are paid differently from full-time faculty. The study will not examine or address issues such as lecturer rank or other such graduate student positions, accreditation policies and requirements, Common Law Rules, independent contractors, state or federal law, or holdings from the National Labor Review Board.

Twenty-first century studies addressing mentoring strategies and programs for contingent faculty teaching online were sparse. Studies more likely than not focused on contingent faculty and full-time faculty wherein the results could not be separated easily by faculty status (Diegel, 2010; Linck, 2004; Oomen-Early, & Murphy, 2009; Maier, 2012; Marsh, 2010).
Contingent faculty may remain de-professionalized and managed by administrators embedded in the culture of academe, unless this new faculty can be supported and encouraged by stakeholders. Then, too, mentoring programs need financial, technological, and personnel resources as well as cooperating full-time faculty members (Brannagan & Oriol, 2014; Wallin, 2005, 2007). To follow are studies of mentoring programs and/or strategies with applicability to the population of interest.

**Methodology**

Synthesis of the research allows for greater understanding of the phenomena under study and is interpretive or explanatory rather than deductive. Meta-synthesis is a meta-methodology that aggregates all forms of qualitative research and presents an interpretive conclusion (Bondas & Hall, 2007). Aggregation of the contingent faculty experiences surrounding mentoring are synthesized and interpretively presented.

The search strategy aimed to find only published studies or dissertations. The authors searched databases for literature related to contingent online faculty mentoring in ProQuest, Education Source, Educational Administration Abstracts, and ERIC. These databases were identified based on educational, academic, and higher education content, which were all pertinent to the subject. The search terms included adjunct, contingent, associate, online, virtual, faculty, higher education, part-time, mentor*. Limits included scholarly, peer-reviewed journals in the English language where available.

Sixty-four (64) results were returned from a combination of database searching and hand-searching known references. After removing non-English language articles, duplicate articles across databases, and articles that discussed faculty-student mentoring, 12 citations remained for initial assessment. Because the authors wished to review only contemporary findings, further
exclusion included articles published prior to year 2000 and those without higher education context. The initial 12 articles met these criteria. Inclusion criteria for the final review were descriptive, qualitative, and quantitative articles that addressed contingent online faculty mentoring. Following the review using this criteria, nine articles remained for examination.

**Results**

Table 1 is a summary of participants, design, and findings of the synthesized 2000-2016 articles on mentoring contingent online faculty, nine articles analyzed and critically appraised. This process permitted the authors to evaluate and engage with each article to determine its quality. Ultimately, seven papers were included and assessed by the reviewers with two articles excluded. Excluded articles in the final round were not appropriate to the purpose of the study or were of poor quality.

**Synthesized Findings: Organizational Support and Mentor Coaching**

The search discovered publications about mentoring interventions or programming and contingent online faculty. Although the synthesis was limited by the small number of publications, the thematic thread was clear. For example, Rogers, McIntryre, and Jazzar (2010) found online coaching or mentoring accommodated better communication and teaching performance. This result was similar to the findings of Biro (2005) and Blodgett (2008). Moreover, online or virtual mentoring fostered professional development.
Contingent faculty craved rich supportive services such as faculty orientation, professional development, and specialized training for the online environment. Such services improved communication, faculty retention, and satisfaction. The higher education community shared institutional and student policies with contingent faculty, while technology skills and teaching advice were made accessible. With feedback about teaching evaluations foundational and vital for new and continuing contingent faculty, mentoring was basic to providing feedback, and coaching honed online teaching skill sets. In the final analysis, the aggregated studies noted that organizational support for contingent faculty was compulsory, and coaching by a mentor was preferred for career development.

**Ending Perspective**

“Part-time faculty make critical contributions to teaching and learning in the higher education enterprise—educationally, socially, and economically . . . Part-time faculty are sleeping giants; their sheer numbers and their impact on college instruction cannot and should not be ignored. . . . The issues that have separated part-timers from the larger academic community will not go away. They will be addressed, or they will maim higher education” (Roueche, Roueche, & Milliron, 1995, p. 157). For those educational institutions that rely heavily on contingent faculty, online/virtual mentoring and coaching strategies or programs should be investigated to meet the needs of these newly visible faculty colleagues.

A DAY IN THE LIFE OF WILLIAM PENNY BROOKES, A 19TH CENTURY
PIONEER BRITISH EDUCATOR AND INSPIRATION FOR THE MODERN
OLYMPIC GAMES IN 1850

By

Robert B. Kebric

robert.kebric@louisville.edu

ABSTRACT: An original presentation showcasing the life of Dr. William Penny Brookes, pioneer 19th century British educator, by visually following his routine through still extant buildings and grounds, where he lived, worked, and taught in the small town of Much Wenlock, Shropshire. He developed reforms in physical education that led to curriculum reform in England and to the revival of the Olympic Games.

It is a rare occasion when the career of any significant educator from the mid-nineteenth century can be followed closely. It is even rarer when that individual's pioneering reforms that demonstrated, scientifically, the benefits of physical education are currently impacting the revised curriculum for A level Physical Education (16-18 year olds) in his country, in this case Great Britain. The same innovations had such impact in his own day that they led directly to the modern revival of the Olympic Games after a dormancy of 1500 years. Such a man was Dr. William Penny Brookes, whose shadow still looms large after more than a century and a half, not only over his small town of Much Wenlock, Shropshire, in the English Midlands, but also on the now accepted International Olympic Committee's belief that Brookes "really was the founder of the Modern Olympic Games"—a concession
made in 1994 by Juan Antonio Samaranch, then President of the International Olympic Committee, and acknowledged more publicly at the 2012 London Olympics.

Figure 1. Dr. William Penny Brookes (1809-1895), Pioneer Educator, Physician, Magistrate, Botanist, and Organizer of the First Modern Version of the Olympic Games in 1850 at Much Wenlock, Shropshire, England. By permission, Much Wenlock Olympian Society.

Brooke's contributions have been the subject of other studies, especially the groundbreaking volume by David Young, *The Modern Olympics: The Struggle for Revival* (1996), my own papers at the 2015 Annual Hawaii International Conference on Arts & Humanities and the 2012 International Conference on Learning in London
following the close of the London Olympic Games, and a number of Much Wenlock Olympian Society publications (all listed in the accompanying bibliography). It is the focus of this presentation, however, to visually reconstruct the good doctor’s routine as educator, physician, magistrate, and campaigner to include physical education in England’s national school curriculum, as he went about his business in Much Wenlock. Not only does his residence still remain (it is currently up for sale),

Figure 2. William Penny Brookes’ residence as it stands today in Much Wenlock on Wilmore Street.
but also the building in which he began his educational reforms, particularly in regard to the infant study of physical culture-- or physical education as it is known today-- and the grounds, the Linden Field, on which he put his first "Olympian

Figure 3. The author standing at the Brookes’ Commemorative Plaque on Linden Field, where his Olympian Games were first put into practice and continue to this day.
Figure 4. Wenlock Olympian Society Archivist, Chris Cannon, at the Corn Exchange Building, original center for Brookes' educational reforms and his Olympian Society.
Figure 5. Inside the Much Wenlock Archives on the second floor of Brookes’ Corn Exchange Building, where the documents establishing Dr. William Penny Brookes as the first to reestablish a modern Olympic Games may be viewed.

Games” into practice. It is not difficult to do this since the town has essentially been transformed into a modern tribute to Brookes.

In the two times I have visited Much Wenlock since 2012 and used the Archives there for my own studies, I have taken photos of the major places Brookes frequented during his long and productive life (1809-1895), with the object of transporting interested persons to the small town where the move toward establishing physical education and the modern Olympics began. It is a presentation designed to provide visually the best experience short of visiting the place. I have been escorted around the picturesque town by Chris Cannon, the Archivist of the
Much Wenlock Olympian Society, with whom I correspond regularly, and we will follow in the footsteps of Queen Elizabeth II, Samaranch, and other dignitaries and Olympic and world record holders who have made Much Wenlock the must see place for every contemporary enthusiast to visit. In 2012, Much Wenlock attracted the attention of the world media and had its appropriate place in the Opening Ceremonies of the London Olympics. The Wenlock Olympian Society continues to hold athletic games every July, and in the summer of 2015, a Japanese delegation showed up unannounced in preparation for the 2020 Tokyo Olympics. Since that visit, the Tokyo Olympics Organizing Committee has stated, “We have found that the moral, physical and intellectual improvements promoted by Dr. Brookes are still alive today in Much Wenlock. The vision of Tokyo 2020 involves sport, education and culture and we in Japan recognize the importance of the legacy of Brookes and the Wenlock Olympian Society”— indication that their Games will fully appreciate the inspiring individual and township which are at the foundation of the modern Olympics. Brookes’ original intent to include “every grade of man” in athletics has long become Olympic reality.

Born in 1809, Brookes’ father was a physician, and the family’s interests certainly extended well beyond those of what might be expected in a small English township. Young Brookes’ studied in London, later traveling to Padua, Italy, to continue his education at the University’s prestigious medical school, while also indulging his interest in botany at the famous botanical gardens there. In 1830, he furthered his studies in Paris, another center for prosperous young men coming from Great
Britain and the Continent to advance their education—also demonstrated, ironically, by Brookes' contemporary and fellow early Olympic enthusiast, Panagiotis Soutsos, from Greece.¹ Both studied at Padua and Paris within a few years of one another, although Soutsos was not a physician and there is no indication the two ever met or knew one another. Soutsos, Brookes, and, lastly, Baron Pierre de Coubertin of France, are the nineteenth century triumvirs of the modern Olympic movement.

Brookes returned to England upon learning of the death of his father. After qualifying, he took over the family medical practice at Much Wenlock. As a concerned Christian and physician, who later became a Fellow of the Royal College of Surgeons, Brookes wanted to improve the situation of the working class at Much Wenlock and environs. He was also the local Justice of the Peace, a minor magistracy that frequently involved him with petty criminals, drunks, and in other types of disorderly conduct—so he was familiar with all aspects of working class problems. However, it was mostly the poor physical condition and lack of education of local limestone quarry workers and those who labored nearby in Ironbridge Gorge, also in the Borough of Wenlock, Shropshire (Much Wenlock was the administrative center), that prompted Brookes' efforts. The heaviest labor took place at the iron-smelting centers around Coalbrookdale and Ironbridge, where the world's first iron cast bridge was built in 1779. Ironbridge is listed as a World Heritage Site for being the birthplace of the Industrial Revolution, a long-standing tradition that was connected directly with Brookes as part of the 2012 London Olympics Opening Ceremonies.
Brookes also wanted to improve the skills of the average working man for better employment and offered “Still Life” art classes at his school to help prepare many for work at the famous Coalport China works, also in Ironbridge Gorge (through which the Severn River passes). In this, however, Dr. Brookes was the proverbial voice in the wilderness and not a very popular man in his own rural community because of his outspoken advocacy of physical fitness, changes in the local and national education, and other non-traditional Victorian attitudes.

Figure 6. In front of the Brookes’ house (currently up for sale with a thoroughly modernized interior) looking up Wilmore Street toward the town center, Corn Exchange Building, and Olympic Museum. On the left is the Guild House, where Brookes’ magistrate chair (see Figure 1) can still be viewed in its impressive Council Chamber. Brookes was a Justice of the Peace, and Commissioner for Roads and Taxes. He was also heavily involved in the renovation of the Council Chamber.
Pursuant to such interests, Brookes started the Agricultural Reading Society in 1841, "for the promotion and diffusion of useful information," from which a number of classes in the arts and sciences would develop. He also established a lending library, and requested contributions from some of England’s finest, including the Duke of Wellington and Alfred Lord Tennyson. In 1850, an independent “Wenlock Olympian Class” was formed to promote “structure physical exercise and education.” Brookes also believed that physical education would help defend the

Figure 7. “The Corn Exchange was built in 1852 as a Public Reading Room and Library with a Librarian’s residence and a small museum. Provision was made in the open space beneath for a free Corn Market. It was in this building that William Penny Brookes established the Wenlock Olympian Society. From here he spread the message of the benefits of physical exercise and promoted the revival of the Olympic Games far and wide."
nation with a prepared youth to protect it, and he would later campaign for compulsory classes in the national schools. Previously, he had opened the Much Wenlock National School to encourage the benefits of physical education for children.

Brookes' intention to promote education through his proposed "Olympian Games" does not require much inquiry because it is clearly stated in the first few lines of the charter that lead to the creation of the Wenlock Olympian Society. It states, quite simply, "That it was desirable that a class should be established in connection with the Agricultural Reading Society for..."

the promotion of the moral, physical and intellectual improvement of the inhabitants of the town & neighborhood of Wenlock and especially the working classes, by the encouragement of out-door recreation, and by the award of prizes annually at public meetings for skill in athletic exercise and proficiency in intellectual and industrial attainments.

Both the finely bound leather Volumes I (1850-1876) and II (1877-1895) of the Minute Books of the Wenlock Olympian Society (WOS), and the original handwritten page containing the passage above may be viewed in the Society Archives at Much Wenlock. Images of Volume I, and the passage (Figures 8 and 9) in questions are included here by the author.

The contents of these two historic volumes not only demonstrate Dr. Brookes' pioneering educational philosophy and show him to be among the first to recognize the principles underlying the modern discipline of Physical Education to promote health and sport 150 years ago in England, but they also have had a profound impact.
Olympian Clas

of the Wentloog Agricultural Reading Society

At a public Meeting of the Members of the Wentloog Agricultural Reading Society held in the Reading Room, March Wentloog on Monday, Oct. 5th 1836, W. D. Brooke Esq. in the Chair.

It was resolved unanimously,

"That it was desirable that a Club should be established in connexion with the Agricultural Reading Society, for the promotion of the social, physical, and intellectual improvement of the inhabitants of the town & neighborhood of Wentloog, and especially of the Working Classes, by the encouragement of outdoor exercise, and by the award of prizes annually at public meetings for skill in athletic sports and producing intellectual and individual attainment.

That the action of the Wentloog Agricultural Reading Society be adopted. The Olympian Club.

That the annual subscription to the Club be not less than one shilling to be paid in advance to the Treasurer.
in recent years on the actual story of the development of the modern Olympic Games. They clearly demonstrate that Brookes’ educational ideas spread from England to inspire the eventual success of the modern Olympic movement, usually attributed to Baron Pierre de Coubertin of France.

If one is to start his or her journey at Much Wenlock and view the very places Dr. William Penny Brookes frequented to inspire his educational reforms and help set the foundation for the revival of the Modern Olympic Games, the best place to begin is the center of town at the clock. Several places of interest have already been mentioned, including his home, the Corn Exchange, and the Guildhall (seen in the background in Figure 10) below. The modern museum contains the most pertinent exhibits and displays, including original medals from the early Wenlock Olympian
Games. (I have contributed materials from the 1948 London Olympics to the Museum.) Also inside is the famous Much Wenlock Pentathlon Medal, first awarded in 1868, with the major image of the winged figure of Nike, Greek Goddess of Victory, that would inspire the Goddess' appearance on the medals of the first Modern Olympic Games at Athens in 1896 and grace the medals of all Olympic Games since.
Figure 12. The Much Wenlock Pentathlon Medal as displayed at the British Museum during the 2012 London Olympic Games.
During the preliminaries to the 2012 Olympic Games in London, Dr. Brookes and Much Wenlock attracted worldwide attention, and, as seen below, the Olympic Torch Run was routed through the town and passed in front of Brookes’ house—with Archivist, Chris Cannon, as the venerable Doctor symbolically giving a nod of recognition to the London torch in celebration of the Modern Olympic Games he helped to begin. Much of the pomp and celebration created by Brookes for his

Olympian Games found its way into the Modern Olympics, and the grandest of celebrations took place at Linden Field, shown below in both modern and early guise, some 1300 meters from the center of town. Here most of the athletic competitions once took place, and on the way to the Field today, it is almost inevitable that even when the Annual Modern Wenlock Games are not being held, one will encounter local dignitaries of the WOS, or Wenlock Town Officials crossing the streets or getting out of their vehicles. It seems that almost everyone is involved in the celebration of their town and the roots of their Olympic tradition and Dr. William Penny Brookes.

Figure 14. Linden Field as it appears today
Figure 15. Celebration of the Wenlock Olympian Games at Linden Field in June, 1867. This is reputedly the oldest photo of a sports gathering. Note the tower on the hill in the background, which is still visible at the far back of the previous modern view of the Field. By permission.
Figures 16 and 17. Above: The 1887 Procession of the Wenlock Olympian Games of that year. Dr. Brookes appears center right in the top hat and medals. The Herald in Tudor costume is on the white horse in the center. Such pomp and circumstance would influence Ceremonies at later Modern Olympic Games (By permission). Below: The now tree-lined processional lane, as it appears today.
By October 1890, Dr. Brookes' Wenlock Olympian Games had attracted the attention of a young Frenchman named Baron Pierre de Coubertin, generally acknowledged as the founder of the Modern Olympic Games. It is now known, however, that without Brookes' influence upon Coubertin, it is very likely that the same Olympic Games would not have been revived at all—or at least in the form they did. Much of what eventually went into resurrecting the Ancient Olympic Games and turning them into a modern sports phenomenon was the result of William Penny's Brookes' earlier educational and athletic efforts, which, at age 81, he gladly and unselfishly passed on to the twenty-seven year old Coubertin, who initially gave due credit to his older mentor in England when he wrote in tribute to Brookes just after his death in December, 1895 death, "If the Olympic Games that Modern Greece has not yet been able to revive still survives today, it is due, not to a Greek, but to Dr William Penny Brookes."

Unfortunately, the more the success of the revived Olympic Games, first celebrated at Athens in April, 1896, grew and flourished, the more Coubertin relegated his debt to Brookes to the background—until it was virtually forgotten. It was fully revived in the 1990s, chiefly by the work of David Young, confirmed by the IOC President Juan Antonio Samaranch on a visit to Much Wenlock in 1994, and celebrated extensively during the 2012 London Olympic Games.

In 1890, however, Coubertin fully immersed himself in the local glory of Brookes' Much Wenlock Games, and the two shared their ideas at the Raven Hotel. Much that took place in their discussions became a part of of the modern Olympic Games.
Figures 18 and 19. The exterior and interior of the Raven Hotel, the Much Wenlock center for Coubertin’s and Brookes’s discussions about the Olympics’ future.
Figure 20. The tree, as it now stands, adjoining Linden Field that was planted by Pierre de Coubertin in commemoration of his visit to Much Welock and observation of the Olympian Games in 1890.
Figure 21. The notation in the second Minute Book of the Wenlock Olympian Society that “Baron Pierre de Coubertin, Paris,” had been elected an “Honorary Member of the Wenlock Olympian Society, in February, 1891. The entry is the final one on the page. It was original documentation like this and other dated correspondence between Brookes and Coubertin that finally convinced the International Olympic Committee that Brookes had, indeed, preceded Coubertin as, in former IOC President’s Samarach’s own words, “the founder of the Modern Olympic Games.”

The Baron was so impressed that he offered a medal, probably the only personal award ever given in his name, as a prize at the following year’s Wenlock Games.²

Long before Coubertin’s visit, however, Dr. Brookes was already having to deal with the large crowds coming to his Wenlock Olympian Games. As was typical, Brookes led the way in trying to convince the major British railway companies to extend a line to the small community. He finally ended up forming his own Wenlock
and Severn Junction Railway Company, and completed a line in time for the 1861 Wenlock Games. There had been no time for an official inspection, but "Brookes was permitted to run speical trains to carry the many competitors and spectators to the Games— at their own risk. It was reported that, 'a great concourse' of spectators arrived in the town." It was on this line (which no longer exists) and at the station that was built later, that Baron Peierre de Coubertin first arrived at Much Wenlock to see firsthand a modern Olympian experience. The pouring rain at the time apparently did not dampen the Baron's spirits— or Brookes' either. The visit was a complete success.

Figure 22. The old Railway Station, as it appears today, some 1200 meters from the town center. Construction began in 1864. The railway line, itself, has long since disappeared, and the closest rail service is now some miles away at Telford, England, requiring visitors to plan other transportation to reach Much Wenlock.
Figure 23. The rail station in its heyday, a backdrop for a football team that had come to compete at the Wenlock Olympian Games in the 1860s. By permission.

By the time of Coubertin's visit in 1890, Brookes was the foremost advocate of the revival of the Olympic Games—at least outside of Greece. Internationally, no one was more adamant, and Coubertin, born in 1863, was not a player at the time. Brookes' interests had turned more national, putting his initially local educational and athletic ideas into action to form the British Olympic Committee and place physical education in the national school curriculum. In 1860, he reproduced an interesting old passage taken from Roger Ascham, tutor to Queen Elizabeth I, that squared nicely with his own modernist views about education in sport as the great equalizer among classes, promoter of companionship, unifier of country—and guarantor of its strength, on his public announcement for the Eleventh Annual
Meeting of the Wenlock Olympian Games in 1860. Ascham had become known as "The Schoolmaster," because in 1570 he had written a work by that name on teaching and learning, starting with children. It was so well known that Ascham and the title of the work became synonymous.

The one particular passage in "The Schoolmaster" that attracted Brookes’ attention was "to vault lustily, to run, to leap, to wrestle, to swim," are "very necessary for a courtly gentleman to use." To discover such a statement at so early a date is probably as surprising to us as it was to Brookes in his day, because all these physical activities presage modern Olympic events—and were sanctioned by gentlemen, no less. Had not contemporary Christian society come to frown on such pagan Greek rites? Brookes liked the passage so much that he incorporated it into the philosophy of the Olympian Class. Also from the start, pageantry was an integral part of Brookes’ Olympian celebrations, and, considering his admiration of Ascham’s pedagogical comments about sport in Elizabethan times, it should come as no surprise that Brookes included a Herald dressed in Tudor costume (Figure 16) at his Games.

In the meantime, Brookes had heard about plans for the newly revived Greek Olympics to be held at Athens in 1859, and he endeavored to connect them with his own efforts in England by offering a Wenlock Prize of £10—ultimately awarded to the winner of the distance race *(dolichos)* at those Games. This apparently was Brookes’ initial contact with the Greeks, and these 1859 Games were pivotal in Olympic history because they were where the ideas, educational and otherwise, of
both he and Greece’s strongest advocate for the revival of the Olympics, Panagiotis Soutsos, first came together.

The Greek Games had a profound effect on Brookes, who afterwards held an enlarged, countywide, "Shropshire Olympian Games" in 1860 (which would subsequently rotate among the larger towns). They became more Greek—both ancient and modern—in concept; more international; and more elevated intellectually with poetry, essay, and literary contests featured. To concentrate on his now recharged Olympic interests and develop them further, Brookes divorced the Wenlock Olympian Class completely from its parent Agricultural Reading Society, and renamed it the "Wenlock Olympian society" (WOS). His involvement from England with the nascent Athenian Olympics, even though open only to Greeks, also first colored them with an unanticipated international flavor.

Brookes’ tireless efforts to widen the influence of his Shropshire Olympian Games ultimately helped form the National Olympian Association (NOA) at Liverpool in 1865. At key passage in its charter about education and the Olympics reads that besides athletics, the Association “will also pay homage to Mental Excellence, by electing from time to time as honorary members, persons who have distinguished themselves in Literature, Art or Science, or have proved themselves benefactors to mankind.” The NOA, the parent of today’s British National Olympic Committee, held its first successful “Olympics” at the Crystal Palace at London 1866, and Dr. Brookes was president of the organizing committee.

After a promising beginning, however, the NOA quickly met resistance. There remained opposition about associating the revived Games with ancient Greek ritual
and a false god, Zeus—a criticism that had also been raised by those who objected to the name "Olympian Class" or "Olympics" at Brookes' First Shropshire Olympics. This was probably the major reason why he decided to separate the Wenlock Olympian Society from the Agricultural Reading Society since such criticism did not abate. However, most of the opposition was secular in form and now came from rival athletic clubs in the more urban southern part of Britain, including London, where the NOA, viewed as an interloper, shockingly held its first Olympics. The main issue used to undermine the NOA's growing influence was "class-exclusive amateurism." The Amateur Athletic Club (AAC), later the Amateur Athletic Association, had been quickly formed to counter the NOA, and used its elitist ideas about amateurism versus professional as an opposition platform. It pre-empted the NOA's Olympics with an athletic meet of its own, specifically stressing the amateur-elitist view point and directing its "gentlemen athletes" to boycott the NOA Olympics (perhaps qualifying as the first "Olympic boycott").

Consequently, though National Olympics had taken place in England, the once promising Olympic movement now became embroiled in a class controversy over who should be allowed to compete—and this same controversy had moved to Greece in 1870 and similarly undermined Olympic progress there after the successful Greek Olympic Games of that same year. Ironically, the traditional educated elite in both Great Britain and Greece was doing all it could to derail a movement that Brookes had helped to create to promote education.

Nonetheless, Brookes continued his Olympic efforts in England and became more
Figure 24. Brookes at the time of the raging controversy of amateurism vs. professional in the Olympic movement. By permission.
involved with the Greeks, urging an international Olympic festival to be held in Athens in the near future. Unfortunately, he did not live to see it happen-- although he knew before his death in December, 1895, that the first international modern Olympic Games would indeed be held at Athens, as he wished, in 1896, and that the

Figure 25. Dr. William Penny Brookes late in life. By permission.
influence he and his Much Wenlock Olympian Games had on Pierre de Coubertin had helped bring those first international Modern Olympic Games to fruition.

Figure 26. Dr. Brookes' (family) gravesite, as it appears today near Holy Trinity Church— and not far from the house where Brookes grew up and lived at Much Wenlock.

Aside from his Olympics contribution, which would eventually bear rewards he could not possibly have imagined, William Penny Brookes' most enduring and beneficial legacy purely for the advancement of education was his effort to introduce physical education into the curriculum of British national schools as a "regular branch of education."
Dr. Brookes and Much Wenlock transcend the bounds of anything ordinary—both for modern educators and the Olympic Games.

Figure 27. Dr. William Penny Brookes commemorative plaque inside Holy Trinity Church at Much Wenlock.
Figure 28. The tradition continued: A Wenlock Olympian Games program from 1913, during the 63rd Annual Festival—Games still held yearly in July. By permission.

HICE 2016 Abstract

Promoting Youth Engagement in STEM and Physical Activity through an Active GreenSTEM Program: A Self-Determination Theory Perspective

Introduction: A large body of research suggests that outdoor environments offer physical, mental, and cognitive benefits for youth and adults (e.g., Barton & Pretty, 2010; Bratman, Hamilton, & Daily, 2013; Jackson et al., 2013; Ryan et al., 2010). For instance, youth who spend more time outdoors engage in significantly higher levels of physical activity than youth who spend less time outdoors (Schaefer et al., 2014). In a meta-analysis of 28 studies on physical activity and youth, Gray et al. (2015) found that youth aged 3-12 years engaged in more physical activity when they were outdoors than indoors. Physical activity, in turn, supports cognitive learning and improves grades, test scores, on-task behavior, attendance, concentration, attention, and classroom behavior (CDC, 2010). Youth with higher physical activity show greater brain function, energy/concentration, and self-esteem (e.g., Shephard, 1997; Tremblay, Inman, & Williams, 2000). Physical activity outside of the classroom is related to higher attention levels in class and lower perceived boredom levels (Linder, 1999). Although many educational initiatives, such as GreenSTEM programs, have begun to embrace outdoor, place-based learning in order to enhance environmental awareness and the ‘real-world’ relevance of STEM curriculum (e.g., Levin & Dickerson, 2015), educators often overlook the potential these programs to simultaneously improve students’ motivation for physical activity.
Study Purpose & Research Objectives: This study investigated high school students’ psychological experiences of an outdoor adventure-based GreenSTEM course. Twenty-two students participated in a five-day GreenSTEM program that integrated outdoor adventure activities (e.g. downhill skiing, snowboarding, snowshoeing) with snow science education. Students studied self-directed topics relevant to their outdoor activities by learning how to collected and analyze relevant data in the field, such as digging snow pits and examined snow crystal structures to assess avalanche risk. The purpose of this program was to integrate nature-based STEM topics with outdoor adventure activities to enhance students’ engagement with STEM curriculum and physical activity. Specifically, educators sought to facilitate engagement by supporting students’ basic psychological needs for self-determination through autonomy, relatedness and competence (e.g., Deci & Ryan, 2000). The research objectives were to increase (a) student engagement and (b) self-determination (i.e., perceived autonomy, relatedness, and competence) in snow science topics and outdoor activities during the five-day course.

Methodology: Data were collected in small focus groups (e.g., 4-5 students) by two researchers on the final day of the course. A semi-structured interview guide that addressed the key concepts stated in the research objectives was used to facilitate systematic data collection. This interview guide was developed, piloted and refined prior to data collection. Focus groups were first transcribed verbatim; data were then independently coded by three investigators. An external auditor then conducted an audit trail to verify data analyses and identify inconsistencies. No major inconsistencies were identified in the audit trail.
Results: In comparison to their normal school settings, participants reported increased engagement, competence, autonomy, positive relations with peers and instructors, and autonomy-supportive learning climate during the five-day course. Representative quotes that reflect these findings are provided below.

Optimal Engagement: “I think the most focused I was, was probably on the first snow pit on the mountain, because he went into this whole thing about how avalanches start and this stuff, I think it was very cool.” [OE1]

“Oh, like for – digging pits were more like learning - kind of like absorbing stuff.” [OE2]

Autonomy: “Usually teachers will set up a lab and there's only one certain way to do it, where like out here, it was – we had a lot of different choices and stuff.” [A1]

“Like, we're doing something that we enjoy. And we actually like signing up for what we wanted to do, instead of just being forced to do it in class.” [A2]

Relatedness: “Here everybody was engaged. Everybody was supporting each other. And we all were working toward a common goal, we all wanted to be here. So, the attitudes just were completely different [than at school] ... just completely changed. Like, the aspect of learning in itself.” [R1]

“I felt a lot more support and a lot more like, everybody here had clear focus, we didn't – I feel like at the high school, you get those people like if you're in a classroom that don't care, that don't honestly want to be here, instead they'll give you this attitude almost where they make everything so much harder than it really is.” [R2]
"Competence: “I feel like these five days I've learned more than I would in a month at the high school and the college – in any class.” [C1]

“And when we're out here, it gives us an opportunity to see what our abilities are and not just be graded.” [C2]

Autonomy-Supportive Learning Climate: “Well, I never even learn anything about snowflakes in school ... It's like we're still in a classroom, but we also have to experience it. But at school, we're in a classroom, we don't just – we don't get to go outside and experience it most of the time. So, you do both here and only one thing at school. It's a lot more hands-on... And experiencing it teaches you better than just hearing about it. Yeah. And you memorize it more, because you're like, ‘Oh. So, those are what our snowflakes look like,’ because you get to experience it.” [ASC1]

“It's like we learned all the concepts and then we went out and applied them. And I like that much better. In chemistry I don't really do that except for labs, which I don't even get half the labs...” [ASC2]

Discussion: This study provides preliminary insights on student experiences of active GreenSTEM programs. Findings suggest that active outdoor ‘learning laboratories’ have the potential to enhance student autonomy, relatedness and competence in relation to STEM concepts. Data also suggests that active GreenSTEM programs may provide more autonomy-supportive learning climates than traditional classroom settings. Future research should examine various models of K-12 active GreenSTEM programming and how these programs might increase self-determination for STEM learning, academic achievement, and student engagement with STEM programs in higher education. Practical implications of this study include (a) the
importance of developing programs that purposefully integrate opportunities for physical activity with STEM education and (b) the potential role of physical educators in designing STEM curriculum.

Abstract: Despite growth of distance education programs, a significant challenge for higher education institutions is that student retention is lower in online programs than in traditional programs. One reason cited is the lack of connection students feel between themselves and the institution. An initial quantitative study conducted by the authors of this study confirmed that students in an online asynchronous program did indeed desire connectivity. To more deeply understand this, the research team sought participants from the original study to participate in a follow-up, qualitative investigation. Using a consensual qualitative research (CQR) design, the team interviewed participants using open-ended questions. Results indicated that students desired high to very high connectivity with their advisors, instructors, and the online program, but only some connectivity to their fellow students. The leading factor that contributed to their feelings of connectedness was quality communication. Communication must be ongoing, timely, and utilize a variety of modes.

Introduction

Despite the continual growth of distance education programs, a significant challenge for higher education institutions is that student retention in online programs is lower than in traditional ones (DiRamio & Wolverton, 2006; Hoyer, 2006; Stanford-Bowers, 2008; Terry, 2007). This dropout rate is one of the greatest challenges facing online educators and administrators (Lee & Choi, 2011). Literature suggests there are a number of reasons for low retention among students taking coursework online. These include, but are not limited to, lack of institutional support, lack of connection between the student and the institution, quality of interaction between the student and faculty, sense of isolation, disconnection, issues with technology, and student self-discipline (Heyman, 2010, Stanford-Bowers, 2008; Veenstra, 2009).

While there are barriers to online student retention, there are students who persist in distance degree programs. Studies have suggested that faculty-student interaction is correlated with dropout rates. To illustrate, Ivoankova and Stick (2007) found that students were more likely to persist if faculty gave timely feedback, involved students in interactivity activities, and promptly provided supports to struggling students. When Thompson, Miller, and Franz (2013) examined the learning experiences of undergraduate students who failed the online version of a
course, then passed when completed it face-to-face, their findings confirmed the importance of establishing a teaching presence and cultivating social presence among students. Lastly, Carr (2000) and Rovai (2002) suggested that students who take online courses experience a lack of connectivity with their instructors, peers, and the program because they do not have a physical presence.

Schwartz and Holloway (2012) reported that one might assume student-faculty relationships are not valued in graduate education due to the short length of a master’s program and the increased focus on careers. However, they investigated the relationship between faculty and master’s seeking students and found these connections were forces for growth and forward movement. Students felt energized by their connections, had boosts in self-esteem, increased their knowledge, improved their ability to take action, and desired more connection.

Schroeder, Baker, Terras, Mahar, and Chiasson (2016), conducted initial research to ascertain the connectivity students desired and actually experienced within their asynchronous, online Masters of Science in special education program. For the 100 students who participated, researchers investigated their connectivity with students, instructors, advisors, and the online program. Results suggested students desired high connectivity overall but wanted the highest connectivity with their advisors and the least connectivity with other students. There was a variation between participants’ ages and those who wanted connectivity with peers, advisors, instructors, and the program. Students between 26 and 30 years of age desired high connectivity with other students and their instructors. Conversely, students between 46 and 50 years of age desired the least amount of connectivity with students and instructors. All students experienced high or very high connectivity with other students, their instructors, advisors, and program. The greatest level of experienced connectivity was between the student and advisor.

Research on the effectiveness of online learning has largely focused on the instructional process relative to meeting course objectives, which typically is measured through the acquisition of knowledge and skills. Yet, the online learning experience is more expansive and includes relational elements, such as connectivity. To date, there is limited empirical evidence on the degree of connectivity learners feel toward others in their learning communities, especially in distance degree programs.

In the initial quantitative study described above, students desired and experienced high connectivity to the program, their advisors, and their instructors, while at the same time, they reported experiencing and wanting less connectivity to fellow students. In turn, this current study further investigated the concrete perceptions and experiences of connectivity for these graduate students enrolled in this distance degree program using asynchronous, online instruction. Specifically, the perceptions and experiences were focused on connectivity with advisors, instructors, students, and with the online program as a whole.

Method

An applied qualitative design provided a vivid and full description in the natural language of the phenomenon under study. Specifically, Hill, Thompson, and William’s (1997) A Guide to Conducting Consensual Qualitative Research (CQR) provided the framework. CQR uses open-ended questions to collect data, utilizes an inductive analytic process, uses teams to make decisions by consensus, and verifies the stability of results.

In the initial, quantitative study described above, students desired and experienced high connectivity to the program, their advisors, and their instructors, while at the same time, they reported experiencing and wanting less connectivity to fellow students. In turn, this study
further investigated the concrete perceptions and experiences of connectivity for these graduate students enrolled in this distance degree program using asynchronous, online instruction. Specifically, the perceptions and experiences were focused on connectivity with advisors, instructors, students, and with the online program as a whole. Recommendations for increasing connectivity were also ascertained.

Setting

The study was situated in the College of Education and Human Development’s Department of Teaching Learning. This department is comprised of seven programs, one of them being special education. The special education program was selected for this study because it offered a fully online Master’s of Science degree using asynchronous instruction, with no on-campus residency requirement. Enrollment was approximately 325 graduate students. Since the program began offering online learning in 2007, students have resided across 42 states and eight countries.

Participants

During the initial study, participants were asked to provide their name and primary mode of contact if they were willing to participate in an interview for a follow-up, qualitative study. A total of 42 participants provided contact information.

After the project’s approval by the Institutional Review Board, participants were contacted via email. Those who responded were electronically sent the consent form detailing the study. After written consent was received, participants were assigned to members of the research team for an interview to be scheduled. Twelve students participated. CQR recommends 8 to 15 participants, which is small enough to study intensively, yet large enough to determine if findings apply to several participants or are just representative of one or two.

Data Collection

Data were collected across one semester by conducting one semi-structured interview with each of the 12 participants. Interviews were divided amongst researchers resulting in a one-on-one pairing. Each interview was approximately one hour and was conducted by phone or video conferencing. Because interviews were conducted across the five member research team, a semi-structured interview guide was developed for consistency. Findings from the authors’ initial study on the degree of connectivity in online courses was the framework for developing the interview guide. This guide consisted of 22 open-ended questions in order to not constrain the responses of the participants. The questions were categorized into five sections: (1) participant information; (2) connectivity with advisors; (3) connectivity with instructors; (4) connectivity with students; and (5) connectivity with the program.

Data Analysis

To understand this natural phenomenon, data were inductively analyzed using consensual qualitative research (CQR) designed by Hill, Thompson, and Williams (1997). This process relies on two teams, the core team and the audit team. This method permits the core team to
rigorously and systematically analyze data in an effort to reach consensus, then relies on the audit team to check all analyses. The core team was specifically charged with identifying the core ideas for participants’ experiences through analysis of each participant’s statement, then for discovering patterns within these core ideas that accurately represent the sample. The audit team’s role was to audit these core ideas and patterns for stability. In CQR, the core team initially analyzes the majority of the transcripts, while the audit team analyzes a small sample to determine stability of findings. In this study, the core team initially analyzed 10 transcripts and the audit team the remaining two. Four themes emerged from the data and three conclusions were drawn.

Results

Upon completion of data analysis, four themes emerged. Below, each theme is presented along with supporting evidence.

Theme 1

A majority of participants did not experience any change in their desired connectivity to advisors (58%), instructors (83%), students (58%), and program (83%), but for those who did, they experienced greater connectivity than initially desired, especially with advisors. Participants were asked to rate their desired connectivity, with advisors, instructors, students, and the special education program as a whole. They rated the desired connectivity on a scale of 1 to 5 (no connectivity (1); limited connectivity (2); some connectivity (3); high connectivity (4); very high connectivity (5). Connectivity ratings were given for both the student’s desire when first starting graduate school, and then upon reflection, how it may or may not have changed over time. When participants began their fully online program, many revealed being “nervous,” or not sure what they were “getting into.” Consequently, they initially desired high to very high connectivity with advisors and instructors, yet as they progressed through the program and became more “comfortable and confident,” this desire for connectivity did not change for most participants. This may have been a result of participants (n = 10) feeling well supported, especially by their advisors.

Theme 2

Participants desired high to very high connectivity to their advisors, instructors, and the program; whereas no participant desired this degree of connectivity with other students. When participants first began graduate school, none of the 12 wanted high to very high connectivity with other students. This is a stark contrast to the connectivity they wanted with advisors, instructors, and the online program. Nine participants wanted some connectivity, and three wanted low to very low. One participant explained, “I was expecting fully online. Hey great, I won’t have to interact with a room full of strange people. That was just fine with me.” Another explained how she was more focused on having a connection with colleagues at work than with peers in class. Working full-time and having children did not leave time for connectivity with peers for another participant. Over time, only three wanted more connectivity.

Theme 3
The central experience that made most participants feel connected was quality communication; consequently, they felt part of the distance degree program. Quality communication was defined by the participants as the following: variety of modes (not just email), prompt, and ongoing. The preferred mode of communication was a phone call.

**Theme 4**

Most participants did not have a disconnecting experience with advisors nor the program. However, slightly less than half of the participants had delayed feedback from instructors, and half experienced limited interaction from other students, which impacted their connectivity.

**Discussion**

This follow-up study investigated the concrete perceptions and experiences of connectivity for graduate students enrolled in a distance degree program using asynchronous, online instruction. Specifically, their perceptions and experiences focused on connectivity with advisors, instructors, students, and with the online program as a whole. Three conclusions were drawn.

**Conclusion 1**

Participants enrolled in this distance degree program desired high to very high connectivity with advisors, instructors, and to the program as a whole, whereas none desired this degree of connectivity with other students.

Participants revealed that the greatest level of connectivity was experienced between them and their advisors. Other research corroborates this finding as one study found that academic advising was vital to a student’s success within any program of study, affecting both student retention and student satisfaction (Corts et al., 2000). A more recent study stated adult graduate learners needed their advisors to provide good programmatic guidance they could trust, to care about them as individuals, and to remain readily available with timely responses (Schroeder & Terras, 2015). The participants in the current study identified similar essential characteristics, such as timely communicative responses and guidance.

While previous research supports the notion that students desire connectivity with advisors, and have better retention when there is high connectivity, studies substantiate that students also need an involved instructor. Woods and Baker (2004) found that a “sufficient level of interaction with faculty generally creates a sense of personalization and customization of learning and helps students overcome feelings of remoteness; perhaps the greatest obstacle to fostering a student’s sense of community in online distance learning” (p. 6). In another study, Reupert, Mayberry, Patrick, and Chittleborough (2009), stated that students needed online instructors to provide a personal presence by being engaging, approachable, understanding, patient, and passionate about the subject. Accordingly, they purported these qualities were enacted through specific teaching strategies including self-disclosure, relationship building, humor, provisions of individualized and timely feedback, and organization. Comparatively, findings from this current study support these assertions. Participants felt connected when
advisors and instructors initiated and responded through a variety of modes of communication, because being able to talk to somebody made students feel faculty's presence. Participants also felt cared about through personal information shared during formal and informal dialogue.

Much like research on traditional, face-to-face teaching, participants in this online program also implied that it is the connective experiences with their advisors and instructors that link students to their institution of higher education and their academic programs. In an effort to retain students in online programs, advisors and instructors must form relationships with their students in an effort to create levels of connectivity that have traditionally been desired among on-campus learners.

**Conclusion 2**

Participants desired *some* connectivity with other students. Although participants wanted connectivity with their peers, having an increased connection with their advisors and instructors was more important for the aforementioned reasons. Findings from the initial, quantitative study revealed that only 12% of students wanted *high* to *very high* connectivity with their peers. Similar to the initial study, students were more concerned with establishing and maintaining a sense of connection to their academic advisors first, instructors second, online program third, and fellow students last.

Many students desired lower connectivity with peers. This phenomenon can be explained by a study conducted by Capdeferro and Romero (2012) who investigated online master’s students’ perceptions of collaborative learning activities. Students identified these activities as the most important source of frustration in online learning due to the following: group disorganization, lack of shared goals amongst team members, imbalance in level of commitment and quality of individual contributions, excess time spent on these tasks, and difficulties in communication. Empirically supported, not all students want a social connection with their instructors and classmates (Drouin & Vartanian, 2010), rather the *flexibility* of online learning is paramount (Reupert et al., 2009). Reupert et al.’s finding is corroborated with the current study as the majority of participants selected the online, distance degree program because of its flexibility and convenience. However, this cannot be generalized to all students. Müller’s (2008) study found that students ranked high in importance the relations they built with online classmates because building social relationships with peers provided a key support system for them. Müller’s findings are reinforced by Mykota and Duncan (2007) which found students are able to develop a sense of connection to others if they experience belonging and a sense of being part of the online experience.

Participants’ pursuit for a graduate degree, in order to advance their professional careers, would explain their reduced connectivity with other students, but increased connectivity with advisors, instructors, and the program. Participants enrolled in this online program to attain a graduate degree for career advancement; advisors and instructors were their primary pathways for meeting this goal. Similarly, Ivankova and Stick (2007) postulated that graduate students are motivated for goal attainment and valued the career and financial outcomes of their education. This current study should not imply that participants do not want a connection with their peers, rather connectivity with peers may be pursued more in the workplace than in the college classroom, as all participants in this study were practicing professionals.

**Conclusion 3**
Quality communication was the leading factor in participants feeling connected or disconnected in this distance degree program. Quality communication was operationalized as ongoing, timely, and utilizing a variety of modes. Without these variables, disconnection ensued, especially when feedback to participants was delayed. Müller (2008) found that instructors’ [and advisors’] availability (through email, telephone, or online chat), timeliness of their replies, and words of encouragement were viewed as critical to students’ academic success.

The impact of quality communication is that participants in this current study understood the program, resulting in feelings of calmness and comfort. Numerous studies have suggested a positive correlation between relationally supportive online environments and cognitive learning (e.g., Baker, 2010; Gunawardena, 1995; Rovai, 2002). Another impact was that most participants in this study had connecting experiences, which were provocations for desiring high to very high connectivity with advisors, instructors, and the program. This supports a major finding from the initial, quantitative study that concluded all participants experienced high to very high connectivity. Pigliapoco and Boglio (2008) found that students’ perceived sense of community in online courses was relevant to student satisfaction, performance, and persistence. Fundamentally, it was theorized that if students feel involved and develop relationships with other members of the learning community their levels of satisfaction and persistence increase (Tinto, 1993; Rovai, 2002). When examining these supportive and relational elements, they may have contributed to participants’ average GPA of 3.9, especially when considering how GPA is a significantly predictive of student persistence (Harrell & Bower, 2011). Woods and Baker (2004) postulated that failure to fully consider the relational dynamic in the online setting may produce greater feelings of isolation among distance learners, reduced levels of student satisfaction, poor academic performance, and increased attrition.

Findings from this current study provide evidence that quality communication with students is paramount for connectivity, which can have a direct effect on retention. Although online learning is expanding in availability and popularity, the high dropout rate remains one of the greatest challenges facing online educators and administrators (Lee & Choi, 2010). Ivankova and Stick (2007) had a parallel finding in that if faculty gave timely and appropriate feedback, involved students in interactive activities, and promptly provided supports to struggling students, then students are more likely to persist in online courses, whereas ineffective communication is a barrier to persistence (Aragon & Johnson, 2008). Because this study was situated in a graduate, special education program, retention of students is vital in order to help reduce the national shortage of qualified special education teachers.

Abstract
The purpose of this two-year observational study was to determine if the use of technology and intervention groups affected fourth-grade math scores. Specifically, the desire was to identify the percentage of students who met or exceeded grade-level standards on the state standardized test. This study indicated possible reasons that enhanced conceptual understanding within the study group at a Title I elementary school. Throughout the two-year time period, the classroom teachers created mathematics awareness through technology, teamwork, engagement and rigor. The findings revealed a significant percent of fourth-grade students who used technology and participated in specific learning activities met or exceeded grade-level standards in math as measured by the Washington State standardized test.

Keywords: conceptual understanding; discourse; engage; interactive whiteboard; intervention; rigor; Common Core State Standards for Mathematics

1. Introduction
Mathematics concepts can be difficult for elementary students to grasp. That is why it is important to create a classroom climate allowing students to feel comfortable to take risks, ask questions, and learn through inquiry. When having a deeper level of discussion, students can make their discoveries while talking about their thought process when solving problems (Zwiers & Crawford, 2011). Through this process, students increase their need to know why something works in math, not just how it works. Understanding why and how to solve problems requires students to acquire the proper language and terminology (Zwiers, 2014). Therefore, providing students with a supportive infrastructure in math is vital to their success.

What steps help students deepen their understanding of new knowledge in the math classroom? First, daily instruction must build from prior lessons to engage students in thinking and learning about mathematics. Next, teachers need to be creative through a combination of integrated technology and intervention groups while providing a positive classroom atmosphere where students learn from each other. Teachers must help students acquire mathematical language (NCTM, 2000). Finally, students can expand their understanding through productive struggle. When students make mistakes experiencing productive struggle, their brain activity grows because synapse fires making new connections (Boaler, 2013).

This study illustrates how fourth-grade students enhanced their math skills on their way to becoming more mathematically literate. Math is more than just remembering facts and using formulas; it is about being able to explain your thinking, solve problems, and learn through productive struggle. This progression leads students to change their approach to mathematics and increase their academic drive creating a growth mindset. Students are creating a growth mindset when believing they can develop their mathematical ability reinforcing the idea that math is the process of learning not the product (Boaler, 2013). Mathematical concepts that students are in the process of constructing formulate over time (Van de Walle & Lovin, 2006). In doing so, students acquire the ability to apply their knowledge in creating sophisticated products (Wiske, 2005).

One challenge in education is getting students at Title I schools to meet grade level standards on state academic assessments (Office of Superintendent of Public Instruction, 2016). Under current law, Title I provides financial
assistance to local educational agencies and schools with high numbers or high percentages of children from low-income families to help these students meet state academic standards (U.S. Department of Education, 2010). To support the current needs of students who attend a Title I school the federal government provides additional funding to enhance instructional services and activities for the entire school. The intent is to support the academic achievement of students who are most at risk of failing (Office of Superintendent of Public Instruction, 2016). Therefore, the goal of a Title I school is to provide customized instruction to help students meet challenging academic standards and take an active role in the learning process.

1.1 Background: Teaching Mathematics Effectively

Before the start of the school year, it is necessary for teachers to collaborate to develop an instructional plan incorporating hands-on activities and technology to enrich student learning. There is an emphasis placed on how to teach the big ideas in math more effectively so students can make sense of mathematical problems and concepts (NCTM, 2000). Effective teachers ask students appropriate and timely questions that connect new ideas to big ideas. These big ideas in mathematics allow students to make connections by building background knowledge and enduring understanding.

To develop students’ level of knowledge, teachers need to ask open-ended questions creating a more rigorous classroom setting. Rigor creates an environment in which students learn at high levels, articulate their thought process, and apply mathematical knowledge (Common Core State Standards Initiative, 2016). When mathematical rigor increases, the students develop cognitive skills through reflective thought and creativity. The teachers must recognize the importance of immersing students with key mathematical vocabulary as well as provide opportunities to answer higher-level questions. It is necessary for students to comprehend complex ideas, so they solve problems and transfer their knowledge to new situations. Since all students have different experiences in math, students need to know the teacher’s expectations for them as well as what they can expect from the teacher. When the teachers establish mathematical expectations, the students willingly interact among themselves (Marzano, 2007).

A math lesson design that uses interactive technology allows for higher levels of scaffolding (DeVita, Verschaffel, & Elen, 2014). Instructional scaffolding helps to bridge learning gaps identifying what students learned and what they were expected to comprehend. For real learning to take place, there must be some challenge, some new ideas even if students merely saw an old idea in a new format (Van de Walle & Lovin, 2006). The students’ ideas should be valued and serve as a source of learning (NCTM, 2000).

Technology infused within the core curriculum requires a new way to teach and think about mathematical content. Understanding the role of technology in the classroom is an essential component in the students’ learning development (Scoter & Boss, 2004). A way to keep students on track would be to follow a pacing guide (Marzano, 2007). When teachers create a logical scope and sequence for their students, downtime decreases making it possible to expedite a pacing guide.

1.2 Supporting Mathematics Instruction

To support math instruction, the teachers must develop a well-rounded math program essential for student success. Students apply previously learned strategies to the problem, summarize main points, organize information in a logical way, and compare a problem to similar problems (Zwiers, 2014). Making math a priority, the students take a journey to become mathematicians. Becoming a mathematician does not just mean doing things a different way. Being a mathematician means taking action. These actions prepare the students for real-world mathematical problems as well as standardized tests.

The interactive whiteboard is a sensory, hands-on learning tool providing students with different learning styles to become more engaged in the lesson (DeVita, Verschaffel, & Elen, 2014). Students who are tactile learners can touch and move things around on the interactive board while visual learners benefit from the information provided in a clear and organized fashion. The interactive whiteboard focuses instruction on the development of specific concepts and helps to improve students’ mathematical knowledge. The students become skillful learners by adapting continuously.

The integration of the interactive whiteboard creates a collaborative classroom where students absorb information, talk about new knowledge, and reflect on how their understanding changes. Using an interactive whiteboard as an extension of the computer creates new opportunities for learning (Zevenbergen & Lerman, 2008). The interactive whiteboard turns a traditional classroom whiteboard into a kinesthetic experience making it useful and engaging for
students (Lever-Duffy & McDonald, 2011). During the learning process, students can think and talk like mathematicians.

Teachers use flipcharts for each lesson as a way to share information through multiple electronic slides. Each flipchart is an electronic tool used to display mathematical concepts, save notes, and review previous content on a large, vertical display (Mercer, Henessy, & Warwick, 2010). The flipcharts make it simple for students to use the interactive technology while revising previous work (Scoter & Boss, 2004). When students construct their understanding and test new ideas of mathematical concepts, how they are learning is as important as what they are learning (Van de Walle & Lovin, 2006). As a result, this technology is an essential tool for both learning and teaching mathematics (Van de Walle, Karp & Bay-Williams, 2016).

1.3 Why having a Positive Classroom Atmosphere Matters

At the beginning of the school year, it is important to create a positive classroom atmosphere allowing students to feel comfortable to take risks, ask questions, and learn from each other. When students think positively about themselves, they unlock their abilities and prevent stress from blocking their working memory (Boaler, 2013). The teacher models and guides students in ways to compliment and encourage each other. One way to ensure in-depth discourse is to provide sentence starters so students can articulate their thinking. Because of this form of dialogue, students gain confidence in their mathematical discourse and begin to share their thoughts openly. This rigorous, interactive environment empowers students to learn (Van de Walle, Karp & Bay-Williams, 2016). Open communication allows the teachers to identify misconceptions students have regarding their learning. Also, the teacher needs to encourage students to ask questions when they do not understand (NCTM, 2000). Deep understanding develops over time (Hiebert & Wearne, 2003). Reviewing mathematical content in groups helps gain a higher conceptual understanding of the material. Conceptual understanding is an important component of proficiency (NCTM, 2000).

Effective and accurate peer feedback is just as powerful as teacher feedback. When students provide each other with feedback, it shows they are listening and understanding what others are saying. Students check their thinking and look for ways to solve problems by using mathematical discourse. Students use the language of mathematics to express their thoughts building connections to formal mathematical terms (NCTM, 2000). The conversations help students develop vocabulary, syntax, background knowledge, and thinking skills (Zwiers & Crawford, 2011).

Even though students may struggle, creating a risk-free setting where they can externalize their struggle creates opportunities for success (Hiebert & Wearne, 2003). Conversations allow students to show what they know and what they can do (Zwiers & Crawford, 2011). When having opportunities to discuss topics, students talk about their thought process making discoveries and expanding understanding of how the math works. This discovery helps students realize they are capable of doing well in mathematics (Boaler, 2013). When students share with each other, they expand on new mathematical concepts (Van de Walle, Karp & Bay-Williams, 2016). Through the group discussions, students discover working together is fun.

Another notable technique used in the math classrooms is peer tutoring. During peer tutoring time, students work through problems and explain their mathematical reasoning to each other. While articulating their thoughts, students might think differently and struggle. This approach to learning provides opportunities to deepen their level of understanding they might have executed without thinking (Hiebert & Wearne, 2003). Having in-depth conversations allows the students to process and clarify content (Zwiers & Crawford, 2011). Because of this discourse, students use clear and precise language in their discussions with peers. Furthermore, the students develop a sense of pride and confidence to figure out and make sense of the mathematics (Van de Walle & Lovin, 2006).

During a math work time, small groups of students relearn specific content with the assistance of the classroom teacher. The teacher bridges learning gaps by using a variety of instructional techniques to reinforce mathematics. Some students use the classroom computers to reinforce mathematical concepts which transfer their knowledge to other situations. Students might view computer activities as games, but instead the activities reinforce fundamental concepts including basic facts, geometry, measurement, fractions, and word problems.

2. Methods

The intent of this two-year study was to determine if students who used interactive technology and intervention groups in math would meet or exceed grade level standards. In the first year of this two-year study, there were 46 students in the fourth-grade study group. Participants selected for the study group consisted of all students enrolled in
the two classrooms. This Title I elementary school had 74% of the students receiving free or reduced-priced meals and 34% of the students were transitional bilingual.

The second year of this study consisted of a different group of 50 fourth-grade students. Participants in the study group included all students enrolled in the two classrooms. The teachers used the same pacing guide, teaching techniques, and technology with this study group as they did the previous year. The same Title I elementary school had 77% of the students receiving free or reduced-priced meals and 36% of the students were transitional bilingual.

The common threads in the classrooms for all mathematic lessons were the interactive technology and intervention groups. The two teachers used the interactive whiteboard to review previous mathematical concepts and problems. The review would last approximately 20 minutes leaving 70 minutes to integrate the next mathematical standard or big idea. The first slide of each flipchart displayed on the interactive white board was the Common Core State Standard for Mathematics along with the learning targets. As the units developed each week, the number of slides within the flipchart increased.

At the beginning of the year, the two teachers developed procedures and administered a baseline assessment to evaluate the students’ current performance levels. The assessments were part of the instruction process, not apart from it (Popham, 2011). With the data collected, the teachers shared learning targets and the criteria for success. To begin each math lesson, students sat on the floor in the front of the room with a small dry erase board and marker. The teachers used an interactive whiteboard as a means to model problems. Students took part in the instruction process by standing next to interactive whiteboard and manipulating the information to explain problems and show their work within the flipchart. By using an interactive whiteboard, the speed of questions displayed and the delivery of instruction decreases lag time within the math lesson (Zevenbergen & Lerman, 2008).

The teachers used exit slips and posttests to evaluate the fourth-grade students on mathematical content. The teachers compiled scores onto a spreadsheet forming intervention groups. Structuring intervention groups in multiple classrooms allowed students to receive instruction that was more refined while learning concepts at their level. Through the guided instruction process, students extended their mathematical knowledge while generating ways to solve problems and testing their hypothesis to complete tasks.

2.1 Utilizing Technology in the Classroom

The students were motivated to do the math as well as make meaningful connections to the mathematical concepts when hands-on activities were part of the instructional lesson. Technology reinforced mathematical thinking as students developed the knowledge, skills, and disposition that engaged multiple strategies for understanding. When the teachers provided real-world applications to math, students saw a purpose for math and made connections to emerging technologies. Those technologies included classroom computers, handheld tablets to view eBooks, access to stream videos, and collaboration online. Technology engaged students and promoted active learning as a regular part of students’ educational experiences (Scoter & Boss, 2004).

The students used classroom computers and the Internet to help develop and reinforce mathematical concepts. A frequently used Internet site was IXL.com. The IXL Learning site made learning fun for students through open-ended standard aligned questions and exercises (IXL Learning, 2016). The Internet program adjusted the types of questions to the level of success of each student while at the same time provided immediate feedback guiding students through problem-solving activities (Scoter & Boss, 2004). The IXL program provided teachers data tracking reports with content specific information. The tracking reports displayed the actual problem students missed and their incorrect response (IXL Learning, 2016). The data from the performance tracking was useful information when delivering instruction in the intervention groups.

Professionally produced math videos offered additional resources in the classroom. Videos outlined strategies to enhance and support concepts. Using visually appealing videos to introduce or reinforce a specific skill was one more way students connected with math. To provide students more time to absorb and clarify information it was helpful to pause, review, or watch the video multiple times.

2.2 Other Variables in Math

The teachers implemented other activities into the classroom to promote student learning and support the Common Core State Standards for Mathematics. The teachers presented multiple contexts for students to acquire information and demonstrate understanding through the key shifts in mathematics. By teaching fewer topics with greater focus, students strengthened their foundation and enhanced their ability to solve problems. Linking topics from grade to grade increased coherence so students built new understanding onto foundations from previous years. The Common
Core Key Shifts ensured the math rigor provided authentic learning letting students apply knowledge to real-world situations (Common Core State Standards Initiative, 2016).

The mathematical discourse in the classrooms helped students talk, write, participate, and share information. Even though the teachers provided a positive climate where students collaborated and explained how they arrived at their answers, for students to be successful, there were other areas to address. Through this style of instruction, the teachers were explicit in identifying each math standard that aligned the task and assessment meeting the students’ individual learning targets. When students understood the learning target and the assessment criteria, they improved their ability to self-regulate (Moss & Brookhart, 2012).

Using assessments designed with a purpose in mind promoted learning significantly (Wiske, 2005). Teachers made instruction meaningful and used assessment to drive instruction in the classroom. To monitor student progress, the teachers used results of classroom assessments as evidence to improve and modify instruction (Popham, 2011). The teachers tracked student successes as well as content areas that needed improvement. Throughout the day, students solved mental math problems linked to their learning targets. At the end of each day, students received homework related to the learning target. Homework had a well-articulated purpose and structure to ensure high completion rates (Marzano, 2007).

Students played a more active role and took ownership of their learning when they recorded their learning targets, identified their success criteria, and charted their growth on a spreadsheet. They decided what was important and had a deeper understanding of themselves as learners. Students can be successful when they control their learning environment by monitoring their progress to meet their math goals. The best way to share their success criteria and provide evidence of learning was through their experiences and performances that represent the learning target (Moss & Brookhart, 2012).

3. Findings

The findings from this two-year study revealed notable results existed among the students in the study group who received additional support in math with a combination of technology and intervention groups. It was apparent providing multiple contexts for learning presented new opportunities for students to develop their mathematical skills. Students used their prior knowledge to make sense of a mathematical problem and then extended their learning through conceptual understanding.

In the first year of this two-year study, there were 19 girls and 27 boys in the study group. Based on the results of the Washington State standardized math test, 74% of these fourth-grade students met grade-level standards. From the 74% of the students who met grade-level standards, 71% of those students scored at an advanced Level 4 exceeding state standards.

In comparison to the study group, there were 246 fourth-grade girls and 256 boys in the other Title I elementary schools in the district. From this group, 49% of fourth-grade students met grade-level standards with 19% of those students scoring at an advanced Level 4. In the school district, there were 474 fourth-grade girls and 511 boys with 62% of the students meeting grade-level standards and 34% of those students scoring at an advanced Level 4. In all the Washington State elementary schools, there were 37,163 fourth-grade girls and 39,605 boys. Within the state, the percentage of all fourth-grade students meeting standards was 60% with 29% of those students scoring at an advanced Level 4.

Figure 1 shows a comparison of four areas in the first year of the study. Based on the results of the fourth-grade Washington State standardized test, a notable percentage of students in the study group were more successful in meeting grade-level standards with a vast number of those students exceeding grade level standard. Therefore, the 74% of students in this study group who met or exceeded grade-level standards in math was more than the percentage of students at Title I schools in the same district, all the district elementary schools, and all the Washington State elementary schools.
The second-year of this study consisted of a different group of 27 girls and 23 boys. Based on the results, 88% of these fourth-grade students met grade-level standards on the state standardized math test. From the 88% who met grade-level standards, 66% of those students scored at an advanced Level 4 exceeding state standards.

In comparison to the study group, there were 266 fourth-grade girls and 246 boys in the other Title I elementary schools in the district. From this group, 64% of fourth-grade students met grade-level standards with 30% of those students scoring at an advanced Level 4. In the school district, there were 511 fourth-grade girls and 529 boys with 70% of the students meeting grade-level standards and 39% of those students scoring at an advanced Level 4. In all the Washington State elementary schools, there were 37,868 fourth-grade girls and 39,295 boys. The percentage of all fourth-grade students meeting standards was 63% with 32% of those students scoring at an advanced Level 4.

Figure 2 shows a comparison of four areas in the second year of the study. Based on the results of the fourth-grade Washington State standardized test, the study group had a higher percentage of students meeting grade-level standards. Thus within this study group, the 88% of students who met or exceeded grade-level standards in math were significantly above the percentage of students at Title I schools in the same district, all the district elementary schools, and all the Washington State elementary schools.
4. Discussions

The main purpose of this study was to identify the percentage of students who would meet or exceed grade level standards if their math instruction included technology tools and intervention groups. Information collected supported the findings of this two-year study. The outcome provided insight and information on how a notable percentage of fourth-grade students at a Title I school met the Common Core State Standards for Mathematics on the Washington State standardized test.

There was a higher percentage of students in the study group meeting grade-level standards than their peers. The teachers worked as a team to support student learning while implementing multiple teaching strategies to provide opportunities for students to discover solutions that made sense to them. When students received a balanced math program, they constructed their conceptual understanding by applying new knowledge. Other key areas integrated into the math classroom included solving open-ended questions, identifying learning targets, watching videos, and using computer activities to reinforce content.

Overall, this study represented a small step in exploring the students’ successes in math through integrated technology, intervention groups, and creating a positive classroom atmosphere. Therefore, the methods used in this study can help guide professional educators in their pursuit to having students meet grade-level standards in math.

Running Title: An Asset Based Approach for Male Students of Color: The Impact of PACT.

Topic Areas: Higher Education: Student Affairs

Presentation Format: Panel session

Description:

Males of Color, historically have had limited access and experience difficulty acclimating to predominantly White institutions (PWI). Often, they lag behind their White and female counterparts in high school completion, college enrollment, and graduation rates. Using critical race and stereotype threat theory, we will present a case study of PACT, an asset based mentorship program for undergraduate Males of Color. From our findings we hope to advocate for the application of similar asset based modeled programs at PWIs.

Abstract

In response to the widening higher education gap between the US and its counterparts, President Obama’s goal for the country is that by 2020, America would once again have the highest proportion of college graduates in the world. Acknowledging the increase in the population of people of color in the US and the educational trends for Males of Color, the White House has created initiatives to address persistent opportunity gaps specifically faced by boys and young men of color to ensure that all young people can reach their full potential (Force, 2014). Historically, this group has been denied access and experience difficulty acclimating to predominantly White institutions (PWI). Researchers have often proven that young Males of Color lag behind their White and female counterparts in high school completion, college enrollment, and graduation rates (Kena et al. 2015). The scattering of programs, initiatives and spaces at PWIs make it difficult for Male Students of Color to successfully matriculate and graduate from said institutions (Strange & Banning, 2001). Some of the unique challenges they face in higher education include navigating daily micro-aggressions, low societal expectations and a low sense of belonging due to inadequate representation. Facing such dilemmas, Male Students of Color have been discovered to leave universities before graduation more often than their white peers on PWIs (Harper, Patton & Wooden, 2009; Yosso, Smith, Ceja, & Solorzano, 2009). Through theory based programing, culturally competent practitioners and fully committed institutions, we have the opportunity and obligation to change the pernicious narrative surrounding Male Students of Color.

Using critical race and stereotype threat theory, we will present a case study of PACT, an asset based mentorship program for undergraduate Males of Color. We will evaluate if or how
tailored and intentionally created programs positively influence the campus climate and culture at a PWI for Male Students of Color. To do so, we will determine how PACT has 1) created a supportive structure, 2) cultivate self-efficacy within participants to successfully navigate PWIs and 3) provide opportunities for community building and engagement. From our findings we hope to advocate for the application of similar asset based modeled programs at PWIs.
Online STEM Education Content Modules: A Third Year Review

Lee Allen, Ed.D
University of Memphis, TN USA

A team of rural West Tennessee master teachers developed twenty-nine Science, Technology, Engineering and Mathematics (STEM) education high school-level content modules accessible to all teachers in TN via a Web Portal. Required courses for graduation were integrated with STEM content to enhance students’ knowledge of STEM content and post-secondary education and career paths; the content was developed in alignment with national, state, and Common Core standards. The online STEM education high school content modules are also accessible by parents, as well as teachers and students, throughout the state. This study examines the success of the initiative as measured by module access and completion rates over a two-and-a-half year period.

Keywords: Science, Technology, Engineering and Mathematics education, online teaching and learning, content modules, secondary education.

Introduction

Rural school districts face the continuing challenge of having access to a limited number of teachers qualified to teach upper-level secondary science, technology, engineering and mathematics, or “STEM” courses (Goodpaster, Adedokun & Weaver, 2012). The West Tennessee STEM Collaboratory was developed as a component of a statewide initiative in the state of Tennessee to increase the pipeline of students entering STEM majors, improve K-12 transitions to IHE, and address the needs of regional industries (Honey, Pearson & Schweingruber, 2014). The West Tennessee STEM Collaboratory mission is to unite K–12, institutes of higher education, and STEM industry partners in an innovative approach to transforming regional STEM education and workforce opportunities. The partnership envisions a community-wide initiative to increase students’ STEM preparedness, interest, and transition to the STEM workforce. Industry and higher education partners, working with K–12 teachers and administrators, are helping to bridge gaps in developing appropriate curriculum content, delivery, and community connections to create unique learning environments.

Background

One component of the West Tennessee (TN) STEM Collaboratory was to organize a team of master secondary teachers who were tasked with developing a set of online STEM and STEM-integrated course content modules for high school/secondary education. The steps for meeting this goal were met by accomplishing the following:

- Recruiting ten teachers from the West TN mostly rural districts who were identified by their district’s administrators as being master teachers in STEM as well as other HS content curriculum.
• Identifying and dedicating a central location in which to meet with the teacher team to develop HS core content online modules.

• Develop modules for 100% online delivery cooperatively as five two-member teacher teams in the specialization areas of required HS core content: English/Language Arts; Mathematics; Science; and Social Studies, plus a two-teacher team dedicated to developing content in HS Engineering.

• The content modules were based on Challenge-Based and Problem-Based Learning instructional concepts (Johnson & Adams, 2011; Boud & Felleti, 1998; Savery & Duffy, 1995; Margetson, 1991), comprehensively utilizing problem- and project-based learning while incorporating STEM content and the Common Core Standards as these are being adopted nationally and in the state of Tennessee.

The primary goals and expectations for the interdisciplinary online HS content module development teacher-team are to:

• Develop and make available a minimum of twenty online interdisciplinary/STEM integrated high school content modules during the timeframe of the funded project (2013-14).

• Integrate STEM and interdisciplinary content and incorporate Common Core standards and assessments where available in the TN curriculum.

• Promote regional implementation of the online STEM content modules and interdisciplinary curriculum.

Methodology

As of July 2016, twenty-nine HS content modules are available online via the Battelle For Kids/TN (BFK/TN) professional development web portal through a partnership between the West TN STEM Collaboratory and BFK; this vehicle for access was selected due to its already extensive use by K-12 teachers in the region (since 2011). The first fourteen modules were completed in June 2013 with availability for TN teachers during the 2013-14 academic year beginning in August 2013. The content modules are accessible for free and readily available to all TN teachers; usage can be tracked by region. The West TN STEM Collaboratory and Battelle For Kids-Tennessee provides access to the BFK/TN portal through their websites so that modules can be accessed by teachers and other educators across the country.

To gauge the success - or not - of the implementation and diffusion of the online HS content modules, the researcher determined that comparing the usage of the online STEM content modules would provide a visual representation in measuring the degree of success – or lack thereof – according to increases in usage of the content modules available online via the BFK/TN portal from when first made available to the present. The initial “snapshot” (screenshot) of the modules’ access and usage was obtained on January 21, 2014, approximately six months after the 2013-14 academic year began for public schools in Tennessee (Fig. 1). (Note that while all of the online modules shown in the view are designated as “Non Path Courses”, the modules under discussion are labeled “TNSTEM”.)
As shown in Figure 1, the total number of users for all of the “Non-Path” TN STEM courses was 143. The total number of users who had completed the TNSTEM courses by the Jan. 21, 2014 date was 56.

The latest “snapshot” (screenshot) of the modules’ access and usage was taken on June 21, 2016, thirty-six months after the first view, and three years after the initial availability of the modules. There are currently twenty-nine content modules available (since January 2015) for public and private educational use in Tennessee (Fig. 2). (Again, note that while all of the online modules shown in the view are designated as “Non Path Courses”, the modules under discussion are labeled “TNSTEM”.)
As shown in Figure 2, the total number of TNSTEM users enrolled in the “Non-Path” courses after two-and-a-half years (30 months) was 1,040; the total number of users who had “Completed” the TNSTEM courses by the June 21, 2016, date was 603.
**Results**

The screenshots illustrating TNSTEM online content module usage from, respectively, January 21, 2014 and June 21, 2016, show an overall increase of user enrollment and completion rate of the TNSTEM modules. User enrollment increased from 143 in January 2014 to 1,040 in June 2016, an increase of 897 users, or 627%. A comparison of user completion of the TNSTEM modules between January 2014 and June 2016 shows an increase from 56 to 603, an increase of 547 users, or 977%. (“Completion” of each module indicates only that users viewed every screen in the module; it is not an indication of successful completion of any particular measurable level of achievement.)

**Discussion**

The results of the comparison of the TNSTEM online content modules between January 2014 and June 2016 readily reveal that the implementation has been an overall success in achieving and surpassing the primary goals and expectations for the online HS content modules as determined by the West TN STEM Collaboratory; to wit:

*Develop and make available a minimum of twenty online interdisciplinary/STEM integrated high school content modules during the timeframe of the funded project (2013-14).*

This goal was achieved and exceeded, as there are currently 29 online content modules available; this number was achieved by the end of the grant’s funding period on December 31, 2014.

*Integrate STEM and interdisciplinary content and incorporate Common Core standards and assessments where available in the TN curriculum.*

While the integration of interdisciplinary STEM content into each online module cannot be measured by a numerical comparison of the modules’ overall usage, the significant increase in completion of the TNSTEM modules indicates that the users have determined that the content is of value to them as teacher/educators.

It is also noteworthy that each and every content module contains the full name and email address of the two teachers who developed and authored that particular model and, to date, none of the teachers involved have been contacted in regards to the module. In addition, the name and email address of the teacher team coordinator was also provided, as is the BFK/TN hosting web portal administration’s contact information. None have ever received communications in regards to the TNSTEM modules.

*Promote regional implementation of the online STEM content modules and interdisciplinary curriculum.*

Promotion and dissemination of the information on the availability of-and instructions on how to access the content modules online via the BFK/TN web portal has consisted primarily of printed informational flyers developed collaboratively by the Battelle For Kids organization as hosts of the TNSTEM modules, and by the West TN STEM Collaboratory communications’ team, as the sponsoring agency for the initiative. The flyers were distributed at various STEM-related
presentation and conference venues throughout West Tennessee, mostly, and the state as a whole; it is also available online as a downloadable PDF. The West TN STEM Collaboratory also hosts its own website with links to various STEM-related resources accessible online, and promotes the online HS content modules via that vehicle as one of the available teacher/educator resources: http://www.westtnstem.org/teachers.

Conclusions

In bringing the various West Tennessee rural and urban districts’ designated master teachers together in February 2013, the five 2-person teacher teams designed course content - as well as associated professional development - to improve teachers’ STEM content knowledge and pedagogical approaches. As a result of the 23-month implementation in developing and uploading the online HS content modules, teachers and other educators have benefitted from the products made available via the BFK/TN web portal, as evidenced by the very significant increase in access, use, and completion of the modules over the monitored 30-month period.

While the relative qualitative “value” of the online modules cannot be identified via analysis of the quantitative data collected of user enrollment and completion of the modules, the overall numerical increase in these two areas over a relatively brief time period cannot be viewed other than as significant: the availability of the online HS content module met - and surpassed - the criteria for the goals and expectations of the original mandate for the West TN STEM Collaboratory in the areas of development, dissemination, diffusion, and actual use of online STEM- and Common Core-related high school/secondary core content made available online via a readily accessible vehicle.

Service Learning in the Community in a Pre-Service Teacher Education Course

Kathleen Carroll Luttenegger, PhD

Kathleen Luttenegger
Elementary Education and Literacy
Metropolitan State University of Denver
kluttene@msudenver.edu

Abstract

In the fall of 2015, we began offering a residency-based elementary education major at Metropolitan State University of Denver. As part of the new major, we revised the multicultural course to include service learning within the community. The course is placed early in the sequence of courses for the major. Students are asked to complete 15 hours of service learning during the semester in a community setting outside of school. There are three identified objectives for this component of the course:

- To learn about what community services are available and used by families in the metro area;
- To meet community volunteers to find out more about their work and why they volunteer;
- And, to work with community members from different backgrounds from their own.

Students are asked to engage with the community and community members in some way. They are asked to fulfill a need that is identified within the community. And, they commit to working with the organization over the course of the semester.

This paper examines the design of this service learning component including effective practices based on three semesters of implementation. In addition, we will look at students’ responses to the required service learning component in this course from apprehension when learning about this requirement to embracing their work in the community.
Service Learning in the Community in a Pre-Service Teacher Education Course

Theoretical Framework: Service Learning

As part of a new elementary education major, the course on human diversity was completely redesigned. One component of the new course is the focus on service learning. Service learning is “a form of experiential education in which students engage in activities that address human and community needs together with structured opportunities for reflection designed to achieve desired learning outcomes,” (Jacoby, 2014, pp. 1-2). The purpose of service learning within the community is so that students become aware of the types of services available. As teachers, they may be in a position in which their students and their families need to access services such as food banks or donations of clothing, for example. Through their work in this class, they will develop an understanding of the range of services available to people within the community.

For the service learning component in this new course, students work out in the community (not in a school-based setting) with people who are different from themselves. Students have a variety of choices for service learning activities which meet the requirements of the assignment. They spend a minimum of 15 hours over the course of the semester, attending at least 4 times. A typical service learning setting is with a non-profit organization that provides food / clothing to families in need.

The benefits of service learning within university courses are well-documented (for example, Jacoby, 2014). Student benefits include: personal growth, application of learning, and development of interpersonal skills. Students develop a sense of community responsibility. They have the opportunity for application of skills and knowledge which helps students retain and understand course content. And, students have opportunities to practice and develop communication, leadership, and collaboration skills (Jacoby, 2014). Service learning is acknowledged as a high-impact instructional move in higher-education.

Most service learning activities within teacher education courses are at schools through field placements and student teaching. Again, the benefits that students receive through placements in schools is well-documented. However, the benefits of service learning in the community are less documented in teacher education. One study by Carrington et al (2015) found: “that transformational learning experiences in a critical service learning program can facilitate the development of the attitudes, values and practices that support inclusive educational approaches in schools. While some students may have already possessed inclusive values and attitudes, the service learning program provided all the students with a foundation on which to develop and build on their understanding of inclusive practices,” (p. 70). Although they state that service learning can be transformational for students, their study does not identify what made the experiences so powerful.

One common objective found in service learning courses is a focus on social justice—allowing students to learn about social inequities through experience (Hildenbrand & Schultz, 2015). This objective fits well with the objectives of multicultural courses in pre-service teacher education programs. The theme of this course focused on engaging with the community which also fits well with the objectives of a multicultural course.
Design of the Service Learning Component

On the first day of class, students receive information about the service learning component including goals, expectations, and coursework for the project. Although I provide several examples of possible organizations, I encourage students to identify their own service learning project. Our students commute from a variety of locations in and around the Denver area. This allows students to find opportunities for service within their own communities. When they decide on an organization, they create a service learning plan in which they answer the following questions:

• What organization are you planning to work with for your service learning?
• Why did you choose this organization?
• In what ways are you going to be working with people who are different from yourself as you complete your service learning hours with this organization?
• What skills or dispositions do you have to offer to this organization as you complete your service learning hours?
• What questions or concerns do you have now, if any?

During the semester, students complete 4 written reflections and a final multi-media project. The prompts for each paper are:

Reflection Paper #1
Tell me about your organization. What is the mission? What services do they provide in the community? Who is involved? Why did you select this organization to work with this semester? How is this service learning connecting with you with people different from your own background? How did you feel contacting this organization and beginning your service hours? What are your first impressions? What goals do you have for yourself this semester related to your service learning activities?

Reflection Paper #2
What kinds of activities have you been working on during your service learning hours? What has surprised? What is challenging you? What are you noticing about the other volunteers you are meeting during your hours?

Reflection Paper #3
What are you learning about yourself through your service learning hours? What are you learning about others? What did you expect when you began? Were your expectations realistic? In what ways are you making progress on your goals for yourself this semester? What impact is your organization making on the community?

Reflection Paper #4
How has your work this semester made a difference in the community? What is the most important thing you have learned from your work this semester? How does working in this organization help you understand the families you will be working with as a teacher? Would you refer families to this organization? Why or why not? How are you going to
continue engaging with the community beyond this semester? Reflect on your goals. Did you meet them? What are next steps?

The reflections are evaluated using a course rubric which considers depth of reflection, connections with coursework, use of a critical lens, and personal growth. In addition to the reflections, students create a final project which is described below.

Final Project
For your final project, you will create a 2-3 minute multimedia presentation about your service learning project. You can include pictures and videos (please do not take pictures or videos of the people who are using the services provided by your organization; you may take pictures or videos of the site or activities). Videos will be posted on the School of Education YouTube channel.

Students’ Responses to the Service Learning Component

Students had many concerns before they started their service learning projects. These concerns fell into four primary categories: logistical, emotional, organizational, and safety.

The primary concern students expressed about the service learning project was logistical. The students enrolled in this pre-service teacher education program are busy. Most students are working, often full-time. Approximately half of the students have family care-taking responsibilities such as taking care of children or parents. Typically, students are taking 12 credits of courses (with this course being 3 credits). Students were very concerned about fitting the service learning project in their schedules.

The second concern that students expressed was related to their emotions about doing the project. They expressed that they were nervous, apprehensive, anxious, and uncomfortable. Some students felt like the environment might be chaotic or dirty. Some students felt uncomfortable working with adults.

The third concern expressed was organizational—primarily concerns around how the organization that they selected to work with worked. They did not know how they would fit in as a volunteer and what they would be expected to do. Some students were worried that they might not have the skills they needed to do the work.

And, finally, some students expressed concern about their safety such as going in to areas in which they did not know well (such as downtown).

By the end of the experience, the vast majority of students found the learning experience valuable and many students expressed an interest in continuing their work with the organization.

Conclusion

Through thoughtful integration of a service learning component into this teacher education course, students are able to meet the objectives of this assignment—to learn about community services available; to meet community volunteers; and, to work with people different than themselves. The service learning component is an effective way to add depth and experience to a multicultural course. Students have the opportunity to learn
about themselves and a small sliver of their community. One primary theme in this course
is engaging with the community—students learn that schools are part of a larger
community and learn that engaging with the community benefits teachers, students, and
families.

Jacoby, Barbara (2014). Service-Learning Essentials: Questions, Answers, and
This session focuses on the application of a prominent psychological theory utilized in leadership and business known as the “Elephant and the Rider” theory. This model was first advanced by Dan and Chip Heath and has been utilized successfully in combination with various models of advising and student support to advance student retention efforts at a small, private university in the Midwest. The approaches taken by both Sarah Klucker, Faculty in the School of Business and Director of Student Affairs and Jennifer Miller, Assistant Dean for Student Success will be specifically explored through case study analysis, theoretical framework and creative application. Discussion about the difficulties all of us have with creating and responding to change will lead the session. Further description of the theory and it’s application will follow. Emphasis is placed on the need for leaders in education to focus not only on the rational but the emotional in order to create lasting and positive change in any environment. Methods for focusing on both are broken down into a series of 9 steps, as initially advanced in the theory and literature. Not only did the presenters observe measurable success in retention of students, but there was also success in applying these strategies to the often overwhelming pieces of higher education politics and structure. Through their combined 35 years in the field, both presenters demonstrate a creative enthusiasm about opportunities for change not only among students but among the workplace in general. This session will be engaging and participants will walk away with a new lens on the work they do creating positive change in and around themselves. When applied, their students will find these strategies easy to understand, motivating and creating the sense of hope that so many of our future leaders need to improve the world in which we live. Regardless of your academic background, your institution size, your role in education or your previous experiences with change, this session will undoubtedly be inspiring and applicable.
P-20 Collaboration and Induction Practices: Enhancing Teacher Preparation in Georgia

Paper Presentation
Abstract

Not only are school districts across the nation currently facing a difficult time hiring sufficient numbers of teachers to fill their classrooms, but they are also challenged to keep newly hired teachers in the profession. It is widely reported that 40% to 50% of teachers leave the profession during their first five years of teaching (Ingersoll, 2012). A study by the U.S. Department of Education of teachers who left the profession found that many did so because teaching offered few opportunities for professional development or advancement, collaboration with colleagues, recognition of their work by administrators, decision making on school or district policies or practices, and autonomy for their work (Keigher, 2010). In an effort to address these limitations in the workplace and reduce the attrition of new teachers, the state of Georgia is implementing an innovative process to revamp teacher induction programs across the state.

The Georgia Department of Education, the Georgia Professional Standards Commission, and the University System of Georgia are collaborating to develop and support P-20 regional partnerships across the state. Currently, nine regional partnerships are functioning and each focus on continuous school improvement and student learning and growth through the preparation of teacher candidates and the professional development of P-20 educators.
Introduction

Over the past twenty years, the number of teacher induction programs have grown as school districts attempt to provide professional development and support for new teachers entering the profession. However, the impact of the majority of these programs has not been particularly strong, as indicated by the large percentage of new teachers who leave the profession during their first five years in the classroom (Ingersoll, 2012). Until recently, little research was conducted on teacher induction; thus, we are just beginning to identify effective induction practices. Providing a mentor teacher for newly hired teachers has been a standard practice embedded in most induction programs, yet research by Smith and Ingersoll (2004); Kapadia, Coca, and Easton (2007); and DeAngelis, Wall, and Che (2013) have helped us understand that providing a mentor as the main induction support is ineffective and is poor usage of already-limited time.

In addition to a mentor, comprehensive induction support activities are needed, and it is important that such supports be tailored to meet the distinctive needs of each individual teacher. Not only do these comprehensive induction practices reduce teacher turnover, but they also result in a positive impact on student achievement (Ingersoll, 2012). Since schools with large numbers of students living in poverty have higher levels of teacher turnover than suburban schools with low numbers of students living in poverty (Boyd, Lankford, Loeb, Ronfeldt, & Wyckoff, 2011), comprehensive induction supports are especially needed in schools with large numbers of underserved students. Georgia has one of the highest rates of childhood poverty in the nation; according to the Children’s Defense Fund (2015), more than one in four children in the state of Georgia were poor in 2014. Therefore, induction models are critical for attracting and retaining highly qualified educators within the state who can meet the challenges and set high expectations.
for student learning, as research conducted by Johnson, Kraft, and Papay (2012) found that there is greater teacher retention in high poverty schools that are identified as high performing.

Teacher preparation and teacher induction have traditionally been viewed as separate processes, but many teacher educators are beginning to recognize that teacher induction begins when a teacher candidate is accepted into a teacher preparation program. Teaching is a highly complex profession that involves many dimensions which are interactive and integrative (Hollins, 2011). Learning to teach is not an easy process for preservice teachers since they build their understanding of teaching by combining various dynamics at once, including content knowledge, pedagogy, student assessment, classroom management, differentiated learning styles, and numerous other facets. Based on this, initial teacher education programs must aim to provide teacher candidates with theoretical and practical knowledge in order to cultivate their teaching skills, attitudes, and behaviors. The Blue Ribbon Panel on Clinical Preparation and Partnerships for Improved Student Learning (2010), commissioned by the National Council for Accreditation of Teacher Education (NCATE), encourages teacher preparation programs to create extensive and intensive field and clinical experiences that connect to academic content and professional education courses. Under the mentorship of skilled practitioners, both P-12 teachers and teacher educators, teacher candidates will “blend practitioner knowledge with academic knowledge as they learn by doing” (NCATE Blue Ribbon Panel, 2010, p. ii).

**P-20 Regional Collaborative Practices:**

Recognizing a looming teacher shortage and a critical need to bring educators together for the common good, the Georgia Department of Education (GaDoE), the Georgia Professional Standards Commission (GaPSC), and the University System of Georgia (USG) joined together to establish “P-20 Collaboratives” within the state. These collaborative networks serve as regional
structures to support for pre-service candidates as they advance into the role of certified teachers. The P-20 Collaboratives also provide continued support through professional learning for practitioners and leaders within school systems (Georgia Professional Standards Commission, 2016).

At the inception of the P-20 Collaboratives, the state demographics were divided into nine regions. Each region includes a group of institutions of higher education or state agencies that prepares teachers. Each of these nine regional groups convene twice during an academic year. The topics discussed within the collaborative settings vary by region, as the focal points in various areas of the state differ from year to year and from location to location. Topics of valuable importance include recruitment efforts within the region, especially in high-needs areas, best practices for the recruitment and training of future teachers, induction for in-service teachers, support for in-service teachers and educational leaders, and professional learning for all (Georgia Professional Standards Commission, 2016).

Each regional collaborative has a strategic planning team that plans the collaborative agendas based on needs of the region. These strategic planning teams are compiled of P-12 teachers and administrators and faculty and staff members of Educational Preparation Providers (EPPs) and state agencies. Each regional collaborative also has a lead contact person who works with representatives from state educational agencies to facilitate and disseminate important information throughout the network. Planning team members join together throughout the academic year to determine critical needs within that region.

Due to significant ramifications, a critical component throughout all regions of the state is the mentoring of novice teachers. Educational leaders within state agencies and P-20 environments recognize that stronger support systems must be in place for both teacher mentors and induction-
phase teachers. Because of an impending teacher shortage and the reality that a large percentage of teachers leave the field within the first five years, in Georgia and throughout the nation (Ingersoll, 2012), teacher mentoring throughout the induction phase has become critical to the success of students within school systems, to the attraction of college students to the field of education, and to the retention of novice teachers. Mentors are a significant factor in the retention of teachers within the state; therefore, those who serve as mentors must also be provided with intensive support and encouragement. The objective is to retain quality mentors so that the state can retain novice teachers.

While the work of each regional collaborative varies, there is a strong commitment of each one for the improvement of mentoring practices within the state. For this reason, data is being collected to determine perceptions of the challenges and rewards of mentorship so that external and internal provisions for success can be put into place. Listening to the teachers concerning mentoring practices has proven to be a very critical component in finding deficiencies within the current structure. In addition, determining what novice teachers require in order to feel successful in the classroom allows for a better understanding of what is not working within induction practices.

Data is helping to define needs of novice teachers in specific geographical regions; the “one size fits all” approach does not work when providing support for induction-level teachers. The needs of novice teachers in large inner-city environments are much different than teachers in small, rural school systems, and Georgia is recognizing that both mentors and mentees must be looked at individually and systematically, as areas of needs and levels of needs vary greatly within the geographical locations within the state. Members of the P-20 collaborative groups have been looking for ways to best improve the quality of mentoring programs within the school
systems of the regions. While mentors must go through trainings, the P-20 Collaboratives want to enhance and improve the trainings to be most effective for all involved.

The forming of academic partnerships is nothing new, but the approach of making such collaboration both meaningful and deliberate allows for all entities to better understand the work that is taking place in other academic settings. Those in P-12 environments have the opportunity to share information pertaining to assessments and mandates within their respective school systems, and EPPs have a platform for which to voice new initiatives and mandates occurring within the realm of higher education and teacher preparation. College faculty and directors of field and clinical placements are now able to better prepare teacher candidates for what is currently taking place in P-12 schools in regards to assessment measures, including state and school system testing for students and annual teacher assessments, new curricula development, and state and local mandates that affect both teacher practitioners and teacher candidates preparing for the field. In the same manner, EPPs use this venue to discuss advancements taking place within teacher preparation.

The notion of bringing both groups to the table and giving voice to both P-12 and higher education personnel within the state has proven to be extremely beneficial. It allows educator preparation programs to have better knowledge of what teacher candidates will see in the P-12 classrooms, and it also allows school systems, within the entire state, to know current expectations of the pre-service teachers who will be entering their schools for clinical practices. This allows and encourages richer discussion in regards to what is currently working in education and what needs to be improved throughout both entities.

Challenges:
As with any new initiative that occurs in educational settings, there have been challenges along the way. Establishing true, authentic relationships between P-12 and EPPs can sometimes be formidable. For real partnerships to transpire, feelings of trust and equality must be present between members of the school establishments. It is often difficult to get faculty members from respective educational settings devoted to this work; although the mindset that “we are all stronger together” is interwoven into the mission of the P-20 working groups within the state, the reality is that not everyone sees the importance of such collaborative practices. Real partnerships between P-12 and higher education can only exist when one entity does not feel as though they are more, or less, valuable than the other. The goal is to continuously improve upon partnerships within educational settings, and this can only be accomplished when stakeholders recognize and embrace the significance.

Another challenge is the need to find willing and qualified mentors who will use their expertise and knowledge to help support novice teachers throughout the induction phase. Undoubtedly, teachers are consumed with a multitude of tasks, leaving little time for additional responsibilities. However, new teachers can suffer tremendously, especially in their first year in the classroom, when there is a deficiency in the support received. When done appropriately, being a mentor for an early-career educator can greatly increase a teacher’s workload. Since this is an obstacle, many teachers decide not to mentor new teachers, or do so in a way that is not beneficial to the novice educator. This is a main reason that the initiatives for better preparation within the state are so critical.

Perhaps the greatest challenge of the work in the P-20 efforts throughout Georgia is time. There is often little time for colleagues within an educational setting to meet and talk, and it becomes extremely difficult for members of various P-12 and EPP settings to find the time to
share and to plan collaboratively. This can become a tremendous obstacle, but finding the time to identify needs, develop strategies for engagement and support, and to target deficiencies is imperative. Although time is limited, evaluate what is working and not working within educational settings is invaluable.

Conclusion

The goal of collaboration practices throughout the state allows for the continual use of best practices within all areas of education. The context is very simple: If EPPs are able to better prepare teacher candidates, and if mentoring practices begin early and last throughout the induction phase, those candidates will become novice teachers who have the stamina, drive, and knowledge to stay in the career. In turn, these individuals will then be more able and willing to mentor others at an appropriate time. Educator preparation systems must know current practices in P-12 settings in order to better prepare pre-service teachers, and school systems must know current dictates within educator preparation in order to give best hands-on clinical practice. There is a great need to support all of those in education, from those pre-service teachers, to those in the induction process, to those ones who are seasoned practitioners in the field.

Though much continued research is needed to identify the most effective practices, collaboration across the P-20 spectrum that combines quality teacher preparation and on-going support and professional learning during the early years of teaching is viewed as a positive approach to addressing both a teacher shortage and teacher attrition within the state of Georgia. Working to both prepare pre-service teachers and to retain quality teachers is critical. Now more than ever, educators must be partners in preparing all learners, from P-12 to college and beyond.

Examining Preservice Educators’ Perceptions of Teaching Children of Poverty

Vicki L. Luther

Laila J. Richman
Department of Special Education; College of Education
Towson University
lrichman@towson.edu
Abstract

According to the Children’s Defense Fund (2014), the United States has one of the highest rates of child poverty among industrialized nations, and the percentage of children living in or near poverty has been steadily increasing (Jiang, Ekono, & Skinner, 2016). There is consistent research to show the academic difficulties that students from poverty often face: For example, in his work, Allington (2012) found that there is a large gap in the abilities of children from low-income families and those living in middle class families, and Gargiulo and Metcalf believe that poverty is a “significant factor placing children at risk for school failure” (2010, p. 115). Poverty can be an opposition in every stage of learning and can hinder later success in life, as children who live in impoverished conditions are more likely to drop out of high school (Gollnick & Chinn, 2009).

However, classroom teachers, as well as preservice teachers enrolled in educator preparation providers, are most commonly from middle class backgrounds (Parameswaran, 2007). Due to a lack of understanding on how best to meet the unique needs of these learners, educators often have difficulty teaching and relating to students from impoverished environments. Many novice teachers enter the classroom unprepared to work with a population of low-income students; therefore, those working to prepare teachers for the field must be explicit in addressing the needs of poor children (Hughes, 2010).

The purpose of this study was to evaluate teacher candidates’ perceptions of poverty on education. Teacher candidates were surveyed about their experiences with those living in poverty, thoughts on teaching children of poverty, and the extent of information they had received from their education courses concerning poverty. Groups of sophomores, juniors, and seniors were surveyed. Analysis of the surveys was used to inform policy and practice. Learning about the attitudes of teacher candidates concerning poverty, as well as the perceived time being spent discussing children of poverty in education courses, are key components in strengthening course curricula and enhancing understanding of diversity in P-12 environments. The discussion of this study may be relevant for individuals from other EPPs who hope to enhance preservice teachers’ knowledge and understanding. The impact of this could be far-reaching for teacher preparation programs globally, as the field of education, and the global economy, is ever-changing and EPPs must know how best to equip candidates for the increasingly diverse landscape of education. Preservice teachers must be prepared to meet the demands of the profession; therefore, better training and preparation can benefit novice teachers and the students with whom they work, and this could have a positive impact in keeping teachers in the classroom and reducing attrition. The use of such qualitative evidence helps to inform decision-making and adjust practices which are currently being used.

ABSTRACT

RESULTS OF THE 2014 STUDY

This study investigated the participation of small business managers in adult and continuing educational activities. The population for this study was small business managers who were members of the Montana State Chamber of Commerce (MSCOC). The 2013 membership of MSCOC consisted of a wide range of diverse members. The small business managers selected for participation in this study resided in varied geographical locations in the state, possessed various income levels, had varied educational backgrounds, had differing amounts of business experience, represented both genders, and were a wide variety of age. From the population of approximately 1200 a random sample of 200 small business managers was obtained from the 2013 membership roster. Forty-one usable surveys were returned for a response rate of 20.5%. The data were collected with the Adult Attitudes toward Continuing Education Scale (AACES), the Deterrents to Participation Scale-General (DPS-G), and a demographic sheet. The data were organized to facilitate statistical analysis. A t-test was utilized to assess whether a statistically significant difference existed between the participants and nonparticipants in adult and continuing education.

The study respondents had an average age of 52.2 years. Their ages ranged from 24 years to 80 years.
Of this group 45% were males and 55% were females. The educational level of respondents ranged from 9 to 20 years with an average of 15.4 years. Their gross income ranged from $20,000 to $300,000 with an average of $116,444. Respondent’s years in business ranged from four years to 47 years with an average of 22.7 years. This group had participated in adult educational activities; the participation status of respondents revealed that 61% had participated while 39% had not participated.

The group varied in its perceived barriers to participation and its attitude towards adult and continuing education. On the DPS-G, which had a possible range of 34 to 170, the group’s average score was 70.97 and their scores ranged from 34 to 130. On the AACES which had a possible range of 22 to 110, the group’s average was 88.13 and their scores ranged from 56 to 110.

An analysis of the group means for the various variables indicated that participants and nonparticipants did not differ greatly on most of the variables. On all the variables the participant group scored higher than the nonparticipant group. On the AACES adult education participants scored an average of 91.42 and nonparticipants scored 82.92. On the DPS-G, participants scored an average of 71.78 and nonparticipants 69.67. The average of participants was 53 years and nonparticipants were 50 years. Participants had an average educational level of 15.68 years and nonparticipants had 15.08 years. The average gross income of participants was $130,278 and nonparticipant’s gross income was $88,778. Finally, participants have an average of 23.6 years’ experience and nonparticipants had 21.42 years.

Although the participants group was consistently higher on these variables, the AACES total score and gross income were the only variables with sizeable mean differences between the groups. This difference was statistically significant at the .05 level on both the AACES total score and the gross income levels of small business participants and nonparticipants in adult and continuing education in Montana.

In conclusion, the 2014 study suggests that small business managers who have participated in adult and continuing education have more favorable attitudes toward continuing education. In addition, they tend to be older, better educated, have more business experience, and earn significantly more income.

RESULTS OF THE 1989 STUDY

This study investigated the participation of small business managers in adult and continuing educational activities. The population for this study was small business managers who were members of the Nebraska State Chamber of Commerce (NSCOC). The 1988 membership of NSCOC consisted of a wide range of diverse members. The small business managers selected for participation in this study resided in varied geographical locations in the state, possessed various income levels, had varied educational backgrounds, had differing amounts of business experience, represented both genders, and were a wide variety of age. A random sample of 600 small business managers was obtained from the 1989 membership roster. A total of 302 usable surveys were returned for a response rate of 50.3%. The data were collected with the Adult Attitudes toward Continuing Education Scale (AACES), the Deterrents to Participation Scale-General (DPS-G), and a demographic sheet. The data were organized to facilitate statistical analysis. Discriminant analysis was done using select demographics along with the total score on the AACES and the DPS-G.
The study respondents had an average age of 48.1 years. The educational level of respondents ranged from 9 to 18 years with an average of 15.2 years. Their gross income average was $73,573. Respondent’s years in business ranged from one year to 65 years with an average of 22.3 years. This group had participated in adult educational activities; the participation status of respondents revealed that 67% had participated while 33% had not participated.

The group varied in its perceived barriers to participation and its attitude towards adult and continuing education. On the DPS-G, which had a possible range of 34 to 170, the group’s average score was 73.6 and their scores ranged from 34 to 135. On the AACES which had a possible range of 22 to 110, the group’s average was 88.3 and their scores ranged from 29 to 110.

An analysis of the group means for the various variables indicated that participants and nonparticipants did not differ greatly on most of the variables. On most of the variables the participant group scored higher than the nonparticipant group. On the AACES adult education participants scored an average of 90.2 and nonparticipants scored 84.5. On the DPS-G, participants scored an average of 72.4 and nonparticipants 73.1. The average age of participants was 48 years and nonparticipants were 46 years. Participants had an average educational level of 15.3 years and nonparticipants had 14.9 years. The average gross income of participants was $76,251 and nonparticipant’s gross income was $68,680. Finally, participants have an average of 22.8 years’ experience and nonparticipants had 20.3 years. The participants group was consistently higher on these variables with the DPS-G total score the only minor exception.

In conclusion, the 1989 study found that attitudes toward adult education were the most powerful discriminators of adult education participation. In addition, participants tend to be older, better educated, have more business experience, and earn more income.

Data Comparison from 1989 & 2014

Both studies found that participants were older, better educated, wealthier, had more professional experience, and they scored higher on the AACES instrument than nonparticipants in adult education. In the 1989 study it was found that attitudes toward adult education was the most significant variable that discriminates participants from nonparticipants in adult educational activities. While the 2014 study determined that participants had significantly stronger attitudes toward adult education than nonparticipants and it was statistically significant at the .05 level. The DPS-G scores did not significantly differ between participants and nonparticipants on both studies.

In conclusion, the data suggests that all the variables examined remain relatively consistent over 25 years. The studies revealed that there is a difference between participants and nonparticipants in their attitudes toward participation in adult education. This difference in attitude may be the key determinant of their participation in these educational activities.
Six Media-Savvy Ways of Answering the *Tell Me About Yourself* Question

Julie Stewart, University of Cincinnati

Thomas Clark, Xavier University

Brian Clark, Miami University

Alex Van Leeuwen, Xavier University

*The Web is no longer just about the present.... As we share messages, photos and updates, we're building a data trail about our lives and histories online. We can now tell stories not just about what is happening today, but where we've been, what we've shared, and what might happen in the future.”* — Keith Ferrazzi

“The skills necessary to be an effective communicator today are different than in the past. Today, literacy is not only about reading and writing—which are necessary—but also about understanding visual communication. Today we need a higher degree of visual literacy and an understanding of the great power that imagery has for conveying important messages.” — Garr Reynolds

*Self-promotion is a leadership and political skill that is critical to master in order to navigate the realities of the workplace and position you for success.* — Bonnie Marcus

**Key words:** Media richness, channel choice, audience analysis, social media, careers, pedagogy, social capital, networking, video, personal awareness

As educators, part of our responsibility to students is to prepare them for “life in the Digital Economy of the 21st century” (Kivunga, 2015, p. 9). As an example of fulfilling this goal, this paper describes a series of exercises assigned in Managerial Communication classes to raise awareness of the value of using a variety of multimedia tools available to students to answer the question at the heart of networking and job interviews: *Tell Me About Yourself.* It uses data students originate using their social capital as a starting point for six exercises that show them how to promote their talents for job and internship opportunities by using a variety of visual, networking, and social media tools that connect with different audiences for different purposes.
We have used these exercises in over 40 sections over the past six years in a class focused exclusively on career communication and required of all business students at our university. Our classes meet twice a week for 75 minutes each, and we schedule the exercises over the first five weeks of an eleven week course. We view them as appropriate for both part-time and full-time undergraduate students, as well as for non-credit career development workshops.

Students enjoy these exercises as they rely on their ability to use their creativity, digital media, and networking skills on behalf of a personal goal—finding a co-op, internship, or full-time job. And students demonstrate initiative and self-direction skills as they plan and execute a variety of personal brand building actions.

**Pre-class readings**

As a prereading assignment for the first day, we assign three online readings about branding and networking in the age of social media, with an emphasis on using the resources of LinkedIn. The articles are """"Wikihow: Build Your Personal Brand (Wikihow, n.d.),"""" """"5 Reasons, Why Your Online Presence Will Replace Your Resume in 10 Years,"""" (Schwabel, 2011) and """"The Importance of Loose Ties."""" (Brown, 2011).

Students answer Discussion Board questions about each selection. The questions are

1. What have you learned from reading """"Wikihow, Build Your Personal Brand"""" about how to promote yourself effectively for internship and full-time jobs you are seeking?
2. With what conclusions do you agree or disagree in """"5 Reasons Why Your Online Presence Will Replace Your Resume in 10 Years?"""" Support each of your claims with at least one reason.
3. Analyze the argument Brown makes about the importance of weak ties to networking and job hunting success.

For this assignment, we ask students, as a basis for subsequent in-class assignments and discussions, to read and comment on the answers of at least two other students prior to attending the initial class.

**First day of class: Awareness**

Our goal in the first class is demonstrate to students that they can adapt communication strategies that are already using to their career objectives. We divide the session into 3 steps: We begin the class by having students break into small groups to initially comment on a slide of the three quotations that start this article. We then ask for feedback about how the students use social media tools in their own lives. Students tell stories of using Skype, Twitter, Evernote, PowerPoint, Snapchat, and other social media tools to communicate about group projects as well as in-class and internship presentations.

As a second step, we ask students to analyze how they use different tools, such as Snapchat, Pinterest, Facebook, PowerPoint, Twitter, LinkedIn, and Email for different purposes and for different audiences. This exercise allows us to briefly explain media richness theory and to show students that they already have some insight into the issues of purpose, audience, message, length, design, and channel choice in their current social media contributions (Trevino, et al., 1987). After part of their analysis, students are asked which of the networks on their list are most appropriate for career communication, along with the how and why.

As a third step, we analyze “The Importance of Weak Ties” (Brown, 2011) which cites data that people were more than three times as likely to find a job through a networking contact
than through traditional means—and that “loose ties” were more productive in the job search than “strong ties.” We point out that existing student networks are typically with strong ties—consisting of relationships with people they perceive to be like themselves and also with whom they interact on a consistent basis. We invite the class to discuss the importance of networking beyond the “echo chamber” of close relationships to the loose ties who may be instrumental in helping them identify job and internship opportunities (Stewart et al., 2014).

At the end of class we ask students to read a chart covering Mayer’s (2009) 10 principles of multimedia design and to be prepared to talk about them in their small groups. We also let students know that in the second class period we will ask them to introduce themselves using a variation on the game, Pictionary (See PlayNet, n. d.).

**Pictionary**

Rather than a standard biographical sketch where each student talks about the same topics, such as major, year in school, and career aspirations, we ask students to create a pictorial biography on a chart pad and then share the meaning of each symbol with the class in an oral presentation. We explain that research shows combining very brief text with visual images aids the “sense-making process through activating both verbal and visual cognitive processes simultaneously” (Reynolds, 2012).

We point out this exercise has two purposes: as an introduction to developing a brand, or a set of unique selling points, as part of their career positioning—and as a tool for networking for discovering conversation topics with others. In this case, we define our audience as class mates and ask students to represent themselves with facts and events that have defined their lives, being careful to minimize negative or embarrassing information while highlighting objective and positive information. Typically, we see students draw pictures of cities or countries to indicate
the various places they have lived or visited; titles of jobs they have held and companies for which they have worked; military symbols to highlight the role that service has played in their lives; drawings of family members and pets; religious symbols to indicate faith commitments, as well as images of game competitions, such as chess, bridge or trivia; food preferences; athletic pursuits; volunteer activities; honors and awards; and artistic, musical, cooking, fashion, mechanical, software, social media, foreign language, and other specific talents. Students enjoy hearing these presentations, and during break are encouraged to connect with classmates based on mutual interests and experiences, something that allows students from diverse backgrounds to find areas of mutuality with fellow undergraduates. We also ask students by the next class period to select one or two accountability partners with whom they will work on the remaining five branding projects.

After introductions, small groups discuss Mayer’s multimedia guidelines as preparation for the next four exercises which use a mix of video, photos, graphics and text. We also briefly summarize the storytelling principles the Heath brothers highlight in *Made to Stick* (Heath & Heath, 2007): Simple, Unexpected, and Concrete Creditable Emotional Stories as good criteria by which to evaluate their own and their partners’ efforts.

**Networking Brief**

During the second week of class, we introduce students to a relatively new type of message: the networking brief, a one-page document sent to individuals who might network on the applicant’s behalf. We ask students to create a one-page document that contains a branding statement, highlighted with a series of headings that indicate to contacts what the candidate has to offer; a persuasive presentation of the applicant’s career history, including a list of
organizations for which the applicant has worked, their highest titles, and significant accomplishments, focusing on how they have added value to these organizations; and a list of organizations and job titles of interest that describe the applicant’s desired career path (Right Management, 2015).

We suggest using the networking brief as part of the job search, best emailed prior to a telephone or face to face networking meeting. This document allows contacts to focus their thoughts on who they might know for a student to contact in a particular company. We stress that third party recommendations, especially from a current employee of a target company, are especially powerful ways to move to the front of an applicant list. We include examples on Canvas and Flickr on which students can model their networking briefs. Highlighting the multiplier effect, how a few contacts can turn into hundreds through networking, we encourage students to send the brief to others in their networks and to request their contacts send the brief to others in their networks, thus making loose ties aware of a student’s credentials, career goals, and graphic design abilities. We also encourage students to link to their preferred companies’ LinkedIn sites as a way of becoming acquainted with the most recent stories of each so they can cite them should they hear from recruiters who have contacted them after seeing their briefs.

**Video Resume**

During the third week of class, we introduce the Video Resume assignment in which we ask students to create a video that they will upload to LinkedIn, Facebook, and other sites. We indicate this assignment will have the additional value of preparing them to answer the “Tell Me About Yourself” question in one-on-one networking and job interviews. We encourage them to consider highlighting their career goals, major and minors, work and volunteer history, special
talents, such as social media or mechanical skills, or deep insight into an industry, as well as team and individual goal achievement and expectations for future achievements. We request that they dress as professionally as they would for a formal interview.

As preparation, we ask them to view “Five Tips on Creating a Video Resume” (Elliott, 2011) which uses text and video examples to highlight the Do’s and Don’ts of video resume productions. We also provide student examples from past classes saved on Canvas to show what efforts have met our highest standards. For this assignment, students first submit a script, limited to 400 words, which they share with a class partner, who also films their video resume rehearsals. We encourage students to use a teleprompter and to record their videos in an on-campus studio to provide a quiet and professional background to the video, to get feedback on delivery, content, and audience, and to record their pitch as many times as necessary to create the best impression. Some students have used soft background music and character generation to showcase film editing skills as well.

Once, as faculty, we agree the submitted video represents a professional effort, we ask students to upload a link, preferably on YouTube with closed captioning, to it on their LinkedIn account and to reference their LinkedIn url on other branding items, such as their resume, business card, Facebook accounts, and SlideShare presentation. We warn students not to submit the video resume to an employer as part of a job application, as some companies do not want to view them in this context for legal reasons.

**Business Card**

During the third week of class, typically 1-2 weeks before the college’s Job Fair, we ask students to design a business card, reflecting their brand. We argue that business cards serve as an inexpensive and valuable aid because they often remain in a wallet or card caddie and are not
as easily misplaced as a resume or letter. We stress that they are valuable to take advantage of unexpected networking opportunities—and if students provide one while other job applicants do not, they may appear to recruiters to be more prepared and professional. We suggest that students go to vistaprint.com or a similar site, using templates to create a business card that promotes their brand, both visually and in text. We stress the importance of the design of the card as critical to “winning the first moment of truth” in establishing a theme. So, for example, a student pursuing a career in child care, designed a card featuring a series of different colors of small hands; an accounting student created a card with a 1099 tax form as a key visual; a finance major designed a card tinted green with a drawing of a dollar sign to indicate her interest in a career as a financial consultant, and an IT major used a picture of a computer screen as his attention getter.

We recommend that students provide their name, college, major, LinkedIn and email addresses, and personal cell phone number on the card. Some have used an inspirational quotation to show their commitment to positive ideals and others have put a CZ code on the back so a potential employer could scan immediately into their LinkedIn account. Another alternative has been to use the front of the card for personal information and the back for a mini resume, highlighting degrees, work experience, key personal qualities and achievements.

**SlideShare Presentation**

During the fourth week of class, we show students that LinkedIn has an application that allows a link to SlideShare.com. We ask them to create 2-3 PowerPoint slides, with the caveat that “a picture is worth a thousand words,” that have brief text and photographs incorporated into them to create a visual resume that shows aspects of their personality as they relate to a career choice. We point out that pictorial representations may suggest qualities not apparent on a
resume that are important to an employer which include competitive, compassionate; empathetic, team player; creative; goal achiever; bilingual; mechanical, entrepreneurial; loyal, and disciplined—and we encourage students to use one of these or similar positive term above each visual.

For example, some students have highlighted their creativity and cultural appreciation by picturing their talents in fashion design, painting, videography, playing an instrument, singing or dancing. Others showed through volunteering that they cared about others and were team players. Some have demonstrated goal achievement by picturing evidence of honors, such as National Honor Society, Eagle Scout, DECA, 4-H, Model United Nations award or mastery of software and statistical programs, and by highlighting certifications, such as a Six Sigma Black Belt. Others have highlighted knowledge of foreign languages and cultures to demonstrate an ability to navigate globally. Photos of participation in varsity or recreational sports have demonstrated a competitive spirit, solid teamwork and a commitment healthy living. Highlighting college and professional team favorites has suggested enthusiasm and loyalty. And photos of mechanical (repairing a car), construction (putting up drywall) or landscaping abilities (building a fire pit) can promote talents important to businesses employing these skills.

On the technical side, we stress the importance of having a strong contrast of text and background colors so words can be easily read and provide examples on Canvas of the best efforts of previous students.

Prior to the subsequent class, we ask students to read and comment on the online article, “6 New LinkedIn Job Search Strategies” (Keath, n.d.). We also ask them to follow its advice of identifying five people they could ask to write recommendations to post on LinkedIn.
Recommendations: Independent Proof of Claim

Our sixth branding assignment, assigned the fifth week of class, starts with a discussion of the assigned article and its emphasis on posting recommendations on a LinkedIn account. This last assignment, the only one without a visual design element, is for students to identify a minimum of five contacts from whom they could secure outstanding references to post on their LinkedIn accounts and have students consider: *What talents would you want these references to promote about your “brand”?* We indicate that the value of references (not endorsements) is they appear to be relatively unbiased independent verifications of student branding claims see them as a human to human connection, more valuable than a brief list of references at the end of a resume. We ask students to consider what employers, managers, customers, and leaders of service and political organizations would potentially write--or videotape-- as these are people who can testify to their success in a work environment. We also suggest they consider requesting recommendations from coaches, relatives, alumni, friends, neighbors, professional colleagues, teachers, and church and social club members as they might provide evidence of positive personal qualities and skills.

We encourage students to make these requests through email, phone calls, face to face interactions and the LinkedIn request tool and to suggest content for a 1-2 paragraph personal reference--and, if they are confident enough in the relationship, to ask permission to edit it for length, content, grammar, spelling, and diction prior to asking the reference to post it. We also point out students can remove any recommendation that they believe does not advance their career objectives.

As additional advice, we encourage students to consistently review their LinkedIn profiles to update and improve them.
Why These Exercises Work

These exercises proved to be both popular and valuable because they use students’ experiences with social media to lay the groundwork for highlighting the principles of networking through visual design and social media that can help identify opportunities that students might not have known about through their own limited networks. And these exercises relate directly to student career aspirations, helping them see the significance of promoting their unique brand of talents, accomplishments, and qualities in a variety of media as a foundation skill for gaining co-ops, internships, and full time work—and as a career building skill to be employed throughout a lifetime.

And these exercises help highlight the importance of seeing oneself through the eyes of potential employers, a key to tailoring career information to particular jobs. Specifically, they help students define their audiences, improve their storytelling abilities, show their talents using visual design tools, focus on meeting the audience’s needs, and sharing their ideals and passions to make emotional as well as rational connections with their target audiences. Of particular importance, these exercises help students understand the social construction of identity—how to employ a variety of narrative forms to promote oneself in a variety of ways to a variety of audience (Somers, 1994). Students also expressed excitement about sharing their stories in multimedia formats, commenting that these tools are much more “high touch” than career materials composed solely of words.

They also work because students can immediately use the materials they have created in a career search and hear classmates share positive and real-time feedback about the success of these tools in enhancing their career portfolios. And these exercises help highlight the importance of seeing oneself through the eyes of potential employers, a key to tailoring career
information to specific jobs. Of particular importance, these exercises help students understand the social construction of identity—in a variety of narrative forms/getting noticed required promoting oneself in a variety of ways to a variety of audiences.

An additional benefit is that students get to meet and network with each other during the first week of class, and to gain the benefit of both peer and faculty feedback on the career branding tools they employ during the semester.

In short, these exercises sensitize students to the importance of implementing a branding plan that demonstrates their ability to use a variety of contemporary multimedia resources to answer the question, Tell Me About Yourself.

Quality of life in Mental Health Professionals Treating Military Service Members

Statement of problem

Trauma is characterized by the reaction of individuals after experiencing an event that involves threatens their lives, causes serious injury, or threatens their wellbeing or that of others. Traumatic events are associated with vary degree of physical and mental health issues. Children or adolescents that have grown up in poverty stricken environments have an increased susceptibility for trauma. As well, it has been shown that they are twice as likely as adults to experience or become a victim of serious violent crimes (Parker & Henfield, 2012).

With trauma experiences increasingly related to violent crime, sexual abuse, or military combat, a clinician will have more clients needing treatment for the emotional disruptions and the distress that it creates. Vicarious trauma is recognized as the result of these clinicians internalizing and re-experience the clients’ trauma throughout the course of treatment. The clinician can experience feelings of emotional pain, sadness, and distress as clients retelling their experiences. The clinician’s symptoms can be similar to those of Post-Traumatic Stress Disorder (PTSD). Whether combat trauma or other trauma as sexual abuse, the clinician can experience the stigma of the events and isolation which may be similar to that of the client (Parker, Henfield, 2012).

The presence of PTSD symptoms in clinician as a result of the exposure to the telling and retelling of experiences of their client’s increases their vulnerability to vicarious (VT) or secondary trauma (ST). Secondary trauma is defined as the symptoms and reactions that are held by clinicians as a result of similar symptomology of the clients as a result of their traumatic experiences. The symptomology is similar to those of PTSD in those having experienced trauma first hand.
Purpose Statement

The purpose of this study is to gain understanding of the influences of trauma can have service members and the professionals providing treatment. Identifying triggers and personal characteristics from the professional’s history or experiences can improve self-care routines both as an individual and within the organization to ensure quality client care and positive treatment outcomes.

Literature Review

Framework and Foundations

In establishing and understanding of compassion fatigue, burnout, and compassion satisfaction, it is necessary to define the theoretical framework used in approaching research. These terms and the methods used to measure them may be ones that have been defined and detailed based on current experiences currently; however, the thoughts surrounding the influence of these concepts has been present for many years.

Jung (1966) introduced the concept of self and “the wounded healer” in his explanation of behaviors. Self is the personal identification individuals form based on your experiences and “the wounded healer” is described as the clinician that has experienced life events in their life to cause negative emotional reactions. The idea of “wounded healer” demonstrates a paradox of the clinician being aware and engaged in the care of their own wounds while being available and successful in healing the wounds of others. The cost of caring is defined as the mental health effects that result from clinicians listening to their clients’ stories of pain and suffering and fears. The clinician begins to feel the similar pain, fear, and suffering thus identifying as secondary trauma (ST; Wang, Strosky, & Fletes, 2014). These reactions can be on many levels and with more or less intensity. These reactions influence the clinician’s experiences treating clients of
trauma. As a result of common trauma experiences, the client’s recalling of their trauma can trigger similar reactions in a clinician having experienced similar events or by simply living the trauma experiences as clients tell and re-tell their storied in counseling sessions. It requires the clinician to be mindful of their own emotional reactions and examine these hurts and difficulties within themselves (Laro-Hayes, 2013).

Clinical professional role

Laro-Hayes (2013) describes the clinical professional having the important role of providing external support to people having experienced trauma who are and have been hurting and having developed maladaptive ways of coping as a result. This support is gained and maintained through the clinician and client’s senses of self that has been influenced by trauma. Trauma experiences that may have been personally experienced by clinicians and clients or the clinician secondary experience of the client’s trauma from the recounting of can have similar distressing effects. These experiences and emotional reactions are part of trauma treatment and are significant in the success of treatment for the client. The clinician’s experiences and emotional reactions can create an unstable, uneasy therapeutic relationship that may interfere with the therapeutic process. The common traumatic experiences determine the clinician’s belief system is personal awareness, coping strategies (positive and maladaptive), life experience and personal history, and clinical training and experience with trauma and traumatic experiences.

As a result of traumatic events that have caused psychological injuries, clients will build a protective wall to ensure the no one is able to hurt them. Despite this wall, the client expects betrayal and loss of trust from anyone within their lives, including the clinician. The clinician may be the only support that is able to penetrate the resistance enough to effect positive change within the client. The clinician poses a double role for the client. The clinician has the power to
initiate and facilitate healing and at the same time can result in more hurt. The client enters treatment to establish a genuine relationship that begins their therapeutic journal but also fear that the same relationship it will result in more hurt and betrayal. The clinician has to have the ability to maintain balance of this continuum and be aware of the client’s struggles and their own personal struggles.

Trauma specialists have unique challenges by virtue of their work. It is not unusual for them to experience impasses during treatment or moments of anger, aggression, and a many other transferences related behaviors from the client. In addition, due to these factors, early termination is not an unusual occurrence either. All participants in the therapeutic process can self-protect or mimic and invite trauma-related emotions and behaviors from each other. The clinician’s challenge is to allow space for the client to have opportunity for emotional reactions and examining how the client’s own experiences can create any variance of behaviors from their client, i.e. denying, avoiding, repressing, etc.

**Combat Trauma**

Combat has been an avenue used for centuries to maintain order in a non-diplomatic, aggressive way between opposing sides. Those individuals that are actually participating in the fights are expected to carry out their roles in the mission and manage any personal, psychological experiences these events create. As a result, they carry around these memories and the emotions that these memories invoke. The ongoing recollection creates persistent, consistent distress for those participating in combat.

Combat stress has been termed as “combat fatigue” or “shellshock” early in our history. A “service member’s heart” was use to describe the post-traumatic stress symptomology that exists within combat veterans in an effort to define the impact that these events have on them
psychologically and emotionally long after any physical injuries have healed. When combat warriors are seen succumbing to the pressures of their traumatic experiences, where does that leave others? The practical struggle is seeing the strongest crumble under the weight of their own emotions and fears and not being able to overcome the demons that they face. Non-combat individuals feel disconcerted when these people of strength struggle. If these “strong warriors” struggle and become emotional reactive, where does that leave the one that feel that they are not? (Laro Hayes, 2013).

Other abuse trauma

Wang, et al. (2014) describe that traumatic experiences can include many areas. The most significant experiences that create more emotional reactions and symptomology include combat trauma, domestic violence, sexual and physical abuse, sexual violence, rape and torture. In addition, they reported that victims of criminal violence and those experiencing unexpected deaths did not correlate strongly to secondary or vicarious trauma. Clinicians that regularly work sexual abuse victims reported more disruptive perception of safety, trust, and self-esteem.

Modern Challenges

Research recognizes that combat related trauma is a common occurrence in the US military. The US participation in world conflicts and wars has increased significantly. It is estimated that over 38 million men and women have been charged with combat actions to date. As a result, the use of more sophisticated weaponry creates far more devastation. However, advances in medicine and emergency treatment have decreased service member fatalities but have significantly affected service member psychological trauma resulting in more PTSD related symptoms. These conditions can be disabling and create long term psychological injuries from the memories of the physical devastation and are significantly more common. In World War II,
there was over 400,000 lives lost during both combat and support actions with an additional 500,000 psychiatric injuries alone. In World War I, World War II, and Korea combined estimates the number of service members removed from frontline for psychological injuries was greater than the number of fatalities of those wars (Cantrell & Dean, 2005). The “hidden” symptoms that miss medical detection can create significant distress with long, lasting deficiencies in emotional, behavioral, and cognitive functioning.

Factors that will contribute to the lifetime mental health effects on service members include deployments, length and frequency, the shortness of time between deployments, witnessing more civilian casualties, and wide spread exposure to devastation. These factors not only affect direct combat service members but support functions as well. No one in combat is immune to witnessing traumatic events. These individuals may not be aware of what they personally need when returning from combat. However, they will experience the emotional distresses but won’t seek treatment. (Laro Hayes, 2013).

**Clinical professional traits**

The personal experiences of clinicians can affect the beliefs of the client. A clinician who has not experienced combat trauma may be seen as not being able to understand or would be judgmental. Clinicians must be able to hear clients’ story while being emotionally affective and reflect genuine positive regard for the client. Hearing the clients’ story entails understanding experiences to minor details without the client feeling as if they are being dismissed or blamed for the effect that it has on their lives. Demonstrating respect for the client and their story is critical for solid, therapeutic engagement. To demonstrate denial of a clients’ experience creates and disconnect that will result in the client feeling as alone as before seeking help.
To work effectively with military requires that clinicians have knowledge of the military culture and its effect on the thinking of service members. Clinicians must be attuned that when working with military personnel and their families, early termination is probable due to early permanent change of station (PCS) and other similar reasons. Military clients have the tendency of minimizing their reactions and their experiences for reasons that they feel may affect their families, their military service, or their privacy. Combat experiences may not be shared as freely for fear of placing an unwanted burden on someone that has not experienced similar things. This behavior is protection of those closest to them and including the clinician. Despite these being external factors, clinicians can feel that the lack of progress is a reflection of their abilities and lose motivation in the therapeutic process (Laro-Hayes, 2013).

Factors associated with trauma specialists, how treatment is delivered, and its effectiveness has been identified as experience level, education or specialized training, and any history of personal trauma. These factors effect the presence of Vicarious (VT, or Secondary Trauma (ST). In new or inexperienced therapists, vulnerability to secondary trauma is increased. External factors as the level of professional support or supervision in the workplace play a role in how well the clinician is able to remain resilient and objective in trauma work.

Preferred treatments for Post-Traumatic Stress Disorder are Cognitive Processing Therapy (CPT) and Prolonged Exposure (PE). Both methods require the client to tell and retell their traumatic experiences in an effort to desensitize them or normalize their emotional reactions. Breaking through the client’s avoiding of memories and their reminders is a key component of any PTSD treatment. Research has found that clinicians suffer the accumulative effects of these sessions over multiple clients concurrently. To establish resiliency based on one client and their experiences is quite different than multiple clients with varying degrees of
intensity. Listening to the telling and retelling of stories from multiple clients creates anxieties, depression, and other PTSD type symptomology within the clinician.

The risk factors associated with increased potential of maladaptive results of vicarious trauma in the therapist include increased caseloads, severity of client cases, lack of perceived support through consultation and supervision, and providing treatment that is not evidenced based. Having a personal history of trauma can have a significant impact as well. If a clinician has trauma history and has received their own treatment, it may buffer them from vicarious trauma symptoms. The commonality of traumatic events between clinician and client can affect the impact of vicarious trauma (Wang, Strosky, & Fletes, 2014).

**Therapist challenges**

There are common themes and challenges that exist when working with clients who have experienced trauma. The culture around how they experience events and how they self-identify after the event is a consideration. For example, someone who has been sexually assaulted may identify as an assault victim afterwards. However, in the case of combat trauma, the military client typically identified as a service member prior to combat and may continue to identify as same after. The military culture becomes a mitigating factor regarding the mindset that, as military, they are strong, do not show weakness, and able to handle all situations. And if they are do seek treatment it is often within their own culture or from private resources where they feel they are protected from being seen as “weak” by their peer group.

Individuals who experience trauma that is work related, as military or emergency personnel, do so from their voluntarily choosing this career with the understanding that they may be put in harm’s way and experience violence in the course of their work. Clients in these situations may choose not to seek help for fear of seniors knowing their struggles and the stigma
attached with mental health treatment. This group often accepts the attitude that they do not need help and should be able to deal with it alone. When they do seek help, it can be through private, non-work related assistance to maintain strict confidentiality. Because of the stigma of seeking help and the concerns with privacy, this group typically has a negative view of seeking treatment.

Treatment professionals must be aware that younger military clients and females who have experience combat trauma in addition to sexual trauma is common in today’s military culture. Younger service members may have differing attitudes surrounding the military as a lifestyle and as a mission than those from older generations. The “mission first” mindset allows service members to distance themselves from others which interferes with professionals helping these service members.

The military culture as a whole exhibits the “mission first” mindset and have commonalities between groups, either between service branches or job duties. However, subcultures exist between groups that are distinguished by the uniforms, language, job duties, structural hierarchies, and comradery. Experiences of the service members of these subcultures may look vastly different from other military service members. An example would be military healthcare workers who have been deployed to combat have a very different experience of casualties and fatalities that can be more frequent and intensity. As a result, their experiences create its own set of emotional concerns from the exposure and can affect their role as a service provider (Laro Hayes, 2013).

Quality of Life

Clinicians who have experienced vicarious trauma through their clients function both personally and professionally within a decreased quality of life. The quality of life reduction can
be marked with poor sleep, nightmares, anxiety, depression, intimacy issues, and increased stress. Having a reduction in quality of life creates suffering that greatly affects their life and wellbeing. As a result, quality of care and client care outcomes can be compromised. A decreased quality of life becomes a quality of care issue in addition to a personal care one (Wies & Coy, 2013).

**Compassion Fatigue**

Secondary trauma has been defined more broadly as compassion fatigue. Compassion fatigue is the reduction of the client’s ability to express empathy resulting from their personal reactions to the client’s traumatic experiences. It affects the consequences associated with emotional and cognitive elements of secondary trauma exposure that may be similar but not directly the symptoms of PTSD.

Vicarious trauma and secondary trauma are often used synonymously however there is a subtle difference. Vicarious trauma is recognizes the accumulative effects of exposure to multiple clients and experiences. Secondary trauma is associated with a single event. Vicarious trauma is problematic as new information from life experiences is attempted to be assimilated into existing beliefs systems of the world or self. This assimilation can be related to the client or clinician’s beliefs as a result. Trauma specialists experience negative effects of indirect exposure to a client’s trauma including distressing emotions, decreased self-trust, disassociation, and decrease quality in personal. Vicarious and secondary trauma compromises the clinician’s ability to find meaning and purpose in their work that results in feelings of hopelessness and internal suffering through their client’s traumatic experiences (Wang, et. al, 2014).

Compassion Fatigue can be present as a result of physical and psychological distress often seen in caregivers with accumulating effects from their secondary exposure to trauma. The
feelings associated with Compassion Fatigue are derived from multiple disappointments in caregiving that promotes what is known as “helper syndrome”. Compassion Fatigue is referred to as vicarious trauma can manifest with symptoms of avoidance, fear, and hypervigilance similar to those of PTSD when the trauma is experienced first-hand. Burnout is usually diagnosed through exhaustion, frustration, and depression earmarked by over involvement with client trauma and lack of support within the work environment (Van Mol, et. al, 2015).

Care takers in social services agencies who provide services to the poverty stricken or underserved clients often experience this type of stress. In addition, clinicians with sexual assault clients, forensic examiners, and those in rape crisis is well researched and demonstrated frequent symptoms of vicarious or secondary trauma leading to compassion fatigue. Vicarious trauma symptoms include the clinician can experience increase nightmares, caution for safety of themselves and their families, loss of sexual interest or discomfort, and an increase intensity of personal boundaries. They often become increasingly distrustful people and situations that they encounter. This symptomology is similar to PTSD (Wies & Coy, 2013).

**Burnout**

Burnout is described as the result of stress in working with difficult cases and clients. Burnout can be associated in three ways: emotional, exhaustion, and personal distancing and reducing feelings of accomplishment. It can also be described as the general overwhelming feelings from experience traumatic events indirectly through client experiences. (Parker & Henfield, 2012). Van Mol, et. al. (2015) states burnout can be seen as emotional and behavioral in its effects.

Job stress that can lead to burnout can manifest in a variety of ways depending on the clinician and the work environment. The negative effects of job stress can reduce enjoyment
from work and the work environment. Lack of enjoyment creates long-term absenteeism and reduction of skills from leaving the job prematurely and being unemployed. It can also create physical symptoms of headaches poor sleep, backaches, and stomach problems. Mentally, it can lead to irritability, poor concentration, and reduction in self-esteem (Van Mol, et al., 2015).

**Compassion Satisfaction**

Compassion satisfaction is the third area quantified by the ProQOL evaluation instrument. Stamm (2005) defines compassion satisfaction as the opposite of compassion fatigue. Specifically, compassion satisfaction is the feelings of fulfillment and pleasure from providing healing and helping through therapeutic work. In turn, it promotes a sense of efficacy in one’s ability to promote positive healing and broad impact on the world. Its primary focus in on the providers or helpers in the psychotherapeutic process most often related to trauma specialists (as cited in McKim & Smith-Adcock, 2014). In addition, Stamm states that compassion satisfaction is the positive side of helping others and through that achieves satisfaction from being able to do the job well (Hunsaker, Chen, Maughan, & Heaton, 2015).

**Research Questions**

RQ1: Does age, gender, prior military experience and prior military combat experience correlate with compassion fatigue, burnout, secondary trauma, and compassion satisfaction when working with military service members?

RQ2: Does years of professional experience, professional license held, age, and gender correlate with compassion fatigue, burnout, secondary trauma, and compassion satisfaction when working with military service members?

RQ3: Does personal history of non-combat trauma in mental health professionals correlate with compassion fatigue, burnout, compassion satisfaction, and secondary trauma when working with military service members?
Discussion

Trauma experiences and treatment has become more common in psychotherapy. Clients suffering from trauma history have a unique set of challenges and obstacles that affect all areas of their lives. Trauma effects interpersonal relationships, trust, and betrayal. Clients seek treatment out of overwhelming emotional reactions that they are unable to manage.

Military population and combat trauma has significant characteristics that are not present with other forms of abuse. Combat experiences of loss of life and devastation are unique in the environment that it occurs and how the military culture addresses and creates personal struggles for military service members. Experiencing graphic violence between opposing sides and the same within the opposing side creates a chaotic, out of control feeling. The military culture establishes a “mission” mindset that requires them to respond to discord and violence in order to gain advantage over the opponent. This mindset once returning from combat can create PTSD symptomology. These symptoms come from an inability to manage the emotions created from witnessing significant negative events. As well, the service members’ families also must assimilate the changes in their service member when they return. Military service members experience related to combat. The changes in military culture and attitudes have identified sexual assault and childhood sexual and physical abuse as a presence that combat trauma compounds.

Therapeutic challenges require clinical professional to understand military service member and the culture that they are part. Military culture promotes comradery and inclusion by service members by virtue of shared training and “mission” mindset taught to them. This culture can make it hard for service members to seek and accept help with emotional issues. Strength and weakness is defined by the service members’ ability manage their personal struggles.
Quality of life can be measured and quantified by use of the ProQOL instrument. This instrument presents statements that the participant scores on a Likert scale of 1 to 5 regarding their level of agreement or disagreement. The ProQOL measures compassion fatigue, burnout, and compassion satisfaction. Each area contributes to the clinician’s ability to maintain empathy in the therapeutic process of trauma work and it success. The scores from this scale and variables of gender, experience, professional license, military experience, etc. can identify areas of concern and the needs to strengthen negative reactions. Increasing education, support, number and intensity of cases, and personal and peer mindfulness can increase satisfaction and reduce fatigue and burnout. Identifying what and how factors effect quality of life facilitates efforts to improve the work environment and personal beliefs improving overall success of trauma treatment.

¹.rnavid3@yahoo.com ².farahrasul786@yahoo.com

Abstract

The current research has been formulated to compare the Self-Efficacy beliefs in teachers at University level. It is greatly interested in this study to explore factors of self-efficacy beliefs. Locus of control, persistent behavior, classroom anxiety and professional mastery beliefs are the substantial indicators of self-efficacy beliefs. The main objective of study is to compare self efficacy beliefs in teacher of Distance Learning Education. Population of the study consisted on teachers of distance learning education Government College University Faisalabad. Twenty percent of total population was selected as sample i.e.136 respondents draw through purposive sampling technique. Moreover, data was collected with the help of questionnaire for teachers. The data analysis was done through statistical package for social sciences (SPSS) version 17. Multivariate analysis was done to check the association between variables. Male tutors have greater level of efficacy as compared to the female tutors in the Distance Learning Education Government College University Faisalabad.

Key Words: Self-Efficacy, Distance Learning, Locus of control, Persistent behaviour, classroom anxiety, Professional Mastery, Multivariate Analysis

Introduction

The idea of self-efficacy is claimed that every individual assess their skills to perform the certain tasks successfully. There are number of different researches that depict a strong interdependence between the level of self-efficacy and academic performance. In an online educational management system that needs students’ higher sense of freedom, as well as a greater
level of persistence and effort in the learning tasks. To be aware and know the intensity of self-efficacy of tutor seems particularly relevant.

Self-efficacy is defining as the person’s abilities and capabilities to accustom and achieves the tasks to expertise on the specific goals. Bandura (1997) defined, “Self proficiency as people’s decisions to adapt and assassinate courses appropriate attaining appointed types of performances. It is anxious not with the abilities one has but with judgments of what one can do with whatever abilities one possesses”. The distance education has recognized as a podium of the formal educational system after consciousness of the fact that merely formal educational system does not accomplish to necessitate the total population. In Pakistan the stipulate for education through formal system has constantly run in advance of resources the vastness of their population. Therefore, failing the demand in formal system, the need of non-formal education becomes palpable in concept of distance education.

Education is anxious for the absolute development of person. Education improves person’s capabilities, skills, adeptness and ideas. Education guides the attention of nations as vigorous as address and conserves the accomplished and present of the nations. Augment the expertise of advantageous and specialized manpower in association due to education. Teaching is a lot of acute profession in society. Teaching is major exigent occupation in the world. They are means of support to run the education system. “They bear the weight and responsibility of teaching, and apart from parents, are the main source of knowledge and values for children. Teachers are essential for the effective functioning of education system and for improving the quality of learning process” (Sartial and Tomer, 2004; Nadeem, 2011).

Teaching is a demanding and circuitous profession the job of teacher is both tough and demanding in the field of education. Hanif (2004) stated, “Teachers draw upon physical, emotional and intellectual resources in order to be effective in the classroom. Like all professionals, teachers are also overwhelmed by multiple and complex challenges. They lag behind their counterparts in relations to the opportunities for self development and professional enhancement”.

According to Bandura (1977) teacher efficacy is a particular type of self-efficacy. It is cognitive processes in which beliefs are constructed about an individual’s capacities to perform
at a given level of accomplishment are constructed. Effort put forth, persistence in facing obstacles, and resilience, all are considered to be influenced by self-efficacy.

Perceived ability named as Self-efficacy, “refers to the confidence people have in their abilities that they can successfully perform a particular task” (Bandura, 1977). The significance of a teacher’s self-efficacy has been proven by researchers of self-efficacy to be an imperative aspect of positive student academic achievement (Bryant, 2010). A teacher’s self-efficacy is a teacher’s own belief on performance of creating constructive scholastic changes.

This study was aimed at to compare self-efficacy between males and female teachers. It is greatly interested in this study to explore factors of self-efficacy beliefs. Locus of control, persistent behavior, classroom anxiety and professional mastery beliefs are the substantial indicators of self-efficacy beliefs (Woolfolk, 2004).

Though self-efficacy is an important access on behavior, it is not the alone influence. Behavior is an action of abounding variables. In adeptness settings, such as college education, added important variables cover skills, aftereffect expectations, and the perceived bulk of outcomes (Schunk, 1991). When the all-important abilities are lacking, self-efficacy will not aftermath competent performances. According to Bandura (1997), already adeptness behavior is formed, they are not stable. They can alter in backbone because the alone is consistently evaluating new information. However, already adeptness behavior accepts been accustomed over continued periods of time and based on a ample bulk of information, they are absurd to be changed. Because self-efficacy behavior is specific in nature, it is absurd to altercate “general” or “global” self-efficacy.

Objectives of the study

1. To explore the sense of self efficacy beliefs in teachers of distance learning education.
2. To explore the sense of self efficacy beliefs in teachers on locus of control.
3. To explore the sense of self efficacy beliefs in teachers on persistent behaviour.
4. To explore the sense of self efficacy beliefs in teachers on professional Mastery.
5. To explore the sense of self efficacy beliefs in teachers on class room anxiety.
Review of related Literature

Although women do have a noteworthy role in the medical sciences like clinical psychology and nurses discipline (Halford, 2003).

Locus of control is determined by three elements of control. These are ideology, motivational and self-important orientations. Relationship among these dimensions has been observed and some theoretical similarity has been found among ideology (structured control setting) and motivation orientation. Motivational orientation is anxious with the strategies that teachers tend to use to improve the academic and social feature of students’ life. The organize ideology dimension is purposely anxious with the maintenance of the classroom. Self-important orientation compares the association along with teachers’ self-efficacy beliefs and efficacy expectations. Efficacy potential confirms the self-efficacy beliefs on individuals have control in themselves (Hoy& Woolfolk, 1990).

Locus of control and anxiety are the significant components of self-efficacy beliefs. Individuals’ with self-efficacy belief can exercise some control over a demanding situation. However insight of lack of control is associated to increased levels of anxiety (Endler et al., 2000). According to Lang (1977) “anxiety is characterized as a set of loosely coupled components embodying apprehensive cognitions, physiological arousal and avoidant behaviour” (as cited in Bandura, 1997).

Self-efficacy viewpoint have a noteworthy correlation levels of persistence. self-efficacy viewpoint has a cause on the selection of individuals’ actions and activities, the hard work they spend on those actions and activities, how long they carry on with them when they face problems and how they search out the manage strategies for them (Bandura,1997). Individuals with high self-efficacy can exhibit more persistent behavior on difficult tasks than those individuals with low efficacy (Luthans, 2002; Myer, 2005).

Self-efficacy is an important variable in understanding variable in considerate the individuals’ success behavior that what knowledge they acquire and how they use it in successful situation (Schunk, 1982). Self-efficacy has a significant affect on the activities students are involved in. They exercise more effort; they show deeper interest, a stronger locus of control and have a higher level of achievement (Schunk, 1982).
Hypothesis

Multivariate analysis was done in this paper that test the following hypothesis

H0: There is no significant association among the, persistent behavior, professional mastery, locus of control, class room anxiety and self-efficacy.

Method and Procedure

The detail of material and methods applied to attain required purposes of this research. Precise method is a combination of different set of laws, techniques, and ways that the groundwork of research is based. During research scientific methods offer a line of action for authentication of available facts (Nachmias & Nachmias, 1992). Current research focus on the topic “Comparative Analysis of Self-Efficacy among Distance learning teachers: A case of Government College University Faisalabad”. All the male and female teachers who are teaching in the directorate of distance learning education Government college university Faisalabad consisted of the population of the study.

Sample

There are total 678 teachers (237 female and 441 male) in the distance education. A sample of 136 respondents was draw through purposive sampling technique that is the twenty percent of the total population. The data was collected with the help of a “Questionnaire for teachers”. Participants were personally approached. 68 male and 68 female teachers returned the questionnaire after filling.

Delimitations

The research has following delimitations:

1. The study was delimited to GCUF (Government College University Faisalabad).

2. The Study was covering the teachers of distance learning education GCUF.

Instrument of Research
In the context of data gathering about efficacy of teachers created by Tschannen – Moran & Hoy, (2001) was implemented this instrument for the measurement of tutors beliefs towards their own skills in the local circumstances of Pakistan. He fund this very useful. Researcher follows the same scale in this research. There are 50 questions/items at efficacy scale. 5 point Scale was used. The reliability of teacher self-efficacy scale was calculated through reliability on data collected pilot study. Sample consisted of 20 teachers from Distance learning. The reliability of scale comes out 0.68

Analysis of Data

Data analysis was done by applying simple linear regression Multivariate analysis. In this research, to check the effects of independent variables on the response variable multiple regression analysis was conducted. Regression model was used to analysis of cause and effect relationship between explanatory variables and response variable.

Relevance of the Model

This model is applied to check the effects of more than two variables on the respond variable. However, the factors that shape the community attitude toward life insurance were analysed through liner regression model. To check the suitability of the model assumption of the model was checked. The linear relation was analyzed by drawing the graph and the straight line shows that model is applicable (Gujarati, 2003).

Stepwise Regression analysis was applied to complete the analysis procedure. Analysis of data was done by using (SPSS) statistical package for social sciences version 17.0.

Table 1: Influence of various independent variables on dependent variable: a multiple linear regression model

Locus of Control  0.440  0.082  0.283  5.373  0.000**
Persistent Behavior  0.266  0.047  0.302  5.659  0.000**
Class room anxiety  0.133  0.057  0.126  2.328  0.021*
Professional Mystery  0.143  0.082  0.092  1.738  0.003*

Dependent Variable:  Self-Efficacy

$R^2 = 0.61$  \hspace{1cm} F-value = 22.45  \hspace{1cm} Sig. = 0.000**

The value of R-Square is 0.57. It shows, 61% change in Self-Efficacy in the faculty members of GC University in Faisalabad was explained by four variables such as Persistent behavior, professional mystery, class room anxiety and Locus of Control. F-test may also judge the overall significance of the model. The F-value is 22.45 which have significant at < 5% level of significant. It also suggests the high significance of the model.

**Impact of Locus of Control**

The coefficient for Locus of control had a +ve sign with the value 0.440 and is highly significant at 5% level of significance. This shows the locus of control has significant impact on the development of self-efficacy. Self efficacy can be increased or decreased through the level of teaching methodology, critic and mastering of skill activities performed by the teacher.

**Impact of Persistent behavior**

The coefficient for Persistent behavior had a +ve sign with the value of 0.266 and is highly significant at 5% level of significance. It shows the persistent behavior has positive impact on self-efficacy.

**Impact of class room anxiety**

The coefficient for classroom anxiety had a +ve sign with the value of 0.133 and is significant at 5% level of significance. It shows the class room anxiety from the teacher has positive impact on self-efficacy. Significant association between both variables depicts that through persistent behavior we enhance self-efficacy.

**Impact of Professional Mystery**
The coefficient for professional Mystery had a -ve sign with the value of 0.143 has significant at 5% level of significance. It points out that professionalism among teachers is very essential for the self-efficacy.

Conclusion

It was concluded that null hypothesis was rejected, there is significant association among the Persistent behavior, professional mystery, class room anxiety, Locus of Control and self-efficacy. It was also concluded male has more self efficacy as compared to the female teachers in the Distance Learning Education Government College University Faisalabad.

Discussion

The male teachers had more control over their work as compared to the female teachers. Bandura (1997) claims that Success or achievement constructs a strong belief in an individual’s own self-efficacy beliefs and control on their work.

It was further explored that male teachers have more skills of teaching without the help of others as compared to the female teachers. Myers (2005) reported that Efficacy is an individual’s belief regarding his or her capability to execute an assignment efficiently, reach a goal, apprehend about the consequences of performance, and to overcome obstruction for achieving the desired outcomes, required to deal with prospective circumstances. Individuals who have strong feelings of self-efficacy are more persistent, less anxious and are more rationally successful and mostly teach the class without the help of the other teachers because they have absolute trust on their abilities.

The male teacher reported favorable response towards the option that teachers feel worry about the style of teaching in the class as compared to the females’ respondents.. Stipek (1993) found efficacious teachers exercise trouble solving techniques and tasks to improve the attainment scores of students. If they feeling worry then they adopt new strategy of teaching. Roughton (2009) found that the attitude of the teachers can be affected by the people towards teachers whether negative or positive. Teachers own attitude does matter to allocate the responsibilities by the organization which will help him/her to do best of expectations Perceptually teachers develop their style of performance according to their attitude with their own behavior towards achievements.

Analyzing *South Park*’s “Proper Condom Use” as an Introduction to Critical Media Theory

Julie Stewart, University of Cincinnati

Thomas Clark, Xavier University

Brian Clark, Miami University

Alex Van Leeuwen, Xavier University

Abstract

Popular culture figures in television, movies, comics, video games and online videos have captured the imaginations of young people. The themes and characters of shows students watch regularly help shape their views on contemporary issues, especially as they compare their experiences with those portrayed on their favorite shows. This paper examines how “Proper Condom Use,” an episode of *South Park*, one of the most popular shows among young viewers, can be used as a springboard for in-class discussion of critical media theory through an analysis of this episode’s visual and aural humor, themes, characters, audience, and genre.

Our experience in exploring this episode with adult students confirms it is an excellent way of generating lively feedback, while also introducing students to concepts relevant to critical media theory, including imagery, character, theme, genre, and audience.

Teaser text: Delight students: introduce them to critical media theory by guiding them in a “literary” explication of “Proper Condom Use,” an episode of the popular and transgressive cartoon, *South Park*.

Popular culture figures in television, movies, comics, video games and online videos have captured the imaginations of young people. The themes and characters of shows students
watch regularly help shape their views on contemporary issues, especially as they compare their
experiences with those portrayed on their favorite shows (Duff, 2002). Lisa Patel Stevens points out that it helps to create student engagement to use non-print materials as pedagogical artifacts as students regularly engage in dynamic multiliteracies through their personal media choices, the content of which constitutes part of their conversations with fellow students (2001).

This paper highlights how we organize a class using an episode from *South Park*, “Proper Condom Use,” to introduce topics relevant to literary analysis as a platform for using similar frames in analyzing more complex media. Specifically, it describes an early in-class exercise designed to generate class discussion in weekend and evening classes at a Midwestern college.

These classes are populated largely by diverse adult students in their late twenties or early thirties, many of whom are parents, pursuing associate degrees on a part time basis. Our experience in exploring this episode with adult students--nearly all of whom report having seen one or more episodes of *South Park*, Comedy Central’s most popular show--confirms it is an excellent way of generating lively feedback, while also introducing students to concepts relevant to critical media theory, including imagery, character, theme, genre, and audience (See Hull, 2003 & Vasudevan, 2010). This exercise takes 60 - 75 minutes to complete, including showing the 22-minute episode.

**Pedagogical approach**

We introduce the conflict at the center of *Proper Condom Use* (Parker & Stone, 2001), which concerns how, when, and through what agents sex education should take place. This episode raises questions about the paths children should follow to adulthood. To stimulate discussion and establish a premise for later class analysis, prior to viewing the video, we post a quotation by Marie Winn that highlights the competing ideologies that students can see revealed
in this episode. She points out that we “have seen, in an amazingly short span of time, a transformation of society's most fundamental attitudes toward children. Where parents once felt obliged to shelter their children from life's vicissitudes, today, great numbers of them have come to operate according to a new belief: that children must be exposed early to adult experience in order to survive in an increasingly uncontrollable world. The Age of Protection has ended. An Age of Preparation has set in” (Winn, 1983).

We then play *Proper Condom Use* from start to finish, pausing at intervals to introduce a literary vocabulary and asking students to answer questions about each segment that specifically highlight a means of analyzing a literary work.

**Visual and Aural Humor**

We begin by asking students to identify visual and aural elements, the sights, sounds, colors, vocal inflections and actions (Nixon, 1999) that are key to *South Park*’s comedy. In the opening scene Stan and Kyle are burning a Jennifer Lopez doll with a magnifying glass, during which Stan yells, “Scream for me bitch.” Cartman, the most controversial of the main characters, then shows them how to “milk a dog,” a technique taught to him by mischievous fifth graders. We pause the episode, and students volunteer specifics of what they saw and heard and also indicate how these sensory--and transgressive--elements add interest to the story.

**Character**

We next introduce the concept of character, with definitions of protagonist and antagonist, that drive *South Park* stories. We ask students to identity traits of their favorite character and explain the role that character typically plays, including what makes that character interesting. We also ask whether this character is flat, displaying little change within or throughout episodes, or evolving, demonstrating growth and understanding. Students highlight
that within the cartoon format of *South Park* characters typically remain largely flat, though students point out that some characters admit to seeing the error of their ways at a particular episode’s end.

**Themes**

**Experience vs. Expertise**

We show subsequent scenes and ask students to analyze how elements of plot, motivation, tone, and values highlight specific themes within the episode, all of which can be identified in one or another of the short stories we analyze in subsequent classes. For example, a major theme of *South Park* is parodying the reliance on expertise rather than trusting personal experience. When Stan “milks” the dog, and when Randy and Sharon, his parents, observe his behavior, they say they will ground him for 10 months. Yet they cannot bear to speak with Stan about sex: their notions about childhood innocence destroyed, they do not provide age-appropriate information. Instead, they call a PTA meeting, assuming sex education at school is a “safe space” between their children, their children’s friends, and MTV—and that with comprehensive sex education, the children will subsequently engage in sexually responsible ways, and not in behaviors that lead to pregnancy and STDs.

*Principal Victoria:* Okay, parents. I know a lot of you want a chance to speak, but we have to talk one at a time.

*Sharon:* Look, our kids are learning sexual things on the street and on television. There’s no way we can stop it. The schools have to teach them sexual education at a younger age.

*Principal Victoria:* School policy has been to teach sexual education later. In fifth grade.
Mr. Tweek: It isn’t soon enough!

Stuart: Yeah. Why, just this afternoon our son was caught beating off our dog.

Chef: Look, parents. Do you really want your children learning about sex? Part of the fun of being a kid is being naïve! Let them be kids for a while.

Ms. Choksondik: Naïve at what cost, Chef? Parents, we have to face facts: Children in America are having sex at younger and younger ages. STD’s are affecting younger and younger kids all the time. The only way we can combat that is by educating children before they have sex.

Chef: The first thing that kids learn about sex shouldn’t be some bitch-scare tactic about STD’s.

Sheila: No, she’s right! With all the teen pregnancies that are out today, I think my boy does need to know about sexual education. From the school.

Students point out that this dialogue represents support for the view that common sense and experience lead to better decision-making than its opposite: relying on so-called experts. While the parents are concerned about their children, rather than teaching them about sex themselves based on their own experience and insight, their traditional role, they want to avoid discomfort and assume the school has experts who can teach their children more effectively than they can.

Students point out that this proves to be a false assumption. Miss Choksondik, an advocate for teaching sex education to the fourth grade children whom parents may presume has been licensed by the state as an expert in the subject matters she teaches, admits she has had little sexual experience. Chef, who represents the voice of experience and a character who has a reputation for having sex with many women, serves as a foil to this groupthink, asserting,
unsuccessfully at this point in the episode, that sex education should not be taught in schools, especially to 8-10 year-old children.

**Scare tactics are the best way to influence future behavior**

Another theme students highlight is the ineffectiveness of fear as a way of changing behavior. To implement the sex education program, adults use scare tactics to prevent their children from engaging in what they perceive as unsafe behavior. For example, when Wendy and Bebe indicate they believe the lessons will be fun, Miss Choksondick, responds emotionally, intent on making the girls so “scared straight” of sex that they will never even think about it as an option. “Fun, you think this is going to be fun! Well, let’s start with our first lesson then, shall we? She writes SEXUALLY TRANSMITTED DISEASES on the blackboard, asserting, That’s right, because unless you get boys to wear condoms you can and will get a sexually transmitted disease from them! ...Gonorrhea, herpes, chlamydia, HPV, syphilis, hepatitis B, hepatitis C, the list goes on and on.

This satirizes sex education classes as the lessons are inappropriate for this age group and scare tactics about negative consequences lead to fear of sex rather than a lifelong commitment to responsible sexual behavior, the program’s stated purpose. This scene allows for a conversation on the effectiveness of fear appeals in reducing harmful behavior. Many students report having experienced similar fear appeals in high school about sex education, and about smoking, driving and texting, and drug use as well.

**Unintended Consequences**

Another theme is the role of unintended consequences, a key driver of the plot.

On the second day of sex education, Miss Choksondik focuses the lesson on pregnancy, stating:
Alright girls. Yesterday we went over the myriad of diseases you can get from boys, but today we’re going to talk about the most horrible thing they can give you of all. Pregnancy! That’s right, since you girls have decided to be sexually active; teen-pregnancy is at an all-time high! You seem to think it’s gonna be fun and neat to have a baby, well let’s watch a little video shall we?

She shows them a traumatizing video during which the narrator states, “...later the contractions are happening closer together. Mom sure is in a lot of pain. Now we can see the crown of the baby’s head, stretching the vaginal walls in ways never before thought possible by Mom. Finally, the miracle happens, and the baby is born. But mom’s not done yet! She still has some afterbirth to push out of her.” This terrifies the girls who later run away from the boys when they meet in the cafeteria.

It becomes clear that the children are too young to understand the ideas that teachers are presenting, and no parents are present to object to this content. For example, when the girls learn about STDs and AIDS, their reaction is to reject the boys unless they wear condoms. Fear replaces friendship.

**Wendy:** Stay away from me Stan!

**Stan:** Why?

**Wendy:** Are you wearing a condom?

**Stan:** A what?!?

**Girls:** [all screaming loudly] AAAAAAGGGHHHHHHH!

**Bebe:** Do any of you have your condoms on?

**Kyle:** No.

**Girls:** AAAAAAGGHHHHHHHHH!
**Wendy:**  don’t you know that without wearing a condom you could get a disease?

**Kyle:**  Nun. Uh.

**Bebe:**  yeah huh.  If you don’t wear a condom, you’re gonna get AIDS!

**Wendy:**  You guys have to wear condoms.  Now, please, just, just go away.  We don’t want your AIDS.

The girls are terrified, not just of having sex, but of boys in general—without insight into actual sexual behavior. The boys are so upset about the conversation with the girls that they run to the drug store. The pharmacist is reluctant to sell such young children condoms, but the assistant explains, “**kids are going to do what they do, and it’s up to us to make sure they’re protected.**” The kids purchase condoms especially for boys their age, “**We just got in the new Gladiators for kids. ‘Lil Mini’s. They’re specially designed for kids under 10, and they’re only $5.95 for a box of fifty.**”

The next scene shows the boys trying to use the condoms. They are confused, evidenced by Butters passing out rubber bands to all of the boys to make the condom “stay on.” He exclaims, “there isn’t nothing’ that’s getting’ in my wiener through this thing!  And it’s even got a little reservoir at the end so you can pee in it!”

When the teachers hear about the condom purchase, and without knowledge of its context, they almost gleefully decide that they must start teaching sex ed. to students in kindergarten, oblivious to the fact that the kids only purchased condoms in the first place because of their scary lessons at school. These scenes are used to generate conversation about experiences students have had when they believe their voices were not heard at home or in the classroom.
Importantly, we point out that the children do not seek these remedies. The adults have bought into the idea that says that kids are having sex at younger ages, when in reality the *South Park* kids have no desire for sex or any real understanding of what sex is. The parents do not talk to their children about sex, ask them questions about their experience, or see if the children have questions for them. This spoof of the push to have sex education taught in schools at younger ages suggests that adults often project their ideas onto children, resulting in a misunderstanding on the part of naïve students, with the boys and girls each believing the other to be responsible for spreading disease.

Students laugh at the unintended consequences of the sex education program: the boys and girls skirmish, with the girls protecting themselves behind a steel fortress and the boys, riding in battery operated cars, on the attack, using water guns to break through this defense. In this battle, Kenny, hiding in his jacket, dies, a *South Park* plot convention, when struck by a boomerang. His death shows that the children are not the idealized innocents of their parents’ imaginations, another fruitful area for class discussion.

Nonetheless, while ignorant of carnal knowledge, the *South Park* children can be cruel and can experience fear, regret, anxiety, and especially in Kenny’s case, be subject to repeated extreme violence—and students can reflect on bullying they experienced in school and the emotional stress it created.

Similarly, some students report that like the *South Park* parents, their parents seemed only dimly aware their children were experiencing these negative emotions. In this episode this feeling serves as a source of the parents’ feelings of inadequacy, resulting in their histrionic outrage and grief over evidence that their children are leaving the Garden and facing uncertain and terrifying consequences which the parents cannot control.
Hypocrisy

Hypocrisy is another prominent theme. While Miss Choksondik and Mr. Mackey are busy teaching the kids about safe sex, they have unprotected sex themselves. Students point out that this illustrates the limitation of education as a predictor of behavior: while the teachers tell parents that sex education will lead their children to make responsible decisions, the teachers themselves fail to practice what they preach. After Miss Choksondick scares all of the girls into believing they will instantly contract a deadly STD from even being in the same room as a boy who is not wearing a condom, she is so desperate for sexual contact that she ignores her own rules, offers Mr. Mackey a drink, strips naked, lowers her head off-screen, and is later portrayed with disheveled hair. These scenes are ripe for conversation with students’ perceptions of adult insensitivity and hypocrisy.

Genre

We point out that in this South Park episode, a monolog, which we teach is a convention of satire and burlesque, lampoons the idea that if evil influences are not headed off early, a social apocalypse will occur—and the naive hope that experts can fix all issues children face. The monolog is delivered by Chef, the voice of experience in which he calls for rationality and truthfulness from parents.

Chef: Schools are teaching condom use to younger students each day. But sex isn’t something that should be taught in textbooks and diagrams. Sex is emotional and spiritual. It needs to be taught by family. I know it can be hard, parents, but if you leave it up to the schools to teach sex, you don’t know who they’re learning it from. It could be from someone who doesn’t know, someone who has a bad opinion of it, or even a complete pervert.
Miss Choksondik: He’s right. I never knew how special and personal sex was until just recently.

Sharon: This whole mess started because we couldn’t talk to our boys ourselves.

Sheila: It’s easier just to leave it up to the school, but it’s just not a school subject.

Principal Victoria: Then it’s decided: no more condom classes in grade school.

Stan: But Chef, when is the right age for us to start having sex?

Chef: It’s very simple, children. The right time to start having sex is…seventeen.

Kyle: Seventeen?

Sheila: So you mean seventeen as long as you’re in love?

Chef: Nope, just seventeen.

Gerald: But what if you’re not ready at seventeen?

Chef: Seventeen! You’re ready!

Stan: Well, I guess we got a while to wait before we have to worry about sex and diseases, huh?

When the parents see the error of their ways, they show they can reflect on their actions and learn from experience. We point out viewers sympathize with them because they realize their behavior springs from a positive motive to protect their children from future harm, in Kenneth Burke’s words, “a comic corrective” which serves as a relief valve from the tensions of the ware between the girls and boys.

Consistent with South Park’s transgressive nature, the episode ends with Cartman again “milking” the dog, indifferent to what he now knows is objectionable to the parents, as he finds it
personally gratifying. Students point out this is another indication of a self-absorption and “will to power” that defines his character.

**Audience Analysis**

After students have viewed the entire episode, we address the issue of audience analysis, asking students to identify what they find compelling in this episode and also how they see it appealing to other viewers (Duff, 2002).

Students identify plot elements that support differing value sets. The scriptwriters present a conservative perspective of traditional morality, where sex education comes from home and is not mandated by the government through the schools. Yet they mock conventional moral values by showing characters in highly degrading situations that stretch the limits of what is acceptable on a television show. They present a secularist world view with Chef’s declaration that the age seventeen is the right age to have sex—outside of love and marriage. Finally, they reflect a populist perspective that implies gaining carnal knowledge from older adolescents during puberty is preferable to teaching it to elementary school children before they have the experience or physical maturity to understand its role in human society.

**Conclusion**

Teachers can lead an analysis of “Proper Condom Use” as a way of introducing students to critical media theory, relating to young adult students in terms of their popular culture references and preferences. Within South Park’s ecosystem, the children remain ageless, indulging in the pleasures of childhood immaturity. They serve as outsiders, spectators to the futility of parents and others who try to impose adult burdens on them. Students laugh as they discuss the unintended consequences of the adults’ decisions and share similar stories from their own experience.
Our students report that they like this exercise as it introduces them to literary concepts, including theme, character, genre, imagery, and audience, in an accessible and humorous way. They also enjoy it because it offers them the opportunity to reflect within a familiar learning space on something they have experienced in their own lives: the use of fear appeals and worst case thinking intended to change young adult behavior--whether it be warnings about underage and unprotected sex, as in “Proper Condom Use,” or tobacco, alcohol and marijuana abuse as in South Park episodes “Butt Out” and “My Future Self ‘N’ Me.” In short, this exercise allows students to reflect thoughtfully as they share stories about their own school experiences with fear appeals while teachers can introduce literary concepts in an easily understood format.

Take Action Sidebars

Below are the discussion guides we have used for 1) analyzing “Proper Condom Use” and 2) for using similar literary concepts in subsequent analysis of short stories

Discussion Guide for “Proper Condom Use”

Images

What are the visual and aural elements that help create South Park’s brand of humor?

Character

With which character in South Park do you most identify? Explain the personality characteristics that you feel you have in common with that character.

Themes

Recall how fear appeals were used in school programs? Did you observe any unintended consequences in student reactions to them? Did you observe teachers or administrators practicing some of the actions the school discouraged in students, such as speeding or smoking?

As a series, South Park suggests that parents don't really understand what's going on in their young children's lives. Do you agree with this idea? Explain your answer with reference to your own school experiences.

Genre
What purpose does the ending monologue, a convention of burlesque, serve in this episode?

**Audience**

Why do you believe *South Park* resonates so strongly with a young and primarily male audience?

**Discussion questions for subsequent literary analysis**

Identify specific passages in London’s “To Build a Fire” and Crane’s “The Open Boat” that use descriptive language of colors, sounds, and other sensory experiences.

Describe how Ms. Brill’s character evolves from the beginning to the end of the story.

Explore how the theme of experience vs. expertise is developed in Gilman’s “The Yellow Wallpaper.”

What role does fear play in Jackson’s “The Lottery?” Identify text from the story that supports your analysis.

What are the unintended consequences of the grandmother’s actions in O’Connor’s “A Good Man is Hard to Find.”

How does the narrator in Walker’s “Everyday Use” view her daughter’s motivation in desiring to obtain her possessions?

Identify specific passages that create a satiric tone in Thurber’s “Secret Life of Walter Mitty.”

**More to explore**  
Abstract: Bauman's (2000) 'Liquid modernity' proposes that late capitalism and post-modern society place downward pressure on the individual and thus lifelong learner to subsume the destabilizing and disenfranchising effects of neoliberalism (Grace, 2013). Theorists including Foucault (1996), Jardine (2012), Butler (in Dushinsky, Greco & Solomon, 2014), Hillman (1990) contend that the psychosocial fragmentation that occurs from confusing this post-modern effect with individual agency or choice are mistakenly—and perhaps deliberately, to preserve power—represented as decompensation on a personal level (psychopathology). This 'subjectification' (Foucault) effectively places the individual in a double-bind (Bateson, 1972) similar to the psychological distress that accompanies attachment disorders in affected child/parent relationships. The ‘macro’ effect of such is examined through Shepard’s (1998) anthropological, epochal study of human social organization, values and ontogeny.

This article explores the psychological, sociopolitical and philosophical implications of bifurcating ‘inner’ from ‘outer’ reality regarding awareness and agency in the face of global ecological crisis as a similar double-bind and attachment wound. In contrast to the long shadow of Cartesianism through modernity, which renders the natural world into mechanistic form from which human rationality is sovereign, Hillman’s call to re-engage the ‘world soul-ensnared’ as anima mundi, invites a holistic and interdependent reformation of psychology, pedagogy and human interrelatedness with Kosmos. Naess’ ‘ecological self’ is similarly examined as more holistic philosophical identification from which an ‘engaged’ (hooks,) loving
(Zajonc) and spiritual (Palmer) pedagogy can be reimagined as pivotal to healing this psychoideological rift with the ecology of life.

Title: Building and Leveraging e-Portfolios for Hiring Purposes in the Field of Early Childhood Education

Topic Area: Early Childhood Education

Author: Jessica Alvarado, Ed.D

Affiliation: National University: Sanford College of Education, Early Childhood Education

Author Addresses:

1425 Perkins Drive. Chula Vista, CA. 91911

jalvarado@nu.edu

Abstract:

Technology is being used more and more in the field of early childhood education. With the technology focus and integration, early childhood education candidates are using these to apply for teaching and leadership positions and/or promotions. Recent literature suggests it is a way for potential candidates to showcase their technology skills and their match to a particular center or school based on the content of their e-portfolio (teaching approach, philosophy, etc.). In addition, potential employers are able to get a glimpse of the candidate’s skills, dispositions, etc. by having the opportunity to view the different elements in the e-portfolio either in the pre-screening process or in the final stages of hiring or promotion.
Counselor Self-Exploration as it Relates to the Communication Process

This article explores the pre-requisites of the helping profession as well as basic guidelines of counseling and emancipation from self. Additionally, a counseling session structure is proposed which may be especially helpful for beginning counselors. This structure includes the steps for identifying the concern, identifying the primary category of the concern, sharing the meaning of the experience and utilizing an appropriate response style.

Pre-requisites of the Helping Profession

1. We must sincerely want to enter the profession. We must want to work with individuals with concerns. We must have a continued passion and enthusiasm for what we have chosen to do or we will disintegrate into inadequacy.

2. We must be willing to give time. Counseling cannot be mailed in; it is a face-to-face relationship that requires a portion of our lifetime.

3. We must derive satisfaction from what we do if we are to replenish ourselves professionally. Most of us enjoy nurturing others. As counselors, we touch people and they grow. There are those who touch people and cause them to shrink.

Basic Guidelines of the Counseling Process

1. Clients come to counseling because they want change in their lives. We can help to promote change by either adding or reducing forces in our clients’ lives. Adding forces involves giving advice, suggestions and information. Reducing forces is a more important counselor role in that it addresses hindrances that may be preventing change within the client.

2. The primary goal in counseling is emancipation. To help or clients become self-directing by introducing them to the skills of decision making, problem solving, critical thinking, risk tolerance, and confidence building.

3. An effective counseling session is not concerned with whether the client leaves either happy or sad but rather that they leave the counseling session thinking.
4. The primary tool of the counselor is communication.

5. The foundation of the counseling process is that it is a relationship. As in all relationships we must remember that it involves the changing process of relating. It is a verb not a noun. It requires an individual’s commitment, agreement and investment.

Counselor Emancipations and Transformations as Readiness for Counseling

1. Clarity vs. Solutions: Counselors provide clarity of self and situations so clients can find their own solutions and make their own decisions. A counselor who gives advice is not helping the client learn how to become self-directed.

2. Observer vs. Reformer: Observation is to be with something without a point of view. Our emphasis is not to reform but to observe the behavior that is being demonstrated. Our focus is on the problem as well as the client presenting the concern.

3. Understanding through the Client’s Perception: We must see the world through our client’s eyes not our own if we want to understand our client’s world. Acceptance of our client is the residue of true understanding and acceptance. Understanding leads to mutual respect.

4. Communication vs. Conversation: We can define communication as sharing the meaning of an experience, while conversation can be defined as sharing the experience only.

5. Participation vs. Removed: We must invest ourselves 100 percent in being with those things we choose in life. To the extent that we do not, that is the extent to which we exist rather than live. The counselor must be “with” his client 100 percent.

6. Confiding vs. Confessing: Confiding is affective in nature while confessing is cognitive in nature. We gravitate to those we can confide in and likewise distance ourselves from those of whom we feel we have confessed. With confiding, we do not feel as if we have lost one iota of our self-concept or self-esteem.

Structuring the Counseling Session

1. Provide a supportive statement recognize the client’s efforts.
2. Identify the concern as stated by the client; not what we interpret what the concern should be.
3. First discuss what the client came in to discuss.
4. Follow the steps in sharing the meaning of an experience.
5. Utilize the appropriate styles of responding.
6. Incorporate techniques that facilitate communication.
7. End the session leaving the client thinking.

**Identifying the Primary Areas of Concern**
1. Problem solving
2. Decision making
3. Self
4. Relationships
5. Information and planning.

**Styles of Responding**
1. Supportive
2. Understanding
3. Probing
4. Interpretive
5. Evaluative

**Sharing the Meaning of an Experience**
1. Statement of the Item - *What is the concern?*
2. Physical Awareness - *Where is the pain or joy?*
3. Primary Emotions and Feelings - *Loneliness, inadequacy, fear etc.*
4. Attitude-Point of View - *My fault or their fault?*
5. Behavior - *What do you do?*
6. Considerations- Beliefs-Ideas ... *that may impact the concern.*
7. Images of the Past
8. Images of the Present - *How will you handle the situation now?*
9. Images of the Future - *How does the situation affect future plans?*

**Samples of Techniques in Counseling**

Listening, summarizing, reflecting, silence, open-ended questions, confronting, clarify, active listening, accurate empathy, evocative responding, etc.

**Blending Competency-based Education with Self-directed Learning in an Online Course**

**Abstract**

Self-directed learning in an online learning environment is a growing phenomenon in society as Massive Open Online Courses (MOOCS), professional development, and competency-based education platforms emerge (Bonk, Lee, Kou, Xu, & Sheu, 2015; Lasse, 2012; Nemec, 2011). Bonk et al. (2015) present the findings from their qualitative data analysis, which highlight the positive effects of self-directed learning. Subject specific skill learning as well as general skills for career advancement are noted as positive outcomes from MOOC participation by the respondents to a survey (Bonk et al., 2015). Considering the academic area of self-directed learning, Chou (2013) provides case study evidence, which suggests a positive relationship between self-directed learning and academic achievement. As a course developer in an online learning environment, it is important to recognize the need to differentiate instruction and assessment in a self-directed learning environment to evaluate the attainment of the desired competencies. A study of current work in a developing self-directed online system of education is underway using a mixed methods approach. The non-experimentally designed research will use a survey similar to the Bonk et al. model for the qualitative data collection. The Moodle platform will be analyzed for time spent in the units of instruction in the 10 core courses of the program with successful completion of courses and graduation rates forming the quantitative data. Descriptive statistics and MANOVA analysis will be a part of the data analysis.
Keywords: self-directed learning, professional development, competency-based, course development, Moodle
Currently, IBL has become the central focus and method of delivery to support mathematics learning, especially within elementary schools in Ontario. In seeking how to optimally increase student achievement in mathematics, my research becomes one of investigating a vigorously espoused pedagogy among mathematics scholars today: inquiry-based learning. Therefore, identifying key methods and strategies, specifically as they relate to IBL, that serve to promote student achievement in mathematics is at the heart of my research. I describe the role teachers play in utilizing inquiry-based learning (IBL) methods to increase student achievement in mathematics. My study specifically focuses on investigating how elementary teachers implement IBL strategies/methods in their mathematics classrooms to promote mathematical understanding and proficiency among their students. In the context of my study, the term inquiry-based learning (IBL) will come to mean student-centered learning, where teachers take on a facilitatory role in promoting active engagement of learning through discovery, interaction and experiential problem-solving. In my research, I conduct a case study of my colleague, focusing on how she implements IBL strategies/methods in her mathematics classroom to promote mathematical understanding and proficiency among her Grade 5 students.

Brett L. Bruner, Fort Hays State University

Abstract: We explored the benefits and challenges of peer mentoring for student affairs professionals who are learning about assessment. Benefits included gaining a different perspective, mentoring and being mentored, and having a trusting relationship. Challenges included role issues and fewer spring meetings. Findings have implications for training student affairs professionals in assessment.

Keywords: Peer mentoring, assessment, student affairs

Assessment has become increasingly important in student affairs. The field of student affairs defines assessment as “the process of collecting and analyzing information to improve the conditions of student life, student learning or the quality and efficiency of services and programs provided for students” (Blimling, 2013, p. 5). Student success outcomes have become increasingly important in higher education which prompted the field of student affairs to develop the Assessment Skills and Knowledge Standards (ASK) which “describe and prescribe assessment practices that are needed to address accountability initiatives” (Henning, Mitchell, & Maki, 2012, p. 12). These assessment practices apply to student programs and student learning (Elkins, 2015).

Despite the demand for assessment skills, many entry-level student affairs professionals lack preparation in this area (Young & Janosik, 2007 as cited in Herdlein, Riefler & Mrowka, 2013). Student affairs professionals may be intimidated by the assessment process and may believe they lack the expertise or time to evaluate their programs. (Elkins, 2015).

In order to promote a culture of assessment in student affairs, administrators may try various methods including having meetings on assessment topics and pairing participants with assessment mentors. The traditional mentor relationship consists of a mentor with years of experience and a protégé whereas the “step-ahead” mentor “is one hierarchical level about the protégé or in a position that would be the protégé’s next logical step in career progress (Darling, 1986)” (Ensher, Thomas & Murphy, 2001, p. 421). Peer mentors are at the same level regarding experience and status (Kram & Isabella, 1985 as cited in Ensher et al., 2001, p. 421).

Mentoring plays an important role in the success of student affairs professionals (Blackhurst, 2000). However, the importance of peer mentoring in higher education has focused mostly on faculty (e.g. Murakami, & Nunez, 2014; Thomas, Bystydzienki, & Desai, 2015). However, the experiences of student affairs professionals in a formal peer and step-ahead mentoring relationships in order to learn of assessment has not been examined. The exploration of this topic could add the perspectives of student affairs professionals to the peer mentoring literature. Therefore, the purpose of this study is to explore the experiences of student affairs professionals in peer and step-ahead mentoring relationships in learning assessment. The research questions are:

1. What are the benefits of peer mentoring in learning assessment?
2. What are the challenges of peer mentoring in learning assessment?
Literature Review

Assessment in Student Affairs

Student affairs professionals were asked to take a more active role in assessing student learning outcomes in order to demonstrate a connection between “our work” and the “academic mission of our institutions” (Upcraft & Schuh, 1996, as cited in Elkins, 2015, p. 40). By the early 2000s, student affairs professionals were expected to have skills in assessment (ACPA 2007 as cited in Elkins, 2015) and institutions developed assessment offices often in student affairs (Elkins, 2015). Whereas, senior student affairs personnel reported being committed to assessment, staff in residence life cited a lack of time and training as reasons for their resistance (Elkins, 2014 cited in Elkins, 2015). The assessment of learning outcomes needs more attention in particular (Elkins, 2015).

Although new student affairs professionals (those with 5 or fewer years of experience) believe assessment is important “at least 20% rated themselves as not at all proficient on 15 of 34 [assessment] skills” (Hoffman, 2015, p. 51). Respondents reported that graduate assessment courses and practical experience were the most helpful ways to learn assessment skills (Hoffman, 2015). Regarding how they anticipated learning assessment in the future, 84.5% believed they were very likely or likely to learn assessment on their own as part of their job or a workshop.

Peer Mentoring

Whereas the benefits and challenges of peer or step-ahead mentoring of student affairs professionals engaged in learning assessment have not been examined, the effects of peer mentoring in faculty contexts have been studied. Scholars discovered that women professors and administrators in STEM fields who joined peer mentoring groups at their institution reported benefiting from the personal and professional connections. Challenges remain as to how to facilitate the groups (Thomas et al., 2015). New faculty reported that they felt safe engaging in “backroom talk” with their peer mentor. At their meetings, they reviewed what “went well and what didn’t” and discussed their personal lives (Kensington-Miller & Ratima, 2014, p. 29). They came to know more about the university and received support (Kensington-Miller & Ratima, 2014).

Research Context

The Assessment Colleague Team (ACT) Project was implemented at a four-year primarily non-residential public university in the Midwest that offers numerous bachelor’s and master’s degree programs. Enrollment is approximately 15,000 students. The Division of Student Affairs employs approximately 120 individuals including graduate students. Roughly 900 faculty and staff are employed at this university.

Method

The Assessment Colleague Team (ACT) Project was implemented and funded by Division of Student Affairs at this university. This project ran for one academic year. Any unclassified professional staff members and graduate assistants that worked in the area of Student Life were eligible to participate and were emailed a flyer explaining the ACT Project including what it is, who is eligible and program activities. Individuals signed up for the program online and were matched with a colleague based on similar interests regarding assessment experience. Participants attended an initial kick-off meeting in the fall. They received an ACT Colleague Manual that explained the role of the ACT Colleague, how to provide constructive feedback, and tips for holding each other accountable.
After the kick-off meeting, colleagues were encouraged to meet to set goals and discuss assessment. These colleague meetings were supplemented by Student Affairs Divisional professional development activities on assessment, webinars, and existing professional development activities on campus that had to do with assessment.

Eleven program participants consented to take part in exit interviews. Seven participants are White, 2 are Latino/a and 1 is African American. Four participants were graduate students at the time of the interview and 7 are working professionals. Seven participants are women and four are men.

Interviews lasted between 30 and 90 minutes. Interview questions included: Tell me about your journey in developing assessment skills; Tell me about your experience with your ACT Colleague; What were some benefits to having a colleague? What were some challenges to having an ACT Colleague? What did you discuss in your meetings? Participants consented to the study and to having the interview audiotaped. The study was approved by the appropriate Institutional Review Boards. Respondents chose or were assigned a pseudonym. Interviews were taped and transcribed by the first author. Transcripts were sent to participants and respondents were asked to read the transcript and respond with any comments. One respondent indicated there were spelling and punctuation errors in the transcript. These errors were corrected.

The data were analyzed inductively using the constant comparative method (Glaser & Strauss, 1967). Initial coding was completed which was followed by axial coding (Glaser & Strauss, 1967). Team members looked within and between transcripts to ascertain themes.

Findings

Participants discussed the benefits and challenges of peer mentoring. The themes for benefits included: Gaining a different perspective, mentoring and being mentored, and having a trusting relationship. The challenges included role issues, particularly for those who were in step-ahead partnerships. Second, the peer mentoring meetings became less of a priority in the spring.

Benefits of Peer Mentoring

Gaining a different perspective. Gaining a different perspective was the most reported benefit of peer mentoring. Everyone worked in the field of student affairs but had different expertise. For example, one person in the dyad worked in Greek Life whereas the other person worked in residential life. Participants learned about other areas of student affairs and asked questions that strengthened assessment efforts. In addition, individuals learned more about each other’s areas. Third, individuals realized that assessment could be accomplished in other ways and they received new ideas about how to assess their programs. Participants also gleaned new ideas about how to assess for things and apply this knowledge to their own context.

Mentoring and being mentored. Mentoring occurred in the peer mentor project and most enjoyed mentoring their partner and/or being mentored. Lisa enjoyed mentoring her partner as he was a graduate student and she was a working professional in student affairs because she learned “what [he] is passionate about and why he is doing assessment” as well as asking about his goals after graduation. Respondents mentioned enjoying having to defend choices regarding assessment because this made them think more critically about their choices.

Although only one participant indicated that her peer mentoring experience made her remain in the ACT program and become more interested in assessment, we believed this finding might be underrepresented. Jessie Mae admitted that prior to joining the ACT project, she was “not remotely” interested in assessment. Her peer mentor helped Jessie Mae become excited
about assessment. Jessie Mae stated, “[My partner’s] intentionality helped me stay on track and want to continue to do it. People’s passions are contagious.”

**Relationship of Trust.** Implicit in many of the findings was a relationship of trust. Peer mentors met informally throughout the year and learned more from each other. The most successful partnerships were based on trust.

**Challenges of Peer Mentoring**

**Role issues.** In general, participants mentioned few challenges in the peer mentoring dyads. Although few individuals discussed this challenge, we believed that this finding was significant. In step-ahead dyads, there were sometimes role issues that surfaced. Betty was a step ahead of her partner. She stated,

> Yeah. [Meeting] was hard for me because I think at times I fell into the mentor role for her which was great but she was really struggling in her work life and it put me in this really weird spot because she was supervised by a colleague so it was really hard.”

In contrast, Denny did not want to be mentored by his partner. He stated:

> I would say what was less effective is that sometimes there was role confusion a little bit. She wanted to be a mentor in more than just assessment so 15-20 minutes of the hour was: How are you doing in classes? What’s your job like? How is that working with your supervisor? This is role confusion because you are not that mentor. I already have another mentor on campus where I go to have those conversations. That was less helpful.

Challenges arose when individuals had differing expectations concerning their roles or purposes.

**Meetings were less of a priority in the spring.** The spring semester tended to be busier for many of the participants. The peer mentoring meetings seemed like less of a priority for some. Denny’s comments were representative:

> With the second colleague what was less helpful is probably the fact that she wasn’t a participant from the beginning and also the schedule. It wasn’t a priority on her list so it didn’t become as much of a priority for me. That’s why it only went to once a month meetings instead of trying to push to meet every other week and continue progress on this.

**Conclusions and Implications**

Respondents benefitted in several ways from their meetings over the academic year. The peer meetings broadened their worlds. They gained new understandings about their projects and offered insights to their partners. They learned about other areas of the university which enriched the assessment in their own area. In short, all participants were in the field of student affairs, but not being familiar with each other’s particular contexts, they were outsider within. Expanding one’s knowledge about other areas of student affairs created interconnections between areas. It also exposed graduate students to other areas in which they may want to become employed. When organizing learning groups and dyads, student affairs professionals should recognize that everyone brings knowledge and experience that inform their ability to teach others and learn from others.

In addition to learning about other areas in student affairs, individuals enjoyed defining and defending the assessment choices they made and they also applied ideas they learned from
their respective partner to their context. The colleague team meetings gave partners the time and space to engage in critical thinking. Critical thinking “refers to the use of cognitive skills or strategies that increase the probability of a desirable outcome” (Halpern, 1999, p. 69). Making decisions, analyzing arguments and solving problems involve critical thinking (Halpern, 1999). Second, adults more often want to learn something they find useful in their lives and the dyad conversations helped them achieve this goal (Knowles, 1984).

Colleagues not only engaged in critical thinking but they also mentored each other which confirms previous literature on peer mentoring (Driscoll, Parkes, Tilley-Lubbs, Brill & Bannister, 2009). In the traditional mentoring relationship, the mentor dispenses knowledge and the protégé receives this information and has little to give. It is rather the “banking” model of education (Freire, 2007) in the traditional mentor relationship. However, participants in this study noted that they were teachers and learners in the peer mentoring process. Lindeman (1926) and Knowles (1984) note that adults come to learning opportunities with a variety of experiences that helps them learn and teach others.

While there were benefits to peer mentoring, there were also challenges. The findings from this study confirm others (Brown, Nairn, van der Meer, & Scott, 2015) that note that role conflict emerges particularly in next-step mentoring relationships where parties are at different levels of the organizational structure. To ameliorate this problem, perhaps in an early meeting, partners in next step relationships can discuss expectations for topics of conversation and come up with some tenets to abide by. Brookfield and Preskill (2005) suggest establishing discussion rules. In next step peer mentoring relationships, establishing expectations might be helpful, particularly when individuals are in a small student affairs division or people work on a small campus.

Last, participants noted that there were fewer reminders from ACT Team Leaders in the spring and the spring term was busier which led to fewer meetings with one’s ACT partner. Program leaders may want to reinvigorate the dyad colleague meetings in the spring. This could be accomplished by remaining vigilant regarding email reminders, changing or increasing incentives to meet, and perhaps having the dyads regroup to review their goals and make new ones.

**Limitations and Future Research**

There are limitations to this study. First, all of the participants were from one university in the Midwest. Universities that have smaller or larger student affairs divisions and programs may have different results. Second, respondents were all volunteers that participated in the Assessment Colleague Team project and worked in the Division of Student Affairs. Those who did not volunteer for the program might have different experiences in peer dyads. Participants requested either peers or next step peers. Results might differ if participants were assigned to dyads based on different criteria. Third, many participants were new to the field or believed they had little experience in assessment. Participants with more assessment experience may recognize different benefits and challenges to peer mentoring in the area of assessment.

In order to obtain a more detailed examination of the ACT program and of the peer mentoring experiences in general, perhaps dyads could keep journals of their meeting experiences as part of a formative evaluation of the ACT program and of their peer mentoring experiences. What types of learning occurred in the dyads? What enhances learning in the dyads? Last, a closer investigation of the power and control issues involved in peer mentoring in student affairs is in order, particularly in the step-ahead pairings. How do power dynamics influence the learning of assessment?

presentation format Workshop,

Dr. Mark Alexander Nixon  
Religious Education Department  
Catholic Central High School  
nixonm@holyspirit.ab.ca

This workshop will lead participants through the four quadrants of the Medicine Wheel, i.e., Mind, Body, Emotions, and Spirit, as exploratory points of self-awareness. As a very adaptable instrument, it can be tailored specifically to direct the attention of students and/or employees using various stimuli, e.g. a short video, reflection, meditation or walk, in order to deepen personal awareness within the context of the classroom/work environment.
Mindfulness through the Medicine Wheel

Dr. Mark Alexander Nixon
Religious Studies Catholic Central High School
nixonm@holyspirit.ab.ca

Abstract

Although there are many variations of the Medicine Wheels, all can be instruments to assist people of all ages, races and faith to increase one’s self-awareness. Each can illustrate an individual’s relevance of the moment in creation and connection to the Sacred Mystery. During my doctoral studies (2002-2007), I participated in an “Intensive” course. Each day in class we centered ourselves and reflected on the whole person incorporating the four directions of the medicine wheel, i.e., East, South, West, and North along with the four quadrants, i.e., mind, body, spirit and emotions.

This workshop employs Graphic Intelligences (Bennett 2011) by applying a placemat activity developed since then to help high school students and employees of Covenant Health, Lethbridge better understand themselves and their relationship to specific topics. The high school where I teach has approximately 18% aboriginal population mainly Blood and Piikani Nations, the Medicine Wheel used is rooted in the Blackfoot tradition.

In my classes, the Medicine Wheel assists students to convey observations during various educational activities both academic and non-academic. As well, it forms the basis in a mindfulness walking exercise to break up a two-hour class. A list of descriptive words for each quadrant is provided. All students are able to identify one word or find one of her/his own that best describes each part of the Medicine Wheel at that moment in time. Then, using the descriptors as a spring board, the students are able to write a rationale for identifying those descriptors.

In the workshops, the Medicine Wheel provides a simple way for employees (various ages, nationalities and educational background) of Covenant Health, Lethbridge to articulate his/her observations after viewing short videos on specific values of the organization. This provides a safe way to quickly document self-awareness and then choose a part of the Wheel that she/he is willing to comfortably share with another employee using Think/Pair/Share (Bennett/Rolheiser 2001). Thus building trust, understanding and relationships.
Title: The Impact of Technology and Course Design on Traditional and Distance Student Engagement, Success, and Satisfaction

Authors:

Tawnya Means
Warrington College of Business
University of Florida
tawnya.means@ufl.edu

Jean E. Starobin
UF Online
University of Florida
starj@ufl.edu

Abstract

Distance education and online learning are not new phenomena, and a plethora of information exists about best practices for teaching students located remotely. However, focusing on online technologies and the design of course sites for only distance education does not leverage the true power of these technologies for students, regardless of their location. The real potential for technology’s transformative effect on higher education is to harness the disruptive power of online technologies to impact the ways that we teach all students. Technological innovations in teaching provide clear opportunities for enhancing student engagement (as measured by level of interaction with online course materials and activities), student success (as measured by student performance and overall course grades), and student satisfaction (as measured by faculty course evaluations) for all students.

The Warrington College of Business at the University of Florida has experienced an evolution of change in course design support for faculty teaching in high-enrollment courses that include both traditional and online students. The college has been involved in teaching core and elective courses in the undergraduate program with enrollments in the hundreds since the 1970s. Beginning with lecture capture in traditional classrooms that progressed from simulcast to cable television to VHS recordings to online streaming videos, the college has leveraged this resource into an online program that enrolled its first students in 2001. However, at the time of the online program rollout, faculty had very little support related to video production, technology innovations, or support for online course design. In 2014, with the creation of UF Online (http://ufonline.ufl.edu/), resources became available to support faculty, and a transition began. Working with faculty, instructional designers in the Center for Teaching & Learning helped to create online course websites in the university’s learning management system, supported the integration of learning activities and technology tools into the course sites, and encouraged shifts in the methods of video production. Additional course activities were incorporated into courses such as online business simulations, online discussions, student projects and blogging, and team-based learning. In addition, several courses transformed their assessment practices. All these changes had an impact on the learning environment and experience for both traditional and online students.
Student involvement is one of the most important predictors of success in college (Astin, 1993), and increased student involvement with both faculty and fellow students provide for the strongest positive involvement (Astin, 1996). Historically, in high-enrollment courses, little opportunity existed for in-person involvement and interaction. This was due to the faculty resorting to passive activities that left students primarily consuming lectures and completing mostly multiple-choice exams. Even though considerable research indicates that active or cooperative teaching approaches that engage students in “doing” have benefits for student learning, many instructors still teach their courses using traditional lecture methods (Faust & Paulson, 1998). McKeachie wrote in the Handbook of Research on Teaching (Gage, 1963, p. 1125) that "college teaching and lecturing have been so long associated that when one pictures a college professor in a classroom, he almost inevitably pictures him as lecturing." The fundamental transformation of education from lecture-based to activity-based learning can occur when technologies that allow for activities other than simply watching lectures are added.

In addition to the benefits for the student learning experience, these technologies have an impact on both students’ course persistence and institutional retention. Based on data from the National Survey of Student Engagement (NSSE) gathered from 18 different universities, Kuh et al. (2001) found that the probability of student persistence increased as students engaged in “educationally purposeful activities.” The addition of simulations, projects, and discussions are activities that contribute to creating a more active student learning experience.

Coming to the Table of Mission Statement Based Bargaining:  
An Incarnational Paradigm.

Educational Administration or  
Human Resource Development

Paper Session

To bridge the apparent gap between a process of collective bargaining driven by economics only and one motivated by the parties’ mission statements, Lonergan’s Transcendental Precepts and Functional Specialties (Lonergan, 1972) were employed to create Mission Statement Based Bargaining. Every bridge requires a sound foundation, so in the construction of this new paradigm, envisioning “a community of truth” (Palmer, 1998) before reflecting on collective bargaining within the framework of a mission statement is paramount.

Coming to the Table of Mission Statement Based Bargaining: An Incarnational Paradigm.

Dr. Mark Alexander Nixon
President, Holy Spirit Catholic Alberta Teachers’ Association Local #5
nixonm@hslocal5.ca

Abstract

Whether management or union, this session sets the table for both organizations to live their Mission Statement within the six stages of collective bargaining i.e. fact finding, priority setting, proposal development, proposal exchange, negotiation, memorandum of agreement. With Lonergan’s Transcendental Imperatives (Lonergan, 1972) i.e., Be attentive! Be intelligent! Be reasonable! Be responsible! as a template, this presentation will walk participants through these six stages of collective bargaining by means of Lonergan’s Eight Functional Specialties (Lonergan, 1972) as outlined in this flowchart developed for Holy Spirit Catholic A.T.A. Local #5.

Although this new paradigm for collective bargaining came out of the Catholic tradition, it is not mutually exclusive to Catholic Schools or Catholic organizations. My preliminary research demonstrated the need for a new paradigm in order to bridge the apparent gap between a process of collective bargaining driven by economics/politics and one motivated by the parties’ mission statements. Since every bridge requires a sound foundation, it was deemed necessary, in the construction of this new paradigm, to envision “a community of truth” (Palmer 1998) before reflecting on collective bargaining within the framework of a mission statement. Since this reflection requires fleshing out a mission statement throughout the collective bargaining process of a Catholic school division, it seemed fundamental to view collective bargaining in the light of a theology of Incarnation which provided a way of coming to the table of Mission Statement Based Collective Bargaining.

ADVANCING NUMERACY: AN EXAMINATION INTO FIJI LITERACY & NUMERACY ASSESSMENT (LANA) AS A DIAGNOSTIC TOOL FOR NUMERACY LEARNING.

Abstract

This is a study done to investigate the effectiveness of Fiji Islands Literacy and Numeracy Assessment (LANA) programme in primary schools. This assessment is conducted for Years 4, 6 and 8 in Fiji Primary schools to diagnose learning deficiencies in literacy and numeracy. This study was done in Suva, Fiji Islands, to ascertain the role of LANA in the diagnosis of students' needs in numeracy skills. The literacy assessment of this programme will be done at a later stage as the researcher for this study is a specialist in Mathematics and therefore has focused on numeracy skills assessment. The study adopted a mixed methods approach, using ‘talanoa’, traditional Fijian dialogue, and survey methods as its key instruments for data collection. The sample population comprised ninety teachers from twenty primary schools in the central division of Fiji. The study argues that although there has been extensive emphasis on improving numeracy in Fiji, it has had inadequate impact on improving the numeracy skills of primary school children. The findings revealed that a large proportion of teachers understand that the role of LANA is to diagnose numeracy learning gaps. However, they often ignore this role of LANA and use it as summative assessment. The findings also reveal that teachers perceive LANA as another national examination rather than a diagnostic tool for assessment and therefore teaching pedagogies are aimed at achieving the more difficult learning outcomes. This perception is so derived because one of the key indicators of a high performance rating from staff performance appraisal is a high achievement in LANA; the higher the pass rate in LANA, the better the appraisal rating of teachers. The study found that teachers are teaching students to pass LANA exams rather than focusing on numeracy skills acquisition. The study also found that teachers do not have the necessary skills to develop pedagogies to assess if the learning outcomes of their lesson have been achieved. Recommendations to address the issues arising from this study include a
range of initiatives to provide professional development and skills enhancement for the primary teacher workforce in Fiji.

1.0 Introduction

The Fiji Islands Literacy and Numeracy Assessment (LANA) is a standardized assessment prepared by the Fiji Ministry of Education to be undertaken by students in years 4, 6 and 8. It is a national formative assessment in which students are tested on their understanding of concept. It assesses literacy (English) and numeracy (Mathematics) skills only. Although the assessment is administered to diagnose the learning gaps in both literacy and numeracy, this study focused on the teachers' effort to use LANA as a diagnostic tool for numeracy learning.

The Fiji Education system has undergone a number of reforms recently which has impacted the teaching and learning process. This study was conducted in selected primary schools in the central division of Fiji. Total school roll, distance from the main urban centers and the ethnic makeup of the schools were some of the features taken into consideration during the selection of the sample.

1.1 Statement of the Problem.

In Fiji, numeracy has always been an area of concern as reports show that students achieve poor scores in mathematics examinations. A report by the Minister of Education (2014) highlighted the very low average on Mathematics scores of students in the Year 12 and Year 13 national examinations as compared to other key learning areas. This problem has been attributed to non-mastery of the basic mathematical concepts at the foundation years of learning.

1.2 Purpose

The purpose of the study is to ascertain whether teachers are using LANA to diagnose numeracy learning gaps.
1.3 Significance of the Study

This study is significant and timely given the ongoing deliberations of the mathematics achievement of students and their inability to solve mathematical problems. It will also inform the development of teacher training programs at the Fiji National University regarding relevancy of assessment and its commitment to the teaching learning process. It would also provide platform for further research in the area of assessment and instructional practice.

1.4 Research Questions

The main research questions that guided this study were;

(i) What impact does LANA have on the teaching strategies used by the Fijian Primary School teachers?

(ii) What are teachers doing to fulfill the objectives of LANA?

(iii) Are the teachers utilizing LANA feedback to improve numeracy learning?

2.0 Background

2.1 What Is LANA?

Literacy and Numeracy Assessment is the standardized assessment method which is carried out in Year 4, Year 6 and Year 8. It is a national formative assessment in which students are tested for their understanding of concept and not knowledge at crucial levels in the system. It assesses literacy (English) and numeracy (Mathematics) skills only.

LANA satisfies a criterion-referenced category of assessment where the students’ performances are assessed in relation to an expected standard or specific objective. The test items used reveals the students strengths and weaknesses in terms of knowledge or skills (Hart, 1994). It follows an outcome based prescription, which means that the objectives outlined in the mathematics and English prescription for teachers are rewritten in outcomes form for parents and students. This is done to give meaningful feedback to allow an understanding of what students have achieved and have failed to achieve. LANA uses new
analyzing software (Rasch Scale) that places items on a graduated scale of concepts/skills ranging from easy to more difficult.

2.2 Purpose of LANA

Proficiency in literacy and numeracy is essential if young people are to fully develop their potential in their careers and as effective members of their community and society. Where there are low levels of literacy and numeracy in the adult population it is an indication of low basic skills and low employment levels (UNESCO, 2011).

The purpose of LANA is, first, to empower teachers to be able to use appropriate assessment activities to gather evidence on what students can or cannot do in any given area of study, or outcomes, in order to provide specific assistance to students (MOE, 2010). According to Tombari & Borich (1999, p.3), assessment occurs overtime during which the role of the teacher is to help the learner improve. This makes assessment of students with regards to goals and objectives important (Goldenberg, 2004).

Secondly, as has been noted, to improve the curriculum and teaching methods, it is very important that the assessment methods are also improved (Torrance, 1995). This suggests that assessment paves the way for the effectiveness and efficiency of the teaching/learning process in the classroom. Thus LANA empowers teachers' capacity to identify weaknesses in Literacy and Numeracy and take immediate remedial action.

Thirdly, assessment also has a focus on accountability. It supports progression in learning. LANA leads to actions that will support further learning and attainment of mathematical skills (Broadfoot, 2007). Actions would only be taken by the teachers to improve teaching; students would also be motivated to improve themselves by putting in more effort to learn. Therefore, LANA empowers both, the teacher and the learner in the classroom. It can also be referred to as assessment for learning rather than assessment of learning. Assessment of learning is summative in nature. It provides feedback on what learning has taken place. Assessment for learning on the other hand is formative in nature and provides feedback for the improvement of learning. This indicates that the analysis of the result of assessment creates a benchmark on which the teacher and the learner can progress from.
2.3 LANA as a diagnostic tool for assessment.

Assessment has taken a turn from the traditional examination to a more outcome-based, child-oriented, parent friendly comprehensive reporting. This suggests that there is also a shift in the teachers’ role from that of the transmitter of knowledge to a facilitator of learning. Zevenbergen et al (2004,p.5) states that...

*Good pedagogy is about high intellectual engagement and helping students see and make connections; it is learner centered, where each individual's knowledge and culture is valued and learners feel supported in their learning*

LANA was introduced, following the attempt by the Curriculum Development Unit (CDU) of the Ministry of Education, to localize and contextualize the teaching learning process and to make assessment more student-centered and less teacher directed. Students do not ‘pass’ or ‘fail’ LANA, rather they are only able to determine the skills that they have not mastered from the given outcomes. From the result of LANA, teachers are able to plan for remedial activities that would assist the learner to master the skills.

LANA uses multiple choice test items which comprise of a question, 3 functional distractors and a correct answer. The distractors are usually taken from the common mistakes that student's make. Teachers are expected to do the analysis of the student’s Response Record Sheet (RRS) and determine where the learner has misunderstood the concept. Based on this analysis, teachers are expected to plan for remedial intervention lessons.

3.0 Literature Review

3.1 What Is Assessment?

The term assessment has its roots in the Latin word ‘assidre’ meaning ‘to sit beside’ (Weber, 1999). Many writers (Hart, 1994; Weber, 1999; Chaswe, 1999; Tombari & Borich, 1999; Linn and Gronlund, 2000) have equated evaluation, measurement and testing to assessment. They all concur with the view that although there may be inconsiderable differences in the context where the term (evaluation, measurement and testing) are used, they are part of the assessment process as a whole. Murray & Ward (1999) have highlighted alternative assessment which refers to assessment procedures other than traditional test items. These include performance-based assessment, observations, rating scales, and portfolios.
With reference to the root of the word assessment as highlighted by Weber, assessment in the educational context is perceived as a process of sitting beside the learner with a purpose of bringing out the potential that exists within them, creating an opportunity for them to demonstrate what they know (knowledge); what they can do (skills); what they feel (emotion) and what they understand (comprehension) (Conner, 1999; Trotman, 1999).

In the Mathematics context, assessment should reflect processes that are required for doing mathematics which include reasoning, problem solving, communication and connecting ideas. This implies that assessment must enhance mathematical learning and support good instructional practice. According to the National Research Council of the Mathematical Sciences Education Board, assessment is the means by which teachers determine what students know and can do. It provides information to teachers, students, parents and policymakers about what students have learned; the mathematical terms they recognize and can use, the procedures they can carry out, the kind of mathematical thinking they do, the concepts they understand and the problems they can formulate and solve (BMSE, 1993).

Norm-referenced assessment and criterion referenced assessment are two methods of assessment generally used in classrooms (Townsend et al, 1981). Tombari & Borich have defined norm referenced assessment as an assessment where the child’s performance is assessed against the performance of other children in the group. Criterion-referenced assessment on the other hand is the assessment of a child’s performance against some pre-determined standards (Tombari & Borich, 1999). Literacy and Numeracy Assessment (LANA) favors the latter where the criteria of mastery of literacy and numeracy skills are specified. LANA is designed to assess understanding of concept rather than knowledge. It is planned to assist learning rather than just gaining result from the test. It is a diagnostic tool for learning.
Coxon (2000) in her report on curriculum, pedagogy and assessment in Fiji primary schools stated that there is a lack of creativity in the teaching and learning programs of primary schools. This implies that assessment is designed to test students on the curriculum content rather than, or little, on students understanding. This is demonstrated by the fact that testing and examinations are prevalent to such an extent in schools that there are no provisions for the assessment of creativity and flexibility as important aspects of the teaching and learning process. A research by the National Research council of the Mathematical Sciences Education Board suggests that assessment and instruction can be combined, either through seamlessly weaving the two kinds of activities together or by taking advantage of opportunities for assessment as instruction proceeds (BSME, 1993).

3.2 Purpose of Assessment

Gredler (1999), for example, highlighted an eighth year study conducted by Tyler in 1932. This study demonstrated a variety of activities that could be used to assess educational objectives that will contribute to teacher expertise and also be of significant benefit to students.

Tanner and Jones (2006) have noted that students are usually assessed for pedagogical reasons. They pointed out eight reasons for assessing students, four of which are reiterated by writers such as (Sadler, 2000; Gradler, 1999; Chinapah, 1996; and Corner, 1999). Carr & Harris (2001) in their own studies also noted that assessment provides means for measuring success at several levels.

3.3 Assessment in Mathematics

According to the Mathematical Sciences and Education Board, assessment in mathematics explores what students know and can do. It also communicates to teachers, parents and policymakers what concepts students have learnt; the mathematical terms they recognize and can use, the procedures they can carry out, the kind of mathematical thinking they do, the concept they understand and the problems they can
formulate and solve (MSEB, 1993). This suggests that assessment should reflect processes that are required for doing mathematics which include, reasoning, problem solving, communication and connecting ideas.

For the reasons stated above assessment in Mathematics should therefore seek to enhance mathematics learning and support good instructional practice as noted by the MSEB (1993). It must also ensure that assessment tasks are ‘interwoven’ with the instructional design to maximize conceptual learning and at the same time gives the teacher the opportunity to receive feedbacks and review pedagogical practices. This entails assessment as part of pedagogical process.

3.4 Assessment as a diagnostic tool for learning.

Diagnosis of learning needs is a very crucial task in the teaching learning process. Diagnosis of learning gaps provides an opportunity for teachers to create activities to bridge the gap between what students know and what they are expected to know. Assessment is one tool that supports the diagnosis of students’ learning needs. Freeman & Lewis (1998) states that objective tests are valuable because of its ability to diagnose learning difficulties. They further argue that diagnostic and formative tests seek to answer the question ‘What should the learner study next? Why is the learner finding certain concepts difficult? How might the learner study differently?’ (Freeman & Lewis, 1998). Teachers’ responses to these important questions helps identify the learning gaps and plan for the improvement of instruction. Terrance (2008), states that new forms of assessment should drive teaching and learning; and provide useful diagnostic information for future instruction. Diagnosis of learning gaps informs teachers of instructional activities. According to Shavelson (2008), teachers use their knowledge of the ‘gap’ to provide timely feedback to students as to how they might close the gap. Teachers’ knowledge of the ‘gap’ can be enhanced through the use of diagnostic assessment tool – objective tests. These diagnostic tests are said to be ‘easy’ and
only tests content knowledge and comprehension; and are based on representatives' sample of errors and difficulties (Lewis & Freeman, 1998). It is imperative for teachers to be equipped with appropriate skills to analyze the outcome of the diagnostic tests and provide feedback to improve instruction and the teaching learning process.

3.5 What is ‘Talanoa’?

Talanoa has been a way of transmitting traditional knowledge in most Pacific Island Countries. Fiji, Samoa, Solomon Islands, Niue, Hawaii, the Cook Islands & Tonga recognize talanoa as the means of sharing knowledge and tradition (Prescott, 2008).

According to Halapua (2008), *talanoa is engaging in dialogue with or telling stories to each other without concealment of inner feelings and experiences that resonate in our hearts and minds*. Similarly, Nabobo-Baba (2007) refers to it as ‘to offload’, *which provides opportunities for talking straight from the heart which opens up space for greater empathic understanding*. Violeti (2006) defines it as a personal encounter where people story their issue, their realities and their aspirations without any particular framework. These definitions support that although talanoa operates without any rigid framework, participants of talanoa openly discuss their issues and experiences without any suppression. Therefore, according to Halapua (2008), talanoa research is now arguably the most prominent research methodology applied across the Pacific.

4.0 Research Methodology

This study used a qualitative approach to research in data collection, analysis and presentation. According to Leedy (2005), *qualitative research involves studying those phenomena in all their complexity and focus on phenomena that occurs in natural setting*. Cozby (2007) further states the qualitative researchers emphasize collecting in-depth information on a relatively few individuals within a very limited setting.
Merriam agrees that this approach is a predominant methodology for addressing problems for which understanding is sought to improve practice (Merriam, 1990).

4.1 Population and Sampling.

The teachers selected for this study were those in-charges of the Grade level that LANA is administered in. Other criteria used for the selection of the study participants were gender, ethnicity, class sizes, years of teaching experience and teaching qualifications. Moreover, teachers teaching in rural and urban schools in the main island of Viti Levu were selected. 92 teachers from 20 different schools were part of this study (see Table1).

Additionally, 25% of the participants were undergraduates, 37% possessed a Diploma with the remaining 36% has Certificate in Primary teaching. Teacher-student ratio was also considered as having an important impact on the diagnostic process that teachers use in the classroom.

4.2 Instrumentation

Two distinctive ethnic groups are dominant in Fiji, commonly referred to as Fijians of Indian decent and ethnic Fijians or I-Taukei. Studies done by a number of researchers (Vaioleti, 2006; McFall-McCaffery, 2010; Farrelly & Nabobo-Baba, 2012) have indicated that to obtain reliable and valid data, it is essential to engage culturally appropriate research methodology with indigenous people such as ethnic Fijians. Therefore, Talanoa, a culturally appropriate research tool was used to gather information on how teachers
were using LANA to diagnose numeracy learning needs in their classrooms. *Talanoa* refers to informal talk or conversation or exchange of ideas. Halapua (2008) defines ‘talanoa’ as frank expression without cover-up in face to face dialogue and represents the understanding of the inner feelings and experience of members of a shared community. Since *talanoa* engages informal talk, it is best that it is conducted in the participants’ mother tongue, or a language in which the participant feels comfortable with and can express ideas clearly. Credibility of this method was boosted by the fact that the researcher is a fluent speaker of the Hindustani, I-taukei and English language.

Some aspects of quantitative method were also used as in survey. Questionnaires were given out to teachers. These questionnaires focused mainly on the teachers’ perception of the LANA process and its implication to the teaching learning process of numeracy skills. These questionnaires had statements listed on them where teachers had to check whether they agree or disagree. Data collected from the questionnaires were analyzed quantitatively.

In this study, credibility of the data was enhanced by the fact that all the research participants were teachers who took charge of the classes that administered LANA. This ensures that the information collected was valid and relevant to the issue being investigated and teachers understood the importance of their contribution. The questionnaire was given to teachers from the rural, urban, remote rural and semi-urban context. Focus group interview was also conducted with teachers from different location. This ensured there was representation of the different geographical settings of the schools.

5.0 Ethical Consideration

The researcher while undertaking this study ensured that privacy, anonymity and confidentiality were preserved. Since the participants of this study were practicing teachers, the researcher took all care not to compromise their current position or career prospects. For example, the questionnaire did not ask for their names, employment number or school name. Furthermore, during the interview, questions that would identify personal details were avoided and coding (X, Y, Z) was used for the purpose of analysis.

6.0 Analysis

The graph below shows the participants’ responses to the statements made in the questionnaire. Participants were given statements (*ref. appendix 1*), and they were asked to rate them on a scale of 1 – 5 where 5 indicated strongly agree and 1 being strongly disagree.
7.0 Findings

The study aimed at developing an understanding of Fiji Primary school teachers’ insight on the role of LANA as a diagnostic tool for numeracy learning. The driver of this study is the researchers work as a Mathematics teacher- education, and awareness of some of the vital issues in Mathematics achievement of students. In particular, these include the current education reforms and the consideration to make Mathematics a compulsory subject in schools.

While reporting on their opinions on LANA as a diagnostic tool for numeracy learning, the teachers also described a series of issues that impacted their numeracy instructional practices.
The following sections discuss the main themes that emerged from the study. The first section illustrates that LANA is viewed as an examination. The second section reports on the instructional strategies for Mathematics teaching. The third section presents the teachers perception on remedial intervention strategies.

### 7.1 Assessment as an Examination

Formative assessment serves to inform the teacher of what has been learned and skills attained. 70% of the teachers agree that LANA is a useful tool for diagnostic learning that uses child friendly testing tool. However, 80% of Year 8 teachers feel that the use of multiple choices alone to assess skills at their level does not show a true picture of numeracy skills attainment.

The findings show that LANA is perceived as a measure of teachers' performance and thus drives lesson preparation in the classroom. This was expressed by one teacher as follows:

> LANA results will reflect the teacher performance that contributes to our APA ratings.

The teachers reported preparing their lessons so that students do well in LANA. Previous LANA Numeracy papers are given to students as homework or revision worksheets. The views on this are illustrated by the following teachers' comments:

> Our school is rated underperforming or performing based on our performance in LANA. So we just teach so that our students do well in LANA.

> APA plays a huge role in what happens in the classroom. LANA is one measure of performance used by Head Teachers to rate Year 4, 6 & 8 teachers.

Additionally, the teachers provided numerous examples of activities that views LANA as an examination rather than a diagnostic tool for numeracy learning. One teacher comprehensively described it as follows:

> Since we have to communicate the LANA report to parents, they will only ask whether their child has passed or fail LANA. They will look at the bar on their child's report and make comparisons with the school average and national average. So I have to drill past years LANA paper with my class, so that they are familiar with the LANA format and at least get above the school average.

---

1 Annual Performance Appraisal (APA) is the performance appraisal used to assess teachers’ performance.
In addition 70% of the teachers agree that all their lesson preparations are done to prepare students for LANA. One teacher made the following comments:

*There is not much time to teach, so I just teach to prepare students for LANA.*

Accordingly, only 55% of teacher participants agree that LANA administration allows for students to be assessed fairly. Majority of the teachers particularly the Yr.6 and Yr.8 teachers are of the view that multiple choices alone do not give an authentic result. On this they described the need to consider the overlapping concept in numeracy. This was concisely described by a teacher as follows:

*In Numeracy, using multiple choices, students can just guess their answer. They should allow students to show how they work out the answer because in Numeracy, many concepts can be assessed in one question.*

**7.2 LANA before Numeracy**

Teaching mathematics through problem solving ensures that students learn precisely the mathematical idea that the curriculum demands for them to learn (McDougal & Takahashi, 2014). The majority of the teachers regardless of their gender, ethnicity, and years of teaching experience, qualification or class size admit to using teacher centered approach due to the limited time for the syllabus coverage. Although they agree that problem solving is the best method to teach mathematics for understanding they also noted that the problem solving approach is time consuming. This was described by a teacher as follows:

*I could use problem solving, but it is more time consuming and I have to finish the coverage before LANA. So I just show examples and give activity sheets.*

Year 4 teachers reported using a more child friendly approach by using group work to solve mathematical problem. However, these problems were mostly worksheets containing a number of sums. Yr.6 and Yr.8 teachers focused their teaching mostly on the supplied textbook and thus the strategy was more teachers centered.
7.3 Authenticity

Monitoring ensures that the process is authentic and achieves its desired goal. 50% of the teachers disagree that LANA results gives the true reflection of the students' ability. Majority of the teachers reported that students can just guess their answers and circle their choices. 80% of teachers agree that marking and analysis of LANA paper gives a platform for intervention program. However, all of them agree that this needs to be monitored well by responsible supervisors. LANA reports which highlight the outcomes achieved by the students do not arrive in time for the proper intervention program. One teacher concisely described it as follows:

LANA takes place in July; we get the LANA result in the last week of the school year, so there is no way intervention can take place.

LANA result is available on FEMIS and our school doesn't have internet connection, so no intervention program.

Moreover, teachers claimed that time and class sizes were significant factors that hindered intervention activities. One teacher comprehensively described it as follows:

We do not have time to discuss LANA papers after the test; After LANA, we continue with our normal teaching because we need to finish our coverage.

Additionally, 80% of teachers agree that the report released by the Ministry of Education is very late and does not allow for timely numeracy intervention program. Most of these teachers reported that very little is done about the students' numeracy performance after LANA. On this they reportedly use LANA paper as a revision activity in preparation for the examination.

8.0 Discussion

The study reported in this paper indicates that majority of Primary school teachers in Fiji do understand that the role of LANA is to diagnose numeracy learning needs. However, the teachers are not skilled to diagnose conceptual understanding of mathematical concepts and do timely remedial intervention. Conceptual understanding is what determines ones level of numeracy. It is argued that the claims made by the teacher-participants on the many factors that hinder their timely remedial intervention are camouflaging the truth.
The result shows conflicting viewpoints of teachers on the purpose of LANA. While majority of the teachers agree that LANA is a useful diagnostic tool for numeracy learning; the same majority agree that their lesson preparations are done to prepare students for LANA. In doing so, the teachers do not allow for diagnosis to take place, rather achievement becomes paramount. For instance, when describing classroom practices, the teachers reportedly taught LANA outcomes instead of Mathematics concepts. They attributed this to the teachers own measure of performance annually. Therefore, due to the immense pressure from stakeholders to produce results, teachers are compelled to teach for examination rather than for numeracy.

Another example of the teachers' claims regarding hindrance to diagnosis of numeracy skills is reflected on the teacher-participants view of the release of LANA reports. The LANA reports released by the Ministry of Education clearly highlight the outcomes students have mastered and those yet to be mastered; the school average and the national average. However, since teachers depend on the release of these reports, and the reports are usually late, teachers do not make an effort to make their diagnosis. Some teachers made an effort of photocopying LANA answer sheets of students, but for the purpose of comparing results with the official report from the Ministry.

Teachers are working under an education system that is making too many demands of them. The number of reforms that the system has undergone in the recent years has caught teachers ‘flat footed’. Recent changes in the assessment policy and the role of LANA as a diagnostic tool challenges them to be creative, innovative, problem solving and critical thinking. The teachers appear confused on the use of LANA as a diagnostic tool for numeracy learning.

Accordingly, the teachers have treated LANA as another summative examination instead of a diagnostic test. The teachers blamed the late release of result by the Ministry of Education for not being able to do the appropriate intervention program. However, it is the position of this paper, that this situation is more likely to be a reflection of how teachers view LANA. According to Ajzen, what teachers think assessment is and what it is for become important questions since attitude, beliefs and values are known to be strong predictors of intentions and actions (Ajzen, 2005).

The findings of this study reveal that Primary school numeracy teachers are teaching for LANA rather than for numeracy. However, it is argued that the main reason for this perception is that they do not have the skills to use assessment as a pedagogical process (Brown, 2006). Furthermore, the existing monitoring and
support system in place are ineffective in achieving the goal of diagnosing numeracy needs in the classroom.

Teachers do have the content knowledge; however, they need competencies in diagnosing numeracy learning needs through their pedagogical process. The teachers blame the very late release of LANA reports by the Ministry of Education for not being able to gauge the students' numeracy mastery level. However, it is disputed that this situation is more likely to be a reflection of the teachers ‘failing' to apply the necessary skills.

Teacher Annual Performance Appraisal (APA) was strongly referenced in the teachers claim that LANA drives classroom instruction. On this, the main argument was that the immediate supervisors rate their teachers’ according to students’ achievement in LANA.

Although the Ministry of Education had conducted rigorous awareness training on LANA as a diagnostic tool for learning, teachers still failed to utilize it as per its purpose. Teachers need skills to use assessment for learning as a pedagogical process.

This study is particularly timely given significant and ongoing deliberations on the mathematics achievement of students in secondary school external examination. It is believed that if students’ numeracy skills are grounded well in the early years of schooling they are highly likely to improve mathematics achievement at High School (Duncan, 2013) In addition, the announcement by the Minister of Education to make mathematics compulsory in schools (Fiji Times, 2015) has gotten teachers to the need to re-look and re-vamp numeracy teaching and learning in the classrooms. The shift should be from teaching for LANA to now teaching for numeracy.

9.0 Conclusion

There have been numerous reforms in the Fiji Education sector recently. Assessment has also undergone reforms. Re-introducing national examinations after 6 years and amending the class based assessment policy are few of the most current assessment reforms. While assessment continues to be an integral part of the teaching learning process, its purpose continues to determine what happens in the classroom.

There have been a lot of deliberations on the numeracy level of students in Fiji schools. Curriculum reforms have presented new numeracy resources. Awareness on these reforms has been carried out consistently.
Teachers have made an effort to utilize these resources in the development of numeracy skills. However, it is claimed that assessments continue to drive the teachers’ classroom practices.

10.0 Recommendations & Implications

The finding of this study has important implications for policy and practice, and opens up the issues of LANA for further research. While the government is investing substantially in the promotion of quality education, policy-makers must also recognize the importance of investing in the capacity building of its existing teacher workforce.

Additionally, this study suggests that the current expectation of diagnosis of numeracy learning gaps through LANA is not achieving its desired purpose. It is recommended that training of teachers and monitoring by their supervisors be made more vigilant to ensure that quality teaching learning process is happening in classrooms. To ensure students’ numeracy learning skills are diagnosed accurately, the following initiatives are recommended for consideration:

- Develop a center for excellence in numeracy learning & teaching. This center is to be staffed by numeracy experts who are continually undertaking research in numeracy best practices.
- Establishment of a Numeracy Professional development database that identifies teachers on a 5 yearly basis that needs professional up skilling in numeracy teaching.
- Continued professional development for the Primary teacher workforce on current best practices in mathematics. This will ensure that diagnosis of numeracy skills is part of the pedagogical process.
- Creating a Professional Learning community that would implement lesson study to refine mathematics learning teaching process.
- Re-looking at the assessment policy to include Pre-test and Posttest to ensure that remedial intervention takes place after the need has been diagnosed.

Many of these proposed initiatives can be made cost effective through utilizing of the expertise at the local and regional Universities who are consistently undertaking research to inform curriculum development & design, content & pedagogy and assessment. Encouraging teachers to be research active facilitators of learning would empower them to develop their own Community of Practice and thus refine and redevelop their own numeracy pedagogies.

Abstract
There is a need for teachers to train the students in the state in which they understand more information about the students in professional graduate schools than in normal universities and graduate schools. Some of the students of the professional graduate schools just graduated from colleges, and some adult students have work experiences for several decades. Thus, their already mastered knowledge and skills are different. Otherwise, their goals as highly professional human resources after completion of the professional graduate schools are also wide range from project managers to entrepreneurs. We can build the information of their course subjects, attendance rate, and career goals, as students information DB. And, it is also possible for teachers to carry out fine guidance for students effectively by their sharing it properly. Further, can we expect strategically educational effects by leveraging it?

In Kamei, S., Koyama, H., Tozawa, Y., and Sakamori, K. (2016), we analyzed the project based learning case in our professional graduate school. And, we proposed a contribution due to learning diversity human resources portfolio. As a result, PBL feedback loop had been accelerated because learners with different backgrounds play complementary roles. That case study shows the possibility that task type diversity of learning human resources accelerate the PBL feedback loop and improve its quality through the expansion of their competency and subsidiarity. In other words, it increases enhancement of strategic integration power of the whole team by repeating to analyze their strengths and weaknesses, and fulfill their complementary roles. We clarified that students gain various experiences that they can not gain in alone learning or homogeneous type team by teachers' creating task type diversity team, and they would have wide career prospects after the completion. And, that study suggests the possibility that learning obtained in the professional graduate school can be recognized as one of task type diversity components.

In our previous study, we got the implications that we could improve the educational quality through forming portfolio of learning diversity human resources by using task type diversity attribute database of professional graduate school students, such as their course subjects, abilities, and work experiences. In this study, we propose strategically educational utilization of students information DB for the purpose of the portfolio formation in business persons' re-learning.

15th Annual Hawaii International Conference on Education
January 3 – 6, 2017
Honolulu, Hawaii (USA)

**Topic areas:** higher education; cross-disciplinary areas of education.

**Presentation format:** Paper session.

**Summary:** This presentation describes the development of a visiting scholar mentor and support program at a mid-sized public U.S. university. Areas covered include the institutional and scholar goals, challenges, needs, and outcomes of hosting international scholars in various academic fields. We offer recommendations for maximizing scholarly productivity and cultural exchanges for university administrators and faculty members who are considering hosting international academic colleagues.
Abstract

Indiana State University (ISU) has hosted international scholars for several years and is a designated sponsor organization for visiting professors, research scholars, and short-term scholars. Academicians come to collaborate on specific research projects with known faculty, to learn new research methodologies, and to develop partner programs (2x2) between ISU and their university. Many scholars currently come from China, some with dependents, and have the additional goal of gaining English language exposure and proficiency for themselves and their children. ISU benefits from these exchanges by supporting faculty in scholarly productivity, expanding cultural knowledge for students and ISU faculty, creating collaborative research opportunities, and attracting future international students for enrollment. Scholars and host departments also experience challenges, such as cultural misunderstandings, language difficulties, housing problems, and isolation. Communication and preparation with the host before the scholar arrives can improve outcomes, as can ongoing support and active outreach during their stay. Interdepartmental cooperation is vital for creating opportunities for social and academic exchanges. The ISU program endeavors to reduce misunderstandings and promote rewarding exchanges between visiting scholars, the university, and the community. Models for successful visitor and host interactions are discussed.

15th Annual Hawaii International Conference on Education
January 3 – 6, 2017
Honolulu, Hawaii (USA)

Topic areas: ESL/TESL; higher education; language education.

Presentation format: Paper session.

Summary: This paper will present preliminary research findings to develop a conceptual model of a regional language center for educators and administrators affiliated with universities in ASEAN countries. English language proficiency is becoming a requirement for completing a PhD, and the common language for conference presentations and research publication. The center will support English skill development to enhance career mobility, scholarly productivity, and international collaboration.
“380 million speak it as their primary language, 260 million as their second language, a billion are learning it, and about a third of the world’s population is exposed to it” (Spicer-Escalante and deJonge-Kannan, 2014). Around the world, English is no longer viewed as an extra credential. Even in developing countries, some level of English competence is now a requirement for admission to higher education and a necessity for doing business with multinational corporations and organizations.

In December 2015, the nine members of the Association of Southeast Asian Nations (ASEAN) began economic integration into a single market where citizens have cross-border opportunities for education and employment (Stroupe & Kimura, 2015). English has been adopted as an international language to connect institutes of higher education throughout the region, with governments investing billions of dollars to boost English instruction and international scholarship for internationally competitive universities (Chang, 2015). Education programs in Vietnam, for example, are currently adjusting their curricula and developing in-service teacher programs in response to the government’s “2020 Initiative,” which mandates (among other things) that all teachers of English, from primary to tertiary grades, achieve a specified level of English communicative competence on standardized tests (Ministry of Education and Training, 2014). In many Thai universities, English language proficiency is becoming a requirement for completing a PhD, and is now the common language for conference presentations and research publication (Stroupe & Kimura, 2015). While English proficiency is regarded as the key to global competitiveness -- the preferred language of communication and teaching in more than 70 percent of higher education institutions and industries globally (Maringe, 2010) -- there is still disagreement among teachers, administrators, and students about
the goals, necessity, and effectiveness of teaching higher education content courses only in English (Foskett & Maringe, 2010).

English has traditionally been taught as a language subject. Classes in a country with English as the official language are referred to as English as a Second Language (ESL), English for Speakers of Other Languages (ESOL), or English as an Additional Language (EAL). Classes in a country where English is not the official language are referred to as English as a Foreign Language (EFL). In addition, classes preparing learners to use English in a specific context or profession, such as journalism or medicine, are English for Special Purposes (ESP), and for preparing learners for academic study are English for Academic Purposes (EAP). Most recently, English is being used to deliver entire programs of study in international universities, referred to as English as the Medium of Instruction (EMI).

Secondary and even primary schools in many countries offer EFL classes, and some universities require a few semesters of EFL (similar to many US undergraduate requirement of two years of foreign language study). In the past decade, some countries have begun to require English proficiency for admission. For example, recent changes to National Higher Education Exams in China (the GaoKao) place increased emphasis on communicative English proficiency, a challenge when most EFL classes are taught with traditional instructional strategies focusing on grammar and memorized dialogue rather than speaking and interaction (Tang, 2015). In addition, more university programs are being provided as EMI, such that communicative English competence in the academic field is imperative for students as well as teachers. In South Korea, for example, 30% of universities in Seoul use EMI, with 92% of all undergrad Engineering classes in 2010 (Kim, 2016).
Whereas EFL teachers have always faced pressure to help students learn English better and earlier, now non-EFL teachers are under pressure to demonstrate English proficiency in their own field, and teach their discipline in English. Research into effective instructional strategies has not caught up with the rapid expansion of EAP and EMI classes. There is even disagreement about whether learning the content in a foreign language can enable deep knowledge, or if this form of instruction is actually causing more harm than benefit to students and teachers. Nevertheless, despite these challenges and the need for a clearer picture of best practices and uses of English in higher education for more than EFL, mandates for increased English proficiency and programs are likely to continue and grow in the coming decade. Universities and ministries of education are faced with a question of not whether English should be required in education, but how best to implement and support it.

Thailand is a typical example of how the rapid changes in English programming and requirements are affecting institutions, educators, and students. While EFL classes have been offered from middle school onward, recent government mandates require that students pass English exams to enter and graduate from university, and all incoming faculty in every discipline must pass English competency exams (TOEFL or IELTS). For current faculty there is increasing pressure to attend international conferences, publish in Western journals, or pursue post-doctoral studies abroad, all of which require advanced English skills. In major cities, such as Bangkok or Chiang Mai, there are numerous language programs geared for adult learners, as well as many English-speaking workers and tourists to interact with. Outside of the cities, however, instructional and practice opportunities for working professionals.

In May 2016, I delivered a series of workshops on language development and acquisition at Pibulsongkram Rajabhat University (PSRU) in Phitsanulok, Thailand. During this visit, I also
met with administrators and instructors in several departments to learn about their English language instructional programs, goals, and needs. These discussions revealed that there is an urgent and growing need for instructors and professors from all fields to gain documented English skills, and for university administrators to support English development programs for their faculty members.

The visit to PSRU included a series of interviews and focus-group discussions with a selection of administrators (vice presidents and deans) and instructors from several faculties. Each faculty has some teachers with English experience, but less than 20% have international experience. Several faculty members have presented research in international conferences, and five administrators earned PhD in Western universities, including the U.S., the U.K., and Australia. In addition there are several foreigners (currently 14) on campus working in different departments. The president wants to internationalize the university and have more English-speaking foreigners on campus, ideally to develop a regional language center at PSRU which could be emulated by other Rajabhat universities for academic collaboration with ASEAN nations, including Cambodia, Vietnam and Laos.

One professor explained that faculty members at PSRU can be categorized under one or more of the following six areas of English skill and interest: 1) needing English improvement to pass their PhD program requirement; 2) wanting English improvement to pass TOEFL/IELTS for future PhD abroad; 3) wanting academic professional English skill building to attend international conferences; 4) wanting real-life English communication skill and confidence to speak with a variety of people in social settings; 5) needing to support and interact with English-speaking teachers who are/will come to PSRU; and 6) having no interest in improvement. To
address these varied purposes, faculty members need academic instruction and/or structured opportunities to use English.

As for their current use of English, instructors and faculty members described sometimes writing letters or reports, giving a lecture or teaching a class, attending a presentation, and reading. Some speak English to students, other faculty/staff, and other non-English speakers frequently, but many felt that they were understood only about half the time. Academic writing and listening to (native) English speakers were the most difficult situations for using English. Most want to improve their reading, writing, and speaking in English to pursue, continue, or complete doctoral studies, study abroad, and advance their career, but felt they were challenged by time limitations and opportunity for authentic communication in their current environment. Facilitators to improving English skill include personal factors (practicing, reading, goals) and external factors (native speakers, English textual environment). Some examples of what can help build English were “more native speakers in my university,” “practice more often,” or “keep my apps translator out.” Motivational factors were also evident, for example, “if I have a goal, I will try to improve my English skill,” and “just speaking out, even sometime I have a wrong grammar.”

The challenges for faculty who want to improve is lack of opportunity: limited time and few to no English-speakers to interact with. The foreigners available on campus are from varied language backgrounds and have accent variations which are not viewed as a good model for imitation. Also, foreigners teaching/working at PSRU usually have other jobs so don’t spend additional time on campus, and often interact with each other much more than Thai colleagues/faculty. Some faculty have low skills and confidence so don’t try to practice; even in English classes there may be few English speaking opportunities as instruction focuses on
grammar skills. Currently there are no established resources specific to faculty wanting to improve their English skill, particularly with academic writing and research. Faculty pursuing advanced degrees must pass some form of English exam to finish their degree, but many take the exam multiple times without achieving a passing score. They prepare individually, but have little/no feedback on what areas are preventing their development.

During the visit, we discussed ways to address these challenges using available resources. Most faculty who are trying to improve their English skills are working independently with readily available online resources, so could compile a list of software programs or online courses that people can use on their own time for specific goals (exam prep, personal practice). The university could create a resource center in the English Department for faculty to access these and receive basic instruction on how to maximize their effectiveness. The university could also offer more intensive small-group workshops for specific skills by inviting visiting English instructors or trainers from the network of faculty connections (in the same way that I came to PSRU). Informally, Thai faculty could create their own simulated-immersion settings where they only communicate in English, such as themed coffee hours or brownbag lunch sessions, interdisciplinary lectures, or discussion groups to expand general knowledge of other fields.

One faculty member suggested that the university could help create a positive English culture by recognizing English development achievements publicly as a form of positive reinforcement and motivation for other faculty (and students). For example, providing awards for “most frequent user” of language software programs (with login to trace users time), or extra money (a bonus) for passing English exams or gaining course completion certificates. Also, departments with foreign instructors could create more opportunities for other faculty and students to interact with them, even in short, informal situations (e.g. coffee hours, being present
in faculty offices where all faculty must see them), and “share” or introduce foreign instructors to other departments with no foreigners.

Given these findings, the new requirements for faculty English proficiency across all disciplines, and growing academic exchanges within the region, there is a clear need for new strategies for faculty English learning and practice, and more research on what methods are most effective, replicable, and sustainable. The information gained from this visit can lead to advances in both these areas.

**Abstract**

A language needs assessment was conducted at Pibulsongkram Rajabhat University (PSRU) in Thailand to gather preliminary data regarding the need for a regional English language development center for university educators and administrators in ASEAN countries, as a potential collaborative venture with Indiana State University (ISU). The assessment, conducted in May 2016, involved interviews, a questionnaire (hard copy and online), and focus-group discussions with a selection of administrators (vice presidents and deans) and instructors from several faculties. Most noted that they speak English to students, other instructors/staff, and other non-English speakers more frequently. Findings suggest that many respondents want to improve their reading and writing skills more than listening or speaking, and indicate an academic more than a personal communicative need. English language proficiency has clear career implications for respondents, many of whom wish to pursue, continue, or complete doctoral studies, study abroad, or gain promotion from their current position. Commonly reported challenges to improving English skill include time limitations for studying, and limited opportunity for authentic communication in their current environment. Given these findings, new requirements for faculty English proficiency across all disciplines, and growing academic exchanges within the region, there is a need to conduct additional research from other regional academic institutions and develop a model for an effective ASEAN English Language Development Center.

Epistemology and Ontology: The Lived Experience of Non-traditional Adult Students in Online and Study-Abroad Learning Environments

R. Jeffery Maxfield

and

Gary Noll

Utah Valley University

2016
Abstract

The goal of this study was to better understand the lived experiences, perceptions, and attitudes of nontraditional, adult university students enrolled in an online Emergency Services baccalaureate degree program, who were given an opportunity to participate in an engaged, study-abroad program. This understanding was achieved through rigorous analysis of student learning journals required as part of the study abroad course. Students were asked to journal their feelings, perceptions, experiences and learning. The purpose of the analysis was to identify and describe the various experiences and perceptions, then group these experiences and perceptions into a logically organized description of the lived experience of adult emergency services students.
Max Van Manen (1990) posited that the preferred method for human science (as opposed to natural science) was based in description, interpretations, and self-reflective or critical analysis. In other words, we explain nature but we must come to understand human life. Since the inception of online learning, researchers have studied and investigated the differences between online (distance) education and traditional face-to-face learning. Most of the work has been done in quantitative methodologies, focusing on the similarities and differences in the cognitive achievement of students. The extant literature is replete with studies and positions claiming little or no difference between the two delivery methods. However, Chisholm, Harris, Northwood & Johrendt (2009) offer the following:

Over the past decade, the analysis of what occurs when learners are involved in ‘work’-based learning (WBL) has, at best, been superficial and simplistic, i.e. it has been accepted that individuals learn by being in a knowledge-based work-based environment. It does not follow, however, that they will acquire the knowledge they are seeking simply by being in a ‘real world’ workplace environment. What needs to be considered is how the learning processes take place in ‘work’-related environments and how, by understanding the mechanisms of learning, the work-based environment can be formalised as an authentic learning environment and thus accepted as comparable but nevertheless different from the traditional on-campus one (p. 319).

The goal of this study was to better understand the lived experiences, perceptions, and attitudes of nontraditional, adult university students enrolled in an online Emergency Services baccalaureate degree program, who were then given the opportunity to participate in an engaged, study abroad program. This understanding was achieved through rigorous analysis of student
learning journals required as part of the study abroad course. Students were asked to journal their feelings, perceptions, experiences and learning. The purpose of the analysis was to identify and describe the various experiences and perceptions, then group these experiences and perceptions into a logically organized description of the lived experience of adult emergency services students.

With the creation of the Internet and increased societal emphasis on education, the adult learner has become the focus of many institutions of higher education, but it has also created a need for re-evaluating how education is best delivered.

Over the last two decades, higher education in America has witnessed an enormous shift in the demographics of students, while at the same time technology has enabled access to formal higher education. By the late 1990s, national attendance figures showed that 42 percent of the undergraduate and 59 percent of the graduate students attended part-time (UCEA, 1998). Of those part-time students, the largest segment was women thirty-five years and older. Clearly, there has been an important shift in the past twenty-five years in the profile of the average college student, which is changing the American University. In addition to putting pressure on the University for an increasingly vocational and professionally oriented curriculum, this shift is also leading to pressure for the general accommodation of the working adult student through more convenient scheduling and location of courses (Berg, 2005, p. 3).

This is reinforced by research commissioned by the United States Department of Education in the Report of the Web-Based Education Commission to the President and the Congress of the United States (Kerry et al., 2000, p. 4), which stated:

Large numbers of older persons, working adults, and part-time students attended college
in 1999. The adult age cohort is the fastest growing segment of students in postsecondary courses. Despite rising enrollment noted above, just 16% of college students fit the traditional 18- to 22-year-old profile, attend full-time, and live on campus.

Andragogical assumptions posited by Knowles and others may yet prove to be of great value in higher education, particularly in light of the changing demographics of many, if not most universities and colleges. Adult students appear to have a different learning style requiring a targeted approach when using modern technology (Pelletier, 2005). This seems particularly true for the emergency management/services and homeland security workers. Due to the nature of their jobs, previous training, and education experiences (like most adult students) they have an expectation for immediate applicability.

Adults need to know why they should learn something. Under the standard pedagogical model, it is assumed that the student will simply learn what they are told. Adults, however, are accustomed to understanding what they do in life. They want to know the reason they will need to learn something or how it will benefit them (Fidishun, n.d., p. 2).

**Statement of the Problem**

The extant literature is replete with quantitative data comparing and contrasting cognition between traditional face-to-face teaching methods and Internet-based, online delivery of curriculum. However, very little qualitative data are available with respect to the experiences and perceptions of online or students in hybrid learning environments, especially the nontraditional adult population. Understanding these experiences and perceptions may allow researchers and educators to design, develop, and teach courses that facilitate higher cognitive and affective knowledge acquisition in the fast growing demographic of non-traditional adult students.

However, traditional pedagogies may not be effective with the non-traditional adult
student population. Finding a good method of allowing these students to immediately apply knowledge, while still being able to take responsibility for their own learning, could help create an appealing and effective delivery model. Adult students need to be moved “away from their old habits and into new patterns of learning where they become self-directed, take responsibility for their own learning, and the direction it takes” (Fidishun, n.d., p. 3).

There also seems to be little data respective to the affective domain of nontraditional adult students and online and/or blended (hybrid) education. Krathwhol, Bloom, and Masia (1964), in their seminal work on educational taxonomies, asserted the need to explore the human reaction or response to educational content. This included a range of human responses, including knowing about something, problem solving, evincing an interest in human experiences, having an attitude toward some object or concept, and/or expressing one’s feelings and opinions on a variety of subjects. These principles of learning, especially for adults need to be explored further as the technological advances are or appear to be altering the educational schemas and deliveries at many universities. Therefore, the following question guided our research: How do adult students experience and or perceive the nexus between what is known and what is experienced in an asynchronous online environment and a face-to-face study abroad learning opportunity?

**Literature Review**

**Ontology and Epistemology**

Adult learners want and need to use their lived experience and incorporate reflection into their learning schemas. Maxfield (2008) in his research on non-traditional adult students and asynchronous online learning shared the following:

Barab, Thomas, and Merrill (2001) noted a concern for the human or social dimension of online learning environments. They addressed the fact that much is often discussed about
the technical components of distance education, but less often discussed is the human or social dimension of these environments. They found that online instruction might foster a reflective and social environment (Merrill, DiSilvestro, & Young, 2003). A need exists to find a way to transform experience(s) into learning.

Adults usually bring a plethora of real-life experiences with them to the classroom, experiences that need to be recognized and integrated into the learning process (Knowles, 1984). Key points of andragogy or adult learning include consideration of the learner’s experiences, the importance of the learning environment, the learner’s readiness to learn, and the teacher as a facilitator (Brown, 2001). Kolb (1984) proposed a four-stage cycle: (a) concrete experience, (b) reflective observation, (c) abstract conceptualization (theory building) and, (d) active experimentation or application (p. 8).

Krathwohl and colleagues (1964 identified divisions within the objectives of education. They presented them as:

1. **Cognitive**: Objectives that emphasize remembering, recalling or reproducing something that has been believed to be learned.

2. **Affective**: Objectives that emphasize a feeling, an emotion, or acceptance or rejection of material. They further identified these objectives as interests, attitudes, appreciations, values, and emotional sets or biases.

3. **Psychomotor**: Objectives that emphasize motor skills (muscular), manipulation of materials and objects, or some act that requires a neuromuscular coordination.

When contrasting the cognitive domain with the affective domain, some important distinctions are apparent. The cognitive domain posits the assumption that the student should be able to do a task when requested. The affective domain is more concerned that the student does a
task when it is appropriate, after understanding or recognizing that he/she can do it (Krathwohl et al., 1964). Put into simpler terms, the cognitive domain is “can do” while the affective domain is “does do.” However, compartmentalizing these behaviors into cognition and affect is not as easy as it may appear. Rarely is curricula developed with the intention that one is independent of the other. There is research that shows that cognition cannot be completely separated from affect. A more interesting idea is the possibility that one is the effect of the other. There may even be a deeper relationship or effect between cognitive and affective domains (Maxfield, 2008).

The theoretical construct used for this work is social constructivism. Constructivism posits that learning is a process of “constructing” meaning from one’s experience (Merriam & Caffarella, 1999). Well-known constructivists like Piaget and Vygotsky had different perspectives, yet based their works on the premise that experience had a major role in learning. Piaget theorized two types of constructivism: personal (cognitive) and social. Personal constructivism draws heavily upon an individual’s adaptation to his/her environment. The social constructivist view posits that knowledge is constructed through conversations, activities or in socially sharing (Merriam & Caffarella).

Epistemology (what is known) has been the educational foundation for centuries. Basically, cognition portion of the taxonomy identified by Krathwohl, Bloom and Masia (1964) is centered on the ability to remember, recall, or reproduce something learned, or in other words, recall what is known.

Ontology (what is lived) is based on what is experienced or experimented with through social or emotional reflection and/or activity. This has not been as extensively studied, yet based on the constructivist foundations this appears to be where learning is completed. In other words, when one has knowledge through cognition and/or muscular manipulation (psychomotor), and it
is combined with reflection and experimentation, then a person can be said to have learned
(known) and been educated (lived) in a particular area of learning. Greeno (1997) stated it this
way:

   In these practices, students develop patterns of participation that contribute to their
   identities as learners, which include the ways in which they take initiative and
   responsibility for their learning and function actively in the formulation of goals and
   criteria for their success. (p. 9)

Social Interactions

   Social interaction with the instructor, other students, and other communities of learning is
   particularly important when delivering courses via the Internet (Ryan, Carlton, & Ali, 2004).
   One problem that may have surfaced with the introduction of online learning is that curriculum
   developers have concentrated more on the technology and less upon the content and
   methodology of their instruction. The danger in the rapid introduction of electronic delivery is
   that the focus may be on the mechanism of delivery, rather than on the quality of the learning
   experience (O’Keefe & McGrath, 2000). Research has generally focused on technological
   aspects, with relatively few academic studies or articles written on the human and social aspects
   of teaching and online learning. Recent research indicates that quality of learning depends on the
   design of instruction and that learning transfer and retention are most strongly impacted by the
   frequency and quality of learner-centered practice activities, socialization and instructor
   feedback. Therefore, the instructional design process has the biggest effect on final
   course/program quality—not the use of technology itself (Barclay, 2001).

   Therefore, creating opportunities for ontological learning have become of increasing
   importance for the non-traditional adult learner.
Metacognition

One method of enhancing learning with the adult learner is to incorporate metacognitive practices into pedagogies. Metacognition has been simply defined as “thinking about thinking.” It is not that simple, but this gives a simpler view into the process of metacognition.

Cognition as presented above is the gaining of knowledge. For example, if a student is taught that $2 + 2 = 4$, then he or she has learned the answer to the problem and will be able to get it correct the next time. Metacognition, however, is the thought process (usually reflective) on how the learning took place. If the student were to think about how he/she became cognizant of the answer, he/she may realize that a mental picture of two objects being added to two other objects was used, thereby learning that visualization is a metacognitive activity (Maxfield, 2008). By providing activities that allow the adult to think about, plan, implement and succeed, metacognitive awareness assists the student in learning. In other words, knowing how one thinks about and processes information can assist in the learning process for other problems or issues that arise. One way of incorporating metacognition into a learning experience is by having the student keep a journal of how he/she went about solving problems. Journaling promotes growth in learners and is a way to develop thinking and reflection skills (Mizerow, 1990).

Another method for which journaling can be a great assistance is self-questioning. Livingston (1997) gave the following insight:

Metacognitive experiences involve the use of metacognitive strategies or metacognitive regulation (Brown, 1987). Metacognitive strategies are sequential processes that one uses to control cognitive activities, and to ensure that a cognitive goal (e.g., understanding a text) has been met. These processes help to regulate and oversee learning, and consist of planning and monitoring cognitive activities, as well as checking the outcomes of those
activities. For example, after reading a paragraph in a text a learner may question herself about the concepts discussed in the paragraph. Her cognitive goal is to understand the text. Self-questioning is a common metacognitive comprehension monitoring strategy. If she finds that she cannot answer her own questions, or that she does not understand the material discussed, she must then determine what needs to be done to ensure that she meets the cognitive goal of understanding the text. She may decide to go back and re-read the paragraph with the goal of being able to answer the questions she had generated. If, after re-reading through the text she can now answer the questions, she may determine that she understands the material. Thus, the metacognitive strategy of self-questioning is used to ensure that the cognitive goal of comprehension is met. (pp. 1-2)

Metacognition is important to the adult learner. After reflecting on his/her vast reservoir of experience, the adult student if given the right instructions and tools, can understand his/her unique learning processes. Metacognition enhances learning and further gives the adult learner a tool(s) to use in further life-long learning (epistemology) and being (ontology).

Reflective Practice

Reflection and the learning process has been studies extensively and found to have particular importance to the adult learner. Maxfield (2008) also shared the following:

Researchers and educators have been exploring reflective practice for a long time. Thinking about one’s cognition can be traced back to the times of Plato and Aristotle. In more recent times there has been extensive work in reflective practice by some noted researchers.

British researcher and educator, Peter Jarvis, developed a theory about the process of learning through social experience and reflectivity. The premise of Jarvis’ learning
process model is based on the assumption that all adults have experiences; some are
good, some bad. Many experiences, however, may be so rote or routine that a person
gains nothing from them. The learning process then calls for an experience out of the
“norm,” which elicits a response at a different level than would be typically done. In
other words, the experience requires some reflective action. Reflection is the heart of
Jarvis’ model.

Merriam and Cafferella (1999) present that Jarvis posited from an experience, there are
nine different routes or responses a person can make.

1. Presumption–mechanical response or a presumption that what has previously
   worked will work again.
2. Nonconsideration–too preoccupied with something else to even consider the
   experience.
3. Rejection–a conscious choice to reject the opportunity to learn.
4. Preconscious–a person unconsciously internalizes something.
5. Practice–practice a new skill until it is learned.
6. Memorization–acquire information with which they have been presented and
   learn it so it can be reproduced at a later time.
7. Contemplation–thinking about what is being learned.
8. Reflective practice–similar to problem solving.
9. Experimental learning–actually experimenting on one’s environment. (p. 284)

The first three responses (presumption, nonconsideration, and rejection) are choices in
which no learning takes place. In the second group of three, preconscious, practice, and
memorization (which Jarvis considers nonreflective) a small amount of learning will
occur. The final group of three, contemplation, reflective practice, and experimental learning are considered choices of reflective learning. Jarvis later shared how he developed an interest in reflective practice and credits the work of Donald Schön.

Reflective practice found its way into the educational vocabulary with the publication of Schön’s *Reflective Practitioner* (1983), a book that has changed the way many people think about their practice and has led to many innovations in teaching and research. At the same time, my own very early experience with long evaluative reports written by the students about their own practice was the time in my own academic career when I began to question the traditional relationship between practice and theory. This eventually led to my writing *The Practitioner Researcher* (Jarvis, 1999), in which I tried to work out something more about this relationship—but this happened only after I had begun to get students to use learning journals in their own doctoral research. (Jarvis, 2001, p. 80)

As Jarvis pointed out, Donald Schön added to, or as some would assert, created this field of study with his book, *The Reflective Practitioner* (1983). His notions of reflection-in-action and reflection-on-action are central to this effort. In fact, he related directly to teacher reflection in a presentation at the meeting of the American Educational Research Association (1997),

These explanations give the teacher the knowledge of the greatest possible number of methods, the ability of inventing new methods and, above all, not a blind adherence to ONE method but the conviction that all methods are one-sided, and that the best method would be the one that would answer best to all the possible difficulties incurred by a pupil. That is, not a method, but an art and a
talent. And this is teaching in the form of reflection-in-action. It involves a surprise, a response to surprise by thought turning back on itself, thinking what we’re doing as we do it, setting the problem of the situation anew, conducting an action experiment on the spot by which we seek to solve the new problems we’ve set, an experiment in which we test both our new way of seeing the situation, and also try to change that situation for the better. (Schön, 1997)

Schön (1983) also asserted that there is a sense of artistry in the function of a reflective practitioner,

The practitioner allows himself to experience surprise, puzzlement, or confusion in a situation which he finds uncertain or unique. He reflects on the phenomenon before him, and on the prior understandings which have been implicit in his behavior. He carries out an experiment which serves to generate both a new understanding of the phenomenon and a change in the situation. (p. 68)

**Experiential Education/Learning**

Experiential learning foundations can be traced to the philosophies of social constructivists like Vygotsky and Piaget. Experiential education places importance on constructing individual meaning, prior experience and social values. In a general sense, experiential education frequently uses reflection as a tool to develop and understand further meaning, especially through social interaction (Furman & Sibthorp, 2013).

Common strategies exist for utilizing the effects of experiential learning. Furman & Sibthorp (2013) have identified these strategies as: 1) Problem-based learning; 2) Project-based learning; 3) Cooperative learning; 4) Service learning; and 5) Reflective learning. These strategies represent the types of methodologies of instruction that teachers may develop their
One of the benefits of these strategies is the ability to connect the abstract with the concrete. The traditional model of pedagogy where the teacher leads the learning model does not allow for the self-directedness and individual experimentation that is characteristic to the adult learner and a natural extension of the lived experience (Challis, 1996). This is also supported by Kolb’s learning cycle. Kolb (1984) proposed a four-stage cycle: (a) concrete experience, (b) reflective observation, (c) abstract conceptualization (theory building) and, (d) active experimentation or application.

Cantor (1997) presents five objectives for the demands society and academia. They are: 1) Increase understanding of learning theories and cognitive development; 2) Use of varied learning modalities for the nontraditional learner; 3) Create team players; 4) Interface more with business and/or the community; and 5) Critique extant methods of cognitive evaluation. This is relevant in that it is no longer enough for students to master epistemologies and logic in the academic sense; they must be able apply knowledge and experience outside of the academy.

**Methodology**

The review of the literature led to the research question: How do adult students experience and or perceive the nexus between what is known and what is experienced in an asynchronous online environment and a study abroad learning experience? A qualitative study is most appropriate to explore this question. Qualitative research is an inquiry process that explores a human or social problem.

Phenomenology is a qualitative research methodology used to explore and interpret deep human experiences. “[A] phenomenological study describes the meaning of lived experiences for several individuals about a concept or the phenomenon” (Creswell, 1998, p. 51). Since this study
explored the lived experiences of nontraditional, adult emergency services students and how the experiences fit into adult learning, a phenomenological design seemed most appropriate.

Data were gathered from student-submitted learning journals. As part of the requirements of a study abroad experience, students were required to keep a learning journal of their feelings, perceptions and knowledge acquisition throughout the course. They were required to submit journal entries to the instructor on a weekly basis throughout the semester.

Data analysis began as soon as the first journal entries were submitted and was ongoing throughout the duration of the study. A constant comparative analysis was used to analyze the data. Because qualitative research is an emerging process, the data were dynamic and based upon the responses and feedback of the participants. Revisions occurred throughout data collection and/or analysis of this study (Creswell, 2002).

The next step in the analysis was to look at the actual data gathered from the students and begin the process of grouping. We found statements in the students’ journals about how the participants were experiencing the study abroad class and its comparisons to the asynchronous, online work. We then grouped these statements into meaning units. Care was taken to ensure that the original intent of each statement had not been compromised by the meaning(s) derived. The aggregate meanings were then coded (grouped or clustered by theme). Several codes or themes were identified or differentiated. This process led to the need of further clarification or more detailed information, and then more grouping or coding until saturation had been achieved. To validate the themes, they were compared to the original statements to ensure that something significant in the original statements had not been left out in the groupings or that the coding created something not in the original statements.

Using a structural description, we sought to identify all possible meanings and
perspectives to construct a description of how the phenomenon was experienced by the participants. After the data were coded and analyzed, a rich descriptive narrative was written, detailing the participants’ lived experiences (Creswell, 1998).

**Results**

This study strives to give a fuller, richer understanding of what it means to be a nontraditional adult student in the world of asynchronous, online instruction and then placed in a multi-cultural engaged learning environment. We have attempted to discover and present the ways in which the adult student can experience this unique environment.

This research provides a vivid look at the experiences of an asynchronous, online undergraduate course which was highlighted by a study-abroad, engaged learning environment. We believed it essential to understand how this segment of a population of students experienced online and engaged learning because of the growing number of nontraditional students enrolling in degree programs and because of the newness of the online delivery systems. This understanding will enlighten administrators, faculty, course designers and curriculum specialists. Understanding the perceptions, attitudes and experiences of the online students who have an opportunity to apply learning in a real-life, engaged manner may open the door to thousands, if not millions of potential students, who may not be able to pursue education in the traditional manner. Furthermore, since our world has become more global in perspective, understanding how students experience the asynchronous, online learning and culturally diverse laboratory environment may have large impacts in teaching and developing tomorrow’s world leaders.

Two major themes emerged from the data analysis. The first was the emotional impact of witnessing and participating in an actual post-disaster environment. The second theme was the awareness of the cognitive (epistemological) and affective experience of becoming or being an
emergency management specialist (ontological) gained through reflection.

The emotional impact of witnessing and processing the cognitive learning was rich and pervasive in the student learning journals. One student reported the following:

Today my emotions were all over the place!

At 9am we boarded a charter bus and when to downtown Christchurch to see a couple of memorials and what the locals call the Cardboard Cathedral. If you go and look at the disaster photos you will see one with a picture of 185 chairs. Those chairs represent the 185 people who lost their lives in the Feb 2011 quake. I felt the same feeling of loss and reverence when I saw this display as I did when I saw the display of flags Sandy City does on 9/11. Fortunately, that is all there was (fatalities) with so much damage and destruction around (parenthetical comment added).

Another student shared:

The first week in New Zealand has been a rollercoaster of emotions…. As we got into town we headed over to the Christchurch Cathedral and witnessed the sheer destruction that happened to that building. It makes me sad to see how much of the city’s identity was lost or altered. The skyline of the city will never be the same. I can only hope that they make it better. The people of this great city deserve it.

One emotion that was shared throughout the journals was the amazement at how open the people of Christchurch were in sharing their experiences, feelings and lessons learned. The students had many opportunities to speak with the people of Christchurch. This included first-responders, emergency managers, attorneys, university professors, and citizens at large. This seemed to have an emotional impact on the students. For example, a student wrote the following in one of the journal entries:
This morning the Canterbury emergency manager came and spoke with us. I really liked that he was open with us in where they feel they did well and where they lacked. He spoke of several areas where I think we can bring home additional information that could be helpful.

This afternoon's first lecturer was one of the founders of the Student Volunteer Army. That is an organization that began after the Feb 2011 quake that was a grassroots organization of Canterbury University students. The university wasn't nearly as affected as the city just a few kilometers to the east and the school administrators shut all classes down for three weeks. With so much free time one student thought to use social media to organize students to go help out in the community. The amazing thing was is they had no training, no tools, and really not much organization, just a willingness to help. On the first day there was about 100 people that showed up but as the really got some traction they had hundreds of students out in the community. They used social media as a way for people who needed help to let them know and then they just asked students who wanted to go. At one point they had thousands of requests for help with students all over the city.

Attitudes, perspectives, and perceptions were definitely changed by the experience. With all discipline-specific courses taken in an asynchronous, online environment the theoretical or epistemological aspect of learning was not only utilized, but enhanced by the clinical or lab experience. This feeling was pervasive among the students and represented well in the following journal entry.

I have been here for two days already. On the first day I walked into town and I was kind of taken back by how messy the town seemed to be. On the way into town, if someone
did not realize that there had been an earthquake, one would think that it is a poorly maintained area. There are derelict buildings and graffiti all over the place. Yet, knowing that such a disaster had struck, you kind of view it from a different angle. You look at it as a bigger picture. You still see the devastation but you also look to see the restoration that has been accomplished. I can't even imagine where to start with such devastation.

When I finally got to the center and stood at the cathedral, my heart broke a little bit. So much history destroyed. I think that because I have traveled before and have had the opportunity to be in cathedrals and seen their beauty, this made seeing the destruction that much worse. Today, when we went there again, it hit me even harder because I had seen a post card of the way it used to be. Such beauty just gone.

The second grouping or theme that emerged in the data analysis was the awareness of the cognitive (epistemological) and affective experience of becoming or being an emergency management specialist (ontological) gained through reflection. Students began to reflect and apply things learned in the online courses to the situations they were experiencing. Examples of this were frequently interspersed throughout the journal entries and provided a dynamic learning opportunity. One student shared this through her reflection after spending the day touring the destruction and reconstruction of the city.

This week has been quite the learning experience for me in so many ways. As a class, we have learned about the disaster that Christchurch suffered when they were hit with the earthquake of 2011. We have learned about about the preparations they had made and where they failed in those preparations. We learned about the response efforts from the local authorities as well as the efforts by the community. I especially was intrigued by the students of UC and how they band together to form the Student Volunteer Army. It truly
is amazing what individuals will do in the event that they, as a whole, are threatened by disaster.

We also learned about the ways and plans the city is taking to recover from these earthquakes. I think the thing that intrigues me the most is how long it is going to take to complete the recovery phase. It is not as easy as you would think it to be. If I remember correctly, the gentlemen that visited us from CERA stated that it will take roughly 20-25 years before they have completely rebuilt the city of Christchurch. The thing that would scare me the most about that is, “what if another devastating earthquake happens again within that time frame?” It would definitely disrupt their plans for rebuilding and intensify the magnitude of their current situation.

The other aspect of the recovery phase is seeing the intense efforts of those involved in re-establishing this city and how dedicated they are to being absolutely prepared for the next disaster. It is amazing to see so many individuals put so much of their life into ensuring the development and advancement of their Emergency Management so that they are prepared for anything in the future that displaces them in anyway.

I was truly engaged and touched by the experiences of all the people that shared their thoughts with us. We hear and read about disasters all the time around the world. I am sure everyone is the same as me when they think how terrible a situation is for those involved but the reality of being a part of a disaster is unreal. When you physically engage with someone who was part of such a hazard, your feelings are just different. You can actually feel their same feelings that they felt on that day; and that is something that I will always remember and take with me. Being able to actually feel pain and frustration
with these individuals and what they went through was very touching and unforgettable to me. I was also quite touched on their new found love and appreciation for each other and their entire community. It makes me think that I barely know the individuals that live within close proximity to me, and if we would be as resilient as the people in Christchurch when a disaster comes to our area.

As the students reflected on their experience, they began to explore how this information could be utilized in their own lives and/or situations. One area where a lot of discussion took place was the experience and perspectives of the first response communities (fire, police, and emergency medical services). One student response that seems to present this well is the following:

This last week has been a real eye-opener for me. What struck me the most was Steve’s presentation and the relationship he had as a police officer with the public. I have always lamented that communities today don’t view law enforcement officers with the same attitude as they did in *The Andy Griffith Show* and the realization that there is a growing trend of mistrust on both the side of the public and law enforcement agencies. Though I have always felt that law enforcement agencies could contribute so much to the well-being and growth of a community outside of upholding the law, I also always felt it would be impossible to change the attitudes of the public to would view police more favorably. Steve’s presentation, the interaction he demonstrated with the community, and the ideas he put forth proved that such a change in attitudes was possible.

But how is this accomplished? Something that was mentioned is that the community has to feel the police are not around just to monitor their actions and act as big brother. There has to be a feeling of genuine trust and a sense that the police really care. When this
happens I believe the community is more willing to open up and share their concerns. There is a form of collaboration that allows the public to look beyond the blue uniform and view the person. Along with collaborating with the public, law enforcement agencies should collaborate with other departments to ensure the safety of communities. Today Mike and Ian spoke a little more about the responsibilities that police and fire personnel can have in working together to ensure the overall safety of a community. When it comes to community safety and understanding vulnerability and risks, there are several pieces of the puzzle and every agency may be holding key pieces. It is important to stress collaboration among agencies to bring these pieces together to have a clear idea of the whole picture. Only when a whole picture is formed can informed decision be made.

Overall, the experience of being or becoming an emergency manager through a clinical/lab experience is summed up best by the following student’s reflection.

So for me, this was extremely useful to see how it plays out in theory and with real world examples from another agency/person’s perspective. As you see these common theories and concepts repeated in different ways, it helps to understand fully the subject matter’s importance and relevance.

Discussion

This study provided rich and poignant data regarding the non-traditional, adult student and the use of online education enhanced by a cultural and clinical experience. It seemed to reinforce some of the extant literature and educational theories.

One area that seemed to be reinforced by this study is the learning impact of the affective domain of Bloom’s taxonomy.
David Krathwohl, a peer and coresearcher of Benjamin Bloom, has made some notable contributions regarding affective learning to the field of educational psychology. Krathwohl is a co-author of *Taxonomy of Educational Objectives: The Classification of Educational Goal: Handbook I* (Krathwohl et al., 1964), which introduced the widely recognized “Bloom’s Taxonomy.”

Krathwohl’s affective domain taxonomy is a highly recognized and cited source of the affective taxonomies. The affective domain deals in the realm of behaviors and attitudes or personal acceptance of something to the point of making it a part of the person. “The taxonomy is ordered according to the principle of internalization. Internalization refers to the process whereby a person’s affect toward an object passes from a general awareness level to a point where the affect is ‘internalized’ and consistently guides or controls the person’s behavior” (Seels & Glasgow, 1990, p. 28). Affective learning is demonstrated by the behaviors or behavior modification of learners (Krathwohl et al., 1964). This is shown by demonstration of attitudes of awareness, interest, concern, attention, responsibility, the ability to listen and respond appropriately, and the ability to demonstrate characteristics of appropriate values. Hence, Krathwohl and colleagues asserted an ordered taxonomy for the affective domain,

1. Receiving—being aware of or sensitive to the existence of ideas, material, or phenomena and being willing to tolerate them.

2. Responding—committed in some small measure to the ideas, materials, or phenomena by actively responding to them.

3. Valuing—willing to be perceived by others as valuing certain ideas, materials, or phenomena.
4. Organization—relating the value to those already held and bringing it into a harmonious and internally consistent philosophy.

5. Characterization by value or value set—acting consistently in accordance with the values he or she has internalized (p. 37) (Maxfield, 2008).

Another area mentioned earlier in the review of literature is reflective learning. As mentioned previously in this article, the Jarvis model of reflection was an area that was verified by this study. When applied to this model the results indicate that some deep learning took place with these students. Throughout the study, the students reported their use of reflective practice. Through reflections they claimed to have had a deeper, and potentially better learning experience. While it is difficult to determine if they reached the experimentation stage of the Jarvis model or not (it was reported by the students, however, that they were applying some of the learned principles to their work situations) it is apparent that they were reflective and contemplative in their approach to this clinical experience. Based on their experiences and perceptions, the students claimed they had internalized significant amounts of knowledge and/or skills from this study abroad and post-disaster interaction. We believe, and the study results seem to demonstrate this occurred through reflective practice, which is the basis of Jarvis’ theory.

Jarvis believed that there are three possible ways that a person is affected or changed through the learning process: (a) the person is changed through the acquisition of knowledge mentally and emotionally, (b) the person places new meaning on the world and events by incidental or purposeful learning, and (c) the person is changed and able to cope or deal with similar situation which may occur due to the learning that has taken place (Merriam et al., 2007). When comparing the results experienced by the students in this study to Jarvis’ model, we these students changed and will now be able to cope or to handle similar situations better because of
their experience with this course and supports Jarvis’ theory.

A third area mentioned that seem to be reinforced was social constructivism. One could argue that these experiences supported both Piaget’s developmental learning theory and Vygotsky’s social development theory at the same time. Piaget’s theory suggests that the key to growth and maturity of the student is through a twofold process of accommodation of existing cognitive structures and assimilation or interpretation of environmental events based on existing cognitive structures. The students of this study were basically allowed to construct their own learning through some semi-guided instructional activities and through dialog with other students and/or the instructor(s) or community members of Christchurch, New Zealand. They were not given specific structures to follow and were allowed to assimilate and use what they constructed in their written, reflective journals.

Vygotsky’s social development theory suggests that all learning takes place in a social environment and that the learner is gaining knowledge through the social structure or interaction with the social environment. Social constructivist theory has promulgated the idea with some, that distance education is inferior because effective learning needs to be situated in activity, context, and culture or a community of practice.

In some of his later works, Vygotsky developed the theory of the Zone of Proximal Development (ZPD), which is defined as the distance between the actual developmental level and the level of potential development, through problem solving, under guidance of an instructor or more capable peer (Marsh, 2005). Basically, Vygotsky asserts that learning is a social function and can be enhanced when a mentor, whether a teacher or a more knowledgeable and/or skillful peer provides some explanatory instruction. The students of this study experienced social learning through peer discussions, interaction and communication with survivors of the major
earthquakes of Christchurch, and instructor(s) guided feedback. There was much evidence in the journal entries that social learning was facilitated through the student-to-student interactions, interactions with instructors, interactions with responders and interactions with the citizens of the community. Therefore, learning was enhanced through social interaction.

Conclusions

Based on the results of this study, we believe that asynchronous, online learning environments (epistemological) combined with experiential learning (ontological) have the potential to be an important and effective method of educating students, particularly with respect to the increasing use of the Internet and online programs. We believe this to be especially true for the nontraditional adult student, a growing demographic in higher education. However, the experiences of these students were somewhat narrow (within the confines of one class in an entire program). There is no way of knowing if the students had experienced different teachers, different peers, different course design or a different locale that the results would be the same. This is one of the limitations of this (or for that matter, much other) research. That being said, the experiences of these nontraditional adult students in an online learning environment gave a view in time, a particular slice of the human experience, to enrich our understanding. For this reason, the study had relevance.

We believe that more care and concern for the design and use of pedagogies and/or adult learning models can enhance the experiences and learning of the adult online student. This may require the instructors and designers of curricula to be more aware of the experiences and perceptions of the students. We believe this based on our research and the results of this study regarding affective learning. As Krathwohl and colleagues (1964) asserted, the affective domain can be very effective in helping achieve the desired outcomes of the cognitive domain. If
students are having an untoward time in their learning experience, they may do what is necessary to pass the course, but has learning in its truest sense been accomplished? We will leave this to the opinions and conclusions of the reader. However, the definition of learning we feel relevant is best described by, “a persisting change in human performance or performance potential. This means that learners are capable of actions they could not perform before learning occurred and this is true whether or not they actually have an opportunity to exhibit the newly acquired performance” (Driscoll, 2005, p. 9).

This study provided a deeper look at the experiences and perceptions of an important demographic of higher education, the non-traditional adult student. Understanding the lived experiences of non-traditional adult students provides us with a unique and important look at humanity. By using this experience as a means of understanding and learning, current and future students may be able to develop individual and useful learning schemas. Curriculum designers and instructors may also be able to use these experiences to develop methodologies to better facilitate learning, which enlightens and adds to the unique experience of being human.

How does the Theory of Knowledge course in the International Baccalaureate Diploma Programme sit in a rapidly changing world?

Manuel Condoleon¹

Abstract

Globalisation and the various social, political and environmental challenges it exerts has placed schools at the forefront in responding to these challenges, given their role in fostering the competencies in students to not only understand these global challenges, but to potentially act upon them as well. The pivotal role of schools is especially heightened by the increasing presence of transnational institutions as key stakeholders in education. This in turn has naturally given rise to the questions of what should be taught in schools and how it should be taught in this global age? How these question are answered will ultimately determine whether globalisation will transform the role of the educator in an incremental or radical way. Given the growth of the International Baccalaureate in primary and secondary schools around the world, it is this context that will provide a useful backdrop in examining how education is transformed by globalisation. More specifically, focus will be on the Theory of Knowledge (TOK) course in the International Baccalaureate Diploma Programme and where it sits in a rapidly changing world. This is a core component of the programme and the only compulsory subject studied by students which shares the aim of fostering international-mindedness and the ultimate goal of developing responsible global citizens. Drawing from the scholarly work of global theorists, it will be argued that the most profound impact on education as a result of globalisation is in the very purpose of schooling, namely in the stronger moral purpose given to schools. This in turn has triggered a major rethink regarding the roles of both teachers and students; from roles that were predominantly egocentric to ones that foster collective action.

¹ PhD student at the University of Sydney, Australia
Despite the ongoing polarized debates in how the phenomenon of globalisation should be conceptualised, only but a few scholars would deny the very existence of this phenomenon and the social, political and environmental pressures and challenges it exerts in this global age. At the very forefront in responding to these challenges are schools given their role in fostering the competencies in students necessary to not only understand these global challenges, but to potentially act upon them as well. The pivotal role of schools is especially heightened by the increasing presence of transnational institutions as key stakeholders in education. This in turn has naturally given rise to the questions of what should be taught in schools and how it should be taught in this global age? How these questions are answered will ultimately determine whether globalisation will transform the role of the educator in an incremental or radical way. Given the growth of the International Baccalaureate in primary and secondary schools around the world, it is this context that will provide a useful backdrop in examining how education is transformed by globalisation. More specifically, focus will be on the Theory of Knowledge (TOK) course in the International Baccalaureate Diploma Programme and where it sits in a rapidly changing world. This is a core component of the programme and the only compulsory subject studied by students which shares the aim of fostering international-mindedness and developing responsible global citizens.

Drawing from the scholarly work of global theorists, it will be argued that the most profound impact on education as a result of globalisation is in the very purpose of schooling, namely in the stronger moral purpose given to schools. This in turn has triggered a major shift in the roles of both teachers and students; from roles that were predominantly egocentric to ones that foster collective action.

Although many scholars refer to the lack of consensus in how globalization is conceptualized (Bulut et al., 2010, p.149; Pieterse, 2015, p.5; Sklair, 1999, p. 143), there does appear to be a common focus in examining the roles played by transnational institutions and nation-states in this global age. Global theorists such as Sklair (1999) and Rizvi (2004), for example, may disagree as to whether primacy should be given to transnational institutions or nation-states in addressing contemporary economic, political and social problems, however what remains quintessential in both camps is that both transnational institutions and nation-states are key stakeholders in education. The former is evident with the increasing involvement of the World Bank (Reimers, 2006, p.291) and the OECD (Carnoy, 2014, p.25) within the educational sphere as both see education as a key sector contributing to economic growth. The latter evident from the increasing pressure on nation states to improve the quality of education (Carnoy, 2014, p.21) as applied by these transnational institutions. In fact, it can be argued that what is being witnessed is a dialectic tension between the economic and political dimensions of globalization. Although nation-states may have lost some of their authority to economic forces such as transnational institutions in accordance with Sklair’s study on globalisation (1999, p.145-6), nation-states have re-emerged as a key force by promoting quality education to sustain economic growth (Rizvi, 2004, p.162). Ozga & Lingard (2014, p.66) add further light to this dialectic tension by stating that nation-states remain an important political force in education, but now work “in different ways”.

Irrespective, therefore, of how globalisation is conceptualised in terms of main actors, schools appear to be placed at the forefront in responding to the various economic, political, social and environmental challenges of this global age. Reimers (2006, p.276)
explains the reason for this by claiming that schools “have greater potential to be aligned with transnational efforts” as they are “globally public spaces” where both transnational and national institutions can mobilize resources to actively intervene as opposed to the “private spaces” that characterise other institutions such as workplaces, media, religious and political institutions. Schools are considered key arenas in which the competencies of future citizens can be developed to potentially bring forth peaceful resolutions to political and cultural conflicts; to address economic challenges such as the competition for natural resources; and to consider alternatives that will reduce the damage caused to the ecosystem by human-environmental interactions (Reimers, 2006, p.277).

Accepting the pivotal role that schools can play, attention turns to the competencies that need to be fostered in schools to not only understand the new global challenges, but to act upon them as well. Apple (2011, p.226) makes a compelling argument for the dismissal of neo-liberal economic doctrines of efficiency and performance advanced by transnational institutions such as the World Bank for not only have they failed to address adequately the various challenges of this global age, they appear to have actually exacerbated them as exemplified by the growing number of urbanites now living in slums around the world. Instead, Apple (2011, p.229) argues that future or current teachers need to think as “rigorously and critically as possible about the relations between the policies and practices that are taken for granted in education and the larger sets of dominant national and international economic, political, and cultural relations” and then connect this to action. This idea of the “critical” and “activist” teacher is also strongly supported by Reimers (2006, p. 276) who advocates for the “development of skills to promote rationality in deliberation and action.” This call for greater critical thinking and action in education systems provides an interesting backdrop to examine the emergence of the International Baccalaureate (IB) as a global phenomenon in education.

The IB is a not-for-profit educational foundation that offers primary and secondary school programmes for a worldwide community of schools. It was founded in 1968 and by 2015 its programmes were adopted by 3968 schools in 147 countries and taught to over 1,228,000 students (IBO, 2015). The phenomenal growth of the IB is evident when one makes a simple comparison six years ago where the IB was taught in 2822 schools in 138 countries with over 757,000 students (Bagnall, 2010, p.5). Carnoy’s definition of globalisation (2014, p.22) as not only the “unregulated movement of finance capital” but also “the increased movement of innovative ideas”, provides a useful economic lens in which to explain the growth of the IB. The IB as an “innovative idea” is evident in its mission statement where it aspires to “develop inquiring, knowledgeable and caring young people who help to create a better and more peaceful world through intercultural understanding and respect” (IBO, 2013). It is also evident in the structure of its Diploma Programme2 which demands the compulsory study of second languages, humanities, literature, mathematics and sciences. This is in contrast to most pre-university courses around the world where such compulsory elements are not evident. Although it can be argued that this tailors to the neo-liberal economic doctrines of efficiency and performance by catering to what Carnoy (2014, p.22) describes as the worldwide economic “demand for certain kinds of skills – namely language,

2 The IB offers four programs: Primary Years Programme (PYP); Middle Years Programme (MYP); Diploma Programme (DP) and Career-related programme (CP). The DP is a two year pre-university course for students in the 16 to 19 age range and TOK is a compulsory course of the DP.
mathematics reasoning, scientific logic, and programming”, this argument would be too simplistic, especially when one examines another compulsory component of the IB Diploma, the critical thinking course named ‘Theory of Knowledge’.

Essentially, the ‘Theory of Knowledge’ course (TOK) is concerned with discussing what is commonly termed as ‘knowledge questions’. Knowledge questions tend to focus on how knowledge is constructed and evaluated; are open and contestable; and usually have a number of plausible answers to them (IBO, 2013, p. 20). The most central of these questions is “how do we know that?”(IBO, 2013, p.10). More specifically, the course attempts to contrast what we mean when we say we ‘know’ something in the Sciences for example, with ‘knowing’ in History or Ethics or the Arts or Mathematics, as well as other areas of knowledge (Weatherell, 2003, p.7). Students are often required to make links across different ways of knowing (such as reason, emotion, language, sense perception) and areas of knowledge (such as mathematics, sciences, humanities, literature, arts), hence promoting interdisciplinary learning (Cole, Gannon, Ullman, Rooney, 2014, p.5). Examples of knowledge questions drawn from various recent IB documents (IBO, 2013, pp.35-49; 2013b; 2014, p.8; 2014b) include:

- How do human scientist decide between competing knowledge claims, or between the views of experts, when they disagree?
- To what extent might lack of knowledge be an excuse for unethical conduct?
- Given the problems associated with the inductive process (going from the particular to the general), how is it that science can be reliable?
- Is it possible for historical writing to be free from perspective?
- Ethical judgements limit the methods available in the production of knowledge in both the arts and the natural sciences. Discuss.
- What elements of universal significance may we discern in indigenous knowledge systems?
- Are religious beliefs reasonable?
- “There is no reason why we cannot link facts and theories across disciplines and create a common groundwork of explanation.” To what extent do you agree with this statement?

The importance of developing students’ critical thinking skills is seen as an imperative by many scholars of globalisation if current and future generations are to have the competencies in effectively responding to the economic, political, social and environmental challenges of this global age (Apple, 2011, p. 229; Bulut et al, 2010, 150; Osler, 2011, p.15; Reimers,2006, p.276). This idea resonates strongly with ‘global society’ theorists who attribute great significance to ideas like global awareness and planetary consciousness in their general conception of globalisation (Sklair, 1999, p. 154). The Theory of Knowledge course takes centre stage in the IB for developing such an awareness and consciousness in
students as espoused by these globalisation theorists, namely through the critical examination of cross-disciplinary knowledge questions as exemplified above. The most recent guide provided by the IB to TOK teachers explicitly makes this connection between the nature of the course to the prevailing global environment:

“The TOK classroom invites a unique partnership of learning, for global controversies often rest on significant knowledge questions that can provide useful starting points for TOK explorations and TOK, in turn, can contribute significantly to the understanding of these large questions. The IB vision of internationally minded individuals implies a global engagement, embodying a commitment to address these 21st century challenges. TOK exists at the very core of the quest, as we strive toward an enlightened and fulfilled humanity.” (IBO, 2013, p.15)

This idea of teachers and students developing a “unique partnership of learning” for “global engagement” provides a useful insight as to how education is being transformed by globalisation. Globalisation is transforming education by putting to question and potentially changing the very purpose of schooling. Reimers (2006, p.288) sheds light on this by forwarding the argument that schools are “relatively recent institutions in human history” and “have been guided at different times by different purposes”, such as building national identity, improving economic competitiveness and educating for local relevance. With the increased pace of globalisation and the new challenges it presents, a new competing purpose has emerged, namely the moral purpose of schools.

“Education purposes must include clear moral purposes and those should be aligned with universally accepted values and standards, informed by different philosophical and cultural traditions, but which provide clear guidance with regards to standards of fairness, the rights of individuals and with regard to accepting and addressing differences among individuals and cultural groups.” (Reimers, 2006, p.280)

This change in purpose has the potential to transform the role of educators in a profound way. Referring back to TOK’s aim of creating a “unique partnership of learning” for “global engagement” (IBO, 2013, p.15), it can be argued that how this is interpreted by educators will ultimately lead to either an incremental or radical transformation of their role. Smith and Morgan (2010, p.299) through their discourse analysis of the 2006 TOK guide, identified two competing constructions of TOK. To inform their research, they applied the theory of Miller and Seller which essentially categorises the varying roles of educators through a tripartite model of curriculum orientations: a transmission orientation; a transaction orientation and a transformation orientation (Smith & Morgan, 2010, p.301). The ‘transmission orientation’ refers to the more didactic pedagogical style where school subjects are broken down and students are expected to learn facts and concepts to achieve proficiency or mastery. This is in contrast to the ‘transaction orientation’ where the emphasis is not content but skills such as critical thinking and problem-solving through inquiry-based learning. Finally, ‘transformation orientation’ assumes an interdependence among disciplines where learning focuses on “integrating physical, cognitive, affective and spiritual dimensions” with the aims of self-actualisation, self-transcendence and active social involvement.

Based on this tripartite model, Smith and Morgan dismiss the teacher-centred transmission
orientation for TOK focuses on knowledge questions and is not a content prescriptive course. The remaining two orientations, however, dominate and serve different purposes, thus positioning teachers and students in different ways. The transaction orientation is labelled ‘TOK-as-developmental-facilitator’. Here teachers facilitate the development of inquiry skills. The “unique partnership of learning” for “global engagement” is more of an ‘intellectual’ interpretation and construction of the TOK course, where teachers and students work together predominantly through dialogue and jointly develop critical thinking skills. On the other hand, the transformational orientation is labelled ‘TOK-as-hero’ where the construction of TOK is ‘political’ and is seen as an agent of transformational change with the political goals of producing global citizens to create a “better and more peaceful world” (IBO, 2013). This, Smith and Morgan argue, requires teachers to “get in touch with their ‘inner life’ and ... help students with the process of ‘being and becoming’” (Smith & Morgan, 2010, p.308).

Although the transaction orientation does not appear to change the role of the educator as profoundly as the transformation orientation, it nevertheless does involve some incremental change, especially if it is to lead to successful “global engagement” as stated in the aims of the TOK course. Apple (2011, p.229), for example, argues that educators need to ask different questions such as: “Whose knowledge is this? How did it become official?”. Reimers (2006, p.284) takes Apple’s argument further by proposing that the role of the educator should not only be limited to asking different questions and making sense of them, but to make sense in a way that leads to “productive and peaceful cross-cultural dialogue”.

Posing different questions and promoting a more cross-cultural dialogue to enhance the global engagement of students will mean a more overt change in the role of educators - from the egocentric pedagogy of developing an individual student’s critical thinking skills to a pedagogy that promotes a more collective and shared experience. An even more radical change in the role of educators, however, would be to go beyond tackling “different questions” through collective dialogue to tackling “different questions” through collective action. This aligns strongly with the transformation orientation where self-transcendence and active social involvement are the key competencies that educators need to develop in students and is compatible with the viewpoints of many scholars regardless whether their research focused narrowly on TOK or had the broader focus of globalization in education (Apple, 2011; Camicia & Franklin, 2011; Darwish, 2009; Osler, 2011; Reimers, 2006; Robertson, 2006; Smith & Morgan, 2010).

In conclusion, although the aforementioned pivotal role that educators find themselves in is largely due to impersonal forces, ironically it is their personal choices that are likely to have major implications in how global economic, political, social and environmental challenges are addressed. For many research scholars of TOK specifically and global education in general, the importance of educators adopting a more transformative orientation in their roles is a straightforward choice. For the adoption is not only important in promoting global engagement and providing schools with a stronger moral purpose, but also as many global society theorists (Sklair, 1999, p.156) emphatically claim, essential for “survival”.

Decay Rate and Spacing Effect Algorithm for the Learning of Foreign Languages

Topic Area: Language Education

Presentation Format: Paper Session

Description: Retention of information is very important in learning any subject. This cannot be more important than in learning foreign languages because of the large vocabulary required to be proficient in the language. This research developed an algorithm that incorporates research in learning retention. The learning Decay Rate and Spacing Effect are incorporated into this algorithm to maximize retention of information.

Decay Rate and Spacing Effect Algorithm for the Learning of Foreign Languages

Michael J. Pelosi, Michael Scott Brown, Mir Mohammed Assadullah
University of Maryland University College

Abstract. Retention of information is very important in learning any subject. This cannot be more important than in learning foreign languages because of the large vocabulary required to be proficient in the language. This research developed an algorithm that incorporates research in learning retention. The learning Decay Rate and Spacing Effect are incorporated into this algorithm to maximize retention of information.

I. Introduction

The learning of foreign languages can be very difficult, which requires a great amount of memorization. This justifies investigations into new learning models and algorithms to assist in the learning of foreign languages. This research creates a learning algorithm to assist with the memorization of foreign words using the combination of two well-documented empirical observations about learning. These observations model decay-rate of learning and how the spacing of learning episodes improves memorization.

There exists a research opportunity in making an effort to objectify these effects in greater detail and exploit them for maximum learning gain through the use of optimized learning algorithms in conjunction with artificial intelligence. Simply put, students might be able to learn faster during training, retain more knowledge, and perform these training tasks with less effort and more predictability of outcome. In addition, the schools may be put in position to better quantify individual maximum learning rates for candidate selection and promotion through better understanding and measurement of these learning effects and retention results for individuals.
II. Literature Review

Despite over 100 years of research into learning and retention processes, surprisingly little is known. The material that is known and available does not easily lend itself to quantitative models. However, two well-known quantitative effects have been repeatedly empirically observed and reported on in great detail over the many decades: 1) the “decay-rate” effect of learning memory retention, and 2) the “spacing effect” of repeated exposures to the same information that was attempted to be learned. The decay rate effect has been observed to show that the probability that a previously learned to memory item can be correctly recalled decays at an exponential rate over time, similarly to the curve exhibited for radioactive decay. The spacing effect has been observed to show that repeated exposures to the same information boosts future retention probability substantially, and reduces the retention decay rate. Further, the spacing effect also indicates that given two or more learning sessions of the same item, individuals will remember more when the sessions are spaced at larger intervals, regardless of whether the interval is seconds, minutes, hours, weeks, or years. The longer the time gap, or spacing, between sessions, the better the effect for memory retention. For experimentally measured results and worthwhile discussions of these effects see Bahrick (1987 and 1993), Cepeda (2008 and 2009), Goverover (2009), Pavlik (2003 and 2008), and Rohrer (2010).

2.1 Decay Rate

Much research has been done in developing equations for the rate at which people forget information. This empirical research shows that how people forget is a power function (Anderson & Schooler, 1991; Wickelgren, 1974; Wixted & Ebbesen, 1991). There is some variation based upon the information being words, faces and nonsensical syllables. But the power function best describes this rate.

Wickelgren in 1974 developed equation 1 to show the decay-rate of information within people.

\[ m = \lambda (1 + \beta t)^{-\psi} \]  

(1)
In this equation $m$ is the memory strength and $t$ is time, which is the retention interval. There are three parameters to the equation. The parameter $\lambda$ is the state of long-term memory. The parameter $\Psi$ is the rate of forgetting and $\beta$ is the scaling parameter.

Future research by Wixted (2004) confirmed Wicklegren's equation and generalized it to equation 2.

$$m = \theta t^{-\Psi}$$ (2)

Figure 1 shows equation 2 with $\Psi = 1.286$.

2.2 Spacing Effect

The Spacing Effect addresses the amount of time between learning episodes that will maximize information retention. Research indicates that individuals will remember information proportion to the time between learning episodes. A number of researchers have confirmed this (Bahrick, 1987; Bahrick, 1993; Cepeda, 2008; Cepeda, 2009; Pavlik, 2003; Pavlik, 2008; Rohrer, 2010).

For example, if an individual has two learning sessions to learn some information, ideally we would want the time between sessions to be as large as possible. Of course, there are some time
constraints; at some time the individual will be evaluated on the information. But the long the time between sessions will produce better learning results and allow the individual to retain the information better.

III. Methodology

This methodology will create an algorithm to manage training episodes that incorporate research pertaining to the decay rate effect and spacing effect. For each individual the algorithm will determine the learning parameters (rates) that are the best for that individual. Once these rates have been reduced to empirically fitted equations able to predict future performance with a reasonable degree of accuracy, payoff algorithms can be designed and implemented to maximize learning and retention rates by presenting new information and reinforcing older information in the most advantageous programmatic sequences possible. The overall goal is to maximize the retention rate of the entire body of knowledge at a nominally or explicitly defined future date in time.

Foreign language vocabulary pairs have provided an excellent testbed for research on learning and retention. For each foreign word presented, the subject must correctly identify the correct English word translation in a multiple choice test format. Once a new word is “learned” it can be subsequently presented both as a spacing reinforcement and as a test of retention. Over thousands of new and repeated word learnings and testings, using various time spacings, both curve-fitted equations and their coefficients can be derived using standard mathematical methods. These curve-fitted equations would characterize both the decay rate and spacing effect linearities. The variance of the coefficients between individuals, and how these coefficients vary over time, could possibly be measured and characterized. Default equation coefficient values might also be able to be estimated for the general training population.

At this stage learning payoff optimization would be considered. To increase learning payoff, it is helpful if a value can be assigned to individual learning items that is a measure of how desirable it is to have an excellent retention probability of that specific item. For example, in the English language, only 1,000 vocabulary words constitute approximately 84% of the spoken language. The first 100 of these words comprise 40-50% of this. It is of far greater utility to learn the article “the” than the noun
“porcupine”. For vocabulary, learning utility values can be assigned based on the commonly available word frequency lists. Instructors would assign payoffs as needed on specific learning items in learning and testing software databases.

As a result of the above consideration, learning payoffs for the introduction of new, or the repetitions of previously learned items, could be calculated as the value of the boost in retention relative to the required additional learning and testing time. The designed algorithm would, at each new question step, present the learning item likely to produce the highest learning versus training time payoff. Considering current computer processing power, any derived algorithm could most likely consider every training list item and calculate the likely payoff associated with it at every question step.

Finally, the benefits of the final conceived algorithmic method of learning could be compared to the results from a control group of subjects learning the same body of knowledge in the same amount of time using standard methods. This would allow a comparison estimate to quantify the measurable benefits of using the technique.

IV. Current Prototype Learning Reinforcement Software

A fully-functional prototype software program has been created that implements the concepts and methods previously discussed. Shown below in Figure 1 is a screen shot of this program that contains translations of the 10,000 most common English words into 58 other languages. The database of words also contains the frequency of each word in English. Learning specific words has a specific "payoff" associated with the retention of each word. The subject is presented with the English word and is offered 4 multiple-choice answers in their native language. They learn new words and are tested/reinforced on each word using the software through the process.
Figure 2. Prototype Learning Reinforcement Software: ESL Vocabulary Trainer.

The software attempts to present each subsequent word based on a tentative payoff equation. Tentative equations and coefficients for the decay and spacing effect are implemented that can be changed over time owing to the individual learning quality and rate, in order to present the most optimal word question choice. Learning coefficients are anticipated to be different for each individual, therefore being able to have the software automatically update coefficients for individual's training at periodic intervals is seen to be desirable. Levenberg-Marquardt nonlinear regression is built into this software for equation parameter coefficient determination. Timestamped records of all words presented, as well subject answers and the time required to answer each question, are stored to a database for later retrieval and analysis.

Upon completion of the proposed research, the final uncopyrighted version of this software would be made available to the Army Research Laboratory for further analysis and research. The software will be capable of customized instructional design. Staff will be able to input their own questions and answers, including visual recognition and sound information, in any subject matter area. Further improvements and customization under ARL direction would be possible.

Addressing ADHD with UDL Interventions

Dr. Valerie Zelenka, Department of Teacher Education, College of Education, Fort Hays State University, Hays, Kansas, 67601  vlzelenka@fhsu.edu

Abstract

In the United States, approximately 11% of children 4-17 years of age (6.4 million) had a diagnosis of Attention-Deficit/Hyperactivity Disorder (ADHD) in 2012 and current research suggests that rates are on the increase. Due to this prevalence, teachers will come into contact with students with ADHD. Therefore, it is imperative that teachers know about effective class-wide interventions for students with ADHD.

The characteristics of ADHD include persistent inattention or hyperactivity-impulsivity that negatively impacts academic functioning (American Psychiatric Association, 2013). There are three subtypes of ADHD: predominately inattentive, predominately hyperactive-impulsive, and combined. Students identified as predominately inattentive type may experience difficulties in paying attention, listening when someone speaks, finishing tasks, avoiding distractions, and following instructions. Students who experience difficulties in keeping hands and feet still, staying seated, and frequently interrupt others are identified as predominately hyperactive-impulsive type. Students who have features of both inattention and hyperactive-impulsivity are identified as a combined type.

Recent studies have revealed that many students occasionally display symptoms of ADHD. Additionally, the symptoms of ADHD occur on a continuum of risk, and therefore teachers may have students with undiagnosed, but moderate, signs of ADHD. For this reason, class-wide interventions can be more efficient than individualized interventions because they benefit the performance of all the students. Additionally, a class-wide application allows the individual student to remain anonymous, since only the teacher knows which student’s behavior prompted the intervention. Unfortunately, new teachers may not be familiar with effective class-wide interventions for ADHD.

Key words: Universal Design for Learning (UDL), Attention-Deficit/ Hyperactivity Disorder (ADHD)
Getting Close, Letting Go: Service-Learning for Preservice Teachers at a Homeless Shelter

Dr. Valerie Zelenka, Department of Teacher Education, College of Education, Fort Hays State University, Hays, Kansas, 67601  vlzelenka@fhsu.edu

Abstract

Each night in the United States, approximately 1.5 million children do not have a home to call their own. In the past few years, the number of children and families experiencing homelessness and extreme poverty has increased significantly across the nation. For homeless children, residence instability, frequent school changes, excessive absenteeism, and transportation issues present major educational challenges beyond those experienced by housed peers. Approximately 75% of U.S. homeless children performed below grade level in reading and teachers may not have the necessary experience, attitudes, and beliefs to teach these students, thereby further delaying their academic achievement.

Subsequently, teachers can have a profound and positive effect on both the daily lives and the futures of homeless children. Teachers’ perceptions—positive or negative—influence their interactions with children and their families and can have dramatic and long-lasting effects on the lives of the homeless children. Frequently, teachers’ perceptions about homelessness—student abilities and the importance parents place on education—are based on experience. In most cases, negative perceptions—influenced by stereotypical images (e.g. homeless children being low functioning and having behavior problems and parents being lazy and irresponsible)—are the direct result of lack of experience working with homeless families. However, when pre-service teachers have the opportunity to work with homeless children and their families during a university-supervised and mentored internship, they develop the necessary skills, attitudes, and beliefs to teach homeless children.

Thus, teacher education programs should provide preservice teachers with coursework in specialized academic interventions, an authentic field experience, and a supportive university mentorship so they can develop specialized skills and optimistic perceptions of children and families who face homelessness and extreme hardship. This presentation showcases how the perceptions of elementary education preservice teachers were transformed after enrolling in literacy tutoring internships for kindergarten through fifth grade students at a homeless shelter.

6. Abstract of presentation

   ABSTRACT

   Using Technology to Assist with Reading Learning Differences

   Teachers need to integrate new technologies into their repertoire of teaching strategies for
   struggling readers, English learners, and dyslexic learners within the regular classroom.
   Technology in reading instruction presented will include digital tools for word recognition,
   digital tools for fluency, and digital tools for comprehension. Specifically, e-books sites with
   text-to-speech (TTS), resources for teaching vocabulary strategies, internet dictionaries,
   electronic children’s magazines, and web-based tools that help students better understand will
   be shared. Additional resources for the dyslexic students will be presented such as the voice
   activated software which allows the student to speak and then the computer types what is
   spoken. Participants will be encouraged to bring their computers to experience some of these
   sites. The author will end by sharing the importance of educators to keep learning in
   preparation for future technological changes.

Abstract

This paper reappraises the role of the Black Panther Party in the development of the Black Studies Movement at Merritt College and San Francisco State University from 1966 to 1971. It examines the emergence of the Black Studies Movement at Merritt College and San Francisco State University. This paper also identifies Black Panthers who helped to develop the original Afro-American Studies Department at Merritt College and the original Black Studies Department at San Francisco State University. In addition, it examines the role of The Black Panther in fomenting the Black Studies Movement from the 1967 to 1971 period as well as some implications of the research.

Introduction

Standing on the shoulders of previous generations, many young Black college students in the United States of America (USA) during the 1960s proceeded to demand an education that they considered to be relevant to their heritage. The demands surfaced at predominately White colleges as well as predominately Black colleges. As a reaction to those demands, colleges began to approve courses, programs, and departments with an emphasis on Black studies. Instead of coming from above, the push for this new curricula came from below (Crouchett, 1973; Haro, 1979; Cromartie, 1993).

Between 1960 and 1971, Black social movements were developed or retooled to meet the needs of Black college students and the larger Black community. In turn, those Black social movements played a dynamic role in the fight for social justice as defined by leaders like Stokely Carmichael, H. Rap Brown, Max Stanford, Huey P. Newton, Bobby Seale, George Mason Murray, Jimmy Garrett, and Maulana Karenga. Their organizations included SNCC (Students Nonviolent Coordinating Committee), RAM (Revolutionary Action Movement), CORE (Congress for Racial Equality), Afro-American Association, Us Organization, House of Umoja, and the Black Panther Party for Self-Defense (Seale, 1970; Newton, 1973; Karenga, 1993;
In the case of the Black Panther Party led by Newton and Seale, its members were directly involved in the fight for courses, programs, and departments with an emphasis on Black studies at Merritt College and San Francisco State. It was at those two campuses wherein Black college students first succeeded with their demands to get full-fledged departments. To gain those victories, members of the Black Panther Party used Black nationalism and sometimes formed coalitions with non-Black groups to put pressure on administrators at Merritt College and San Francisco State. The Black Panther Party also played a major role in the development of Black Student Union organizations in colleges throughout California and elsewhere (Seale, 1970; Newton, 1973; Akinsanya Kambon, personal communication, April 10, 2016).

This paper will reappraise the role of the Black Panther Party in the development of the Black Studies Movement at Merritt College and San Francisco State University from 1966 to 1971. It will examine the emergence of the Black Studies Movement at Merritt College and San Francisco State University. This paper will also identify Black Panthers who helped to develop the original Afro-American Studies Department at Merritt College and the original Black Studies Department at San Francisco State University. In addition, it will examine the role of *The Black Panther* in fomenting the Black Studies Movement from the 1967 to 1971 period as well as some implications of the research. This paper, in terms of research methodology, makes use of a mixed methods approach consisting of a qualitative survey and a case study.

**The Black Studies Movement, Black Panthers, and *The Black Panther***

From 1959 to 1966, Huey P. Newton and Bobby Seale were students of Merritt College. While attending that institution, Newton and Seale became deeply engrossed in matters related to curriculum and instruction. On the one hand, Newton and Seale wanted the curriculum to have courses that covered the Black experience. On the other hand, they wanted the institution to hire more Black faculty members and administrators. To address those two concerns, Newton and Seale became members of the Soul Students Advisory Committee at Merritt College. That student organization was the forerunner of what later became the Black Student Union. During their stints at Merritt College, Newton and Seale were members of the Soul Students Advisory Committee which led the fight for a Black history course and a Black Studies Department. Hence, they were both involved with the Black Studies Movement when it first emerged (Seale, 1970; Newton, 1973).

After Newton and Seale became disenchanted with some of the practices of the Soul Students Advisory Committee, they left it and formed the Black Panther Party. As a new organization which emerged in October 1966, the Black Panther Party sought members from Merritt College as well as the “streets.” To remain close to the college scene, Newton and Seale opened the first office of the Black Panther Party in Oakland at 5622 Street (as Martin Luther King Boulevard was then known), which was only one block from the original campus of Merritt College. They also used their new organization to continue to participate in the Black Studies Movement (Seale, 1970; Newton, 1973).

For the Black Panther Party, the Black Studies Movement was an important development in educational institutions. Both before and after the founding of the Black Panther Party, members of the organization were deeply involved in the efforts to establish Black studies courses,
programs, and departments. The two founders of the organization encouraged members of the Black Panther Party to advocate for the Black Studies Movement and other areas of education. When the Black Panther Party created its Ten-Point Platform and Program, education was the subject of one. Point number five stated that, “We want education for our people that exposes the true nature of this decadent American society. We want education that teaches us our true history and our role in the present-day society.” The organization made it clear that education was valued by its leadership from the outset. The organization also made it clear that education should shed light on the truth and teach people to use a critical analysis approach to look at social conditions in a given society (Newton, 1972, 1973; Seale, 1970).

From 1967 to 1971 and beyond, the Black Panther Party used the official organ, The Black Panther, to support the Black Studies Movement. It also took the position the Black Studies Movement could be a major factor in exposing the true nature of the USA. Likewise, the organization used The Black Panther to promote the notion that the Black Studies Movement could be a major factor in teaching students their true history and their roles in society. Thus, the Black Panther Party took the position that its members should participate in the Black Studies Movement. It also took the position that its newspaper should promote the agenda of the Black Studies Movement (“Black Curriculum,” 1967).5

As The Black Panther progressed, between 1967 and 1971, it continued to carry reports on the effort to establish a Black Studies Department and other activities at Merritt College as well as San Francisco State (Black Liberation Publishers, 1968a, 1968b; Fleming, 1969; Hilliard, 1969a; Crumby, 1969; “Third World Colleges,” 1969; San Francisco State Black Students Union, 1969; Merritt College Strikes, 1971).5 When San Francisco State staged a strike over conditions at that institution, members of the Black Panther were front and center in the conflict. Whereas Huey P. Newton, Bobby Seale, Elbert “Big Man” Howard, Virtual Murrell, Melvin Newton, and Sidney F. Walton made a mark at Merritt College, George Mason Murray, Landon Williams, Carlotta Simon, Joann Mitchell, and Clarence Thomas were making theirs at San Francisco State. The names of those 11 Black Panthers appear in many important documents related to the Black Studies Movement at Merritt College and San Francisco State.

Within the Black Panther Party, W. E. B. Du Bois was held in great esteem. Three of his books appeared on the list. One was Black Reconstruction in America, which was the book Li’l Bobby Hutton was reading at the time of his death. The second book was The Souls of Black
Folk. The third book was *The World and Africa* (Du Bois, 1903, 1935, 1947). The Black Panthers were well aware that Du Bois was a major sociologist and political activist. The January 4, 1969 issue of *The Black Panther* featured a photograph of Du Bois which filled an 11 by 17 page.7

**Afro-American Studies at Merritt College**

The Afro-American Studies Department at Merritt College was founded in November 1968 and implemented in January 1969 during the Winter Quarter. The first chairperson of the department was William Haralson. He remained in that position until the beginning of the Fall Quarter in September 1969. At that time, Haralson was replaced by Melvin Newton as the chairperson. Melvin Newton was the brother of Huey P. Newton and he taught Black studies and sociology at Merritt College. When the Afro-American Studies Department emerged at Merritt College, Norvel Smith was the president of Merritt College. He was the president of that institution from 1968 to 1973 (Wilmot, 2014; Self, 2014; Murch, 2010a; Cromartie, 2011a, 2011b).8

At Merritt College, the first Black Studies course was taught by Rodney Carlisle, a White man, in 1963. The title of the course was “History of the Negro in America.” According to a contemporary report in a March 5, 1964 issue the *Peralta Bulletin*, Bobby Seale and Herman Porter were two students who played a leading role in advocating for a Black history course at Merritt College. The report also stated that:

The course was offered for the first time last September after more than a year planning and preparation. Interested students met after school hours with Coordinator Duffy and instructors Rodney Carlisle and Dr. William Doyle to plan expansion of the course to include study of contemporary problems. Merritt College students Robert Seale and Herman Porter were particularly active in the conferences and conducted surveys to determine student demand for new sections of the course” (“Negro History Course,” 1964, p. 1).

The report continued:

The first semester of the course provides a survey of African origins, the slave trade, and slavery from colonial times to the Civil War. The Civil War, a more detailed account of the role of the Negro in American life, and an analysis of the current status of the Negro in American society are the areas covered by the second semester” (p. 1).

Eventually, Bobby Seale and other students developed a key Merritt College student organization known as the Soul Students Advisory Council. Members of the Soul Students Advisory Council expressed dissatisfaction with Carlisle’s course and pressured the institution to develop a Black Studies Department. They had also put pressure on college’s administration to develop the course which was taught by Carlisle. The pressure from the Soul Students Advisory Council for a department lasted from at least 1965 to 1968. During that period, members of the Soul Students Advisory Council held meetings with the college’s administration and issued demands related to curricula and hiring practices (Newton, 1973; Seale, 1970; Murch, 2010a).9
Under the leadership of Norvel Smith, Merritt College responded in an affirmative manner to the push from below by the Soul Students Advisory Council for a full-fledged department. With that response, Merritt College became the first college at the two-year level, four-year level, or university level to actually implement a full-fledged department. The Soul Students Advisory Council played a role in the selection for the chair and faculty for the department. Instead of resisting the push from below for a department, Norvel Smith chose to listen to the voices he heard in the ranks of the Soul Students Advisory Council (Seale, 1970; Wilmot, 2014; Self, 2014; Murch, 2010a).

The Soul Students Advisory Council, at one time or another, was composed of Black people like Douglas Allen, Kenny Freeman, Elbert “Big Man” Howard, Virtual Murrell, Isaac Moore, Huey P. Newton, Alex Papillon, Leo Bazille, and Bobby Seale. Eventually, some of those Merritt College students from the Soul Students Advisory Council joined the Black Panther Party for Self-Defense and/or its rival organization the Black Panther Party of Northern California. Thus, the Afro-American Studies Department at Merritt College came from below through the efforts of people who became Black Panthers as well as others. On the one hand, Black Panthers who helped develop the department were Huey P. Newton, Bobby Seale, Melvin Newton, Virtual Murrell, Elbert “Big Man” Howard, and Sidney F. Walton. On the other hand, non-Black Panthers included Doug Allen, Isaac Moore, Alex Papillon, Leo Bazille, William Haralson, and Norvel Smith (Seale, 1970; Newton, 1973; Howard, 2002; Austin, 2006; Murch, 2010a).

Huey P. Newton attended Merritt College between 1959 and 1966. Bobby Seale was a student at that institution from 1960 to at least 1972 on an off and on basis. As members of the Soul Students Advisory Council, the two co-founders of the Black Panther Party became very involved in the campaign to get Black studies curricula at Merritt College. They also used Merritt College as a fertile recruiting ground for the Black Panther Party (Newton, 1973; Seale, 1970; Monsa Nitoto, personal communication, June 16, 2007).

As mentioned above, Melvin Newton was the second chairperson of the Afro-American Studies Department. By the time he got that position in 1969, Melvin Newton had served as the minister of finance for the Black Panther Party. Melvin Newton stayed in the Peralta Community College District on a fulltime basis working as a professor or administrator from 1969 to 2003. Melvin Newton was a former Merritt College student who transferred to the University of California, Berkeley and earned undergraduate and graduate degrees. Elbert “Big Man” Howard began to attend Merritt College in 1960. Eventually, he became an administrator inside of the Peralta Community College District and remained there until around 1972 (“Brother of Newton,” 1969; Merritt College, 2013; Howard, 2002).

Sidney F. Walton was a Merritt College counselor and instructor from 1965 to 1969. He also served as the faculty adviser to the Soul Students Advisory Council (Walton, 1969a). There were at least two Black Panthers whose membership in the organization was not disclosed. One person was Richard Aoki (Fujino, 2012). The other person was Walton (Emory Douglas, personal communication, June 19, 2016).

During the first year of its existence, the Black Panther Party addressed the activities of Walton at Merritt College in several issues of The Black Panther. The fourth issue of The Black Panther was the first to feature a report on the plight of Walton at Merritt College. In the first report, the Black Panther Party related that Walton made a presentation to a screening committee regarding his application for a dean position at Merritt College. Walton told the screening
committee that he had the necessary credentials required to be qualified for the job under California Education Code. He also pointed out that his employment at Merritt College as a counselor dated back to April 1965. In addition, Walton noted that he had experience teaching courses at Merritt College as a part of his load (“Merritt College Refuses Opportunity,” 1967).

The Black Panther Party made it clear in the first report that it supported Walton’s quest to be hired as a dean at Merritt College. For example, the first report argued that Walton was making valuable contributions at Merritt College. It stated:

This past year Brother Walton assisted Black students in their efforts to get Merritt College to provide them with an adequate reading program, helped Sould [sic] Students Advisory Council in its many programs, got the University of California to accept Merritt College’s Negro history course as transfer credit, got Merritt College to change the name of “Negro” history to Afro-American history, assisted with the Black Experience held at Merritt College, got the Merritt College Faculty Senate to approve and support the schools’ recognition of February 21 as Malcolm X Memorial Day, developed a Black Curriculum framework and proposed an Associate of Arts degree with a major in Afro-American studies. (“Merritt College Refuses Opportunity,” 1967, p. 12)

The first report also said that Walton was going to prepare materials for a later issue of the publication and address matters that “deal primarily with education of Black People, for Black People, and by Black People--Included in this issue will be the BLACK CURRICULUM” (p. 12).

In the first report on Walton, the fourth issue of The Black Panther published a list of recommendations made by Merritt College’s Black Personnel Committee regarding openings at that institution. The recommendations were presented by Sylvester Hodges and addressed to “Merritt Council Members and Concerned Individuals” (“Merritt College Refuses Opportunity,” 1967, p. 2). The recommendations called for the Merritt College administration to hire some Black administrators, Black counselors, and Black faculty for open positions. The recommendations also noted that the Black Personnel Committee had been formed through the persistence of the Soul Students Advisory Council. In addition, it noted that the Black Personnel Committee recommended that a Black person be hired for the open dean position. According to the report in The Black Panther, the Merritt Council unanimously approved the proposal (“Merritt College Refuses Opportunity,” 1967).

Nevertheless, the administration at Merritt College did not hire him as a dean despite the efforts of Walton, Soul Students Advisory Committee, and the Black Personal Committee. Instead, the administration at Merritt College “eliminated Dean Castellino’s position and appointed him to fill the vacancy created by Dean Olsen’s reassignment” (p. 12). As a response, The Black Panther stated that, “We suspect foul play and that the racist dogs would rather eliminate a valid position than to fill it with a Black person” (p. 12). The Black Panther also noted that Walton expressed anger at the decision wherein he was not offered a dean position.

The fifth issue of The Black Panther carried the second report on the plight of Sidney F. Walton at Merritt College (“Black Curriculum,” 1967). The newspaper once again said that Sidney F. Walton did not get the dean position at that institution. It also stated once again that the dean position went to a White man, namely Kenneth V. Castellino. Both Sidney F. Walton and the Black Panther Party expressed dismay at that outcome. As promised, the fifth issue
covered the effort of Walton to develop a Black curriculum for the proposed Black Studies Department. In his capacity as a counselor and instructor at Merritt College, Walton was a strong advocate of Merritt College establishing a full-fledged Black Studies Department and eventually published a book detailing his efforts.

The second report on Walton mentioned that Walton held a press conference in front of Merritt College in July 1967. At that press conference, Walton issued a demand for Merritt College to implement a “Black Curriculum” which he had developed. He also issued a demand for Merritt College to hire a Black person who would “develop, coordinate and articulate” that curriculum. Walton complained that, “Two or three courses in the history department listed in the new catalog do not, by any stretch of the imagination make a curriculum and certainly not a Black Curriculum” (“Black Curriculum,” 1967, p. 24).

Before the press conference, Walton found out that he had been passed over for the Dean of Student Personnel position at Merritt College. He expressed some anger at the Merritt College administration for taking that action. In its report on the press conference, The Black Panther stated that Walton was “the most qualified person on campus to hold down the job of dean.” That report also stated that: “The reason Walton was passed over is because he is Black. And the curriculum he [proposes] is Black. The Black Panther believes that this type of curriculum will become the standard thing in all Black colleges in racist dog America (“Black Curriculum,” 1967, p. 24). Thus, in its newspaper, the Black Panther Party let it be known that Walton and his proposal were fully supported by the organization.

As part of its report on Walton’s press conference and his Black curriculum proposal, The Black Panther published the actual list of courses he presented. In the case of Walton’s proposal, it showed that he identified over 20 courses which could be taught as part of a Black curriculum. Those courses represented a variety of disciplines and fields, including sociology, psychology, political science, anthropology, economics, drama, etc. The list prepared by Walton is important because it provided the Black Studies Movement at Merritt College with a dynamic curriculum which could be implemented. Instead of just standing back and spouting rhetoric about what Merritt College should do, Walton took it upon himself to show what Merritt College could do in terms of a developing a dynamic curriculum (“Black Curriculum,” 1967).

The sixth issue of The Black Panther covered the Bay Area Black Educators Conference. It was held at the University of California, Berkeley on October 6, 1967 and October 7, 1967. A key goal of the conference was to discuss the status of Black education in the Bay Area and elsewhere. Keynote speakers for the conference were Nathan Hare and George Ware. During the final session, the conferees passed a number of resolutions, including the endorsement of Merritt College’s Black curriculum designed by Sidney F. Walton and the formation of a nine-person steering committee. Steering Committee members included Sidney F. Walton, Edward O. Lee, Louis Barbe, Harriet Smith, Margaret Amoureux, Sarah Fabio, Welvin Stroud, Howard Jeter, and Henry Casanave. Like Walton, Harriett Smith and Sarah Fabio were representatives from the Peralta Community College District, which was formerly known as the Peralta Junior College District (“B.A.B.E.C.,” 1967).

In 1969, Walton published a book titled The Black Curriculum. He expanded upon the aforementioned proposal and laid out an argument for the implementation of Black Studies curricula at Merritt College. Walton, in his book, included a plethora of letters, memoranda, course outlines, and other documents that trace the battle from below for Black studies curricula at Merritt College. Walton also included some documents that show he was heavily involved

In sum, when the original Afro-American Studies Department was established with William Haralson as the chair, it was standing on the shoulders of the Soul Students Advisory Council and Sidney F. Walton. The initiative to establish that department was the culmination of a protracted struggle from below led by the Soul Students Advisory Council under the advice of Walton much of the time. Although some histories of the Black Studies Movement tend to overlook or ignore Merritt College, it was ground zero for the emergence of the dynamic new curricula from below. The Afro-American Studies Department deserves to be recognized for the innovation and legacy it represents. Likewise, the Black Panther Party, under the leadership of Huey P. Newton and Bobby Seale, deserves to be recognized as one of the key community-based organizations which supported the Soul Students Advisory Council and Walton in their protracted struggle for the establishment of the Afro-American Studies Department at Merritt College. Instead of it being an overnight success, the struggle for a Black Studies Department lasted for more than four years. As that protracted struggle evolved, the following six Black Panthers made valuable contributions: Huey P. Newton, Bobby Seale, Elbert “Big Man” Howard, Virtual Murrell, Melvin Newton, and Sidney F. Walton (Newton, 1973; Seale, 1970; Karenga, 1993; Cromartie, 1993). 17

Black Studies at San Francisco State

The Black Studies Department at San Francisco State was founded in September 1968 and implemented in September 1969. When the Black Studies Department was founded in September 1968, the initial chairperson of the Black Studies Department was Nathan Hare, a Black sociologist. Hare held a Ph.D. in sociology from the University of Chicago and had previously taught at Howard University. Robert Smith held the presidency of San Francisco State at the time the Black Studies Department was initially founded and he hired Hare. By the time the Black Studies Department was implemented in September 1969, S. I. Hayakawa had replaced Robert Smith. It was S. I. Hayakawa who terminated Hare and replaced him with Robert Chrisman as the chairperson (Nathan Hare, personal communication, February 7, 2014). 18

The first Black Studies course was taught by Aubrey LaBrie, a Black man, in 1966. The title of the course was “Black Nationalism” and it was offered during the Spring semester as part of the Experimental College. When LaBrie taught that course, San Francisco State University was then known as San Francisco State College. That same Spring semester, in the month of March, San Francisco State administrators were given a proposal for a Black Studies institute by Jimmy Garrett. His proposal called for a board of directors composed of 10 people. He wanted seven of those directors to be chosen by the students. The proposal called for an increase in Black faculty, students, Black Studies courses, and funding for the Black Students Union. It met with a measure of success in that there was an increase in the number of Black faculty, students, Black Studies courses, and funding for the Black Students Union (LaBrie, 2016; San Francisco State Black Students Union, 1968; Biondi, 2012).
During the Fall 1966 semester, the Black Students Union, under the leadership of Jimmy Garrett, implemented a Black Arts and Culture series under the aegis of the Experimental College. Subsequently, Amiri Baraka (aka LeRoi Jones), Sonia Sanchez, Askia Muhammad Toure (aka Rolland Snellings), and others were brought to San Francisco State by the Black Students Union to teach in the Black Arts and Culture series. Some of those people even managed to teach a few Black Studies courses in mainstream departments such as English. For example, Sonia Sanchez offered a course in that department dealing with Black literature (San Francisco State Black Students Union, 1968; Baraka, 1984; Biondi, 2012; T'Shaka, 2012).

By the Spring 1968 semester, the San Francisco State Black Students Union (1968) had developed a full-fledged curriculum. It was composed of some 11 courses in the disciplines and fields of anthropology, dramatic arts, education, English, history, humanities, psychology, social science, and sociology. The classes were taught by Mary Lewis, John Shoka, Melvin Stuart, Abdul Karim, Harold Head, Sonia Sanchez, George Murray, Rolland Snellings, Christine Williams, Jimmy Garrett, D. Harrison, Lawrence Harrison, Daisy Dumas, Maruyama, Juan Martinez, and Jim Aliniece. Students were able to pick up pre-registration cards for the classes by going to the office of the Black Students Union.

However, during the late 1960s, COINTELPRO (Counterintelligence Program) of the Federal Bureau of Investigation (FBI) was in full operational mode against Black militants in the USA. The works of former censored targets of the FBI, such as W. E. B. Du Bois, and Marcus Garvey, were deemed as unworthy subjects of academic discourse by some of its agents. According to Biondi (2013), Sanchez was visited in her San Francisco home by an FBI agent who interrogated her because she taught the works of W. E. B. Du Bois. Sanchez concluded that she was put on a list because of her teaching the works of W. E. B. Du Bois. Looking back on those times, Sanchez has remarked: “At that time, it was a revolutionary idea to insert into the English Department the study of African-American literature” (Quoted in Biondi, 2012, p. 47).

After Hare arrived at San Francisco State in February 1968, he actually found that some 15 Black Studies courses were being offered in the Black Students Union’s Black Culture and Arts series under the aegis of the Experimental College and in a few departments other than English. Among those courses were “History of the Third World;” “Sociology of Black Oppression;” and “Avant-Garde Jazz.” In addition, Hare found a campus in embroiled in conflict. On the one hand, the Black Students Union and the Black Panther Party were pushing hard for a viable Black Studies Department. On the other hand, White conservative administrators, faculty, and students pushed back with blocking mechanisms (Biondi, 2012).

On April 29, 1968, Hare (1969a) submitted his “A Conceptual Proposal for Black Studies” to college administration and Black Students Union. In his proposal, he outlined some core principles and key objectives for the Black Studies Department. One key principle and objective was that the department would always strive to meet the needs of the Black community. Hare stated:

Aside from the matter of intensified motivation (and increased commitment) to the struggle to build the black community) students who have mustered even a smattering of black studies courses would be advantaged in their postcollege work in the black community. They would be armed with early involvement and experience in the community superior to that of students not so trained. Like their Chinese, Greek, Jewish, and other pluralistic counterparts, those employed outside the black community would
possess a keener sense of security as individuals and would be better equipped to present the black perspective. This would benefit the black community indirectly and perhaps assist those members of the white community who, like the black studies program, seek, in a roundabout way, a better society for all of its members. (p. 166)

Hare seemed to be drawing on the insight of W. E. B. Du Bois (1903) when he emphasized the need for Black students to recognize their responsibility and obligation to improve social conditions in the Black community.

In his proposal, Hare (1969a) detailed two pathways for a bachelor’s degree in Black studies. One pathway was a “Black arts concentration” which consisted of 36 units in the form of the following nine courses offering four units each: (1) The Literature of Blackness; (2) Black Writers Workshop; (3) Black Intellectuals; (4) Black Fiction; (5) Black Poetry; (6) Black Drama; (7) The Painting of Blackness; (8) The Music of Blackness; and (9) Sculpture of Blackness. The other pathway was a “Behavioral and social sciences concentration” which was composed of 32 units to be selected from the following nine courses offering four units each: (1) Black Politics; (2) Sociology; (3) Economics of the Black Community; (4) The Geography of Blackness; (5) Social Organization of Blackness; (6) Development of Black Leadership; (7) Demography of Blackness; (8) Black Counseling; and (9) Black Consciousness and the International Community. Students in both concentrations were required to complete the following four core courses which totaled 16 units: (1) Black History; (2) Black Psychology; (3) Survey of Sciences: Method and History; and (4) Black Arts and Humanities.

Generally speaking, the proposal of Hare (1969a) was embraced by many Black people, including the Black Students Union on campus and the Black Panther Party in the community. However, it caused an alarm among many White administrators, faculty, and students. For example, Bunzel (1968), a White political science professor, felt the need to write an article wherein he discussed the manner in which Hare was hired at San Francisco State and the proposal. Bunzel reported that the president of the college “appointed a man--chosen by the Black Students’ Union--to develop and coordinate a Black Studies curriculum” (p. 23). He noted that the president made the appointment of Hare “without the knowledge of, or consultation with, the Vice President for Academic Affairs, the Council of Academic Deans, or the faculty” (p. 23). As for the proposal, Bunzel said that it raised a number of issues and questions related to (1) college admissions; (2) racial identity and instruction; (3) collective stimulation; and (4) curriculum content. With regard to the issues and questions he raised, Bunzel said that “dispassionate answers are difficult to come by” (p. 34).

On the one hand, the major on-campus organization behind the development of the Black Studies Movement was the Black Students Union. On the other hand, the major off-campus organization behind the development was the Black Panther Party. Both organizations provided man power to push and advocate for the matter from below. In response to the pressure, San Francisco State became the first four-year college or university to implement a full-fledged Black Studies Department (Orrick, 1969).19

From the Black Students Union, people like Jimmy Garrett (aka James P. Garrett), Benny Stewart, Jerry Varnardo, Terry Collins, Landon Williams, and George Mason Murray stepped forward to lead the charge forward in demanding the Black Studies Department. As they used various tactics to pressure the system, those people were singled out for persecution. They found themselves facing institutional charges and/or criminal charges after a brawl broke out between
members of the Black Student Union and White members of the campus newspaper and football team. However, they did manage to gain important concessions from the San Francisco State administrators before they were forced into exile from the campus. Other people who played a crucial role in helping to found the Black Studies Department at San Francisco State were Aubrey LaBrie, Abdul Karim Sabry (aka Gerald LaBrie), Doug Allen, Maruyama Waddy (aka Maryom Ana Alwadi), Ramona Tascoe, Nathan Hare, Robert Chrisman, Carlotta Simon, Randy Simms (Coltrane Chimarenga), Lucille Jones, Woody Jones, Patricia Thornton, Bernard Stringer, Joann Mitchell, Ellendar Barnes, Leroy Goodwin, Clarence Thomas, Nesbit Crutchfield, Bridges Randall, Jack Alexis, George Colbert, Willie Phillips, Thomas Williams, Danny Glover, and Wade L. Woods (Benny Stewart, personal communication, June 7, 2016; LaBrie, 2016; Orrick, 1969; Marvin X, 1998, 1996; Biondi, 2012; Rizga, 2016).

In the case of Murray, he was the Minister of Education of the Black Panther Party. Murray served in the Black Panther Party from 1967 to 1969. Prior to joining the Black Panther Party, Murray had graduated from Castlemont High School and earned a bachelor’s degree from San Francisco State. By the time the Black Panther Party started, Murray was a graduate student at San Francisco State. Murray was also a preacher like his father. He excelled in his graduate studies and was awarded a teaching post as an adjunct lecturer. Internal evaluations at San Francisco State indicated that Murray was very effective in his teaching post. Thus, he held the unique status of being a graduate student and a member of the faculty (George Mason Murray, personal communication, March 13, 2016; Orrick, 1969; Jones & Jeffries, 1998).

During 1967, the year before the strike at San Francisco State, Murray had two life changing events. One of those events was his involvement with the Black Arts Movement play by Ben Caldwell titled the First Militant Minister. Murray performed the leading role in the play which was directed by Amiri Baraka. The performance took place at the Black House, an innovative cultural center established in San Francisco by Eldridge Cleaver, Marvin X, and others. The second event was Murray joining the Black Panther Party. Murray joined the group because he thought it was making an organized effort to address key social problems in Black communities, including police brutality. He wrote an important article in The Black Panther on social problems among Black people in San Francisco. His educational attainment and educational achievement led Newton, Seale, and Cleaver to select him for membership in the Central Committee as the Minister of Education (Murray, 1967; Marvin X, 1995; Baraka, 1984; Biondi, 2012).

After Bobby Hutton (aka Li’l Bobby Hutton) was killed by police officers in Oakland, Murray served as one of the eight pallbearers at the funeral. According to funeral program, the pallbearers were Murray, George Stafford, Emory Douglas, Dexter Woods, Steve Adams, David Hilliard, and Bobby Scales. In the May 4, 1968 issue of The Black Panther, an article about the funeral listed Murray as the minister of education for the Black Panther Party and said that he was one of the speakers. On page 16 of that same issue of The Black Panther, there is a photograph of Murray serving as a pallbearer at Hutton’s funeral. As an officer with high rank, Murray also made important trips to Cuba and the United Nations to represent the Black Panther Party. In addition, Murray spoke at college campuses in the USA on behalf of the Black Panther Party. His speeches often contained the fiery language which was characteristic of many militants during the late 1960s (“Funeral Program,” 1968; “Over 2500, ” 1968; “Reprinted,” 1968; Murray, 1968e).
As the San Francisco State Strike unfolded in 1968, Murray played a key role as a cause celebre. He quickly became one of the key spokespersons for the strike. His high profile attracted a lot of attention. However, Murray became the center of attention for several firestorms that erupted before the start of the strike (Orrick, 1969; Major, 1971; Alkebulan, 2007).22

Orrick (1969) has noted that one firestorm broke out when the Board of Trustees made an eight to five vote on September 26, 1968 to ask San Francisco State president to remove Murray from the classroom. The Board of Trustees appeared to be alarmed by media reports regarding a speech Murray made in Cuba. However, the president, Robert Smith, did not take that action because he felt Murray had a right to academic freedom. Smith said that, “The public statements and political philosophies of faculty members are not grounds for punitive action” (p. 32).

During a speech he gave in Cuba, Murray declared that “the only correct form of struggle for black people in the USA and for the oppressed people throughout the world is guerrilla warfare” (“Reprinted,” 1968, p. 14). Murray also stated that:

The Black Panther Party recognizes the critical position of black people in the United States. We recognize that we are a colony within the imperialist domains of North America and that it is the historic duty of black people in the United States to bring about the complete, absolute and unconditional end of racism and neocolonialism by smashing, shattering and destroying the imperialist domains of North America. (p. 14)

After initially appearing in Cuba’s Gramma News, Murray’s speech was published in part in The Black Panther on October 12, 1969. Murray had gone to Cuba to attend the Day of Solidarity with the Struggle of the Afro-American People, an event sponsored by Cuba’s Organization of Solidarity of the Peoples of Africa, Asia and Latin America (OSPAAAL). He was accompanied by Joudon Ford, a Black Panther leader based in New York (“Late News Briefs,” 1968; “George Murray,” 1968).

A second firestorm emerged on October 24, 1968 when Murray (1968e) delivered a speech at Fresno State. In the speech, Murray remarked that:

We maintain that political power comes through the barrel of a gun. And if you want campus autonomy, if the students want to run the college, if the cracker administrators don’t go for it, then you control it with the gun. Like the racists on the Board of Trustees for the California State Colleges, the same cracker jacks who are meeting here today, they voted that I should not be allowed to teach at San Francisco State, because of some so-called anti-American remarks that I was suppose to have made in Cuba. (p. 24)

Murray added:

Every time an American mercenary is shot, that’s one less cat that’s going to be killing us in the United States. That’s the truth. That’s a fact. Dig this: In Detroit and in Newark (we can not deny it) the 101st airborne division and the 82nd airborne division of the infantry, soldiers from Viet Nam, were sent into the black community. Their ranks had been partially depleted by the victorious fighters in the National Liberation Front. So that when they came into the black community, (it’s sad to say because a lot of those
soldiers were brothers) their ranks had been depleted because they were criminals fighting against another people of color. And the people defended themselves. The Vietnamese defended themselves . . .” So we said that. That is not a lie; that is the truth. But liars do not dig the truth. They would rather salute and pledge allegiance to toilet tissue and homosexuality than pledge allegiance to the equal distribution of the wealth among all the people of the world.

So what we’re saying can be reduced to one simple sentence . . . very simple, very common, one that can be understood by everybody . . . WE ARE SLAVES, AND THE ONLY WAY TO BECOME FREE IS TO KILL ALL THE SLAVE MASTERS!!!

(p. 24)

When he made that speech, Murray was still teaching at San Francisco State. Thus, Murray took the position that he was exercising his right to freedom of speech about social issues.

A third firestorm broke out when the San Francisco Chronicle made a report and asserted that he had given an October 28, 1968 speech at San Francisco State wherein Black students were encouraged to carry guns for their protection against racist administrators. The report led to a negative reaction by the Mayor Joseph Alioto of San Francisco and President Robert Smith of San Francisco State. Both sought grounds to file a criminal complaint, but could not locate a tape of the speech. Moreover, the reporter who broke the story was not present during the speech and relied on a hearsay account (Orrick, 1969).

Nevertheless, the Board of Trustees of the California State Colleges and Chancellor Glen Dumke put tremendous pressure on President Robert Smith of San Francisco State to remove Murray from his teaching post. Smith, on October 31, 1968, was ordered by Dumke to issue a suspension of Murray as an instructor and as a student. Calling the order unprecedented, Smith refused to carry it out and requested a meeting with Dumke. Initially, Smith took the position that the situation with Murray was a matter of intellectual freedom. However, on November 1, 1968, Smith carried out the order to suspend Murray (Orrick, 1969).

Not surprisingly, The Black Panther weighed in on the matter. In its November 16, 1968 issue, The Black Panther reported that Smith had submitted to the pressure and suspended Murray. As a result, the suspension became one of the key issues of the strike. Instead of distancing themselves from Murray, the Black Panther Party and the San Francisco State Black Students Union threw their support behind him. In addition to the activity with its newspaper, as a strategy and tactic, the Black Panther Party sent leading members to speak at the protest demonstration rallies sponsored by the San Francisco State Black Students Union. Bobby Seale, David Hilliard, and other organizational leaders spoke on or near San Francisco State to help inspire the students to maintain the strike and support for Murray. Before, during, and after the strike, the Black Panther Party also held rallies in San Francisco as a strategy and tactic in the Free Huey Movement and the statewide Black Student Union Movement. As an act of cooperation, members of the San Francisco State Black Students Union were active participants at the rallies sponsored by the Black Panther Party (“Panthers--B.S.U. Close S.F. State College,” 1968; “Panthers--S.U. Get It Together,” 1968; “George Murray,” 1968; “San Francisco State Strike,” 1969; Collins, 1969).

On October 26, 1968, which was two days before he made the controversial San Francisco State speech, Murray and other members of the Black Panther Party convened a “Black Students Union State Wide Convention” at the Fillmore Auditorium in San Francisco. In its October 12,
1968 issue and October 19, 1968, *The Black Panther* published a notice about the event. The notice listed Virtual Murrell as the contact person and stated that the speakers at the convention would include Bobby Seale, Eldridge Cleaver, George Mason Murray, and David Hilliard. It also stated that the purpose of the convention was “to discuss national organization of Black students” (“Black Students Union State Wide,” 1968a, p. 9, 1968b, p. 12).

At the time of the convention, Wyse was a student editor of *The Black Panther*. Wyse was also a leading member of the Black Students Union at Berkeley High School. By the time of the convention, Wyse had published a number of her writings in *The Black Panther*. Those writings included essays and poems in separate issues of *The Black Panther.*

In her report on the conference, Wyse (1968m) detailed the proceedings of the one-day convention. She said that the convention started at 10:30 a.m. and lasted until 7:30 p.m. and included George Mason Murray, David Hilliard, and Bobby Seale. Regarding George Mason Murray, Wyse stated:

> Brother George Murray gave a beautiful speech, on how we are born in jail when we are born in America. And that we are still twentieth century slaves. We can not be proud of you would just take a look around you, you would see that there was nothing to be proud of. The reason that black young men aren’t getting into college is because they tell him to take football. And they have all these courses that mean nothing to black people. So he flunks all his courses (except in sports). They ship him off to Vietnam, and if he’s still alive they will make him a sports nut. He went to say that the Black Panthers support any of our demands that deal with Black America. He answered questions that students asked. (p. 16)

Wyse made it clear that she admired the leadership of George Murray and the words he expressed at the convention.

According to Wyse (1968m), Murray and the other Black Panthers helped the convention participants to discuss the implementation of the 10 Point Program and Platform of the statewide Black Students Union which was based on that of the Black Panther Party. Wyse related that Gregory Harrison, a student at Oakland Technical High School, and Ronnie Stevenson, a student at Berkeley High School, held the two leadership positions in the statewide Black Students Union. All three played a major role in the dialogue at the convention. During the convention, students from each high school presented a report on conditions at their institutions. Harrison also had students from each high school nominate a representative for the statewide Black Students Union. Wyse stated that the following people became representatives for schools to the statewide Black Students Union: (1) Edmond Harris, Menlo-Atherton; (2) Roger Johnson, McClymonds; (3) Brenda Loyd, Fremont; (4) Bailey Grant, Fremont; (5) Darnella Gipson, McClather (co-Sharon Dottes); (6) Sheila Wilson, Mission; (7) Jessie Shelton, Poly Tech; (8) Jan Gates, Lowell; (9) Chase Adams, Jr., Berkeley; (10) Leroy Larry, Sequoia; (11) Richard Harris, Washington; and (12) Darrell Logan, Richmond (South Campus).

In a news item, the December 21, 1968 issue of *The Black Panther* reported that that a statewide organization of Black Students Unions had formed. The news item also stated that the formation of a national organization was in process. The Black Students Union shared a mailing address with the national headquarters of the Black Panther Party in Berkeley. In the same issue of *The Black Panther*, Iris Wyse said that the statewide organization had a Central Committee
composed of Gregory Harrison as chairman; Larry Harrison as co-chairman; Ronald Stevenson (aka Ronnie Stevenson) as commander in chief; Edmond Harris as minister of information; and Valerie Douglas as communications secretary. She also pointed out that the leadership of the statewide organization consisted of an additional 13 representatives from at least 11 high schools. Like Wyse, many of those people joined the Black Panther Party, including Gregory Harrison; Larry Harrison; Ronnie Stevenson; and Valerie Douglas (Black Students Union, 1968; Wyse, 1968n).

Two days following the end of the October 26, 1968 conference, Murray and the Black Students Union held a rally at San Francisco State which was attended by Donald Cox and other Black Panthers. When he spoke at that rally on October 28, 1968, Murray called for a student strike to take place on November 6, 1968. He also called for Black people to use guns to defend their communities and accused President Robert Smith of lying. On October 31, 1968, Glenn Dumke, the chancellor and head of the Board of Trustees of the California State Colleges, gave an order to Robert Smith to suspend Murray. Smith carried out the order and suspended Murray on November 1, 1968. However, Smith also resigned as president on November 26, 1968 which was shortly after the San Francisco State Strike began. To his credit, Smith was the president who, on September 18, 1968, approved the creation of a Black Studies Department and named Nathan Hare as the acting chair. Smith was under tremendous pressure from the Black Student Union to take those two actions (Orrick, 1969; Whitson, 1977).

The San Francisco State Strike started in part on November 6, 1968. The Black Students Union, working closely with Murray and the Black Panther Party, as well as groups of other sympathetic students and faculty, were able to keep the strike alive for some five months. The Black Students Union issued a long list of demands. The list included the reinstatement of Murray and a fully tenured position for Nathan Hare (Orrick, 1969; “San Francisco State Black Students Union Central Committee,” 1969; Whitson, 1977).

Eventually, S. I. Hayakawa, the president who replaced Robert Smith on November 26, 1968, made a concession to some of the demands, but refused others. Both before and during the San Francisco State Strike, many Black students in the Black Students Union were targeted by the authorities and found themselves facing various criminal charges. The same was true with Murray and Hare. Both men found themselves facing weapon charges. At the height of the San Francisco State Strike on January 25, 1969, the Central Committee of the San Francisco State Black Students Union consisted of the following positions and persons: Chairman, Benny Stewart; Director of On-Campus Activities, Jerry Varnado; Director of Off-Campus Activities, Leroy Goodwin; Minister of Education, BPP, George Murray; Black Studies Coordinator, Clarence Thomas; Financial Coordinator, Nesbit Crutchfield; Center of Educational Innovation, Jack Alexis; Off-Campus Programs, George Colbert; Chairman of Strike Committee, Willie Phillips; Director of Tutorial Program, Thomas Williams; Chairman of Rally Committee, Danny Glover; Coordinator of Black Draft Council, Terry Collins; Information Officer, Wade L. Woods; and Chairman of Black Studies Department, Dr. Nathan Hare (Orrick, 1969; “San Francisco State Black Student Union Central Committee,” 1969; Biondi, 2012).

On March 20, 1969, Hayakawa made an announcement wherein he stated that San Francisco State was going to have a School of Ethnic Studies which would consist of a Department of Black Studies, Department of Asian American Studies, and a Department of La Raza Studies. Hayakawa also said that San Francisco State made a commitment to have a significant increase in the enrollment of racial and ethnic minorities. However, he refused to allow student
participation in the hiring and firing of faculty and the development of curricula in the departments of the School of Ethnic Studies. Hayakawa also refused to rehire George Mason Murray or Nathan Hare after the strike for the 1969-1970 academic year (Orrick, 1969; Garlington, 1969; “Hare, Murray Lose Their Jobs,” 1969). 28

In the aftermath of the strike, Murray found himself in jail for a weapons charge. Hare found himself in exile from the academy. Murray dealt with his dilemma by resigning from the Black Panther Party and going into the Black church as a member of the clergy. He also went graduate school at Stanford University and became a principal of an alternative high school in East Palo Alto, California. 29 Hare dealt with his dilemma by acquiring a second Ph.D. in psychology and went into private practice. 30 Thus, both men demonstrated that they were resilient (Nathan Hare, personal communication, February 7, 2014; George Mason Murray, personal communication, March 13, 2016).

In sum, when the original Black Studies Department was established with Nathan Hare as the chair, it was standing on the shoulders of the Black Students Union. As has been the case with Merritt College, some histories of the Black Studies Movement tend to overlook or ignore San Francisco State. That institution followed Merritt College as a ground zero for the emergence of the dynamic new curricula from below. Like the original Afro-American Studies Department at Merritt College, the original Black Studies Department at San Francisco State deserves to be recognized for the innovation and legacy it represents. The Black Panther Party, under the leadership of Huey P. Newton and Bobby Seale, deserves to be recognized as the key community-based organization which supported the Black Students Union and Nathan Hare in their protracted struggle for the establishment of the Black Studies Department at San Francisco State. The struggle for the Black Studies Department lasted for more than four years. During that protracted struggle, the following five Black Panthers made valuable contributions: George Mason Murray, Landon Williams, Carlotta Simon, Joann Mitchell, and Clarence Thomas (Newton, 1973; Seale, 1970; Karenga, 1993; Cromartie, 1993). 31

Conclusion

This paper has reappraised the contributions of the Black Panther Party to the Black Studies Movement at Merritt College and San Francisco State. It has examined the role that Black Panthers played in the emergence of the original Afro-American Studies Department at Merritt College and the original Black Studies Department at San Francisco State. This paper has also examined the role of The Black Panther in fomenting the Black Studies Movement. It primarily analyzed the period from 1966 to 1971.

This research has two important implications in terms of significant consequences. One significant consequence is that it sheds light on the contributions of the Black Panther Party to the Black Studies Movement at Merritt College and San Francisco State. The Black Panther Party used The Black Panther as its official organ to support the Black Studies Movement at each institution. During its first four years of existence, between 1966 and 1971, The Black Panther played a leading role in fomenting the Black Studies Movement by disseminating crucial information to its wide readership. For example, the organization published reports wherein it expressed support of the Black Studies Movement at Merritt College, San Francisco State, and elsewhere to promote awareness of particular people and events. The organization
also encouraged its members to take an active role in the struggle to implement Black Studies Departments at Merritt College, San Francisco State, and elsewhere.

In the case of Merritt College and San Francisco State, members of the Black Panthers joined other people to help develop the Afro-American Studies Department at Merritt College and the Black Studies Department at San Francisco State University. Both before and after the official emergence of the Black Panther Party, its members played a vital role in the push for a Black Studies Department at Merritt College and San Francisco State. With regard to the Merritt College mobilization, six very important Black Panthers were Huey P. Newton, Bobby Seale, Elbert “Big Man” Howard, Virtual Murrell, Melvin Newton, and Sidney F. Walton. Of those six people, five took an active role in the Soul Students Advisory Council, which won the fight for an Afro-American Studies Department at Merritt College. Similarly, five very important Black Panthers involved with the San Francisco State mobilization were George Mason Murray, Landon Williams, Carlotta Simon, Joann Mitchell, and Clarence Thomas. Those five people took an active role in the Black Students Union, which won the fight for a Department of Black Studies at San Francisco State.\(^{32}\)

A second significant consequence is that it sheds light on the emergence of the Afro-American Studies Department at Merritt College and the Department of Black Studies at San Francisco State. On the one hand, the Afro-American Studies Department at Merritt College was implemented in January 1969. On the other hand, the Black Studies Department at San Francisco State was implemented in September 1969. Both were landmark developments in higher education.

Further, as the 1960s unfolded, the Black Studies Movement blossomed across the country. By 1972, there were many departments and programs at various institutions. As the years go by, increasing information has come to the light about the development of those programs and departments. Nevertheless, the Afro-American Studies Department at Merritt College and the San Francisco State Department of Black Studies were the first two to reach departmental status. Biondi (2012) has pointed out that, “San Francisco State has developed the reputation of launching the first Black studies department in the United States, but because of the delay caused by the strike, a Black studies department apparently got under way at Merritt College first” (p. 73).

Whereas the Merritt College Afro-American Studies Department was approved on November 22, 1968 by the Merritt College administration and implemented on January 8, 1969, the Black Studies Department at San Francisco State was approved on September 18, 1968 by the San Francisco State administration and implemented on September 22, 1969.\(^{33}\) Both departments came from below as a result of the efforts of Black students and Black faculty to pressure higher education institutions to add curricula related to Black people in the USA. There were many sacrifices made by those Black students and Black faculty as the powers that be at those institutions struck back with vengeance. At Merritt College, Sidney F. Walton became a target of a reactionary initiative against the Black Studies Movement. Similarly, at San Francisco State, George Mason Murray and Nathan Hare became a target of a reactionary initiative against the Black Studies Movement.

Despite the loss of job opportunities by Sidney F. Walton, George Mason Murray, and Nathan Hare, history was made. It occurred under the leadership of Black Panthers and others in the Soul Students Advisory Committee at Merritt College and under the leadership of Black Panthers and others in the Black Students Union at San Francisco State. For the first time in the
USA, Black students could go into higher education institutions and engage in the systematic study of Black people in this country within a department wholly focused on that subject. The crucial role of members of the Black Panther Party in making this happen deserves to be remembered.

Notes

1. Ernest Allen, Jr. (personal communication, November 5, 2009), in an email, stated to me that the Black Panther Party of Northern California, which was founded in August 1966, changed its name to the House of Umoja. Also, in another email, Ernest Allen, Jr. (personal communication, June 22, 2015) said to me that “the BPP of NC model was based on a vision of world black revolution championed by the Revolutionary Action Movement. By late 1967 the activities of the San Francisco BPP had been eclipsed by the BPP for Self-Defense. The SF group decided that leading with the theme of armed struggle and revolutionary political change had turned counter-productive, and turned instead to the organizational model championed by the US organization, which focused on issues of promoting a unified black identity through propagandistic methods and ritual” (p. 1). According to Newton (1973), the name change took place because of the pressure placed on the Black Panther Party of Northern California under the pressure of the Black Panther Party for Self-Defense. Newton has recalled that members of his organization had a custom of referring to the Black Panther Party of Northern California as the “Paper Panthers” (p. 129). He also recalled that “we went to San Francisco, where the Paper Panthers were having a fish fry, and issued an ultimatum: they could merge with us or change their name or be annihilated. When they said they would do none of these things, we waded in. I took on one of them and hooked him in the jaw. It was a short battle, ending a few moments later when somebody fired a shot in the air and people scattered. After that, the Paper Panthers changed their name” (p. 132). Nevertheless, after the name change and Bobby Hutton was killed on April 6, 1968, the House of Umoja (1968) sent a statement to the Black Panther for Self-Defense expressing “its condolences to the family and friends of Brother Bobby James Hutton and to the members of the Black Party who were wounded in battle with our oppressors” (p. 17). The Black Panther Party acknowledged the expression of solidarity and published the statement in The Black Panther.

2. During my April 10, 2016 interview with Akinsanya Kambon, he emphasized the role of the Black Panther Party in the development of Black Student Unions in high schools as well as higher education. Akinsanya Kambon also said that his stint in the Black Panther Party lasted from 1968 to 1971. As a member of the Black Panther Party, Akinsanya Kambon was known as Mark Teemer and created a controversial coloring book. He was a prominent member of the Sacramento Chapter of the Black Panther Party. Before joining the Black Panther Party, he served in the Marines from 1966 to 1968 (Akinsanya Kambon, personal communication, April 10, 2016). Further, the Federal Bureau of Information (FBI) Special Agent in Charge of the Los Angeles office and local Counterintelligence Program (COINTELPRO) expressed concern about the development of Black Student Unions in higher education. In a letter to the director of the agency, he declared that, “The black nationalist organizations that present the greatest potential danger for violence in and about Los Angeles are the Black Panther Party (BPP), the various Black Student Union (BSU) chapters at several local institutions of higher learning, the Student Non-violent Coordinating Committee (SNCC), and ‘US.’ Accordingly, these organizations are the focus of the Black Nationalist Counterintelligence Program at Los Angeles” (Special Agent
in Charge, Los Angeles, 1978, p. 1). The Special Agent in Charge of the San Francisco office of the FBI probably took a similar attitude to that of his fellow agent in Los Angeles. For some evidence that the San Francisco State Black Students Union and George Mason Murray were under surveillance by COINTELPRO, see Special Agent in Charge, San Francisco (1978a, 1978b, 1978c, 1978d).

3. For a discussion of the “historical circumstances” which led to the Black Panther Party, see Murch (2007, 2010b). Murch, in her analysis, focuses on the contributions of Donald Warden and the Afro-American Association to the Black Panther Party through Huey P. Newton and Bobby Seale. The focus of the present paper is on the contributions of the Black Panther Party to the Black Studies Movement at Merritt College and San Francisco State.

4. Newton (1973) and Seale (1970) have acknowledged their participation in the Soul Students Advisory Council. They have also expressed certain disenchantment with Soul Students Advisory Council practices. On the one hand, Newton has recalled that the Soul Students Advisory Council was involved with “a hot issue—the establishment of a program of Afro-American history and culture in the college’s regular program, the authorities were resisting it tooth and nail. Every time we proposed a new course, they countered with reasons why it could not be; at the same time, ironically, they encouraged us to be ‘concerned.’ This was a simple trickery; they were dragging their feet. Bobby and I saw this as an opportunity to move Soul Students a step further by adopting a program of armed self-defense” (p. 108). After members of the Soul Students Advisory Council’s Central Committee rejected Newton armed self-defense proposal, he and Seale left the organization in 1966. Seale (1970) has remembered that a conflict surfaced in the Soul Students Advisory Council when Newton proposed that the Soul Students Advisory Council sponsor an armed protest demonstration at the college. Seale has stated: “. . . Huey suggested to the central group that we bring these brothers off the block, openly armed, on to the campus and bring the press down. We could reach the community (because the press would be hungry for it) and show them, on Malcolm X’s birthday, May 19, that Malcolm X had advocated armed self-defense against the racist power structure and show the racist white power structure that we intend to use the guns to defend our people” (p. 31). According to Seale, the members of the Central Committee of the Soul Students Advisory Council “were scared and rejected it” (pp. 31-32). Seale has also noted that, “Before the Black Panther Party came the Soul Students Advisory Council. . . . the so-called central group of the Soul Students Advisory Council consisted of Virtual Murrell, Alex Papillion, Bobby Seale, Huey P. Newton, Isaac Moore, and a couple of jive cultural nationalists around there” (pp. 26-27). Howard (2002) has reported that, “It was 1966 when I first met Huey Newton and Bobby Seale. We were all attending Grove Street Community College. We all were interested in Black history, as a matter of fact, we were one of the first Black student organizations on any campus that we knew of at that time. It was called the Soul Students Advisory Council. Sid Walton was our campus advisor” (p. 28).

5. The Black Panther Party also used *The Black Panther* to explain its position on violent direct action at a college campus. For example, Eldridge Cleaver, writing as the Minister of Information, condoned a physical attack on James Vasko and some other White members of the *Gator* newspaper at San Francisco State. See MOI (1967) for an article he wrote about the incident which he titled “Black Students Take Care of Business!” For some other reports about that event, see “Violence at College Paper” (1967); Grieg (1967); “Two Suspended In College Raid” (1967); “Suspects in S. F. State Beatings” (1967); “Six Surrender in S. F. State Beating”
(1967); Chapin (1967), and Orrick (1969). According to those reports, George Murray and Landon Williams were involved in the physical attack. At the time, both were Black Panthers. Approximately five years later, there was a similar situation when several Black Panthers physically attacked a Black professor named Fritz Pointer in his classroom on November 15, 1972 at North Peralta Community College. Shortly before the start of a class session, a small group of Black Panthers assaulted Fritz Pointer for remarks he made about the Black Panther Party. At a previous class session, he referred to the Black Panther Party as “integrationists with flak jackets” (Fritz Pointer, personal communication, February 20, 2007). During my interview with him, Pointer told me that he had a meeting with Huey P. Newton shortly after the incident. At the meeting, Newton stated that he had to have him disciplined because of his derogatory remarks made about the Black Panther Party. Newton also informed Pointer that if he had let him get away with the remarks then other people may have made similar attacks. For some information about the incident, see Cromartie (2011a, 2011b); “College Teacher Beaten in Class” (1972); Keane (1972); “3 Surrender In Attack” (1967); Howard (2002); Murch (2010); and the Dr. Huey P. Newton Foundation Inc. Collection in the Department of Special Collections at Stanford University. The latter has some photos of Newton and Pointer at a press conference shortly after the incident. See “Huey and Fritz Pointer 1972” (2008a) located in Series 5: Photographs, Box 3, Folder 21; “Huey and Fritz Pointer [1 of 2] 1972” (2008b) located in Series 5: Photographs, Box 3, Folder 22; and “Huey and Fritz Pointer [2 of 2] 1972” (2008c) located in Series 5: Photographs, Box 4, Folder 1. Also, see Armstrong, Tejada, and Potchatek (2008) for a guide to the Newton collection at Stanford University. According to the article “3 Surrender In Attack” (1967), Fritz Pointer, at one point after the physical attack, signed criminal complaints against Steve McCutcheon, Harold Holmes, and Calvert Manuel Reese for attacking him in the classroom. Although there was a denial in the article by their lawyer Charles Garry, the three people facing charges were Black Panthers. For evidence that they were Black Panthers, see Sister Marie (1969) and McCutcheon (2008). In the case of McCutcheon, he has informed us that, “As class started . . . Flores, Poison, Malik, Calvert and I waited. Five minutes into the class, Flores and Poison rose from their seats. I followed them. Fritz Pointer was down on the floor in the middle of the class while Calvert watched the door. We didn’t say anything to him, just pummeled him until we were done, then walked out of the classroom” (p. 142).

As the newspaper of the Black Panther Party, The Black Panther also carried reports on the effort to establish a Black Studies Department at other higher institutions as well as grade schools, including Solano Community College; Antioch College; University of California, Berkeley; Brandeis University; Northwestern University; Oakland Technical High School in Oakland, CA; McClymonds High School in Oakland, CA; Berkeley High School in Berkeley, CA; Lincoln High School in San Francisco, CA; Fortier High School in New Orleans, LA; and Harrison High School in Chicago, IL. See Thomas (1968); “Education” 1968; Harrison (1968a); Wyse (1968h, 1968j, 1968k, 1968m); “Chicago B.S.U. Closed Schools” (1968); “Concessions at Northwestern Univ.” (1968); Pan African Press (1968); Citizens for Excellence in Education (1968); “Students” (1968); “Black Students Fight” (1969); “Orangeburg Remembered” (1968); “Student Revolt” (1968); Sudan (1969); “Incident” (1969); Hughes (1969); Los Angeles Chapter (1969); “Kathleen Cleaver At Mills College” (1969); “Brandeis Black Students” (1969); “Uncle Roy Stoops Again” (1969); “Panthers and B.S.U” (1969); Hilliard (1969b); Crumby (1969); and Walker (1970). After the country’s very first Black Studies Department was established at Merritt College, The Black Panther continued to cover activities at that institution. For example,
it carried a report when a group of people demanded that the Peralta Community College District Board of Trustees provide a campus for the North Oakland, Berkeley, and Albany area. For that report, see People’s Committee for Defense of Merritt (1970). It also carried a report in 1971 when Black Panther Doug Miranda led protest demonstrations involving some 10 demands. For that report, see “Merritt College Strikes” (1971). See also Merritt College Black Students Union (1971). Shortly after the actions of Doug Miranda at Merritt College, Black Panther Austin Allen (personal communication, March 19, 2016) emerged as a dynamic leader at neighboring Laney College in Oakland.

9. In terms of their efforts, Bobby Seale and other members of the Soul Students Advisory Council acted as a pressure group when they demanded changes in the college’s curricula and hiring practices. Members of the Soul Students Advisory Council also sought to foster Black nationalism in the form of racial solidarity and collective behavior. Further, Bloom and Martin (2013) have asserted that Huey P. Newton and Bobby Seale “joined the Soul Students Advisory Council (SSAC), founded by Ernie Allen” (p. 31). According to Allen and Seale, that is not true. Allen (personal communication, June 18, 2016) has informed me that, “I had moved on from Merritt by the time SSAC was formed. I wish I could take all the credit, but I was NOT the founder of SSAC and NEVER took direct part in its activities.” However, there is an article in the February 28, 1968 issue of the Oakland Tribune which stated that, “Ernie Allen, member of
the executive council of the Soul Students Advisory Council, toldnewsmen yesterday that the campus furor over threats “is part of the administration’s campaign to crush black people” (“Student Leaders,” 1968, p. 12). The article continued: “Allen said no one mentioned threats ‘until black people started getting in positions of power,’ and he demanded proofs that no threats were made. (Oakland police said they have received no formal threats, but have obtained copies of the resignation letters)” (p. 12). Seale (1978) has written that, “I came up with the name ‘Soul Students Advisory Council’” (p. 145). He added: “We put the work out, got the new black-history instructor to sponsor us, and we had the Soul Students Advisory Council officially launched on the Merritt campus” (p. 145).

11. Murch (2010a) has pointed out that many of those people in the Soul Students Advisory Council once belonged to the Afro-American Association led by Donald Warden and/or the Revolutionary Action Movement (RAM) led by Max Stanford. For example, Bobby Seale, at one time or another, belonged to the Afro-American Association, RAM, and the Black Panther Party for Self-Defense. It should be noted that Harriet Smith (aka Makinya Kouate) was a key Black woman involved with the Soul Students Advisory Council, Afro-American Association, and the Black Studies Movement at Merritt College. For some activities of Harriet Smith, see documents in the Soul Students Advisory Council Folder, especially the letter of John Banks (1968), a member of Bay Area Blacks United, and the memorandum of Judy Singer (2001), a librarian and curator of the Black Panther Archive at Merritt College when her document was written. The activities of Harriet Smith have also been covered in the Alameda Times Star, Oakland Tribune, and San Francisco Chronicle. See “College’s Student Leaders” (1968); “Student Leaders” (1968); and Swanston (1968).

12. In the case of Huey P. Newton, he earned an A.A. degree from Merritt College in 1966. He later earned a B.A. degree from the University of California, Santa Cruz in 1974 and a Ph.D. degree from the University of California, Santa Cruz in 1980. For copies of his B.A. degree and Ph.D. degree and the original of his A.A. degree, see “Diplomas” (2008) and “Huey P. Newton’s Original” (2008).

13. Elbert “Big Man” Howard was a key recruit Newton and Seale met at Merritt College. He later served as the editor of The Black Panther and a member of the Central Committee of the Black Panther Party. Another key recruit from Merritt College was Virtual Murrell, who later served as the distribution manager of The Black Panther (Howard, 2002; Black Panther Party, 1969).

14. In the December 7, 1968 issue of The Black Panther, there is a report by Citizens for Excellence in Education (1968) which indicates that Walton had become employed as a Coordinator of Multicultural Activities by the Palo Alto Unified School District. Three months later, in the March 3, 1969 issue of its newspaper, the Black Panther Party stated that, “Sid Walton is currently under fire in Palo Alto for trying to develop multi-racial understanding and for defending the BLACK PANTHER PARTY program and platform. Recent threats have been made against his life by cowardly anonymous phone callers” (“Black Man Stands Off 5,” 1969, p. 7). That issue of the paper reported on a November 27, 1968 police stop of Sidney F. Walton in Mountain View, California by officers from the Mountain View Police Department and the Los Altos Police Department. During the following week, the Black Panther Party reported in
the March 9, 1969 of its newspaper that Sidney F. Walton had resigned from his position in the Palo Alto Unified School District. See Walton (1969b). Several months after that, Montgomery (1969) wrote a report for the Sunday edition of the San Francisco Examiner & Chronicle wherein he stated that Sidney F. Walton had become employed as a principal at a school in Sausalito, CA. Montgomery also said that Walton was a member of the Black Panther Party. He wrote that, “Walton was the founder of the Black Panther chapter at Merritt, and an authorized co-signer of checks drawn on the Huey Newton Defense Fund” (p. A4). Montgomery also wrote that, “He served on the steering committee of the Black Educators of Northern California, whose goal was to turn Merritt into an all-black university” (p. A4). According to Montgomery, Walton was fired from Merritt College by President Edward R. Redford because of the following three charges: (1) Set up in the college files a fictitious “registration” for Black Panther leader Bobby Seale, crediting him with nine units of straight “A” after Seale flunked out of school; (2) filed false attendance records and organized a boycott of classes; (3) presided at a meeting at which two Caucasian students were beaten by his Black Panther associates; and (4) threatened that the college would be burned down “unless we do what he wants us to do,” and on one occasion threatened Redford’s life by pulling a bullet from his pocket saying: “You are going to get it if you continue to obstruct” (p. A4). Thus, if Montgomery is correct, Walton lost his job at Merritt College in the struggle to establish a Black Studies Department at that institution. For two other important articles which sheds light on the attitude of Edward R. Redford towards Sidney F. Walton, see “Ex-Merritt Head” (1969) and Mitchell (1969). In the case of Mitchell, she states that Walton was teaching at Merritt College as a member of the adjunct faculty and that, “Dr. Smith and Walton appeared together last fall before the State Board of Education and won approval for a program allowing students holding associate of arts degrees in Afro-American studies to get provisional teaching credentials” (p. 8). For another important article on the activities of Walton at Merritt College, see “The Black Experience” (1967). For an important article about the activities of Sid Walton at institutions within the Peralta Community College District other than Merritt College, see “Laney” (1967).

15. According to “Black Curriculum” (1967), the list of courses developed by Walton was as follows: (1) Introduction to Afro-American Anthropology; (2) Development of Black Businesses and Financial Institutions; (3) Current Problems of Afro-Americans in Urban Communities; (4) Introduction to the Black Theater; (5) Current Economic Problems of Afro-Americans; (6) Education of Black Americans (Afro-Americans); (7) Contemporary Black Literature in the Ghetto Language; (8) Introduction to Black Prose and Poetry; (9) Contemporary African Languages; (10) The History of Black America; The History of Afro-Americans; United States History from a Black Perspective (This course would be used to satisfy the American Institutions requirement); (11) Introduction to the Preparation of Soul Food; (12) Human Relations in the Black Community; (13) Study of the Black Press; (14) Black Perspective of Law Enforcement; (15) Survey and History of Afro-American Music; (16) Introduction to Current Black Philosophy; (17) Introduction to African Philosophy; (18) Contemporary Afro-American Dance Techniques; (19) Political Problems of Black Americans; (20) American Government from a Black Perspective (This course would be used to satisfy the American Institutions requirement); (20) Personnel and Social Adjustment of Afro-Americans; (21) Social Origins of Black Nationalistic Behavior in America; (22) Social Problems of Black America; and (23) Elements of Supervision for Black Americans.
16. Moore (1967) wrote an important article about a rally at Merritt College the day before the Black Educators Conference began. He said that Nathan Hare spoke at the rally which was held under the sponsorship of the Soul Students Advisory Council. Moore also stated that Hare “endorsed the development of the proposed Black Curriculum which is now being instituted at Merritt College” (p. 7). For two important articles about the Black Educators Conference which appeared in *The Flatlands*, see Cole (1967) and “Black Educators” (1967).

17. On the one hand, Huey P. Newton, Bobby Seale, Elbert “Big Man” Howard, and Virtual Murrell made their mark in a protestor role as members of the Soul Students Advisory Council. On the other hand, Melvin Newton and Sidney F. Walton made theirs as part of the faculty at Merritt College. Newton (1973), in his autobiography, identified himself as a member of the Soul Students Advisory Council and said that “we succeeded in getting the Black history class on campus” (p. 72). In his autobiography, Seale (1978) identified himself as a member of the Soul Students Advisory Council and stated that “Negro History had been expanded to a six-unit, two-semester course—the credit for this falling to Huey and me” (p. 144). Seale also identified Virtual Murrell as a member of the Soul Students Advisory Council. Writing in his autobiography, Howard (2002), like Newton and Seale, identified himself as a member of the Soul Students Advisory Council and expressed that they all had an interest in Black history.

19. T’Shaka (2012) has noted that the Congress on Racial Equality (CORE) was another major off-campus organization which provided man power to push and advocate for a Black Studies Department at San Francisco State. He has informed us that CORE and the NAACP (National Association of Colored People) were a vital part of the San Francisco Civil Rights Movement and that, “The San Francisco Civil Rights Movement preceded the Black Panther Party, and provided inspiration to the Negro Student Association, and the Black Students Union, which led to the San Francisco State Strike” (p. 16). A key San Francisco State student from CORE and SNCC (Student Nonviolent Coordinating Committee) was Jimmy Garrett (aka James P. Garrett), the head of the Black Student Union before Benny Stewart (Rogers, 2009).

20. Both before and during the strike, the tactics of the Black Students Union and their supporters included protest demonstrations as well as negotiation. As the protest demonstrations unfolded, people were arrested on an array of charges related to assembly and the unauthorized use of property. In addition to George Mason Murray, there were other members of the Black Students Union who found themselves facing persecution for their actions before and during the strike. The Black Panther Party played a key role both before and during the strike by providing “manpower” and publishing articles in its newspaper about the treatment of Murray and the others. During my interview with Benny Stewart, he emphasized that there were people who paved the way for the Black Studies before the strike by teaching courses in the experimental college and various departments. Such people included Aubrey LaBrie, Abdul Karim Sabry (aka Gerald LaBrie), Nathan Hare, Mary Lewis, and Maruyama Waddy. Other people who paved the way for the Black Studies Department by participating in the Black Students Union as members of its Central Committee, rank-and-file student activists, and/or concerned faculty before and during the strike were Robert Chrisman, Carlotta Simon, Randy Simms (Coltrane Chimarenga), Lucille Jones, Woody Jones, Patricia Thornton, Bernard Stringer, Joann Mitchell, Ellendar Barnes, Leroy Goodwin, Clarence Thomas, Nesbit Crutchfield, Bridges Randle, Jack Alexis, George Colbert, Willie Phillips, Thomas Williams, Danny Glover, and Wade L. Woods. Stewart
identified Carlotta Simon and Joann Mitchell two Black Panthers who stood out. He also reported that some people went to jail because of they were persecuted for their actions during the strike. He pointed to Nesbit Crutchfield as a victim of that phenomenon. The name of Maruyama Waddy (aka Mayom Ana Alwadi) has been spelled various ways. In his book Post-Prison Writings and Speeches, Eldridge Cleaver (1969a) uses “Marianne Waddy” (p. 26). Marvin X (1998) utilizes “Maryanna Waddy (Mar’yam Wadai)” in his book Somthin’ Proper (p. 97). He also credits her with being the leading force to change the name of the Negro Students Association to the Black Students Union. In his book Eldridge Cleaver My Friend the Devil: A Memoir, Marvin X (2009) uses “Mary Anna Waddy,” “Maryanna Waddy,” and “Mar’yam Wadai.” As he did in previous autobiography, Marvin credits her with being the leading force to change the name of the Negro Students Association to the Black Students Union. Benny Stewart has described Maruyama Waddy as a female version of Malcolm X (personal communication, June 7, 2016).

21. George Mason Murray has explained to me that he attended both undergraduate and graduate school at San Francisco State following his graduation from Castlemont High School during 1963 in Oakland, California. He excelled in his studies and gained an adjunct lecturer position in the Department of English (George Mason Murray, personal communication, March 13, 2016).

22. Like Murray, Alkebulan (2007) is a former member of the Black Panther Party. Alkebulan has written that Murray “led a strike by the San Francisco State black student union to force the college administration to grant demands for a black studies department. This strike set a precedent for other black students throughout the nation. It would encourage them to pursue African American studies aggressively on their own campuses” (p. 20). Bloom and Martin (2013) have taken a similar position and asserted that, “As the San Francisco State strike developed, the student struggle spread across California and the country” (p. 283). They have also pointed out that during an October 28, 1968 speech “George Murray called for a student strike for November 6” (p. 273).

23. During the strike at San Francisco State, The Black Panther published photographs and drawings. Some of them focused on attacking S. I. Hayakawa and Ronald Reagan with satire. For example, see “Puppet Hayakawa V.S. Bootlicker Willie Brown” (1969) and “Riots Continue at San Francisco State College” (1968). Others focused on showing images of student protestors engaged in action. For instance, see “The Movement” (1969) and Black Students Union (1969). Further, after the strike was over, the Black Panther Party sponsored a massive May Day Rally in San Francisco as part its Free Huey Campaign. The event was attended by many members of the San Francisco State Black Students Union. For key speeches that were delivered by various Black leaders at the rally, see Kathleen Cleaver (1969); Seale (1969); Goodlet (1969); and Hilliard (1969a).

26. Gregory Harrison published at least two articles in The Black Panther. Among other things, Harrison discussed the role of the Black Student Union in a school and the concept of Black Power. For those articles, see Harrison (1968a, 1968b). In the January 4, 1969 issue of The Black Panther, Harrison was listed as a student editor (Black Panther Party, 1968i). For an
article about the activities of Harrison at Oakland Technical High School, see “Student Revolt,” (1968). Valerie Douglas, who was also known as Val Douglas, published at least one article in The Black Panther. She addressed the Vallejo liberation school operated by the Black Panther Party. For that article, see Douglas (1969). Upon the death of Ronnie Stevenson, who was also known as Ronald Harold Stevenson, III, his daughter Sonia Waters (2010a, 2010b) wrote an obituary for the Berkeley Daily Planet and a letter to the Black Panther Party Legacy & Alumni--It’s About Time wherein she noted his contributions to the implementation of the Black Panther Party’s free breakfast program and to the establishment of a Black Studies Department at Berkeley High School. In addition to high school students like Harrison, Douglas, Wyse, and Stevenson, the Black Panther Party recruited into its ranks people from all segments of the Black community, including college students, prison inmates, former prison inmates, street hustlers, blue-collar workers, white-collar workers, military veterans, and active duty military personnel. At the outset, its cadre included military veterans Bobby Seale (Air Force) and Elbert “Big Man” Howard (Air Force). They were soon joined by military veterans like Bobby Bowens (Army), Roosevelt “June” Hilliard (Air Force), Valentine Hobbs (Army), Geronimo Pratt (Army), John Seale (Air Force), John Sloane (aka John Sloan) (Army?), Mark Teemer (Marines), Robert Webb (Air Force), Randy Williams (Army), and Landon Williams (Army). For some important articles regarding active duty military personnel, see “Letter from a Black Soldier” (1968); “Black Soldiers Revolt” (1968); Lewis (1968); Seale (1968); “Black Marines Die” (1968); “U.S. Servicemen” (1968); Chatman (1969); “Brass” (1969); “The Black People” (1969); GI’s Civil Liberties Committee (1969); “An Interview with a Black G. I.” (1969); “Black GI’s Fight” (1969); “G.I.’s Refusing to Oink Lie” (1969); The GI Student Union (1969); Baltimore Chapter (1969); “The Second Front” (1969); A.D., 354th Combat Support Group (1969); R. P. (1969); Southern Conference Educational Fund (1969); “Vet of Nam and Danang” (1969); “Star Spangled Sweatshops” (1969); “GI’s Switch Sides in Vietnam” (1969); An Ex GI (1969); “GI Discrimination” (1969); White (1969); “ASU Supports B.P.P.” (1969); “Black Draft Resister” (1969); “From a GI” (1969); “Ft. Dix Repression” (1969); “Case of the Presidio 27” (1969); “G.I. Sentenced” (1969); Stapp (1969); Bryan (1969); The Richard Chase Defense Committee (1969); “GI’s Fed Up” (1969); “You’re Out There,” (1969); “One of 300,000 Victims” (1969); “Union Busting” (1969); Wade (1969); Scott (1969); GI Civil Liberties Def Com. (1969); “Military Pigs” (1969); Eldridge Cleaver (1969); Anderson (1969); Hightower (1969); American Servicemen Union (1969); “Wisconsin’s Anti-Draft Prisoners” (1969); “Black Marines Appeal” (1969); Seale (1969b, 1969c); “Draft Cases” (1969); “Gung-Ho Fascist” (1969); Frenchy (1969); Draznin (1970); Evans (1970); Tabor (1970); The Green Machine (1970, 1971); “In Two Years Randy Williams” (1970); Boston Chapter (1970); “Eyewitness Account” (1970); “Portsmouth” (1970); G.I. Civil Liberties Defense Committee (1970); “Appeal Filed” (1970); “Young Lords Barred” (1970); “Charges Dropped on Marine” (1970); Green (1971); “Fragging Officers” (1971); Winter Soldier (1971); Crumb (1971); Reney (1971); Wheeler (1971); Juan Farinas Defense Committee (1971); Committee to Defend the Ft. Hamilton GIs (1971). See Eldridge Cleaver (1968) for an important work by a former prison
inmate who joined the Black Panther Party and became an important leader as the Minister of Information. For an important work by a former blue-collar worker who joined the Black Panther Party and became an important leader as the Chief of Staff, see Hilliard and Cole (1993).

27. Jimmy Garrett and other students at San Francisco State created a coalition of student groups from various racial and ethnic groups known as the Third World Liberation Front. Students, who belonged to the Third World Liberation Front, helped to mount the strike at San Francisco State in a dynamic fashion. See “San Francisco State Strike” (1969) for a list of five demands issued by the Third World Liberation Front to the San Francisco State Administration in support of the 10 demands issued by the San Francisco State Black Students Union to the San Francisco State Administration. On both lists, one of the items was the demand that George Murray be retained in his teaching position at San Francisco State. For evidence that Merritt College students supported the strike by students at San Francisco State, see “Smith Promises” (1968); “Dr. Smith Deplores” (1968); Bailey (1968); Appleton (1969); and “‘Solidarity’” (1969). During 1969 and 1971, there was student unrest at Merritt College similar to San Francisco State. See “Barricade” (1969), “Militants Win Concessions” (1969); “Students Invade” (1971); “Cops Swoop In” (1971); “Merritt College Remains Shut” (1971); “Strife-torn Merritt May Open Soon” (1971); Mitchell (1971a, 1971b); Maggy (1971); “Miranda” (1971); “Merritt College Turmoil” (1971); “Merritt’s Black Faculty” (1971); and By 1969, Newsweek went so far as to declare that Merritt College was a key center of Black militancy. See “This Course” (1969) and “Merritt Center” (1969).

28. Biondi (2012) has written that, “Hayakawa had fired Nathan Hare in February after Hare and several students disrupted a speech in which Hayakawa was boasting of the recent mass arrest and claiming victory. Hare was never reinstated, never had the opportunity to build the department he had envisioned, and feels he was blacklisted from future employment in the state college system because of his strike activities” (p. 73). In addition to the report by Hare (1969), Orrick (1969) reprinted a number of contemporary reports about the strike by Phil Garlington, Jr., a writer for the San Francisco Examiner. In one of those reports, Garlington (1969b) stated that, “Hayakawa says his decision to fire Nathan Hare as chairman of the Black Studies Department still stands. Likewise for George Murray, Black Panther--ex-English teacher serving six months for parole violation” (p. 26). Garlington (1969a), in another report released two days earlier, quoted Hayakawa as saying that: “A portion of the recent dispute concerns personnel matters. My position is that the decisions announced by the administration in recent weeks will stand. None of this is altered by virtue of the recommendations in the agreement between the select committee and the student group. Dr. Hare’s contract expires in June, as already announced. George Murray’s contract has expired” (p. 4).

29. Biondi (2012) has reported that, “George Murray, the former Black Panther minister of education and San Francisco State strike leader, who had entered Stanford as a graduate student after his release from jail, was the first principal of Nairobi High School” (p. 222). Bloom and Martin (2013) have asserted that, “As part of Murray’s sentence, he was ordered to resign from the Black Panther Party and to refrain from ever appearing or enrolling in an educational institution again without explicit permission from the court. With his mother, wife, and newborn child with him in court, Murray agreed, and he dropped completely out of politics” (p. 283).
Before his resignation from the Black Panther Party and after the start of the strike, Murray (1969) wrote an important opinion piece for *Rolling Stone*. For some important articles or news items written about or by him in *The Black Panther*, see Murray (1968a, 1968b, 1968c, 1968d, 1968e, 1969b); “Minister of Education Returns from Cuba” (1968); “Panthers--B.S.U. Get It Together,” (1968); “Late News Briefs,” (1968); “George Murray Keeps Position,” (1968); “Untitled Article on George Murray,” (1968); “Pig Power Struggle,” (1968); “San Francisco Strike,” (1968); Goodwin (1969); and Collins (1969). For important articles about Murray leaving the Black Panther Party and going into the church, see “A Panther’s Religious Renewal” (1969) and Muller (1969).

30. Nathan Hare joined together with Robert Chrisman and created *The Black Scholar*, a very important journal with a focus on Black arts and letters. Later, Nathan Hare and his wife Julia Hare developed the Black Think Tank, which also served as a counseling center and publisher. One of the many important books they wrote together is titled *Bringing the Black Boy to Manhood* (Hare & Hare, 1985). The papers of Nathan Hare and Julia Hare can be found at the Bancroft Library at the University of California, Berkeley. See Hare and Hare (2014). For three important articles about the problems of Nathan Hare at San Francisco State, see “Hare Must Not Leave” (1969); Greenlee (1969); and “Hayakawa Battling Protests” (1969). For his criticism of the faculty union at San Francisco State, see Hare (1969b). He went so far as to refer to it as a “sellout” (p. 14).

31. At San Francisco State, Murray made his contribution as a leader of the protestors during the strike; Williams made his contribution as a protestor during the strike; Williams made his contribution as a protestor during the strike; Simon made her contribution as a protestor during the strike; Mitchell made her contribution as a protestor during the strike; and Clarence Thomas made his contribution as a leader during the strike.

32. Benny Stewart (personal communication, June 7, 2016), the chair of the Black Studies Department during the strike at San Francisco State, has informed me that those five Black Panthers were deeply involved in the affairs of the Black Students Union from November 1968 to March 1969. Stewart stated to me that he was never a member of the Black Panther Party. However, Benny Stewart said to me that, at one time, he was the chair of the National Advisory Committee of the Black Panther Party and he worked on the Free Breakfast Program of the Black Panther Party. He described himself to me as a supporter of the Black Panther Party. Stewart told me that he attended San Francisco State from September 1966 to June 1970.

33. For the beginning and ending dates of the Fall 1969 Semester at San Francisco State, see its *Class Schedule and Information September 22, 1969--January 23, 1970* (San Francisco State, 1969). According to that document, it began on September 22, 1969 and ended on January 23, 1970. The document is located in the San Francisco State University J. Paul Leonard Library Special Collections/Archives. Further, Streeter (1968) has informed us that, “Merritt just last Friday authorized an autonomous department. It starts operating next January” (p. 8). Streeter made that statement in an article he published on November 24, 1978. Charlotte Smith (personal communication, June 6, 2016), an official in the Peralta Community College District’s Admissions and Records Office, informed me there that the official records indicate that the beginning and ending dates of the Winter 1969 Quarter at Merritt College were January 8, 1969 and March 8, 1969. She also informed me that the official records indicate that the beginning and ending dates of the Winter 1968 Quarter at Merritt College were January 4, 1968 and March 22, 1968; the beginning and ending dates of the Spring 1968 Quarter at Merritt College were
April 3, 1968 and June 20, 1968; the beginning and ending dates of the Summer 1968 Quarter at Merritt College were July 2, 1968 and August 9, 1968; the beginning and ending dates of the Fall 1968 Quarter at Merritt College were September 19, 1968 and December 13, 1968; the beginning and ending dates of the Spring 1969 Quarter at Merritt College were April 9, 1969 and June 27, 1969; the beginning and ending dates of the Summer 1968 Quarter at Merritt College were July 8, 1968 and August 14, 1968; and the beginning and ending dates of the Fall 1969 Quarter at Merritt College were September 19, 1969 and December 12, 1969. For reports in the campus newspaper about the emergence of Afro-American Studies Department at Merritt College, see Wesson (1968); “Smith Seeks Change” (1968); Bailey (1968); Appleton (1968, 1969); Heide (1968); Heider (1968); Hoye (1969); “Merritt Center” (1969); and “Faculty for Credential” (1969).

Abstract

This paper focuses on Black social movements past and present with special reference to the Black Arts Movement and the Hip Hop Movement. It examines the Black Arts Movement as a social movement which emerged during the mid-1960s and lasted until the mid-1970s. It also examines the Hip Hop Movement as a social movement which emerged during the early 1970s and has lasted to the present. This paper presents a comparative analysis of both social movements and identifies their goals, ideologies, organization and status systems, and tactics. The comparative analysis also includes an examination of both movements’ internal development in the form of the incipient phase, organizational phase, and stable phase. Likewise, the comparative analysis includes an examination of both movements’ external development in the form of innovation, selection, and integration. In addition, this paper addresses some implications of the Black Arts Movement and the Hip Hop Movement as social movements. In this study, a mixed methods approach has been employed, including the comparative historical method, participant observation, and a survey. The research techniques include direct observation, interviews with people involved in the two movements, and content analysis of primary and secondary source documents.

Introduction

During the 20th century in the United States of America (USA), Black people developed a host of social movements to address social problems they faced. In the first 25 years of the century, Black people developed the Pan-African Movement, Niagara Movement, National Association for the Advancement of Colored People (NAACP), Moorish Science Temple of America, New Negro Movement, Universal Negro Improvement Association (UNIA), African Blood Brotherhood for African Liberation and Redemption, and Harlem Renaissance as social movements. Between 1926 and 1950, Black people developed the Nation of Islam, Congress of Racial Equality (CORE), Council on African Affairs, and Peace Information Center as social movements. The period between 1951 and 1975 saw Black people develop social movements such as the

This paper will focus on Black social movements past and present with special reference to the Black Arts Movement and the Hip Hop Movement. It will examine the Black Arts Movement as a social movement which emerged during the mid-1960s and lasted until the mid-1970s. It will also examine the Hip Hop Movement as a social movement which emerged during the early 1970s and has lasted to the present. This paper will present a comparative analysis of both social movements and identify their goals, ideologies, organization and status systems, and tactics. The comparative analysis will include an examination of both movements’ internal development in the form of the incipient phase, organizational phase, and stable phase. Likewise, the comparative analysis will include an examination of both movements’ external development in the form of innovation, selection, and integration. In addition, this paper will address some implications of the Black Arts Movement and the Hip Hop Movement as social movements.

As used here, the term social movement refers to an organized collective effort by a group of people to address a social problem. This definition of a social movement draws on the insight of Theodorson and Theodorson (1969) and Jary and Jary (2000). Theodorson and Theodorson have said that a social movement involves an “important form of collective behavior in which large numbers of people are organized or alerted to support and bring about or to resist social change” (p. 390). Jary and Jary have stated that a social movement is “any broad social alliance of people who are associated in seeking to effect or to block an aspect of social change within a society” (p. 575).

The term social problem, as used here, refers to a social condition which (1) affects large number of people; (2) threatens the values of an influential group of people; and (3) can be solved through collective action. The definition of a social problem draws on the insight of Theodorson and Theodorson (1969), Jary and Jary (2000), Ladner (1973), Lauer (1976), Glynn, Hohm, and Stewart (1996), Loseke (2003), and Spector and Kitsuse (2000). Theodorson and Theodorson have related that a social problem is any “undesirable condition or situation that is judged by an influential number of persons within a community to be intolerable and to require group action toward constructive reform” (p. 392). Jary and Jary have noted that a social problem involves “aspects of social life seen to warrant concern and intervention” (p. 577).

All social movements have an ideology. As used here, the term ideology refers to a set of ideas and norms that can be used as the guiding philosophy of a group of people. This definition of an ideology draws on the insight of Theodorson and Theodorson (1969), Jary and Jary (2000), Pinckney (1976), and Alkalimat (1973). Theodorson and Theodorson have defined an ideology in the following manner: “A system of interdependent ideas (beliefs, traditions, principles, and myths) held by a social group or society, which reflects, rationalizes, and defends its particular social, moral, religious, political, and economic institutional interests and commitments” (p. 195). Jary and Jary have defined an ideology as “any system of ideas underlying and informing social and
political action” (p. 289). Writing in 1975, Pinckney informed us that the “ideology of black nationalism is widespread among a significant segment of America’s black community” (p. 1).

**Review of the Literature**

In the discipline of sociology, social movements have long been the subject of scholarly discussion. Since 1973, the American Sociological Association has maintained a section on social movements. Thus, social movements have been a key topic of discussion at American Sociological Association conferences. It has also been a key topic of discussion at Pacific Sociological Association conferences, California Sociological Association conferences, and those of other organizations.

During the middle of the 20th century and the turn of the 21st century, several classic books were published on the systematic study of social movements. Heberle (1951) sought to present a general theory of social movements. He informed us that, “The main criterion of a social movement . . . is that it aims to bring about fundamental changes in the social order, especially in the basic institutions of property and labor relationships” (p. 6). Heberle posed that “it may be claimed that the study of social movements was one of the origins of sociology” (p. 3). In a similar fashion, King (1956) argued that social movements “constitute a significant subject for sociology” (p. v). He proceeded to identify some elements of a social movement, including goals, ideology, organization and status systems, and tactics. King also identified social movements’ internal development in the form of the incipient phase, organizational phase, and stable phase and the external development in the form of innovation, selection, and integration. Cameron (1966) informed us that, “A social movement occurs when a fairly large number of people band together in order to alter or supplant some portion of the existing culture or social order” (p. 7). Cameron emphasized that it is important to understand the background of a given society as well as the purposes and actions of a social movement in it. As examples in his book, Cameron looked at the Nation of Islam as a social movement and the Civil Rights Movement as a social movement.

Between the year 2000 and the year 2013, the literature on social movements in the USA continued to grow. Some of the literature covered social movements among the Black population, including the Black Arts Movement and the Hip Hop Movement. Some of the important primary source books related to the Black Arts Movement were written by Karenga (2007), Ahmad (2008), Salaam (2009), Perkins (2009), and Marvin X (2009). Among the important secondary source books, which appeared between 2000 and 2013, were those written or edited by Gabbin (2004), Clarke (2005), Sell (2005), Smethhurst (2005), Collins and Crawford (2006), Douglas (2008), Reeves (2008), Robson (2008), and Phelps (2013).

Because of their in-depth studies of the Hip Hop Movement under guest editors, two special issues of the *Journal of African American Studies* and the *Journal of Hip Hop Studies* have been selected for a relatively more detailed examination. During the summer of 2005, the *Journal of African American History* released a special issue on “The History of Hip Hop.” In a thoughtful introduction to the special issue, Aldridge and Stewart (2005) unabashedly state that Hip Hop has been “commodified by what Frankfurt School theorists Max Horkheimer and Theodor Adorno called ‘the culture industry,’ which has distributed Hip Hop to the masses in ways that reinforce historical stereotypes about African Americans by highlighting sexist, misogynistic, and nihilistic lyrics and images” (p. 193). Aldridge and Stewart also assert that the five essays in the special issue “offer complex interpretations of Hip Hop that often defy and challenge the negative images promulgated by mainstream commercial media” (p. 193). Authors of the five essays include Stewart (2005), Aldridge (2005), Phillips, Reddick-Morgan, and Stephens (2005), Cheney (2005b), and Dagbovie (2005). On the upside, Aldridge and Stewart set the tone for the special issue by delineating four fundamental elements of Hip Hop, namely disc jockeying (Djing), break dancing, graffiti art, and rapping (emceeing). On the downside, they made one reference to the infamous term “Hip Hop culture.”

J. B. Stewart (2005) led off the special issue with a comparative analysis of political commentary in R & B (rhythm and blues) and Hip Hop songs. He developed a typology of political commentary types to examine R & B songs. The political commentary types included (1) Documentary; (2) Jeremiad; (3) All God’s Children Declaration; (4) Defiant Challenge; (5) Awareness Raising Self-Criticism; (6) Collective Self-Help Solution; (7) Confrontational Declaration; (8) Revolutionary Manifesto; and (9) Spiritual Transcendence Exploration. During his analysis of the political commentary of R & B songs, Stewart looked at the lyrics of Curtis Mayfield, Sam Cooke, Stevie Wonder, Roberta Flack, Donny Hathaway, Marvin Gaye, James Brown, Bobby Womack, Sly Stone, Maurice White, George Clinton, and Gil Scott-Heron.

For J. B. Stewart (2005), the social conditions in the USA during the 1980s forced R & B artists and the emerging Hip Hop artists to grapple with “worsening social problems, including high unemployment, police brutality, incarceration, inadequate public schools, political apathy, and dysfunctional behaviors that perpetuate oppression” (p. 218). Stewart credited the early Hip Hop of Grandmaster Flash and the Furious Five, especially their song “The Message,” with being a link between the past and the future. He explained, “While the lyrics are articulated in a classic Hip Hop spoken word cadence, the background music infuses both traditional R & B and Funk elements” (p. 219). Stewart added: “The song contains the type of graphic description of oppressive conditions found in the best Blues and R & B commentaries, and issues the type of subtle warnings to external audiences found in some of the more assertive R & B commentaries” (p. 219). He reminded us that Hip Hop originated as “a form of mass expression, largely unfettered by corporate attachments, fueled by the harsh realities of inner-city life” (p. 219). However, Stewart admits that Hip Hop changed with the times and has regaled in the “rebirth of dysfunctional and denigrating imagery propagated through blaxploitation in both films and music videos” (p. 220). Stewart closes on a
hopeful note by expressing that there is “the liberatory potential of Hip Hop” (p. 221). He pointed to the Stop the Violence initiative, Get Out the Vote initiative, and the development of foundations by Hip Hop artists.

Aldridge (2005) has presented the argument that Hip Hop has three types of rap artists. One type is the socially and politically conscious rap which focuses on the social, economic, and political situation of oppressed people (e.g., Black people). A second type is party rap which focuses on providing a dance groove. A third type is gangster rap (aka gangsta rap) which focuses on illegal activity including the promotion of killing people, drug dealing, prostitution, and gang banging. In the view of Aldridge, the outlook of scholars like Martin Kilson and others has been clouded by socially and politically conscious rap receiving less airplay in mainstream media outlets than party rap and gangster rap. Aldridge states that socially and politically conscious rap has been created by Public Enemy, Sister Souljah, KRS-One, MeShell Ndegecello, Goodie Mob, The Coup, Blackalicious, Jurassic 5, Kanye West, dead prez, Mr. Lif, Mos Def, Immortal Technique, Hieroglyphic, and Ms. Dynamite. He has credited those artists with offering “cogent analyses and commentary on race, poverty, and discrimination” (p. 227). For Aldridge, these artists have built on the ideas and ideology of the Civil Rights Movement and what he has termed the Black Freedom Struggle. Aldridge also informs us that socially and politically conscious rap artists, like the other two types, have delivered their messages by using imaging, sampling, and scratching.

According to Aldridge (2005), Hip Hop has taken these four main ideas from the Civil Rights Movement and that he has termed the Black Freedom Struggle: (1) self-determination; (2) liberatory education and pedagogy; (3) economic solidarity and entrepreneurship; and (4) Pan-African Connection. Aldridge associates self-determination as an idea with Mos Def and others. He connects liberatory education and pedagogy as an idea with KRS-One, Sister Souljah, and others. Aldridge associates economic solidarity and entrepreneurship as an idea with dead prez, KRS-One, The Coup, Hieroglyphic, Public Enemy, Mos Def, and others. He connects the Pan-African connection as an idea with Michael Franti, KRS-One, Ms. Dynamite, and others. On the one hand, Aldridge has surmised that “the civil rights generation must seek out and connect to the Hip Hop generation and recognize their similar and divergent views” (p. 248). On the other hand, he has written that, “The Hip Hop generation, in turn, must continue to seek knowledge and information about their social circumstances within the context of the larger BFS. Members must also critique their actions by promoting positive messages to youth and helping ameliorate the problems of their generation” (p. 248).

Following Bakari Kitwana, Aldridge (2005) states that the term Hip Hop generation refers to those people who were born between 1965 and 1984 and who identify with the movement. He believes that when the civil rights generation and the Hip Hop generation heed the aforementioned concerns they will have the collective strength to take on the discrimination, racism, and poverty faced by the Black population in the USA. A key problem Aldridge left out for the Hip Hop generation is the commodification problem and cooptation problem its members face from Wall Street and Madison Avenue. For better or worse, socially and politically conscious rappers may feel compelled to use the N-word and B-word to sell records for Wall Street and Madison Avenue. For example, very few of the rappers he listed in the socially and politically conscious have had a record listed on the Billboard Charts between 2009 and 2013. To his credit, Aldridge
refrained from referring to Hip Hop as a culture in and of itself. Instead, Aldridge (2002) is on record for calling Hip Hop a social movement as he well should have.

Phillips, Reddick-Morgan, and Stephens (2005) posed that women have had a dually oppositional stance in Hip Hop. They took the position that the dually oppositional stance has (1) enabled Black women and Latino women to critique the sexism of men in their racial and/or ethnic group; (2) permitted Black women and Latino women to have solidarity with the men in their racial and/or ethnic group when it came to critiquing and struggling against the racism, classism, and sexism flowing from the dominant group and mainstream society; and (3) permitted Black women and Latino women to critique and challenge the feminism of White females from the dominant group and mainstream society, including academic feminism. As might be expected, they eschewed what they termed misogyny in the lyrics of many rappers. A case in point is the obstentious use of the B-word. However, Phillips et al., seem to ignore the fact that the B-word has been used as a term of endearment by girls and women in the Hip Hop Movement.

Women, according to Phillips et al. (2005), have been involved with the Hip Hop from the outset. They pointed to Sharon Jackson, also known as Sha-Rock, as one of the first female rappers. She was dated as having appeared with Kool Herc as early as 1976. Jackson later joined the Funky 4 + 1 More and was present when the group became the first rap act to be featured on the television show Saturday Night Live. Phillips et al. report that the first females to release a rap record were Paulette Tee and Sweet Tee. Their single, Vicious Rap, was released in 1978. Other females involved with Hip Hop during the early days and identified by Phillips et al. were Lady B, Sylvia Robinson, Sylvia Rhone, Cheryl the Pearl, Blondie, MC Angie B (Angie Stone), Queen Lisa Lee, Teena Marie (Lady Tee), Debbie Harris, Monica Lynch, Brenda K. Starr (Real Roxanne), Sparky D, Salt, Pepper, MC Lyte, and Roxanne Shante. They were later joined by Sister Souljah, Ms. Melodie, Yo-Yo, Mary J. Blige, TLC, Da Brat, Mia X, Lady of Rage, Lil’ Kim, Foxy Brown, Trina, Eve, Queen Latifah, Lauryn Hill, Erykah Badu, and Missy Elliott. Phillips et al. have credited such women in Hip Hop with talking back to men in defense of women and demanding respect for women; advocating women’s empowerment, self-help, and solidarity; and advocating the defense of Black men against the larger society. They seemed to ignore the fact that those women, at times, have also disrespected other women and advocated nihilism and criminal behavior. In addition, Phillips et al. also made the mistake of referring to Hip Hop as a culture in and of itself instead of a social movement.

Cheney (2005b) focused on what she calls the “Golden Age of Rap Nationalism” which she dates from 1988 to 1993. She took the position that the period started in 1988 with Public Enemy’s It Takes a Nation of Millions to Hold Us Back and came to a close in 1993 with Ice Cube’s Lethal Injection. During that period, according to Cheney, rap artists used their songs to articulate Black nationalist ideas. Cheney identifies Black nationalism as a social force which involves emigration and internal statism as well as anti- and non-emigration. She posits that her position on Black nationalism follows scholarship that has the phenomenon going “beyond the nation-state configuration to be comprehensive enough to include its cultural manifestations” (p. 280). Whereas Cheney praised some aspects of the Black nationalist pronouncements among rappers, she took them to task for using what she deemed sexist language or anti-homosexual language.
Cheney closed her article by urging heterosexual Black men in the Hip Hop to “address their own gendered oppression, redefine the masculine ideal, and learn to love themselves and their communities without fear or anxiety” (p. 295).

Dagbovie (2005) addressed the relationship between what he termed the Hip Hop generation and Black history. He also self-identified as a Hip Hop generation historian. Dagbovie posed that Hip Hop generation historians need to make a mark in the history discipline, produce scholarship, and get involved in the debates that pertain to the functions of Black history. He stated that discussion of the relationship between the Hip Hop generation and Black history is guided by a premise that “Hip Hop culture is the single most widespread preoccupation among today’s African American and African diasporan youth” (p. 300). Dagbovie also posed that Hip Hop has “the potential to play an important role in rejuvenating the modern black history movement” as well as the “generation’s cultural and historical consciousness” (p. 300).

Whereas Aldridge (2005) focused on the relation between the Hip Hop generation and the Civil Rights Movement generation, Dagbovie (2005) looked at the relation between the Hip Hop generation and the Black Power Movement generation. Following Bakari Kitwana, Dagbovie wrote that he agrees with the view that “one of the greatest problems facing the Hip Hop generation is the fact that we have abandoned the positive cultural values held by our parents, elders, and ancestors” (p. 303). Dagbovie continued: “We have exchanged what Elijah Anderson has called ‘old head’ values for ideals promoted by a capitalistic, individualistic, and racist society” (p. 303). He was right on point about that matter, but wrong in calling Hip Hop a culture.

In 2014, the Journal of Hip Hop Studies was launched under the auspices of North Park University. The initial issue featured five articles by Harris (2014), Livingston (2014), Engels (2014), Long (2014), and Chaney and Mincey (2014). In their introduction for the issue, as the editors, Miller, Hodge, Coleman, and Chaney (2014) spent considerable space referring to Hip Hop as a culture. However, of the five featured articles, only two refer to Hip Hop as a culture.

Harris (2014) focused on a Christian rapper by the name of Lecrae Moore, who goes simply by his first name Lecrae. He argues that Lecrae, a rapper who publicly identifies as a Christian, has unfairly been overlooked. Harris posits that Lecrae has sought to create a bridge between the sacred sphere and the secular sphere. For his analysis of Lecrae, Harris reported that he utilized the lyrics of Lecrae, interviews of Lecrae on a number of mainstream Hip Hop websites, social media, and videos of Lecrae on YouTube. In his discussion, Harris referred to Hip Hop as a culture.

Livingston (2014) traced the African oral tradition from ancient Egypt to inner-city New York and Los Angeles. He poses that the modern sounds of Hip Hop artists like Kendrick Lamar can be traced back to the legendary muses of ancient Egypt. In his own case, Harris informs us that he was standing on the shoulders of Harriette Mullen, Elaine Richardson, Mark Gottdiener in his attempt to link Hip Hop to ancient Egypt through what he calls an “African-centered semeiotic context” (p. 39). Surprisingly, he contends that Hip Hop artists are the continuation of a cultural ethos that rose thousands of years ago. If that is the case, Lamar and his fellow rappers represent a regression not a progression. Given that rappers like Kendrick Lamar revel in calling themselves the N-word and their women the B-word, it is highly unlikely that they will ever reach the level
of ancient poets like Ahkenaton. Livingston, in his discussion, referred to the Hip Hop Movement as a culture.

Engels (2014) explored cultural and economic circumstances that gave birth to the Hip Hop Movement’s gangster rap phenomenon and Hollywood’s Blaxploitation Cinema phenomenon. He argues that there were inherent similarities between the two phenomena. In the view of Engels, the two phenomena both relied on place, setting, myth, and folklore. These aspects of the Black experience were then used to create cultural relevance for Black audiences in the USA. For Engels, the reactions of Black people to the two phenomena have played a crucial role in the establishment of a mainstream cultural identity for Black people. To a certain extent, Engels overlooks how the two phenomena have created and maintained stereotypes of Black people. He also overlooks another crucial fact. Whereas the Blaxploitation Cinema phenomenon glorified Black people killing White people, the gangster rap phenomenon of the Hip Hop Movement has glorified Black people killing Black people. In his discussion, Engels did not refer to the Hip Hop Movement as a culture.

Long (2014) presented an analysis of two urban artists, namely Tyler the Creator and BANKSY. According to Long, Tyler the Creator is a Black rapper “born and raised in Ladera Heights, a middle-class Los Angeles neighborhood” and BANKSY is a “white European graffiti artist.” Whereas Tyler the Creator hails from the USA, BANKSY comes from Bristol, England. Long asserted that the works of those two urban artists reflect disillusionment and nihilism which are spreading from the inner cities to new frontiers. He believes that the implications of the nihilistic mindset need to be understood. Long warned that the nihilistic mindset is based on the rejection of higher values (e.g., the rejection of law and religion), devaluation of life and property, and a loss of hope in one’s surroundings. He has also explained that Tyler the Creator and BANKSY have a large audience after gaining fame and recognition through websites. Long, in his discussion, did not refer to the Hip Hop Movement as a culture. However, Long did refer to it as a subculture.

Chaney and Mincey (2014) conducted a qualitative content analysis of R&B and Hip Hop songs. Using phenomenology as a theoretical foundation, Chaney and Mincey looked at lyrics of 79 R&B and Hip Hop songs. The songs were drawn from the years 1956-2013 and each appeared on the Billboard chart. Chaney and Mincey state that they used Billboard Chart Research Services to select the songs for their analysis. In their study, Chaney and Mincey sought to examine the ways some Black male artists expressed sensitivity. Their analysis of the lyrics showed that Black male sensitivity in R&B and Hip Hop fell into a typology based on the following four dimensions: Private Sensitivity; Partnered Sensitivity; Perceptive Sensitivity; and Public Sensitivity. Chaney and Mincey explained that Private Sensitivity reflects “when the Black male is alone; feels lonely; disguises or hides his tears from his romantic partner or others; and expresses a determination to not cry and/or continue crying” (p. 121). They said that Partnered Sensitivity happens “when the Black male encourages and/or connects with his romantic partner, other men, and/or members of the Black community through crying” (p. 121). Chaney and Mincey say that Perceptive Sensitivity say takes place “when Black men acknowledge the tears shed by others, and shed tears themselves while being conscious of society’s expectation that men suppress emotion and/or refrain from crying” (p. 121). They state that Public Sensitivity reflects “when the Black male cries publicly
and verbally expresses that he does not care what others think of him” (p. 121). Chaney and Mincey report that, “Private Sensitivity was demonstrated in 44 songs (56%), Partnered Sensitivity was demonstrated in 11 songs (14%), Perceptive Sensitivity was demonstrated in 12 songs (15%), Public Sensitivity was demonstrated in 11 songs (14%); and one song (1%) represented the partnered, perceptive, and Public Sensitivity theme” (p. 121). Chaney and Mincey, in their discussion, did not refer to the Hip Hop Movement as a culture.

**Black Arts Movement as a Social Movement**

**Goals**

King (1956) has informed us that the goals of social movements are the objectives toward which the activities are directed. As a whole, the Black Arts Movement developed some key four goals. One goal was to promote social change at the macro, middle, and micro levels of analysis. A second goal was to provide a forum for people to engage in the production of poetry, essays, plays, art, music, etc. A third goal was to develop institutions for the benefit of the masses. A fourth goal was to function as a revolutionary social force in the belly of the beast.

**Ideology**

As a set of ideas and norms, the ideology of the Black Arts Movement reflected two major aspects. The Black Arts Movement was a bastion and citadel of Black nationalism and changing the existing social stratification system. It was also a threat to Wall Street and Madison Avenue. Some of the leaders of the organizations providing energy to the Black Arts Movement had their ideas about Black nationalism, social change, and various arts examined in the pages of the *Life, San Francisco Chronicle, San Francisco Examiner, Sacramento Bee, Oakland Tribune, Wall Street Journal, Newsweek,* and other mainstream periodicals. This occurred early in the history of some organizations as media outlets sought to assess a perceived threat.

During the height of the Black Arts Movement, many Black writers made a conscious attempt to avoid establishing contracts with White publishing houses. Instead, they sought to develop Black controlled periodicals and publishing houses that were independent of White capitalists. This attitude was exemplified in an important essay by
Toure (1968a) titled “The Crises of Black Culture” which was published in The Journal of Black Poetry. Within that essay, Toure made the following statement:

. . . we Black writers must produce more literary journals. It’s a shame that our main journals—Soulbook, Black Dialogue, Journal of Black Poetry—are all located on the West Coast! There should be some kind of regular literary publication representing each area—East Coast, Mid-west, South, and West Coast—as well as publications geared for national and international circulation. The writers in each region should make it their responsibility to organize workshops to train young thinkers and writers in Black Consciousness and New Black writing. Presently we are organizing this for Black Dialogue. (More than likely, we’ll become more organized and develop these things as our movement matures and as we gain more confidence in deciding just what we’re really proposing to accomplish.) All magazines having to do with Rhythm and Blues, Country Blues, etc., are in white hands. (p. 5)

For Toure, it was imperative that Black people establish Black-controlled periodicals and publishing houses across the USA.⁴

A second important statement occurred as a result of the Third Annual Black Power Conference. The conference was coordinated by Amiri Baraka, then LeRoi Jones, and held in Philadelphia, Pennsylvania. After a creativity workshop at the conference, the participants issued a “report and resolution.” Among other things, the participants of the creativity workshop called for the creation of a National Publishing House to be subsidized by “existing negro publishing and Black Front foundation finances, until it is established as a National Educational Cooperative” (“The 3rd Annual Black Power Conference,” 1968, p. 7).

A third important statement appeared in Black Theatre #5 some three years later. That statement warned Black writers to be leery of White-controlled publishing firms—especially 3M. It read:

The 3M Company, a corporation of totally unscrupulous beasts is on a “Black Is Profitable (and dumb)” rampage. They have just written Black Theatre magazine along with several other artists and writers from the Black community for unconditional all-encompassing rights to our writings, paintings, etc., while offering us payment which must have come out of their petty cash box. They have recently distributed several new books which are really photo copies of old books by now dead Black authors. (We don’t know how much money these dead Black folks’ families made off the deal but if 3M holds true to form we’re sure they didn’t treat these dead Brothers any better than they are treating the lives ones.) Several years ago they tried all kinds of maneuvers to get to copy all of the material kept at the Schomberg (Library) Collection in Harlem (one of the most thorough and beautiful and totally BLACK libraries in the world). But Harlem people refused to let them in. O.K. Let’s stay together, Black people. (“Hatari,” 1971, p. 10)
Of course, there were some Black writers who did seek and out and receive contracts from White controlled publishing houses connected with White capitalists. Nevertheless, even after the demise of the Black Arts Movement, a critical mass of Black writers has retained the notion that Black people should develop Black controlled publishing houses and periodicals.

**Organization and Status System**

The organization and status system of the Black Arts Movement were driven by its members and the social conditions they faced. The two types of members involved with the Black Arts Movement included personnel and functionaries. Personnel consisted of those members with sporadic participation and who did not have specialized roles. Functionaries were composed of those members with persistent participation and who did have specialized roles. The three types of functionaries that emerged in the Black Arts Movement were (1) the leader, (2) the bureaucrat; and (3) the agitator.\(^5\)

The leader played the role of founder or successor to the founders. The people serving as leaders appeared to outsiders and personnel as being the catalysts behind the Black Arts Movement’s distinctive policies and objectives. The bureaucrat had predominately administrative activities with either high or low status. Those people serving as bureaucrats with high status were policy-makers. They had the responsibility of efficiently operating the internal machinery. In contrast, those people serving as bureaucrats with low status had the responsibility of handling routine paperwork and implementing policy and major decisions that came from above. The agitator played the role of the liaison between the Black Arts Movement and the outside world. Those people serving as agitators had the chief function of being involved with promotion or proselytizing. As promoters, they furthered the goals of the Black Arts Movement with publicity tactics, propaganda tactics, lobbying tactics, legal sanctions tactics, etc. In the role of proselytizers, they functioned as missionaries with the objective of converting outsiders into members.\(^6\)

**Tactics**

King (1956) has defined tactics as “activities and policies of a movement which are directed at the ‘outside world’” (p. 36). They pertain to “the means by which attainment of goals is directly attempted and by which new members are ultimately brought into the fold” (p. 37). The Black Arts Movement sought to bring as many members into the fold as possible. It sought to transform itself as a mass movement. However, it had a formidable enemy in the COINTELPRO (Counterintelligence Program) developed by the FBI (Federal Bureau of Intelligence). A key tactical blunder of the Black Arts Movement was its inability to control the flow of undercover FBI agents, agent provocateurs, and informants into various organizations. The undercover FBI agents, agent provocateurs, and informants were directed by COINTELPRO to spy on members and to disrupt the normal flow of operations (Cromartie, 2013c).
**Internal Development**

In terms of internal development, King (1956) has reported that social movements have careers that are developed in response to social conditions. Within that context, social conditions “stimulate personal discontent which may become manifest as social unrest” (p. 40). Some of those social conditions identified by King include heterogeneity, cultural confusion, and mass communication. In the case of Black people in the United States of America, those social conditions also include social and economic inequality based on police brutality, racial discrimination in hiring practices, racial discrimination in the criminal justice system, and health disparities. As it sought to respond to those conditions with different types of artistic modes, the Black Arts Movement passed through three major phases, namely the incipient phase, organizational phase, and stable phase.

**Incipient Phase**

King (1956) has pointed out that the incipient phase “is one which is only recognized and defined in retrospect” (p. 42). He has noted that the incipient phase “begins when the individual or individuals chiefly responsible for the inception of a movement become conscious of this possibility” (p. 42). The Black Arts Movement emerged in 1964 with beachfronts in two main areas: the New York City area and the San Francisco-Oakland Bay Area. The New York City area was the location where Amiri Baraka and others developed the Black Arts Repertory Theater/School. Neal (1968) has informed us that:

In the spring of 1964, LeRoi Jones, Charles Patterson, William Patterson, Clarence Reed, Johnny Moore, and a number of other Black artists opened the Black Arts Repertory Theatre School. They produced a number of plays including Jones’ *Experimental Death Unit # One*, *Black Mass*, *Jello*, and *Dutchman*. They also initiated a series of poetry readings and concerts. These activities represented the most advanced tendencies in the movement and were of excellent artistic quality. (p. 32)

In his statement regarding the founding of the Black Arts Repertory Theater/School, Neal may have made an error in writing 1964 instead of 1965. Both Salaam (1997) and Smethurst (2005) list the Black Arts Repertory Theater/School as being founded in 1965 and not 1964. The name of that institution has also been spelled in a variety of ways. Baraka (1984) has spelled it as the “Black Arts Repertory Theater/School.” In his spelling, Neal (1968) used “Black Arts Repertoire Theatre School.” Salaam (1997) has spelled is as the “Black Arts Repertory Theatre/School.” Smethurst (2005) has spelled it as the “Black Arts Repertory Theater/School.” Although their spellings have varied, it is very clear that they are referring to the same institution. As used here, the spelling will follow Baraka.

In 1965, there were two crucial events in the New York area. Malcolm X was assassinated on February 21, 1965 in Harlem and Amiri Baraka left his White wife and moved to Harlem in March 1965 to start the Black Arts Repertory Theater/School. In his
memoir, Baraka (1984) has shed light on some of the Black people who joined him in this important endeavor. He wrote:

A basic core was the Hackensacks (Shammy definite, Tong most of the time), Jimmy Lesser, Dave, McLucas, a friend of Tong’s who came along, Tub, a largish, sourly succinct dude; and after work, Corny and Clarence, plus Leroy McLucas and, a little later, Clarence Reed, the poet, who was hanging around on Lennox Avenue at the Progressive Labor Party offices, due in large part to his friendship with their black organizer, Bill Epton. (p. 368)

Some of the other people Baraka identified as being involved with the Black Arts Repertory Theater/School were Larry P. Neal; Askia Muhummad Toure (Roland Snellings); Max Stanford; Vashti Lownes; Sun Ra; Albert Ayler; Jim Campbell; Yusef Iman; Milford Graves; Andrew Hill; Joe Overstreet; Harold Cruse; Sam Anderson; Ed Spriggs; Sonia Sanchez; Barbara Ann Teer; Olabumi; and Vashti Lownes.8

When the Black Arts Movement first emerged many of the key people had not changed their names. For example, LeRoi Jones became Imamu Amiri Baraka after it emerged. Later he would drop the Imamu and become known simply as Amiri Baraka. Many other people involved with the Black Arts Repertory Theater/School also adopted African or Arabic names. In addition to the Black Arts Repertory Theater/School, the Revolutionary Action Movement was a key organization involved with the Black Arts Movement. Max Stanford was one of the leaders of RAM and he was also involved with the Black Arts Repertory Theater/School. Such participation quickly made Stanford an important target of COINTELPRO. After the FBI intensified that program in 1967, Stanford’s name was at the head of the list to be neutralized (Ahmad, 2008; Baraka, 1984; Cromartie, 2013c).

Basically, the Black Arts Repertory Theater/School broke up when Baraka left Harlem and moved back to Newark, his hometown in December 1965. Baraka (1984) has identified a number of interpersonal conflicts which developed and caused major problems at the Black Arts Repertory Theater/School. Without a doubt, the organization had a number of strong personalities with competing agendas at times. The organization had also been infiltrated by at least two undercover FBI agents. Baraka has recalled:

Harold Cruse was our history teacher and at one time he had two FBI agents in his classes. One, Donald Duncan, was later implicated in framing Max Stanford and Herman Ferguson for some bullshit attempt to assassinate Roy Wilkins and Whitney Young. Another one of these agents had also penetrated Malcolm’s OAAU. One guy was tall and light-skinned with red freckles. I’d see him going back and forth to Harold’s class. Later we put out flyers and circulated them to many cities with these dudes’ pictures and one of their lady friends, alerting people to these agents’ presence. (p. 380)

It very well may be the case that the two undercover FBI agents helped to foster interpersonal conflicts within the Black Arts Repertory Theatre/School.

Another important development on the East Coast was Harlem’s New Lafayette Theatre. Between 1968 and 1973, Ed Bullins served as the associate director for this
institution. While working at the New Lafayette Theatre, Bullins produced many of the plays he wrote dealing with the Black experience. Bullins also developed a Black Theatre Workshop and the periodical *Black Theatre*. The first issue of *Black Theatre*, which was released in 1968 and also known as *Black Theatre #1*, listed the following names and positions on its editorial board: Ed Bullins, editor; Roscoe Orman, associate editor; Marvin X, assistant editor--foreign; George Ford, art director; and Beverly Collins, secretary. The contents included a news item titled “A Report from San Francisco” by Adam David Miller; a news item titled “The Afro-Americans Thespians of Philadelphia” by Barry Shuck; a news item titled “The Free Southern Theatre” by Tom Dent; an essay titled “Black Theatre Notes” by Ed Bullins; a poem titled “The Actress,” which was written by Joe “Dingane” Goncalves and dedicated to Dorothy Dandridge; an essay titled “Cultural Nationalism and Black Theatre” by Larry Neal; an essay titled “The Crises in Black Culture” by Askia Muhammad Toure; an interview with Amiri Baraka titled “Everything’s Cool: An Interview with LeRoi Jones” by Marvin X; an interview with Clifford Mason titled “The Electronic Ni**er Meets the Gold Dust Twins” by Robert Macbeth and Ed Bullins; a theatre review titled “Errol John’s Moon on a Rainbow Shawl” by Marvin X; and a theatre review titled “Richard Wright’s Daddy Goodness” by Peter Bailey.

The second issue of *Black Theatre* was released in 1969. It was also known as *Black Theatre #2* and had the following names and positions on its editorial board: Ed Bullins, editor; Marvin X, associate editor; Roscoe Orman, associate editor; George Ford, art director; Sam Wright, business manager; Hattie Gossett, copy editor; Trixie Bullins, editorial assistant; and Stephen B. Taylor, distribution. The contents consisted of a news item titled “The Southside Center of theh Performing Arts, Inc.” by Bruce Milman; a news item titled “PASLA” by Vantile E. Whitfield; a news item titled “The New Lafayette Theatre” by Roscoe Orman; a news item titled “The Free Southern Theatre” by Thomas Dent; a news item titled “New Orleans” by Theodore E. Gilliam; a news item titled “Spirit House” by Larry Miller; a news item titled “Philadelphia’s Black Drama Season ’67-’68” by Barry Shuck; an anonymous “Third Annual Black Power Conference: Creativity Workshop Report;” a play titled “A Black Ritual” by Robert Macbeth; an interview with Amiri Baraka titled “God is Black! Islam and Black Art: An Interview with LeRoi Jones” by Marvin X and Faruk; an essay titled “Foreword” by Askia Muhammad Toure; a poem by Ameer Baraka titled “Study Peace;” an essay titled “Afterword” by Marvin X; a play titled “Growin’ into Blackness” by Salimu; an essay titled “The Mysterious Disappearance of Black Arts West” by Joe Goncalves; a statement “To All Black Actors and Other Interested Parties Re: ‘The Confessions of Nat Turner’ by William Styron to be Produced by David Wolper and Norman Jewison” distributed by the Association to End Defamation of Black People and signed or endorsed by many people including Ossie Davis, John Henrik Clarke, and Ron Karenga; a March 26, 1968 letter written to David Wolper and Norman Jewison by the Steering Committee of the Association to End Defamation of Black People regarding a motion picture based on the book *The Confessions of Nat Turner* by William Styron; a review of a performance of The Last Poets by Bill Simmons; and a review by Bill Simmons of James Baldwin’s play “The Amen Corner” under the direction of Ernie McClintock.

The third issue of *Black Theatre* appeared in 1969 and was also known as *Black Theatre #3*. The editorial board was composed of the following names and positions: Ed
Bullins, editor; Marvin X, associate editor; Roscoe Orman, associate editor; Lynn Capehart, art director; Hattie Gossett, copy editor; and Trixie Bullins, editorial assistant. As for the contents, they included a news item titled “Newark” which was unsigned; a news item titled “The Dashiki Project Theatre: New Orleans” which was unsigned; a news item titled “We are the Theater: The Free Southern Theater’s Community Workshop Program” by Val Ferdinand; a poem titled “Entertaining’ Troops!” by Askia Muhammad Toure; a play titled “In the Wine Time” by Ed Bullins; an essay titled “Could He have been Born From the Start to be So Near to Our Hearts?: On Langston Hughes” by Woodie King; a scenario for a short film titled “The Box Office” by Ed Bullins as related by Robert Macbeth; an interview with Robert Macbeth titled “The Black Ritual Theatre: An Interview with Robert Macbeth” by Marvin X; a poem titled “Praise Be the Resurrection of the Dead” by Duncan X; a play titled “The Resurrection of the Dead” by Marvin X; a play titled “The King of Soul or the Devil and Otis Redding” by Ben Caldwell; a review by Charles Gordon of Langston Hughes’s play “Black Nativity” under the direction of Ernie McClintock along with Andrew Cooper as the musical director; and a review by Bill Simmons of Joseph Dolan Tuotti’s play “Big Time Buck White” under the direction of Dick Williams. That issue of Black Theatre also featured an advertisement from Amiri Baraka’s Jihad Productions indicating that it had released books, plays, a film, and a record.

In 1968, an influential journal known as The Drama Review selected Bullins to serve as the guest editor for a special issue. Among the writings in that important issue are a comment on the death of Martin Luther King, Jr. by Ed Bullins; a description in the form of an outline of the San Francisco State Black Communications Project by LeRoi Jones (Amiri Baraka); a play titled “The Uncle Toms” by Herbert Stokes; a play titled “And We Own the Night” by Jimmy Garrett; an essay titled “Motion in the Ocean: Some Political Dimensions of the Free Southern Theater” by John O’Neal; a play titled “The Bronx Is Next” by Sonia Sanchez; a play titled “Take Care of Business” by Marvin X; an essay titled “A Short Statement on Street Theatre” by Ed Bullins; a play titled “The Monster: A One-Act Play” by Ron Milner; a play titled “Home on the Range” and another play titled “Police” by LeRoi Jones (Amiri Baraka); an essay titled “Black Theatre: Present Condition” by Woodie King; a play titled “Johnnas” by Bill Gunn; a play titled “Papa’s Daughter” by Dorothy Ahmad; an essay titled “It’s a Long Way to St. Louis: Notes on the Audience for Black Drama” by Adam David Miller; a play titled “Old Judge Mose Is Dead” by Joseph White; an essay titled “Building a Black Theatre” by Henrietta Harris; a play titled “Clara’s Ole Man” by Ed Bullins; and a report titled “Select Bibliography: Black Plays, Books and Articles Related to Black Theatre Published from 1/1960 to 2/1968” by Ola Jurges. The special issue also included a directory of Black theatres in the USA by Ed Bullins and the following four plays by Ben Caldwell: “Riot Sale or Dollar Psyche Fake Out,” “The Job,” “Top Secret or a Few Million after B.C.,” and “Mission Accomplished.”

With his article in the Drama Review, Neal (1968) accomplished several things. First, Neal became one of the first, if not the first to use the term “Black Arts Movement” to identify this forward motion of a critical mass of Black people around cultural matters. Second, Neal informed us that Amiri Baraka (LeRoi Jones) was one first people to use the term “Black Arts” in a positive sense. Third, Neal identified the following people as having made significant contributions to the development of the Black Arts Movement:
Don L. Lee (Haki Madubuti), Etheridge Knight, Charles Patterson, William Patterson, Clarence Reed, Johnny Moore, Maulana Karenga, Ron Milner, Ed Bullins, Ben Caldwell, Jimmy Stewart, Joe White, Charles Fuller, Aisha Hughes, Carol Freeman, and Jimmy Garrett. In his view, those were some of the people who proceeded to “express the general mood of the Black Arts ideology” (p. 37). Instead of protesting and issuing an appeal to the morality of White people as did Black people in the New Negro Movement, Neal said that the Black people in the Black Arts Movement were primarily concerned about speaking to the psyche of Black people. Neal began his essay by stating that:

The Black Arts Movement is radically opposed to any concept of the artist that alienates him from his community. This movement is the aesthetic and spiritual sister of the Black Power concept. As such, it envisions an art that speaks directly to the needs and aspirations of Black America. In order to perform this task, the Black Arts Movement proposes a radical reordering of the western cultural aesthetic. It proposes a separate symbolism, mythology, critique, and iconology. The Black Arts and the Black Power concept both relate broadly to the Afro-American’s desire for self-determination and nationhood. Both concepts are nationalistic. One is concerned with the relationship between art and politics; the other with the art of politics. (p. 29)

For Neal, it was imperative for Black people in the Black Arts Movement to develop a Black aesthetic. He also argued that, “The Black Arts Movement believes that your ethics and your aesthetics are one” (p. 31).

The second beachfront location for the Black Arts Movement in 1964 was the San Francisco-Oakland Bay Area (hereafter Bay Area). The people in the Bay Area’s Black Arts Movement doubled as avowed political activists as well as cultural workers. Some were involved with RAM as members. Others were involved with CORE or SNCC. Some of the people in RAM included Kenneth Freeman (Mamadou Lumumba), Issac Moore, Zolli Ndele, Bobby Seale (future co-founder of the Black Panther Party), Ernie Allen, and Douglas Allen. They created a base at Merritt College through a student organization known as the Soul Students Advisory Council. Looking back on the Bay Area RAM members, Ahmad (2008) has recalled:

Allen, Freeman, and others founded a journal called Soulbook that published prose and poetry that is best described as left black nationalist in orientation. Freeman, in particular, was highly respected among RAM activists and widely read. He constantly pushed his members to think about black struggle in a global context. The editors of Soulbook also developed ties with old African-American radicals; the most famous was former communist Harry Haywood whose work they published in an early issue. (p. 139)

Ahmad further explained that RAM sought to propagate anti-imperialist ideology through several periodicals.

Two of RAM’s periodicals included Soulbook and Black America. On the one hand, the Bay Area’s RAM produced Soulbook. With a post office box as its mailing address in Berkeley, California, Soulbook made its debut in 1964. On the other hand, East Coast
and Midwest RAM members produced a quarterly titled *Black America*. Ahmad (2008) has reported that his mentor Malcolm X would refer to *Black America* as “my publication” when he gave speeches during his last trip to Africa in 1964. RAM members also contributed to a monthly titled *Liberator*. Ahmad has informed us that, “RAM also popularized its writings through feature writers Roland Snellings and me in the popular nationalist monthly *Liberator* magazine edited by Daniel Watts in New York” (p. 137). According to Ahmad, “RAM was also active in helping LeRoi Jones develop the Black Arts Movement. The Black Arts Movement was originally to be the cultural wing of RAM” (p. 141).

When the first issue of *Soulbook* appeared during the winter of 1964, it was known as *Soulbook 1* as well as volume one and number one. The masthead reported that the editorial board consisted of Donald Freeman, Issac Moore, Ernest Allen, Jr. (Ernie Allen), Carroll Holmes, Kenn M. Freeman, and Bobb Hamilton. Bob Hamilton was also listed as the East Coast representative for the periodical. The subtitle of the periodical said that it was “the quarterly journal of revolutionary afroamerica.” The masthead disclosed that the focus of the periodical was jazz, economics, poetry, and anti-imperialism. The contents of the Winter 1964 issue of *Soulbook* were composed of an essay titled “Black Nationalism on the Right” by Ernie Allen; an essay titled “The Real Reasons Tanganyika and Zanzibar United and became Tanzania” by Kenn M. Freeman; a review titled “On Methods and Leadership” by Mamadou Lumumba; a study of Mark Twain’s anti-“Negro” attitudes titled “Puddn’ Head and the Negro” by Bobb Hamilton; an “Annotated Bibliography on the South African Situation” by Kenn M. Freeman; a review of “The Masters and the Slaves” by Donald Freeman; a review of *Short History of Africa* by Kenn M. Freeman; and an essay titled “Delicate Child” by Marvin E. Jackmon. It also included an untitled poem by George Murray (George Murray Murray); five untitled poems by Carol Freeman; a poem titled “Pure Soul” by W. Best; a poem titled “Message to Brothers” and a poem titled “Sam’s Moment” by Wm. Patterson.

The second issue of *Soulbook* made its appearance in Spring 1965. It was also known as *Soulbook 2* as well volume one and number two. The masthead stated that the editorial board was composed of Donald Freeman, Issac Moore, Ernest Allen, Jr., Carroll Holmes, Kenn M. Freeman, and Bobb Hamilton. It also listed Bobb Hamilton as the New York representative and Bobby Seale as the distribution manager. As was the case with the first issue, the subtitle of the periodical said that it was “the quarterly journal of revolutionary afroamerica.” Once again the masthead related that the focus of the periodical was jazz, economics, poetry, and anti-imperialism. In terms of the contents, the Spring 1965 issue of *Soulbook* included an essay titled “El Hajji Malik Shabazz: Leader, Prophet, Martyr” by Bobb Hamilton; a poem titled “For Malcolm” by Ernie Allen; an essay titled “Did the United Nations Benefit the Congo?” by Kenn M. Freeman; an essay titled “American Savagery and the Future” by Elizabeth Ann Rhodes; an essay titled “That Boy LeRoi” by Langston Hughes; an open letter to the editors of the *New York Post* regarding Langston Hughes titled “A Reply” by Bobb Hamilton; an essay titled “To All the Freedom Loving People of the World” by Charles Simmons; a poem titled “All My Yesterdays” by Sherley A. Williams; a poem titled “Malcolm Exsiccated” by T. R. Horne; a poem titled “Consolidated Edison Blues” by Bobb Hamilton; an untitled poem by Carol Freeman; a poem titled “Restitution” by Wm. Patterson; a poem titled “Soul is” by Marvin E. Jackmon; a poem titled “Tranetracks” by Ernie Allen; an untitled

The issue of *Soulbook* for Winter 1965-1966 was also known as *Soulbook 4* as well volume one and number four. For that issue, the masthead noted that the editorial board consisted of Donald Freeman, Issac Moore, Ernie Allen, Alvin Morrel, Kenn M. Freeman, Carroll Holmes, and Bobb Hamilton. Bobb Hamilton was listed as the New York representative and Bobby Seale as the distribution manager. The masthead disclosed that it was “the quarterly journal of revolutionary afroamerica.” It also stated that the focus of the periodical was on jazz, economics, poetry, and anti-imperialism. The contents of the Winter 1965-1966 of *Soulbook* were composed of an editorial on Vietnam, SNCC, Julian Bond, and Richard Gibson; essays by Alvin Morrell, Jumma Troupe, Frantz Fanon, Harry Haywood, Alfredo Pena, Roland Young, Germain Mba, Bobb Hamilton, and Kenn M. Freeman; a short story by Doug Allen; poetry by W. E. B. Du Bois, Carol Turner, Theodore Herne, Ronald Stone, John Fisher, Harold Foster, Wm. Patterson, Ernie Allen, Gaston Neal, and K. William Kgositile; and a play by Carol Freeman.

The seventh issue of *Soulbook* made its appearance in the Summer-Fall 1967. It was also known as *Soulbook 7* as well as volume two and number three. The masthead stated that the editorial board was composed of Donald Freeman, Issac Moore, Ernie Allen, Leo R. Huey, Ama Ata Aidoo, Alvin Morrell, Kenn M. Freeman, Carroll Holmes, and Bobb Hamilton. It also listed Bobb Hamilton as the New York representative, Le Graham as the Detroit representative, Donald P. Stone as the Atlanta representative, and Harold Robinson as the distribution manager. The subtitle of the periodical said that it was “the quarterly journal of revolutionary afroamerica.” The masthead also stated that the focus of the periodical was on Black music, economics, Black poetry, and anti-imperialism. In terms of the contents, the Summer-Fall 1967 issue of *Soulbook* included an editorial on Vietnam and essays by Weusi, Vo Nguyen Giap, Rolland Snellings (Askia Muhummad), Phan Nhuan, Abdelbaki Hermassi, Ama Ata Aidoo, and Carlos Moore. The contents were also composed of poetry by LeRoi Jones, Ed Bullins, Reggie Lockett, Ernie Allen, Margaret Block, John Fisher, Le Graham, William R. Lamppa, Eunice Sanders, Sonny Williams, Clarence Major, and Ho Chi Minh. That issue was dedicated to the memories of John Coltrane, Ruby Doris Robinson, Che Guevara, Albert Lithuli, Martin Luther King, Jr., and Bobby Hutton.

The issue of *Soulbook* for the Spring-Summer 1969 was also known as *Soulbook 8* as well volume two and number four. The masthead included an editorial board and an administrative board. The editorial board listed Mamadou Lumumba as editor-in-chief, Bobb Hamilton as senior editor, Baba Lumumba as co-founder, Zolili as co-editor, Carol Holmes as associate editor, and Ahmed Alhamisi as associate editor. The administrative board consisted of Malaika Lumumba as administrative superintendent, Olumola Babasuji as distribution manager, Harold Robinson as assistant distribution manager, and Donald Stone as assistant distribution manager. The periodical’s subtitle stated that it was “The Revolutionary Journal of the Black World.” As for the contents, the Spring-Summer 1969 issue of *Soulbook* consisted of an editorial on umoja (unity) and essays by Cheik Anta Diop, Bobb Hamilton, Alfredo Pena, Carlos Moore, and Ama Ata Aidoo. It
also included a folk tale by Colinwood August, a short story by Carol Holmes (Freeman), and poetry by Sonia Sanchez, H. Winfield Tavasti, David Henderson, Bobb Hamilton, Carol Holmes (Freeman), Barbara Simmons, Alicia Johnson, and Ahmed Alhamisi.

The ninth issue of Soulbook made its appearance in the Fall-Winter 1970. It was also known as Soulbook 9 as well as volume three and number one. The masthead of that issue listed the editorial board with the following names: Mamadou Lumumba as editor-in-chief, Bobb Hamilton as senior editor, Baba Lumumba as co-founder, Zolili as co-editor, Carol Holmes as associate editor, and Ahmed Alhamisi as associate editor. The administrative board consisted of Malaika Lumumba as administrative superintendent, Harold Robinson as distribution manager, and Donald Stone as assistant distribution manager. The subtitle of the periodical identified it as “The Revolutionary Journal of the Black World.” The contents of the Fall-Winter 1970 issue of Soulbook were composed of an editorial on 1970 and essays by Mamadou Lumumba, Ama Ata Aidoo, Cheik Anta Diop, Willard T. Pinn, Jr., Eusi Kwayana, Guakro O’Kumanin-Sei, and Carlos Moore. The contents were also composed of poetry by James Vaughn, Alicia L. Johnson, David Henderson, Sonia Sanchez, Arthur Pfister, Arthur Simons, Jr., and Claude Jackson.

Two important CORE members involved with the Black Arts Movement on the West Coast beachfront included Joe Goncalves (Dingane) and Jimmy Garrett (James P. Garrett). After Black Dialogue emerged in 1965, they both contributed to the development of that journal. Before he founded his landmark periodical The Journal of Black Poetry, Goncalves served as the poetry editor of Black Dialogue. Under the leadership of Arthur A. Sheridan, Black Dialogue was first released in the 1965. There is a 1965 copyright notice listed, but there is no month, season, or volume information printed in the issue. The inside cover of the issue states that, “This is the first issue of Black Dialogue; we expect to publish at least once every two months. Black Dialogue is a meeting place for voices of the Black community wherever that community may exist.”

The Special Collections section of the McHenry Library at the University of California, Santa Cruz has a copy of the first issue of Black Dialogue. The computerized card catalog log file of the Special Collections section of the McHenry Library at the University of California, Santa Cruz states that the first issue of Black Dialogue was published in Spring 1965. However, that first issue does not indicate on its cover or internal pages that it was published in Spring 1965. It does indicate that the journal was based in California. For that first issue of Black Dialogue, Arthur A. Sheridan was listed as editor-in-chief and Edward Simms Spriggs as the East Coast editor. The periodical also reported that it had an editorial board consisting of Abdul Kaliem, Joe Howard, Aubrey Labree (Aubrey LaBrie), and Sydneyn Schiffer. As for the contents of the periodical, the first issue featured an editorial titled “In Honor of the Late Malcolm X” by Arthur A. Sheridan; a poem titled “Dark Pastures” by Winston O’Hara; an essay titled “The Revolutionary Theatre” by LeRoi Jones (Amiri Baraka); a poem titled “Friday June 12 1964” by Al Young; an essay titled “Negritude Americaine” by Edward S. Spriggs; a poem titled “Lament for a March Wind” by Mary Berry; an essay titled “The Picket Line” by Arthur Sheridan; a poem titled “Harlem is and Harlem has” by Edward S. Spriggs; a short story titled “The Pipe Dreamer” by Marvin E. Jackmon (Marvin X); an untitled poem by George Murray (George Mason Murray); an essay titled “The Afro-American and International Politics: Some Implications” by Aubrey LaBrie; an essay
titled “The Future of ‘Soul’ in America” by Joe Howard; four untitled Haiku poems by Jon Lovett; a poem titled “In the Low and Wretched Land” by Duke Williams; an essay titled “The San Francisco Movement for Dignity and Freedom” by Bill Bradley; a short story titled “Elenore Goodstein” by Ed Bullins; and an essay titled “Books-in-Review” by Joe Goncalves (Joe Goncalves). The latter was actually a review of Daniel Chu and Elliott Skinner’s *A Glorious Age in Africa* and Agnes McCarthy and Lawrence Reddick’s *Worth Fighting For*.

Beginning with its second issue, *Black Dialogue* began the practice of listing the year and month(s) or season as well as the volume and number. The July-August 1965 issue of *Black Dialogue*, which was volume one and number two, listed an Editorial Board with the following people and positions: Arthur A. Sheridan, editor; Abdul Karim, managing editor; Edward S. Spriggs, New York editor; Aubrey Labrie, political editor; Marvin Jackmon, fiction editor; Charles Akin, Southern California representative; Duke Williams, Southern California representative; Saadat Ahmad, art director; Glen Miles, art director; Jon Lovett, circulation; and Jim Aliniece, circulation. The contents of the July-August 1965 issue of *Black Dialogue* consisted of an editorial on the war in Vietnam, police brutality, and other issues; an essay titled “The South in Perspective” by Bob “Moses” Parris; an article titled “Santo Domingo: U.S. Wins Another Battle” by Abdul Karim; an article titled “The Fantasy and Its Enforcers” by Joe Goncalves (Joe Goncalves); an unsigned article titled “The Duke and the (Pulitzer) Prize” reprinted a periodical known as *The Mallet* and published by the Freedom Now Party; an article titled “Jazz or the Mainstream?” by Charles Akin; an article titled “Africa: Economic Unity” by Joseph Steward; an article titled “Negritude–Black Bomb” by Elongo-Sama; an article titled “European-Latin Myth: An Open Letter from an Indonesian Student” by Gerado Rosal; an article titled “Amen to the Revolutionary Theatre & Black Arts” by Edward S. Spriggs; an article titled “To Make a Poet Black and Bid Him Sing” by Arthur A. Sheridan; an article titled “Black Arts” by LeRoi Jones (Amiri Baraka); a book review titled “Fanon's Wretched Earth” by F. Douglas Lewis; an article titled “Spiral” by Romare Bearden; a short story titled “Mother's Day” by Marvin Jackmon (Marvin X); graphics by Earl Miller; a poem titled “Soul Street . . .” by Ojijiko Oshuntoki; a poem titled “Special Section for the N**as on the Lower Eastside or: Invert the Divisor and Multiply” by Welton Smith; a poem titled “Black Mother” by Welton Smith; a poem titled “The Beast Section” by Welton Smith; a poem titled “Washington” by Welton Smith; a poem titled “Second Genesis” by Welton Smith; a poem titled "Marcia" by Jon Lovett; a poem titled “Marie” by Jon Lovett; a poem titled “Formula for Blue Babies” by De Leon Harrison; a poem titled “Saturday Come Sunday” by De Leon Harrison; a poem titled “The Magnificent X” by Duke Williams; an untitled poem by Oswald L. Jones; a poem titled “Raindrops” by McElroy; a poem titled “Toward the End” by McElroy; a poem titled “LXV” by H. Rainey; a poem titled “The Slave” by Larry Neal; an untitled by Larry Neal; a poem titled “Anthem” by Joseph Bailey; a poem titled “Just Look” by Conyus Calhoun; a poem titled “A Woman’s Love” by Patricia Bullins; a poem titled “Je Suis Las” by Al Young; a poem titled “Topsy Part 2” by Al Young; a poem titled “Tom-Tom” by Alphonse Florian Ngoma translated from the French by Mary Beach and reprinted from *City Lights Journal 2*; a play titled “How Do You Do: A Nonsense Drama” by Ed Bullins; a letter to the editors by Peter Edler; a poem titled “For Eric Dolphy: Feathers” by Bram Dijkstra; a poem titled “Billie” by Bram
Dijkstra; a letter to the editors by Seg. Echeverrid; a letter to the editors by George Olshausen; and some drawings by Glen Myles.

The Winter 1966 issue of *Black Dialogue* was volume one and numbers three and four. The journal reported that its Editorial Board was composed of the following people: Arthur A. Sheridan, editor; Abdul Karim, managing editor; Edward S. Spriggs, New York editor; Joseph Seward, African editor; Aubrey Labrie, political editor; Charles Akin, editorial assistant; De Leon Harrison, editorial assistant; Marvin Jackmon, fiction editor; Joe Goncalves, poetry editor; Duke Williams, Southern California representative; Saadat Ahmad, art director; Jim Aliniece, circulation; and Doug Fox, circulation. The contents of the Winter 1966 issue included an unsigned editorial on the direction of Black literature; an essay titled “Problems of Afro-Americans: An Essay Based on Fanon’s Wretched of the Earth” by Lawrence Neal; an essay titled “Vietnam Eyewitness View from Hanoi” by Harold Supriano; an essay titled “Black Nationalism and Black Nationalists” by Donald Hopkins; an essay titled “Revolutionary Nationalism and the Black Artist” by James T. Stewart; an essay titled “My Queen, I Greet You (An Open Letter to Black Women)” by Eldridge Cleaver; a play titled “Flowers for the Trashman: A Play in One Act” by Marvin Jackmon (Marvin X); photographs of five paintings by Raymond Howell; a poem titled “The Year of the Smoke” by Larry Neal; a poem titled “Professor Whiteside” by Marvin E. Jackmon (Marvin X); a poem titled “hayou the pimp” by E. Spriggs (E. Edward Spriggs); a poem titled “The Ni**a Section” by Welton Smith; a poem titled “Malcolm” by Welton Smith; an untitled poem by Welton Smith; a poem titled “A Folding and Unfolding” by Welton Smith; a poem titled “Longness” by Joe Goncalves; a poem titled “The Instrument” by Joe Goncalves; a poem titled “That To Love Her or Her Eyes” by Joe Goncalves; an untitled poem by Patricia Bullins; a poem titled “The Vultures” by David Diop which was translated by Willy Brown; a poem titled “The Renegade” by David Diop which was translated by Willy Brown; three poems from Africa presented by Joe Goncalves; a poem titled “E. M.” by De Leon Harrison; photographs of four sculptures and two paintings by Sargent Johnson; lyrics and music to a song titled “I’m Telling You Brother” by Kaye Dunham; an essay titled “An Open Letter to the Residents of Watts from an Oakland Calif. High School Student” by H. Labrie; a short story titled “Thomas Jefferson Jones III” by Jane Clay; a short story titled “Love Song for Willa Mae” by C. H. Fuller, Jr.; an essay titled “Like It Was” by Ed Bullins; an essay titled “Claude Brown: A Man-Child” by Abdul Karim; and two cartoons by Ollie Harington.

The Autumn 1966 issue of *Black Dialogue*, which was volume two and number five, reported an Editorial Board with the following names and positions: Abdul Karim, editor; Saadat Ahmad, editorial staff; Jim Aliniece, editorial staff; Charles Akin, editorial staff; Joe Goncalves, editorial staff; Duke Williams, editorial staff; George McNeal, editorial staff; Aubrey LaBrie, editorial staff; Huey LaBrie, editorial staff; Edward S. Spriggs, editorial staff; Marvin Jackmon, editorial staff; T. C. Williams, editorial staff; and E. R. DeMoica, editorial staff; George Holland, circulation; and Ramon Tyson, circulation. The contents of the Autumn 1966 issue of *Black Dialogue* consisted of an unsigned editorial on the death of Matthew Johnson; an article titled “Black Black Power in Urban Ghettoes” by Peter LaBrie; an unsigned article titled “US--Black Nationalism on the Move;” an article titled “How Dat? Watcha Say? Say it Again, Huh?” by Cheebo Batuta (Earl “Vann” Evans); an article titled “Will Success Spoil Aretha Franklin?” by Abdul
Karim; a play titled “Papa’s Daughter or People Cry at Weddings, Sometimes: A Drama in One Act” by Dorothy Ahmad; a short story titled “The Bus Ride” by Jimmy Garrett; a drawing by Eugene White; photographs of seven Black women in “The ‘Fox’ Section;” an article titled “On the Artist as a Black Man” by Marvin Jackmon (Marvin X); a poem titled “The Black Man is Making New Gods” by LeRoi Jones (Amiri Baraka); a poem titled “Part of the Doctrine” by LeRoi Jones; a poem titled “Plenty” by LeRoi Jones; a poem titled “The Occident” by LeRoi Jones; a poem titled “Indians” by LeRoi Jones; a poem titled “A Description of Manhattan Isle” by Norman L. Jacob; a poem titled “The Hermit” by Rudy Bee Graham; a poem titled “we know and still we dance” by E. Simm Spriggs; a poem titled “The Middle Passage and After” by Larry Neal; a poem titled “The Tornado” by Aime Cesaire which was translated by Willie Brown; a poem titled “Burn, Baby, Burn” by Marvin X; a book review of LeRoi Jones’s Home by Curley Duke Williams (C. Duke Williams); photographs of eight drawings by Eugene E. White; and a photograph of a drawing by Majed.

By 1969, the editorial offices of Black Dialogue had moved from California to New York. However, it had staff members on both coasts. Members of the New York Editorial Board included Edward Spriggs, Nikki Giovanni, Jaci Early, Elaine Jones, Sam Anderson, and James Hinton. The editorial staff for the San Francisco/West Coast consisted of one person, namely Joe Goncalves (Dingane). For the Mid-West, the editorial staff consisted of Ahmed Alhamisi and Carolyn Rodgers. The editorial staff for the Southern USA was composed of Julia Fields, Akinshiju, and A. B. Spellman. For Africa, the editorial staff was Ted Joans in the West and K. W. Kgotsitsile at large. The Spring 1969 issue of Black Dialogue, which was volume four and number one, included an editorial by the editors which covered the early history of Black Dialogue and the conflict between the Black Panther Party and US; an interview with Aum titled “Dialogue with Aum” by Edward Spriggs; a poem titled “Dreams” by John Faris; a review titled “And What About Laurie? (A Review of Uptight)” by Nikki Giovanni; a poem titled “All in the Street” by Ameer Baraka; a poem titled “Afro” by Ruth Rambo McClain; a poem titled “dance, like an adjective to you” by Will Halsey; a photograph of a sculpture by Agenor; photographs in “The Fox Section” by Douglas Harris, Rufus Hinton, and Jack Harris (Chaka); a poem titled “Passed on Blues: Homage to a Poet” by Ted Joans; a poem titled “How Long has Trane Been Gone” Jayne Cortez; a poem titled “When Brown is Black” by Keorapetse Kgotsitsile; a short story titled “And They Will Be Astounded” by Melba Kgotsitsile; and a play titled “Judgment” by William Halsey.

In the Fall-Winter 1966 issue of The Journal of Black Poetry, which was the third number and release, Joe Goncalves published the works of poets such as David Diop, Alexander Puskin, Clarence Major, Jon Eckels, Fred Bradford, Dwight Newby, Ed

**Organizational Phase**

Although the life span of the Black Arts Repertory Theatre/School was relatively short, it sowed the seeds for the flowering of other organizations and formations, especially in the Bay Area. Marvin X and Eldridge Cleaver joined forces with a few more people to create a Black cultural center known as the Black House in San Francisco. At the Black House, they sponsored poetry readings and plays on the first floor of the relatively large house. When Amiri Baraka came to the Bay Area to work at San Francisco State College for a brief stint, he quickly got involved with the Black House activities. Emory Douglas, a future Black Panther, worked with Baraka as a set designer on some of his theater projects at the Black House and elsewhere.12

Sadly, the Black House went the route of the Black Arts Repertory Theater/School and only lasted a few months. A crisis emerged at the Black House when Marvin X made a negative comment about Huey P. Newton. The comment led Eldridge Cleaver, Bobby Hutton, and other Black Panthers to evict Marvin X with a few hours notice using the threat of gunplay. Since the Black Panther Party had already been infiltrated by Earl Anthony as an FBI informant, it very well maybe the case that he helped to foster interpersonal conflicts between Marvin X and the other people. The Black House lasted from December 1966 to May 1967.13

The Pan-African Cultural Center was another important organization which developed out of the Black Arts Movement in 1967. The two founders of the Pan-African Cultural Center were Dave “Mudavanha” Patterson and Fritz Pointer. A number of the young people who joined the Black Panther Party were recruited by Huey P. Newton and Bobby Seale from the Pan-African Cultural Center. Bobby Hutton was the first person to join the Black Panther Party after Huey P. Newton and Bobby Seale. Joan Tarika Lewis (Matilaba), was one of the first females, if not the first, to join the Black
Panther Party. Both Hutton and Lewis were involved with the programs of the Pan-African Center (Cromartie, 2008a, 2008b, 2008c, 2008d, 2013a, 2013b, 2013c). 14

Chicago and Detroit were also important locations for the activities of the Black Arts Movement. Chicago was the base of operations for the Organization for Black Culture (OBAC). It was founded in May 1967 with the following purposes: (1) To work toward the goal of bringing to the Black community indigenous art forms which reflect and clarify the Black experience in America; (2) to reflect the richness and depth and variety of Black history and culture; and (3) to provide the Black community with a positive image of itself, its history, its achievements, and its possibilities for creativity. When the organization held its first event in Chicago, the Executive Council consisted of Gerald McWorter, Hoyt W. Fuller, Joseph R. Simpson, Ernest “Duke” McNeil, Jeff R. Donaldson, George R. Ricks, Donald H. Smith, Ronald C. Dunham, Bennett J. Johnson, and Conrad Kent Rivers. At one time or another, some of the people who also became involved with organization were Johari Amini, Nora Brooks Blakely, Sam Greenlee, Nikki Giovanni, Brenetta Howell, Angela Jackson, Mae Jackson, Wadsworth Jarrell, Haki Madhubuti (Don L. Lee), David Moore, Sandra Jackson-Opoku, Sterling Plumpp, Carolyn Rodgers, Sonia Sanchez, William Walker, and Val Gray Ward (“Culture Consciousness,” 1967; Donaldson, 1991).

From its base on Chicago’s South Side, OBAC quickly established a national reputation as a haven for Black people involved with various types of arts and letters. During its first year of existence, OBAC participated in the Festival of Black Arts in Chicago. Before and after the Festival of Black Arts, OBAC developed workshops for writers and visual artists. Hoyt Fuller led a weekly writer’s workshop sponsored by OBAC. The writings of various members were also featured in the organization’s journal Nommo. A leading figure in the visual artists’ workshop was Jeff Donaldson. Members in the visual artists’ workshop planned and created the famous Wall of Respect mural (“Culture Consciousness,” 1967; C. Parks, 1987; Donaldson, 1991; Miller, 2008).

As for Detroit, it was the base of operations for Broadside Press. Founded by Dudley Randall in 1965, Broadside Press played a major role in disseminating the poetic works of Black poets across the country. Between 1967 and 1970, Broadside Press published small chapbooks by more than 100 Black poets. Randall published the poetic works of the well-known poets and the not so well-known poets. Under the leadership of Randall, Broadside Press proceeded to publish some 55 books and 90 broadsides in the form of posters. The types of works he published included one author chapbooks, one author books of poetry, anthologies, children’s books, and literary criticism books as well as the broadside posters (Randall, 1975; Harter, 2008).

In addition to serving as the base of operations for Broadside Press, Detroit was the location of a Black Arts Convention in 1966 and in 1967. At the Black Arts Convention in 1967, there was a panel titled “Black Nationalism” and a panel titled “Literature, Writing and Poetry.” The panelists included Dudley Randall, the publisher of Broadside Press; Francis Ward, a writer for Ebony; and Bobb Hamilton, a poet and editor with Soulbook. The session also featured the reading of some poetry by Amir Rashid and Charles Freeman. The moderator of the session was Robena Nelson. The conference was also attended by Don L. Lee (Haki Madhubuti), David Llorens, Joyce Whitsitt, Harold G. Lawrence, Alfred “Slick” Campbell, Jesse Watts, Elton Hill, Gloria Davis, Le Graham, and Betty Shabazz. Following the panel on Black nationalism, Dudley Randall
presented Betty Shabazz with an anthology commemorating Malcolm X. Dudley Randall was also the catalyst behind an effort to form the Black Arts Alliance (Graham, 1967).

**Stable Phase**

Doubtlessly, the monthly periodical *Negro Digest*, which later changed its name to *Black World*, played a major role in bringing stability and continuity to the Black Arts Movement. Its wide circulation allowed Black people from around the country to participate on a mass level in this important intellectual social force. Edited by Hoyt Fuller, *Negro Digest/Black World* helped to stabilize the situation by making people aware of activities around the country and abroad related to the Black Arts Movement. People were able to get information about conferences and other events. They were also able to exchange ideas by submitting their work to Fuller to be considered for publication. Since the periodical was distributed by Johnson Publishing Company, it could be found next to *Jet* and *Ebony* at 7-Eleven Stores across the country.

People involved with the Black Arts Movement sought to have continuity by having intergenerational social interaction based on mentoring. A case in point is the OBAC in Chicago. Members of the OBAC like Haki Maduhubuti reached out to people like Gwendolyn Brooks and were showered with love and affection in the form of mentoring. At a talk given at the site of her grave, Madhubuti (2009) expressed that he deeply appreciated the mentoring given to him by Gwendolyn Brooks. In New York, Muhammad Ahmad (Max Stanford) was showered with love and affection in the form of mentoring from Malcolm X and Queen Mother Audley Moore. Ahmad (2008) has written about his deep appreciation of the mentoring he received from Malcolm X and Queen Mother Audley Moore. On the West Coast, Dave “Mudavanha” Patterson showered Fritz Pointer with love and affection based on mentoring. Pointer has said that he deeply appreciated the manner in which Patterson served as a dear mentor to him. In turn, Fritz Pointer became a mentor to his mentee Joan Tarika Lewis, a childhood friend of his sister Bonnie Pointer. Those social relationships centered on mentoring helped institutions to develop and prosper (Cromartie, 2008a, 2008b, 2011a, 2011b).  

**External Development**

For King (1956), external development of a social movement pertains to “what happens to the movement rather than what happens to the society as a consequence of the existence and activities of the movement” (p. 49). When considering external development, King has reminded us to consider the social movement itself and the changes which the social movement strives to bring about. He has also informed us that social movements “have lost ground or even failed to survive while one or more of their goals has been widely looked upon with favor” (p. 50). External development consists of these three phases: innovation, selection, and integration.
Innovation

According to King (1956), “innovations” involve the acts or processes of introducing new elements into a society. An innovation is also “any thought, behavior, or thing that is new because it is qualitatively different from existing forms” (p. 50). Within the Black Arts Movement, a number of innovations surfaced. One innovation pertained to material culture in the form of clothing. The Black Arts Movement spawned the wearing of African shirts (dashikis) by Black males and African dresses by Black females. Across the country, many people in the Black masses imitated the style of dress they saw worn by people connected to the Black Arts Movement.

A second innovation pertained to nonmaterial culture in the form of ideas and norms. For instance, the US organization, a Black Arts Movement group based in Los Angeles, developed a holiday known as Kwanzaa. The holiday made its first appearance in 1966 and the celebration was restricted to the self-proclaimed cultural nationalists of the US organization. By 2013, the holiday had become a widespread phenomenon in homes, churches, schools, and community centers across the country. In 2002, the U.S. Postal Service released a Kwanzaa stamp and there were national and communal activities organized around that event. During December 2007, there was even a Kwanzaa event in Oakland’s DeFremery Park (Bobby Hutton Park), which was attended by former members of the US organization and the Black Panther Party.

A third innovation was popularization of poetry readings among Black people. In New York City and elsewhere, a critical mass of Black people began to gather and listen to Black poets read and recite their poetry. Among young Black people, The Last Poets became superstars. When The Last Poets and others like Amiri Baraka would perform, they would draw relatively large audiences. A fourth innovation was the use of poetry ensembles with music. Langston Hughes recorded his poetry with Charles Mingus on an album titled the Weary Blues. During the Black Arts Movement, the poets Gil Scott-Heron and Wanda Robinson continued the Langston Hughes tradition of being a single poet recording and performing poetry to music. However, the Black Arts Movement also saw a new innovative development when groups of poets began to perform a single poem together to music. Some of the poems were accompanied only by percussion instruments. Others were accompanied by jazz, rhythm and blues, or funk music. Such groups included The Last Poets of the New York area, Watts Prophets of the Los Angeles area, and the Black Voices of the Los Angeles area.

A fifth innovation was the use of conferences to bring together like-minded people to talk about issues of concern. For instance, there was a Black Arts Convention held in Detroit in 1966 and 1967. From June 24, 1966 to June 26, 1966, Black people gathered in Detroit to attend a Black Arts Convention. The event was held at Central United Church of Christ. It featured panel workshops on literature, music, art, drama, education, religion, Black history, and politics. Some 300 people attended the conference over the three days. They came from cities and towns across the country. Among the conferees were Charles P. Howard, Max Stanford, Dudley Randall, Larry P. Neal, Rhobena Nelson, Oliver LaGrone, Bobb Hamilton, Harold Foster, Harold Lawrence, K. William Kgositsile, Jackie Wilson, David Rambeau, Denise Nicholas, Sylvia King, Grace Boggs, John Oliver Killens, Betty Shabazz, and Val Gray. When he gave his presentation at one
of the panel workshops, Randall urged the conferees to develop Black controlled media and publishing houses. During another panel workshop, Denise Nicholas, an actress, encouraged Black theatres to come together and pool their resources. Larry P. Neal, the writer echoed her sentiments and called for the formation of a national Black theater initiative that would pool resources in Detroit, New York, and elsewhere (Randall, 1966).

When the second Black Arts Convention took place in Detroit in 1967, there were a number of panel workshops. One was titled “Black Nationalism.” A second was titled “Literature, Writing and Poetry.” For the panel workshop on literature, writing, and poetry, the panelists included Dudley Randall, the publisher of Broadside Press; Francis Ward, a writer for Ebony; and Bobb Hamilton, a poet and editor with Soulbook. The panel workshop also featured the reading of some poetry by Amir Rashid and Charles Freeman. The moderator of the panel workshop was Robena Nelson. The conference was also attended by Don L. Lee (Haki Madhubuti), David Llorens, Joyce Whitsitt, Harold G. Lawrence, Alfred “Slick” Campell, Jesse Watts, Elton Hill, Gloria Davis, Le Graham, and Betty Shabazz. Following the panel workshop on Black nationalism, Dudley Randall presented Betty Shabazz with an anthology commemorating Malcolm X. Dudley Randall was also the catalyst behind an effort to form the Black Arts Alliance (Graham, 1967).

Selection

King (1956) defined “selection” as the processes of both the social acceptance and the rejection of innovations. As the Black Arts Movement unfolded, there was an issue regarding free speech and the use of language. People in the Black Arts Movement departed from the earlier Harlem Renaissance Movement and New Negro Movement in the use of language. Wherein members of the Harlem Renaissance and New Negro Movement rarely used the N-word or profanity, things changed with the Black Arts Movement. One was more likely to see the N-word in a poem during the Black Arts Movement than during the Harlem Renaissance and New Negro Movement. Nevertheless, the N-word was used selectively and to illustrate the status of Black people in the existing social stratification system. For example, The Last Poets rarely used the N-Word in their first seven albums. As a whole, the Black Arts Movement was a paragon of that which Du Bois (1897b, 1903) called true self-consciousness.

Nevertheless, there were major gaps in the merger of theory and practice with regard to language which did not reflect true self-consciousness. Eldridge Cleaver, the aforementioned co-founder of the Black House and a leading member of the Black Panther Party, gave an infamous speech in Harlem wherein he used some rather offensive language towards Fannie Lou Hamer, a titan of the Civil Rights Movement. Marvin X has recalled the speech with the following account:

Mr. Soul on Ice came to Harlem’s Mount Morris Park (now Marcus Garvey Park). He gave a disgusting, degenerate speech in the presence of sister Fannie Lou Hamer, the revolutionary sister from the Mississippi freedom struggle. He rapped that “political power grew out of the lips of a pu**y.” Turning to sister Fannie Lou, he said, “I would kiss her pu**y anytime.” After hearing that, I
didn’t wait for him to conclude, but eased my way through the crowd and headed down Lennox Ave. Harlem was famous for its critical acumen and had a tradition of throwing tomatoes at pitiful suckers—I wish I’d had some ripe ones. (pp. 172-173)

According to Marvin X, “I would not see Eldridge again until he returned from exile in 1977” (p. 173).

Huey P. Newton (1971) has explained that Eldridge Cleaver played a major role in the use of profane language in public by Black Panthers. He has explained that:

We went through a free speech movement in the Party, which was unnecessary, and only further isolated us from the Black community. We had all sorts of profanity in our paper and every other word which dropped from our lips was profane. This did not happen before I was jailed because I would not stand for it, but Eldridge’s influence brought it about. I do not blame him altogether; I blame the Party because the Party accepted it. (p. 52)

For Newton, his organization “defected from the community long before Eldridge defected from the Party” (p. 51). He reasoned that language played a part in alienating the Black Panther Party from the Black community, including Black churches which hosted many of the organization’s free breakfast for children programs across the country.

Integration

For King (1956), “integration,” or the integrative phase, refers to an item or some aspect which is “tied in closely with other cultural elements and contributes to the existence or operation of the society” (p. 56). The Nguzo Saba is an integrated item which is connected to other cultural elements and contributes to the existence or operation of society. It is based upon the following seven principles: Umoja; Kujichagulia; Ujima; Ujamaa; Nia; Kuumba; and Imani. The Nguzo Saba is a part of the US organization’s ideology of Kawaida, which has been described by Maulana Karenga as a communitarian African philosophy (Karenga, 2002).

As the founder of Kwanzaa, Karenga (2002) has defined each of the seven principles of the Nguzo Saba. The first principle is Umoja, or unity, and it means to “strive for and maintain unity in the family, community, nation and race” (p. 7). The second principle is Kujichagulia, or self-determination, and it means to “define ourselves, create for ourselves and speak for ourselves” (p. 7). The third principle is Ujima, or collective work and responsibility, and it means to “build and maintain our community together and make our brother’s and sister’s problems our problems and to solve them together” (p. 7). The fourth principle is Ujamaa, or cooperative economics, and it means to “build and maintain our own stores, shops and other businesses and to profit from them together” (p. 7). The fifth principle is Nia, or purpose, and it means to “make our collective vocation the building and developing of our community in order to restore our people to their traditional greatness” (p. 7). The sixth principle is Kuumba, or creativity, and it means to “do always as much as we can, in the way we can, in order to leave our community
more beautiful and beneficial than we inherited it” (p. 8). The seventh principle is Imani, or faith, and it means to “believe with all our hearts in our people, our parents, our teachers, our leaders and the righteousness and victory of our struggle” (p. 8).

As many Black people attempt to rebuild their families in the wake of the crack cocaine epidemic, they have often turned to values and norms spelled out in the Nguzo Saba. Some of them encounter the Nguzo Saba for the first time at a Kwanzaa and come away inspired to use it in their families and community. According to Karenga (2002), that is exactly what he had in mind when he first developed the holiday. He has informed us that he wanted to help build strong Black families and counter the White supremacy and commercialism perpetuated by Christmas.

**Hip Hop Movement as a Social Movement**

**Goals**

The Hip Hop Movement developed some key four goals. One goal was to promote self-expression among individuals. A second goal was to provide a forum for people to engage people to engage in rapping (MCing), DJing, break dancing (B-Boying/B-Girling), graffiti/aerosol art, and style of dressing. A third goal was to develop institutions for the benefit of individuals. A fourth goal was to function as an expressive social force in the belly of the beast.

**Ideology**

Similarly to Black Arts Movement, the ideology of the Hip Hop Movement has reflected two main aspects as a set of ideas and norms. However, the ideology of the Hip Hop Movement has been a bastion and citadel of racial self-debasement and perpetuating the existing social stratification system. The Hip Hop Movement has also been no threat to Wall Street and Madison Avenue. In fact, Wall Street and Madison Avenue have embraced the Hip Hop Movement as a money maker in the USA and abroad.²¹

Whereas many rappers have started out by developing Black firms to create their own compact discs (CDs), they often rush to take contracts with White firms connected with White capitalists. To shield themselves from public criticism about the resulting products, White firms oftentimes will permit rappers to have a label with a Black face out front. Then, those White firms are in a position to say they did not make the CDs many people find offensive, especially those that advocate Black people killing other Black people, advocate the use of the N-word, and the use of the B-word. Instead, those White firms say that just distribute the CDs. Because the CDs typically have little material which denigrates Wall Street and Madison Avenue, White firms have embraced distribution deals with Black labels which include Death Row Records on the West Coast, Def Jam on the East Coast, Bad Boy Entertainment on the East Coast, Roc Nation on the East Coast, No Limit Records in the South, Luke Records in the South, and Rap-A-Lot Records in the South.²²
**Organization and Status System**

As was the case with the Black Arts Movement, the Hip Hop Movement has been driven by its members and the social conditions they have faced. Personnel and functionaries have also been involved with the Hip Hop Movement. Personnel have had sporadic participation and no specialized roles. Functionaries have had persistent participation and specialized roles. Like the Black Arts Movement, the Hip Hop Movement saw the emergence of these three types of functionaries: (1) the leader, (2) the bureaucrat, and (3) the agitator.

Within the Hip Hop Movement, the leaders have played the role of founders or successors to the founders. Behind the distinctive policies and objectives that could be found in the Hip Hop Movement, there were leaders serving as catalysts. With their high or low status, bureaucrats handled the administrative activities. High status bureaucrats function as the policy-makers and have been responsible for efficiently operating the internal machinery. Low status bureaucrats function as the implementers of policy and major decisions from above. They handle the responsibility for dealing with routine paperwork and other matters. The agitators play the role of liaisons between the Hip Hop Movement and the outside world. The promotion and proselytizing of the Hip Hop Movement are handled by the agitators as their chief function. The agitators, in the role of promoters, further the goals of the Hip Hop Movement with publicity tactics, propaganda tactics, lobbying tactics, legal sanctions tactics, etc. As proselytizers, the agitators function as missionaries with the objective of converting outsiders into members.

**Tactics**

Like the Black Arts Movement, the Hip Hop Movement has sought to bring as many members into the fold as possible. The Hip Movement made a conscious decision to make the transition into a mass movement. Unlike the Black Arts Movement, it has not faced the brunt of a formidable enemy in the form of COINTELPRO (Counterintelligence Program), which was developed by the FBI (Federal Bureau of Intelligence). Because of their political positions or lack thereof, the leaders and followers have not been persecuted by COINTELPRO and faced imprisonment as political prisoners as in the case of the Black Arts Movement. However, people in the Hip Hop Movement have been involved with the possession of illegal drugs and illegal weapons which have caused them to be monitored by undercover FBI agents, agent provocateurs, and informants. Doubtlessly, the actions of the undercover FBI agents, agent provocateurs, and informants have disrupted their normal flow of operations. Many people in the Hip Hop Movement have been sent to prison because of drug and weapons charges developed by the undercover FBI agents, agent provocateurs, and informants.

**Internal Development**

With regard to internal development, the Hip Hop Movement evolved in response to the need for self-expression about certain social conditions. Those social conditions
included poverty, drug addiction, police brutality, and racial discrimination in the criminal justice system. Other social conditions faced by the Hip Hop Movement were heterogeneity, cultural confusion, and mass communication. The Hip Hop Movement has developed different types of artistic modes as it sought to respond to those conditions. Like the Black Arts Movement, the Hip Hop Movement has passed through these three major phases: the incipient phase, organizational phase, and stable phase.

**Incipient Phase**

Within the Hip Hop Movement, some of the key pioneers were Clive “Kool Herc” Campbell, Donald “Afrika Bambaattaa” Donovan, Joseph “Grandmaster Flash” Saddler, Keith “Cowboy” Wiggins, Sylvia Robinson, Russell Simmons, and the Sugar Hill Gang. In regard to Clive “Kool Herc” Campbell, Donald “Afrika Bambaattaa” Donovan, and Joseph “Grandmaster Flash” Saddler, George (2004) has related that “these three are the founding fathers of hip-hop music” (p. 45). George also referred to the three as the “progenitors” of Hip Hop (p. 45). Like George, Hebridge (2004) has identified Clive “Kool Herc” Campbell, Donald “Afrika Bambaattaa” Donovan, and Joseph “Grandmaster Flash” Saddler as three major figures in the beginning of Hip Hop. If George and Hebridge are correct, the key fountainheads and pioneers of the Hip Hop Movement are Clive “Kool Herc” Campbell, Donald “Afrika Bambaattaa” Donovan, and Joseph “Grandmaster Flash” Saddler.

When the Hip Hop Movement emerged as a social movement in the early 1970s, perhaps no one was more important than Clive “Kool Herc” Campbell. On his website, Campbell has informed us that the Hip Movement began on August 11, 1973 in the Bronx, New York. According to Campbell, the Hip Hop Movement started at a party held in a recreation room of a public housing project, located at 1520 Sedgwick Avenue. Campbell and his sister Cindy held a back to school party wherein they charged an admissions fee of 50 cents for males and 25 cents for females. He has argued that this first Hip Hop party went on to change the world (Campbell & Campbell, 2013).

In the view of Campbell, the Hip Hop Movement proceeded to provide a gathering of peers and an innovation in the manner in which music was played and listened to. For the role that he played in 1973 and later, Campbell has been credited as a key fountainhead and founding father of the movement. He has called his sister Cindy the first lady of the movement for the role she played as the co-host of the original parties on Sedgwick Avenue. Campbell’s website has stated that the Hip Hop Movement possesses these five elements: (1) DJing; (2) rapping/MCing; (3) break dancing or B-Boying/B-Girling; (4) graffiti/aerosol art; and (5) style of dressing. Between 1973 and 1993, Campbell became a legendary figure in the emerging movement. He became famous for blasting his break music on extremely loud speakers called Herculoids (Campbell & Campbell, 2013).

The following year, 1974, Afrika Bambaattaa (Donald Donovan) founded the Zulu Nation as an organization in the emerging Hip Hop Movement. The charismatic Bambaattaa was able to attract a number of young people to his organization. His official website has identified Afrika Bambaattaa as one of the three main originators of break-beat deejaying. It has also identified him as the “Grandfather” and “Godfather” of the movement as well as “The Father of The Electro Funk Sound.” The website credits
Bambaataa with co-opting a street gang known as the Black Spades into his culture-oriented organization. Between 1980 and the year 2000, Bambaataa recorded frequently and helped to spread the word about the movement (Universal Zulu Nation, 2013).

Like Clive “Kool Herc” Campbell, Joseph “Grandmaster Flash” Saddler has roots in the Bronx, New York. The official website of Saddler has identified him as one of the founding fathers of the Hip Hop Movement. It also detailed how Saddler got his start as a deejay spinning records at neighborhood block parties. According to his website, Saddler was the first deejay to physically lay his hands on a vinyl record and make it go in a backward, forward, or counterclockwise motion. Until then, deejays would handle a record on its edges, place the arm down, and play the vinyl record. Saddler created an innovation in the form of a compass by marking up the record with crayon, a fluorescent pen, a grease pencil. In 1978, he joined together with several other Black men to create Grandmaster Flash and the Furious Five (“Biography,” 2014; Grandmaster Flash & Ritz, 2008).

Keith “Cowboy” Wiggins, a member of the Furious Five, has been credited with coining the term Hip Hop. During an interview with various members of Grandmaster Flash and the Furious Five, Quan (2005) was informed about some of the contributions of Wiggins to the Hip Hop Movement. For example, Grandmaster Mele Mel and Kid Creole both informed Quan that the term Hip Hop was coined by Wiggins. In response to a question regarding whether Wonder Mike borrowed part of the routine of Wiggins and used it on Rapper’s Delight, Grandmaster Mele Mel stated:

> Without a doubt. This kid named Kokomo was going to the army & Cowboy was messin’ with him—teasing him with the marching Hip Hop rhythm Hip/Hop/Hip/Hop; and he just took it on from there and kept goin’ with it. It just took on a life of its own . . . . (Quoted by Quan, p. 2).

Grandmaster Mele Mel also told Quan that Wiggins was the first MC (emcee). He said, “Yeah, it wasn’t called Emceeing back then, but he was the first to get on Flash’s mic and do the crowd response—without a doubt” (Quoted by Quan, p. 2).

In the interview, Kid Creole made similar remarks to Quan about Wiggins. With regard to the term Hip Hop, Kid Creole related:

> On that that term Hip Hop. A friend of ours named Billy was about to go to the Army. I think this was ’75. We had a party at the Black Door over on Boston Rd and 170th St. That was one of the first places that my brother, myself and Cowboy played as the 3 Emcees along with Flash. This was Billy’s last weekend before shipping out, and Cowboy was on the mic playing around doing that Army cadence: Hip/Hop/Hip/Hop. But he wasn’t doing it to music at the time, and the Disco crowd referred to us as those “Hip Hoppers,” but they used it as a derogatory term. But Cowboy was the first one I heard do that to music, as part of his crowd response. (Quoted in Quan, p. 11)

Quan probed Kid Creole to go deeper into the issue by asking him the following question: “So he did something similar to what Wonder Mike is doing at the beginning of Rapper’s Delight?” In his response to that question, Kid Creole remarked: “Except for
all that bang bang boogie sh*t, the intro to Rapper’s Delight is what Cowboy used to say word for word. Except for that up jump the boogie sh*t. Up jump the boogie was some disco sh*t” (p. 11).

Quan (2005) continued the part of his interview Kid Creole by asking him for clarification about the first rappers. He presented the following statement and question to Kid Creole: “When I ask some of the first Emcees who the first person was that they saw Emcee they usually say either you, Mel or Cowboy. But how many times they say just Cowboy. Where as far as you know did he get it from?” Kid Creole proceeded to clarify the issue by giving Quan this statement:

Well Cowboy never really wrote rhymes. He would say li’l nursery rhymes like everybody else. The first person that I heard say a rhyme . . . and not just a phrase, like at Herc’s parties where Clark Kent and Timmy Tim would say “giving you more that what you what paid at the door, on down to the A.M.” The first person that I heard say a rhyme that wasn’t a nursery rhyme was my brother Mel. He was the very first person that I saw say a rhyme about themselves. Not a poem, a bonafide rhyme. That’s what motivated me to rhyme, ’cause Mel was on the mic and he was getting girls. I couldn’t just stand on the sidelines. Cowboy was a guy who had no fear of just getting in front of a crowd, and asking them to do what he wanted. It was a time when people in Hip Hop weren’t doing that. The only other person who did it to any degree on purpose was D.J. Hollywood. (Quoted in Quan, p. 11)

Thus, Grandmaster Mele Mel and Kid Creole made it very clear that Wiggins, in their view, coined the term Hip Hop. They also made it clear that Wiggins was one of the first rappers along with Mele Mel, Kid Creole, and D.J. Hollywood.

**Organizational Phase**

In comparison to other Black social movements, the Hip Hop Movement has had a relatively long life span. During its life span, the Hip Hop Movement has been sustained by emergence of a number of organizations and firms. A very important organization includes the Zulu Nation. Important firms in the Hip Hop Movement include Sugar Hill Records as well as the aforementioned Death Row Records, Def Jam, Bad Boy Entertainment, Roc Nation, No Limit Records, Luke Records, Rap-A-Lot Records, Rhyme Syndicate, Ruthless Records, and Priority Records.

**Stable Phase**

After the emergence of the Hip Hop Movement, it became stabilized through the development of record labels, magazines, and performance venues. The first self-proclaimed Hip Hop record label to put out a record was Sylvia Robinson’s Sugar Hill Records. That occurred in 1979 when her label released the Sugar Hill Gang’s Rapper’s Delight. According to George (1998), the excitement raised by the Sugar Hill Gang’s Rapper’s Delight “swept the country and eventually the world” (p. 29). Among the magazines promoting the Hip Hop Movement were *Serious Hip Hop, The Source, Vibe,*

**External Development**

Like the Black Arts Movement, the Hip Hop Movement has experienced the social phenomenon of external development. The Hip Hop Movement has undergone the innovation phase. It has gone through the selection phase. In addition, the Hip Hop Movement has gone through the integration phase. On the one hand, some of the goals of the Hip Hop Movement have lost ground. On the other hand, the Hip Hop Movement has had some goals that have been looked upon in a favorable light by the larger society.

**Innovation**

The Hip Hop Movement has led to the development of a number of innovations. One innovation pertains to material culture in the form of clothing. Whereas the Black Arts Movement spawned the wearing of African shirts (dashikis) by Black males and African dresses by Black females, the Hip Hop Movement has led to both men and women wearing sagging jeans. A widespread norm among people in the Hip Hop Movement has been to wear jeans and other pants far below the waist. It has not been uncommon to see young people walking around with their underwear exposed for all to see, including much younger children. Some towns and cities have passed ordinances outlawing the practice of sagging (Kitwana, 2002; Koppel, 2007).

A second innovation deals with material culture in the form of “tricking out” cars with exotic paint jobs and big tires. Some youth with cars paint them in exotic candy apple colors. They also place on their cars oversized tires referred to as “dubs.” For the inside of the cars, they purchase and install speakers that can boom out to the streets the latest Hip Hop songs—sometimes to the dismay of other people (Falcon, 2015).

A third innovation involves nonmaterial culture in the form of ideas and norms. Led by Clyde “Kool Herc” Campbell and Joseph “Grandmaster Flash” Saddler, the Hip Hop Movement proceeded to change the way music was made. The music industry saw the development of “scratching” and other deejay techniques. Like disco music, the deejays were at the center of the movement rather than the periphery. Instead of live musicians receiving the fanfare, the deejays became the stars (Campbell & Campbell, 2013).

A fourth innovation pertains to nonmaterial culture in the form of ideas and norms. Both men and women in the Hip Hop Movement have adopted the practice of wearing tattoos. It has not been uncommon for some men and women to have a whole arm or leg covered with tattoos. Many people in the Hip Hop Movement are following the examples of people like Beyonce, Eve, 50 Cent, LL Cool J, Jay-Z, Lil’ Wayne, Rihanna,
and Tupac Shakur by wearing tattoos on the face, neck, arms, arms, legs, and upper torso (Flowers, 2012; Rathod, 2014).

Selection

Like other Black social movements before it, the Hip Hop Movement has had to deal with the processes related to social acceptance and the rejection of innovations. People inside of the Hip Hop Movement have pioneered clothing styles, tattoo adornment, and flashy jewelry adornment. Some people have accepted the new styles with open arms. Many of those engaging in the social phenomena of the new clothing, tattoo adornment fall into the cohort of people born between 1965 and 1985. People born before 1965 in the Baby Boomers cohort have sometimes criticized the new styles as a backwards development.

Inside of the Hip Hop Movement, some people have expressed concern about the fashion trends. Paniccioli (2002), who Powell (2002) has called the Gordon Parks of the Hip Hop Movement, issued the following statement in his book:

Hip Hop is a powerful medium, but I have to drop this in the book, and it’s gonna upset some people: just as reggae prophet-poets like Bob Marley and Peter Tosh were replaced with a prostitute music called dancehall—which is all about sexing girls and getting high and shaking your butt and has no message—the same thing has happened to hiphop. The shift is what I call the “second colonization.” The second colonization is trying to eliminate our efforts to reach back to our history, to the pioneers of hiphop, such as Afrika Bambaattaa and Kool Herc. As a result, hiphop has gone from Public Enemy and conscious brothers like Chubb Rock to Nelly and bling-bling. And “my watch is bigger than yours.” “My Bentley is newer than yours.” “Oh, you only got this Benz and I got this bigger Benz,” and, “I bet you don’t even have leather seats.” (p. 196)

He continued:

. . . the whorehouses now are the radio stations and the music videos. Instead of going to a strip club and seeing a girl with her butt hanging out, now you go and turn on the television and all the camera angles are from the waist down. We’re at a stage where the music itself—not all of it but a lot of it—has fallen into a den of iniquity. It is very garish and almost a joke. And it’s being pimped and prostituted by a variety of folks. You know the most incredible act ever to come out of hiphop? Not Rakim, not Public Enemy—it was Arrested Development. Not because of their work. Because of their name. That is rap music today: Arrested Development. (pp. 196-197)

The observations of Paniccioli reflect the attitudes of many people inside and outside of the Hip Hop Movement. Like Paniccioli, they are concerned that Hip Hop artists readily prostitute themselves as they strive for more and more dollars from Wall Street and Madison Avenue.25
A key innovation from the Hip Hop Movement, which has found widespread acceptance among the Baby Boomer Generation, is the civic engagement initiatives pioneered by Russell Simmons, Shawn “Puffy” Coombs, and Clifford Joseph “T. I.” Harris, Jr. Russell Simmons, a native of New York, was a catalyst behind the Rap the Vote initiative in 2000. Under his leadership, some arena-sized gatherings were held in a pep rally type of environment. To enter the gathering, people had to register to vote or already be registered. The goal of Simmons was to get people to value voting and to stimulate a discussion of the issues and activism (Nelson, 2005; Simmons & Nelson, 2001; Kitwana, 2002).

Coombs, a native of New York, was a catalyst behind the Vote or Die initiative in 2004. Under his leadership, Citizen Change was formed to encourage voter participation. Coombs used “Vote or Die!” as a provocative slogan on tee-shirts and had celebrities wear them. Coombs worked with Rev. Lennox Yearwood, Jr. of the Hip-Hop Caucus to launch the voter registration project (Nelson, 2005; The 305, 2008). Clifford Joseph “T.I.” Harris, Jr., a native of Atlanta, Georgia, was a catalyst behind the Respect My Vote Initiative in 2008. In conjunction with Rev. Lennox Yearwood of the Hip-Hop Caucus, Harris launched a voter registration drive in some 17 cities in various parts of the USA. To his credit, Harris repeated his voter registration efforts during the 2010 midterm elections (“The 305,” 2008; Manzella, 2008; Winslow, 2010).

Integration

Two integrated items that have connected with other cultural elements and contributed to the existence or operation of society are the Stop the Violence Initiative and the Vote or Die Initiative. The Stop the Violence Initiative emerged in response to criticism by C. Dolores Tucker. As George has pointed out, Tucker “attacked white executives whom she viewed as irresponsible or insensitive because they promoted rap music” (p. 72). Tucker was alarmed that rap music of the Hip Hop Movement was featuring the glorification of Black people killing Black people, drug selling, and referring to females as b**ches and whores, and men as “n**gers.

As a response to the public criticism of C. Dolores Tucker, people like the writer Nelson George, Jive Records music executive Ann Carli, and Jive Records music executive Barry Weiss united with Hip Hop artists to release the CD titled Self-Destruction. The CD was released in 1989 and produced by KRS-One. Dyson (2004) has noted that the message in Self-Destruction “insists that violence predates rap and speaks against escalating black-on-black crime, which erodes the social and communal fabric of already debased black inner cities across America” (p. 63). According to Dyson, Self-Destruction was a top-selling CD. George (2005) has related that rapper Kool Moe Dee later “joined forces with a new generation of rap industry figures in working to mount a well-meaning, though aborted Stop the Violence II record and campaign” (p. 200).

In September 2013, the rapper and actor known as Common spoke out against the rampant violence in Chicago, his hometown. He called for a peace summit led by him and another Chicago rapper known as Chief Keef. Common told the Associated Press that a peace summit was a necessary first step to stop the violent crimes in Chicago. For Common, there is certainly a need for more peace summits around the country and actions to get at the root cause of Black-on-Black violence (Kyles, 2013).
During his talk with the Associated Press, Common posed that rap music was not the root cause of the violence in Chicago, but acknowledged that rap music impacts the mind of many young people. He was quoted as follows: “To decide to take someone’s life, I don’t think they let a rap song determine that” (Quoted in Kyles, 2013, p. 1). However, Common said that the youth are “influenced by that energy and take it the wrong way” (Quoted in Kyles, 2013, p. 1). Common has argued that more educational programs for young people could help turn around the violence young people perpetuate. He also took the position that Hip Hop artists need to play a greater role in making positive change happen. Towards that end, Common has developed a Common Ground Foundation to help youth with a summer camp and mentoring program for public school youth in Chicago (Kyles, 2013).

As for the Vote or Die initiative, it was launched by Shawn “Puffy” Combs in 2004. The civic engagement effort of Combs was preceded in the year 2000 by Russell Simmons with his Rap the Vote Initiative. It was also followed by rapper T. I. and his Respect My Vote Initiative in 2008 and 2010. Like the other two initiatives, Combs used his to encourage young people in and outside of the Hip Hop Movement to register and vote. The data show that the voter participation rate for young people increased in 2000, 2004, and 2008. Thus, people in the Hip Hop Movement can make a significant impact in the outcomes of elections and help to determine the destiny of the USA (Nelson, 2005; “The 305,” 2008; Manzella, 2008; Winslow, 2010; Perry, 2010).

**Implications of the Black Arts Movement and the Hip Hop Movement as Social Movements**

The Black Arts Movement and the Hip Hop Movement shook up the social world as social forces. Their influences reached far beyond their points of origin among Black people in the USA. The significant consequences of the two movements can be found in Africa, Asia, Europe, and throughout the Americas. However, the Black Arts Movement was far more progressive than the Hip Hop Movement. Basically, the Hip Hop Movement represents a regression instead of a progression.

The Black Arts Movement was a social force with a primary aim of negating negative influences and creating positive images. It also called for a radical reconstruction of the economic system and political system as the key to combating negative stereotypes about Black people. In fact, some of the people involved with Black Arts Movement called for a total transformation of the economic system and political system of the USA in the form of a revolution.

In contrast, the Hip Hop Movement has been a social force without the primary aim of negating negative influences and creating positive images. Instead, it has perpetuated negative stereotypes about Black people. Nevertheless, there have been at least three instances wherein the Hip Hop Movement has produced some positive initiatives. One was the Rap the Vote Initiative. A second was the Vote or Die Initiative. A third was the Stop the Violence Initiative.
Summary and Conclusion

This paper has focused on Black social movements past and present with special reference to the Black Arts Movement and the Hip Hop Movement. It has examined the Black Arts Movement as a social movement which emerged during the mid-1960s and lasted until the mid-1970s. It has also examined the Hip Hop Movement as a social movement which emerged during the early 1970s and has lasted to the present. This paper presented a comparative analysis of both social movements and identified their goals, ideologies, organization and status systems, and tactics. The comparative analysis also included an examination of both movements’ internal development in the form of the incipient phase, organizational phase, and stable phase. Likewise, the comparative analysis included an examination of both movements’ external development in the form of innovation, selection, and integration. Additionally, this paper addressed some implications of the Black Arts Movement and the Hip Hop Movement as social movements.

The record is clear that both movements proved to be influential social forces in the most powerful country in the world. Since the Black Arts Movement came first, it paved the way for a new consciousness among Black youth especially in the middle 1960s, late 1960s, and early 1970s. Black consciousness was the order of the day until two drug epidemics hit Black communities across the country. A heroin epidemic exploded in major northern cities such as Detroit, Chicago, Philadelphia, and New York. The epidemic popped up in the late 1960s as cheap heroin made it to the streets of the USA from Asia. That was followed by a powder cocaine epidemic which hit cities like Los Angeles and Oakland after Hollywood put out a film titled Superfly. Overnight, young Black men turned their Afro hairstyle into a processed Lord Jesus hairstyle worn by the character named Priest in the film. He was depicted as a major drug dealer looking to make a big score, i.e. sale.

Whereas the use of heroin became a major social problem in the late 1960s, the use of powder cocaine became a major social problem in the early 1970s. There were many would-be revolutionaries with Black consciousness who suddenly found themselves using those substances and getting caught up with heroin addictive behavior and/or cocaine addictive behavior. By the time the Hip Hop Movement emerged, a bad situation got worst. Instead of many young Black people trying to make their communities a better place, they began to suck the life blood out of those places by becoming dope dealers. It was not long before the party music of the early rap phenomenon gave way to the edgier gangster rap phenomenon. Record companies and their producers encouraged their artists to develop songs with a catchy beat which featured the glorification of Black people killing Black people, glorification of drug selling, glorification of conspicuous consumerism, reference to females as b**ches and whores, and reference to men as “n**gers.

During the second decade of the 21st century, the record companies and their producers continue to encourage their artists to develop songs with a catchy beat which features the glorification of Black people killing Black people, glorification of drug selling, glorification of conspicuous consumerism, reference to females as b**ches and whores, and reference to men as “n**gers. Virtually all of the major Black artists in the Hip Hop Movement listed on the Billboard hit list have at least one song wherein they
glorify Black people killing Black people, glorify drug selling, glorify conspicuous consumerism, refer to females as b**ches and whores, and refer to men as “n***gers. A case in point is Jay-Z. His songs Coming of Age and Coming of Age (Da Sequel) brags about selling drugs while he lived in the Marcy Houses, a unit of public housing projects located in the Bedford-Stuyvesant area of New York’s Brooklyn borough. In his autobiography, he has informed us that, “I saw crack addiction destroy families—it almost destroyed mine—but I sold it, too. I stood on cold corners far from home in the middle of the night serving crack fiends . . . ” (Jay-Z, 2010, p. 18).

Another development in the Hip Hop Movement has been the willingness of Hip Hop artists to do virtually anything for money. Many of them have taken degrading roles in Hollywood which stereotype Black people. Some of them have even taken roles wherein they seemed to have gone against their previous pronouncements for better or worse. A case in point is Ice Cube (O’Shea Jackson). At one time, he was a member of the Hip Hop group NWA wherein they had a song that said “f**k the police.” During March 2014, Ice Cube was playing a role of police officer in the film Ride Along. That same month, Ice-T (Tracy Marrow), another Hip Hop artist, was playing a role of a police officer each week in the television series titled Law & Order: Special Victims Unit. He once released a song called “Cop Killer.” On February 2, 2014, Queen Latifah, another Hip Hop artist, readily embraced singing the song America the Beautiful at the 50th Super Bowl. Many Hip Hop artists seem to be willing and able to do anything that capitalists want them to do—as long as they get paid.

Further, both the Black Arts Movement and the Hip Hop Movement have had their detractors. On the one hand, Gates (1994) has deemed the Black Arts Movement to be “the shortest and least successful effective movement in African American cultural history” (p. 74). Gates seemed to ignore that the Black Arts Movement lasted longer the Harlem Renaissance. He also seemed to ignore the accomplishments of the leading institutions and personalities involved with the Black Arts Movement. Clearly, Baraka, one of the founders of the Black Arts Movement, enjoyed a long and successful career as a literary artist and political activist who was able to merge theory and practice.

On the other hand, Wynton Marsalis has referred to the leading institutions and personalities involved with the Hip Hop Movement as running a modern day minstrel show. In an interview with Lewis (2007), Marsalis stated:

I call it “ghetto minstrelsy.” Old school minstrels used to say they were “real darkies from the real plantation.” Hip Hop substitutes the plantation for the streets. Now you have to say that you’re from the streets, you shot some brothers, you went to jail. Rappers have to display the correct pathology. Rap has become a safari for people who get their thrills from watching African American people debase themselves, men dressing in gold, calling themselves stupid names like Ludacris or 50 Cent, spending money on expensive fluff, using language like “b**ch” and “ho” and “n**ger.” (p. 1)

Marsalis castigated the Hip Hop artists for debasing Black people and glorifying the killing of Black people by other Black people. He criticized the men in the movement for wearing their bling and giving themselves eccentric names. Marsalis also blasted them
for the calling women the B-word and the H-word. In addition, Marsalis blasted them for using the N-word.

Despite such criticisms, both movements have proven to be groundbreaking social forces in terms of innovation, selection, and integration. In the case of the Black Arts Movement, Baraka broke new ground with his plays, poetry, essays, and books. He also broke new ground when he joined with others to found institutions such as the Black Arts/Theatre, Spirit House, and the Black Communication Project. With regard to the Hip Hop Movement, Jay-Z has plowed new ground with his rap songs and entrepreneurship in fashion design. He has also plowed new ground with his development of Roc Nation. Jay-Z has made the transition from a drug dealer living in the housing projects to a successful businessman for Wall Street and Madison Avenue interests. In his present role, Jay-Z represents no threat to capitalism. Jay-Z evolved into a type of asset and commodity for capitalists which Baraka never wanted to be nor sought out. Instead of wanting to be an asset and commodity to Wall Street and Madison Avenue interests, Baraka actively sought their demise as bastions of capitalism.

Notes

1. To understand the context and history of the Black Arts Movement and the Hip Hop Movement, I have conducted in-depth interviews with Marvin X, Fritz Pointer, Ptah Mitchell, Menhuam Ayele, and Zahieb Mwongozi. I have also had personal communication with Askia Muhammad Toure, George Mason Murray, Baba Lumumba, Vulindlela I. Wobogo, Cassandra Chaney, Derrick P. Aldridge, Akosua Bea Francis Gymiah, and others. Whereas the in-depth interviews with Marvin X and Fritz Pointer helped me to understand the Black Arts Movement, those with Ptah Mitchell, Menhuam Ayele, and Zahieb Mwongozi helped me to understand the Hip Hop Movement. For some of their writings, see Mwongozi (1984), Marvin X (1998, 2009), Pointer (1970, 1971, 1972), P. Mitchell (2005), Ayele (2012), and Wobogo (2011).

2. In the second issue of The Journal of Black Poetry, it noted that Marvin Jackmon has used the aliases EJX and X-3 (“About the Authors,” 1966). He has also used the aliases El Muhajir and Nazzam Al Sudan (Marvin X, 1998, 2009; Major, 1969).

3. Both before and after the year 2000, there has been a concerted effort by some academics and non-academics to push Hip Hop as a culture on Black people. Some have stated that if Black people do not accept Hip Hop as a culture, they are not being authentic. See McLeod (1999). Few academics and non-academics have given proper attention to the impact of Black migration patterns inside the USA on the Hip Hop Movement. For example, Black people from Georgia have typically migrated to New York and New Jersey; Black people from Alabama have typically migrated to Detroit; Black people from Mississippi have typically migrated to Chicago; Black people from Louisiana, Texas, and Arkansas have typically migrated to California. Such migrations patterns have influenced Black music, including Hip Hop, in profound ways that have been overlooked or ignored.

4. His essay titled “The Crises of Black Culture” also appeared in Black Theatre #1 (Toure, 1968b). It should be noted that Askia Muhammad Toure has also been known as Roland Snellings and Rolland Snellings (Redmond, 1976; Ahmad, 2008). Toure was a major figure in the Black Consciousness Movement which began to flower during the
early 1960s long before the Black Arts Movement and Black Power Movement. For some more literary works by him before he wrote his important essay on Black culture, see Snellings (1963a, 1963) and Toure (1968c, 1968d, 1968e, 1968f, 1968g).

5. The typologies of members and functionaries used in this analysis have been drawn from King (1956).

6. A key missionary of the Black Arts Movement was the aforementioned Askia Muhammad Toure (Roland Snellings, Rolland Snellings). He played a major role in developing the Black Arts Movement along with Amiri Baraka and others. Toure was involved with three important organizations that predated the Black Arts Movement. Those organizations were the Revolutionary Action Movement, Umbra, and the Uptown Writers Movement. Those organizations were also part of the Black Consciousness Movement which dates back as early as the last decade of the 19th century with the publication of these two essays by Du Bois (1897a, 1897b): “The Conservation of Races” and “Strivings of the Negro People.” Other early examples of the Black Consciousness Movement include “Credo,” an essay by Du Bois (1904); “The Song of the Smoke,” a poem by Du Bois (1907); “The Negro in Literature and Art,” an essay by Du Bois (1913); and “Criteria of Negro Art,” an essay by Du Bois (1926). These works clearly celebrate Black consciousness even if they do not mention the actual term. For example, in his essay, “The Conservation of Races,” Du Bois stated that:

For the development of Negro genius, of Negro literature and art, of Negro spirit, only Negroes bound and welded together, Negroes inspired by one vast ideal, can work out in its fullness the great message we have for humanity. We cannot reverse history; we are subject to the same natural laws as other races, and if the Negro is ever to be a factor in the world’s history—if among the gaily-colored banners that deck the broad ramparts of civilization is to hang one uncompromising black, then it must be placed there by black hands, fashioned by black heads and hallowed by the travail of 200,000,000 black hearts beating in one glad song of jubilee. (p. 10).

Du Bois continued:

For this reason, the advance guard of the Negro people—the 8,000,000 people of Negro blood in the United States of America—must soon come to realize that if they are to take their just place in the van of Pan-Negroism, then their destiny is not absorption by the white Americans. That if in America it is to be proven for the first time in the modern world that not only Negroes are capable of evolving individual men like Toussaint, the Saviour, but are a nation stored with wonderful possibilities of culture, then their destiny is not a servile imitation of Anglo-Saxon culture, but a stalwart originality which shall unswervingly follow Negro ideals. (p. 10).

Thus, Du Bois consciously uses the term “Black” in a positive sense when referring to Black people and he uses the term “Pan-Negroism” in anticipation of the Pan-African Movement which emerged in 1900. Du Bois continued to usher in the Black Consciousness Movement in the USA with his landmark book *The Souls of Black Folk.*
Some 60 years later, Du Bois (1962), at the age of 94, introduced the “Afro-centric” concept in his *Proposed Plans for an Encyclopedia Africana* which he wrote on November 15, 1962 under the auspices of the Secretariat for an Encyclopedia Africana. Du Bois used the term “Afro-centric” to refer to social analysis which places Africa and people of African descent at the center rather than the periphery. By 1960, a critical mass of Black people in the USA had embraced Black consciousness as an idea whose time had come. Malcolm X, Martin Luther King, Jr., and their followers boldly began to increasingly refer to themselves as Black people instead of Negroes. Under the inspiration of Du Bois and others, the Black Consciousness Movement flowered in the USA between 1960 and 1964 and paved the way for the Black Arts Movement and the Black Power Movement. Like Toure, others members of the Revolutionary Action Movement, Umbra, and the Uptown Writers Movement became key missionaries in the Black Arts Movement. Some of the other organizations that provided missionaries to the Black Arts Movement were the Black Panther Party, RAM, US, House of Umoja, Nation of Islam, NAACP, CORE, and SNCC. For more information on these organizations, see Thomas (1978), Baraka (1984), Salaam (1997, 2009), Marvin X (1998, 2009), Ahmad (2008), Perkins (2009), and Wobogo (2011). In the case of the Black Panther Party, it had a symbiotic relationship with the Black Arts Movement. As Marvin X (1998, 2009) has pointed out, some Black Panthers like Bobby Seale, Eldridge Cleaver, Emory Douglas, Samuel Napier, and George Mason Murray were involved with the Black Arts Movement before they joined the organization. Other Black Panthers became involved with the Black Arts Movement after they joined the organization by promoting revolutionary nationalism or intercommunalism as an ideal ideology to fuel the movement.

7. Propelled by the influential *Negro Digest*, which later became *Black World*, literature and news of the Black Arts Movement reached all parts of the USA, including cities and towns in the Southeast and Southwest. Black people in Atlanta, Georgia, Savannah, Georgia, and Waycross, Georgia heard the clarion call of people like Amiri Baraka, Haki Madhubuti (Don L. Lee), Carolyn Rodgers, Mari Evans, and Marvin X and proceeded to develop aspects of the Black Arts Movement in their location. The same is true with New Orleans, Louisiana and Tougaloo, Mississippi. In the case of Savannah, it had an Academy of Black Culture. New Orleans had Blk Art South. See “News,” (1972) and Salaam (1972).

8. Baraka (1984) has related that the Spirit House he later developed in Newark, New Jersey was very similar to the Black Arts Repertory Theater/School in Harlem. He has also said that members of The Last Poets “extended the form of the ensemble poetry performance that we had worked with in the Spirit House” (p. 281). For an important history of The Last Poets, see Oyewole and Hassan (1996).

9. Neal (1968) pointed out that Etheridge Knight called for the development and usage of a Black aesthetic. Knight represented the lumpenproletariat who served time in prison, developed Black consciousness behind bars, and joined the Black Arts Movement and the Black Power Movement. Some of the other imprisoned Black people who developed Black consciousness behind bars were Alprentice “Bunchy” Carter, Eldridge Cleaver, B. Kwaku Duren, George Jackson, and Malcolm X. The emergence of Black history study groups played a major role in helping imprisoned Black people to develop Black consciousness behind bars. For some writings by imprisoned Black people with Black
consciousness, see Knight (1968, 1970). For a very important assessment of the Black Arts Movement about 10 years after its demise, see Neal (1987).

10. In the case of the *Liberator*, the January 1965 issue published an important article by Stanford (1965), who later changed his name to Muhammad Ahmad, titled “Revolutionary Nationalism and the Afro-American Student.” He called for unity and action among the following segments of the Black population: high school students, junior high school students, street gangs, and outcasts. It also published an important article by Black (1965) on the return of Malcolm X to the USA from his last trip abroad. She noted that Malcolm X, during a November 29, 1964 speech at the Audubon Ballroom, praised Patrice Lumumba and called Moises Tshombe a puppet and the worst African ever born. The editor-in-chief of the January 1965 issue of the *Liberator* was Daniel H. Watts. The editorial board for that issue consisted of Clebert Ford, Len Holt, Clayton Riley, Carlos E. Russell, Charlie L. Russell, Ossie Sykes, and C. E. Wilson. Another important periodical used by RAM members to popularize their writings was *Umbra*. For example, the very first issue of *Umbra* published a poem by Rolland Snellings (Roland Snellings, Askia Muhammad Toure) titled “Floodtide.” The second issue of *Umbra* published a poem by him titled “Song of the Fire.” See Snellings (1963a, 1963b). A third important Black periodical during the early 1960s was *Freedomways*, which was widely read by RAM members and non-members. In its important memorial issue for W. E. B. Du Bois, Stuckey (1965) and Moore (1965) wrote articles wherein they acknowledged his role in the development of Pan-Africanism. In his article, Stuckey related that Kwame Nkrumah regarded Du Bois as a “symbol of Pan-Africanism” and “one of Africa’s greatest teachers” (p. 151). Stuckey also said that, “Du Bois’ influence was felt from the tenements of Harlem to the African bush, and countless children because of him have grown up with greater confidence and a new vision of themselves and the world” (p. 153). Moore, in his article, referred to Du Bois as the “Grand Old Man of Pan-Africanism” and credited him with being “the veteran spokesman for Pan-African liberation and champion of human rights” (pp. 183, 187). He also acknowledged that, “Dr. W. E. B. Du Bois was hailed as ‘Father’ of Pan-Africanism by George Padmore” (p. 183). In addition, Moore addressed the “background of the Pan-Africanism of W. E. B. Du Bois” and asserted that Du Bois had a “prophetic world vision which encompassed his idea of Pan-Africa” (pp. 167-168). That issue of *Freedomways* also included some selected poems of Du Bois (1965a, 1965b, 1965c, 1965d, 1965e, 1965f). The political activism, scholarship, literary art, and Pan-African philosophy of Du Bois were major influences on the Black Arts Movement. As Walters (1917) noted, Du Bois participated in the first Pan-African Conference, which was held in London, England during 1900 and organized by Henry Sylvester Williams. Other participants from the USA included B. W. Arnett, Thomas J. Calloway, Anna Julia Cooper, Henry F. Downing, Ada Harris, Anna H. Jones, Charles P. Lee, J. L. Love, and Alexander Walters. According to Walters, Du Bois played an important role in his status as the chairman of the Committee on Address to the Nations of the World. Walters also stated that Du Bois was selected to serve as the Vice-President of America to the short-lived permanent organization known as the Pan-African Association. In his final autobiography, Du Bois (1968) addressed the leading role he played in organizing five Pan-African Congresses. At the five Pan-African Congresses, Black people from different countries gathered to engage in Pan-Africanism as an international form of Black nationalism involving racial

11. Joe Goncalves, also known as Dingane, was one of the key Black people addressing the issue of creating independent Black institutions with a focus on publishing (Redmond, 1976). Throughout the Black Arts Movement, he helped to produce Black Dialogue, Black Theatre, and his own The Journal of Black Poetry. When some people in the Black Arts Movement including Hoyt Fuller, complained about Black writers being left out of the American Literary Anthology, Goncalves said that Black people must concentrate on developing their own literary entities. Regarding that matter, a news items in the “Perspectives” column of Negro Digest stated:

Joe Goncalves, the perceptive editor of The Journal of Black Poetry, advised us to give up the struggle. It wasn’t worth it, he said. Black writers should do their own thing, find their own audience, establish their own critics. Black writers did not need the corruptive influence of the annual literary anthology. He was right. (“The American Literary Anthology,” 1969, p. 49).

During the 1970s, Goncalves continued to call for the development of independent Black institutions with a focus on publishing. See Goncalves (1972).

12. Marvin X (personal communication, January 12, 2014) has told me about his social relationships with Eldridge Cleaver and Amiri Baraka. He has also written extensively about his social interaction with Eldridge Cleaver, Amiri Baraka, Emory Douglas, Bobby Seale, George Murray, Samuel Napier, and others at the Black House. See X (1998).

13. Marvin X (personal communication, January 12, 2014) has stated to me that he and Ethna Wyatt (Hurriyah Asar) fled the Black House after being intimidated with guns by Eldridge Cleaver and Bobby Hutton. For writings by him on the incident, see X (1998, 2009).

14. Fritz Pointer (personal communication, May 14, 2015) has informed me that the Pan-African Cultural Center hosted Amiri Baraka and Muhammad Ali at events in Oakland. In the case of Muhammad Ali, he spoke at McClymonds High School under the aegis of the Pan-African Cultural Center. Pointer also noted that Dave “Mudavanha” Paterson later earned a Ph.D. in political science at the University of California, Berkeley. Pointer later earned a M.A. in African history at the University of California Los Angeles and a M.A. in African literature at University of Wisconsin, Madison.

15. Marvin X (personal communication, January 12, 2014) has related to me that he considered Amiri Baraka a mentor. He became close to Amiri Baraka in 1967 when the latter came to the West Coast and participated in the activities of the Black House in San Francisco. Marvin X has served as a mentor to Ptah Mitchell, Menhuam Ayele, Zahieb Mwongozi, and me. It should be noted that I have also been mentored by Fritz Pointer, Joe “Dingane” Goncalves, George Smith, Markell Johnson, Betty Scott, Fleet
‘Melchizedek’ Johnson, Leroy ‘Lee’ Johnson, M’Wile Yaw Askari, Barbara Paige Pointer, Anita DeFrantz, Bishop Scott, and many others.

17. The multi-talented Gil Scott-Heron was a major voice as a singer, musician, novelist, poet, and pioneer rapper who wrote an important memoir about his life. Although he experienced great difficulty in dealing with substance abuse in the form of alcohol and other drugs, Scott-Heron produced an impressive body of work which ranged from his first album in 1970 to his final album during his lifetime in 2010. Scott-Heron displayed how a poet could use dynamic language without relying on the N-word or profanity as a cliche. On his album *Spirits*, which was released in 1994, Scott-Heron included an important poem titled “Message to the Messengers” wherein he chided Hip Hop artists for calling women the B-word. Scott-Heron had a long history of reaching out and encouraging younger poets. In 1979, Scott-Heron selected my poem “Theme for El Jefe” as a grand prize winner in the Gil Scott-Heron Poetry Contest, which was sponsored by Arista Record Company and Radio Station KRE in Berkeley. For his memoir, see Scott-Heron (2012). Further, Scott-Heron was one of the many musicians who made contributions to the Black Arts Movement. Some of the others included the whole Midnight Band (e.g., Brian Jackson, Sunni Bilal Ali, Danny Bowens, and Adenola), Max Roach, Andrew Hill, Sun Ra, Rahsaan Roland Kirk, John Coltrane, Pharoah Sanders, Albert Ayler, Cecil Taylor, Archie Shepp, James T. Stewart, Sonny Murray, Don Cherry, Henry Grimes, Louis Worrell, Marion Brown, Rashid-Ali, Milford Graves, Gary Bartz, Curtis Mayfield, and William Calhoun. See J. T. Stewart (1966), Baraka (1967, 1984), Marvin X (1998), J. B. Stewart (2005), Smethurst (2005), Thomas (1992, 1995), and Vincent (2013).

18. For some information and writings related to Black writers in the Los Angeles, California area during the Black Arts Movement, see Schulberg (1967) and Troupe (1968).

19. Conferences and festivals connected to the Black Arts Movement were also held in Chicago and elsewhere. As mentioned above, there was a Black Arts Festival held in Chicago in 1968. There were also a series of Black Power Conferences which featured workshops or panels pertaining to the Black Arts Movement. In his autobiography, Baraka (1984) provided background information about the following conferences: 1966 Black Power Conference in Washington, DC; 1967 Black Power Conference in Newark, New Jersey; 1968 Black Power Conference in Philadelphia, Pennsylvania; 1969 Black Power Conference in Newark, New Jersey; and 1970 Black Power Conference in Atlanta, Georgia. Baraka also provided background information about the following gatherings: 1972 National Black Political Convention in Gary, Indiana; 1972 African Liberation Day in Washington, DC and San Francisco, California; 1974 National Black Political Convention in Little Rock, Arkansas; 1974 May Conference at Howard University; 1974 June Sixth Pan-African Congress held in Dar es Salaam, Tanzania; and 1974 Afrikan Women’s Conference in Newark, New Jersey. With regard to the 1968 Black Power Conference, Baraka wrote in his autobiography that, “I was coordinator of the Arts Workshop at the ’68 conference” (p. 273).

20. In addition to true self-consciousness, Du Bois (1897b, 1903) called for Black people to have self-realization, self-respect, and self-development.
21. According to Bialik (2005) in the *Wall Street Journal*, the data indicate that most rap records were purchased by White people in 1995, 1999, and 2001. He reported that a study by Mediamark Research Inc. (MRI) found that for all adults and adults between the age of 18 to 34 the percentage of rap records buyers who are White was 70 to 75 percent in 1995, 1999, and 2001. Bialik also reported that:

Spurred by a change in Census Bureau methodology, MRI researchers no longer decide for themselves the race of their respondents, and the group has expanded the number of races and allowed respondents to check more than one. In fall 2004, using the new method, MRI found that just 60% of rap buyers are white, though 78% of Americans self-identify as white. Apparently, a significant number of people whom researchers thought were white wouldn’t identify themselves as such. (p. 2)

22. A case in point is that the companies established by the rapper Shawn “Jay-Z” Carter have sought out contracts with White firms connected with White capitalists. For example, his Roc Nation has possessed a contract with the Universal Music Group and a contract with Sony. See Sisario (2013) and Morris (2013).

23. Allah (2009) has written that, “With ‘two turntables and a microphone,’ Herc ingeniously gave birth to Hip-Hop Music by isolating the instrumental breaks in funk records, while taking over the groove” (p. 374). Allah has also traced the influence of Five Percenters on Hip Hop personalities like DJ Kool Herc, World’s Famous Supreme Team, Just-Ice, Rakim Allah, King Sun, Big Daddy Kane, Lakim Shabazz, Poor Righteous Teachers, Brand Nubians, Wu-Tang Clan, Digable Planets, and Erykah Badu. According to Allah, the teachings of Father Allah, who was also known as Clarence 13X and Clarence Edward Eugene Smith, can be found in their lyrics. In addition, Allah has detailed the destruction of a “man-made blizzard” in the form of “crack-cocaine” on New York City and elsewhere during the 1980s (p. 361). Further, as early as 1971, I saw T. C. James, a Black man and deejay, doing something similar with turntables and a microphone in Waycross, Georgia to what Kool Herc later did in New York City. For an important statement about the original development of the Hip Hop Movement and his philosophy, see DJ Kool Herc (2005).

24. For a compilation of essays making use of these periodicals as sources of information, see Forman and Neal (2004).

25. Questlove (2014) is a Hip Hop insider who has complained about what he has called the conspicuous consumerism in the social movement. In an article for *Vulture*, Questlove traced the conspicuous consumerism in the Hip Hop Movement as far back as Run-DMC and their hit song *My Adidas*. For Questlove, Rap stars “back in the ‘80s celebrated what they owned” (p. 2). He proceeded to charge that contemporary Rap stars like Jay Z, Kanye West, and Puff Daddy have engaged in conspicuous consumerism. In the case of Puff Daddy, Questlove wrote:

Certainly, Puff Daddy’s work with the Notorious B.I.G. in the early ‘90s did plenty to cement the idea of hip-hop as a genre of conspicuous consumption. Before those videos, wealth was evident, but it was also contextualized, given
specific character that harmonized with the backgrounds of the artists. Run-DMC had East Coast cool and cachet; Dr. Dre had West Coast cool and cachet. But Puffy had — and wanted to tell everyone he had — a different idea of power, an abstract capitalist cachet. His videos, and the image they projected, played as well in California as in New York, as well in Chicago as in Florida. It was a cartoon idea of wealth, to the point that specific reality no longer mattered. In literary terms, it was pure signifier. It would take him a little while to formulate that into a manifesto, but when he did, he hit it on the nose. “Bad Boy for Life,” in 2001, contained a line that says all that anyone needs to know about this strain of hip-hop: “Don’t worry if I write rhymes / I write checks.” Picasso, baby. (p. 3)

In the Hip Hop Movement, people like Questlove, who has proven to be willing to make a critique of conspicuous consumerism in the capitalistic USA, are far and few between.

26. For evidence that the Black Arts Movement had an international impact along with its forerunner the Black Consciousness Movement in the USA, see Biko (1978), Eide (2014), Du Toit (2008), Redmond (1976), Gerhart (1978), and Ahmad (2008). On the one hand, a Black Consciousness Movement had emerged in the USA by 1960 long before the Black Arts Movement and Black Power Movement. The Revolutionary Action Movement (RAM), which was founded in 1962, was part of the Black Consciousness Movement. Ahmad has detailed the history of RAM. The Black Consciousness Movement was inspired by independence movements in Africa as well as the long struggle for social justice in the USA led by Frederick Douglass, Alexander Crummel, Ida B. Wells-Barnett, W. E. B. Du Bois, Carter G. Woodson, James R. L. Diggs, Anna Julia Cooper, Noble Drew Ali, Cyril Briggs, Hubert Harrison, Elijah Muhammad, Paul Robeson, Septima Clark, Queen Mother Audley Moore, Ella Baker, Queen Mother Audley Moore, Fannie Lou Hamer, Robert F. Williams, Malcolm X, Martin Luther King, Jr., Don Freeman, Kwame Ture (Stokely Carmichael), Huey P. Newton, and many others. On the other hand, Biko and others have provided some details about the mutual influence of Black social movements in the USA, Africa, and the Caribbean. Biko has stated:

The growth of awareness among South African blacks has often been ascribed to influence from the American ‘Negro’ movement. Yet it seems to me that this is a sequel to the attainment of independence by so many African states within so short a time. . . . The fact that American terminology has often been used to express our thoughts is merely because all new ideas seem to get extensive publicity in the United States. (p. 69)

Eide has mentioned “Biko’s wider investment in Black consciousness, a political philosophy tied to the Black Power movement of the United States and the Negritude philosophical interventions elsewhere in Africa and in the Caribbean” (p. 14). Du Toit has related that Biko “was influenced by people like Frantz Fanon, Leopold Segnhor, Cheikh Anta Diop, Aime Cesaire, Malcolm X, Stokely Carmichael and the like” (p. 29). Redmond has disclosed that Keorapetse Kgositsile was a key figure in the Black Arts Movement in the USA and a native of South Africa. It is highly unlikely that the well-
read Biko did not know of Kgositsile’s impressive body of literary work. Gerhart has informed us that:

The impact of American ideas in the 1960s on the language of the Black Consciousness movement comes through clearly in the popularity of slogans like “Black Is Beautiful” and the frequent use of such terms as “relevance” and “power structure” in SASO literature. Most significant, however, was the terminological revolution in the use of the term “black” itself. (pp. 276-277).

In the aforementioned statement by Gerhart, SASO refers to the South African Students’ Organisation. Further, for evidence of the international impact of the Hip Hop Movement, see Toop (2000), Mitchell (2001), and Condry (2006). Like other social forces produced by the cultural endeavors of Black people, the Hip Hop Movement faces the dilemma of being disconnected to the population which originated the phenomenon. Consider the plight of soul music and jazz. In a thoughtful essay dealing with the future of soul music in the USA, Howard (1966) complained that:

Soulfulness can be looked at in one of two ways. Most of the black community knows what being soulful means, yet few of us connect it with our past. Jazz, for example, is appreciated, but it is not connected with slave songs and the early Negro church where it originated. Furthermore, it is not connected with Africa because too many of us believe that we are completely American and that everything which was African was left behind or destroyed long ago. We, like most of America, and indeed the rest of the Western world suffer from “Tarzan” type depictions of Africans and African culture. (p. 23)

Howard posed that soul music and jazz were faced with the dilemma of being disconnected to the population which originated the two phenomena.

Nurturing Persistent Mathematical Problem Solvers: A Framework for Facilitating Both Teacher and Student Growth

By
Primary Speaker: Dr. James Vicich
Scottsdale Community College
Department of Mathematics
james.vicich@scottsdalecc.edu
with Dr. Patrick Kimani (Glendale CC) patrick.kimani@gccaz.edu

Topic Area(s): Teacher Education, and Secondary Mathematics Education, Middle School Mathematics, Undergraduate Mathematics

Presentation Format: Workshop

Description of Presentation: This is an interactive session. Workshop serves diverse demographics. Topics (include observed changes in): Teacher training experiences, teachers’ classroom practices, students’ performance, and district cultures. Participants will be actively engaged in diagnosing problem-solving behaviors of colleagues (Vicich, 2014) and use the doc cam to share their reasoning within a student-centered classroom model. Discourse, informal assessment, and sociomathematical norms will be addressed. Models of teacher change (Clarke & Hollingsworth, 2002) and instructional practices that promote deep, well-connected conceptual understandings (Arcavi, et al., 1998, Schoenfeld, 2009) within both teachers and students are presented.

First Preference: 90 - Minute Workshop

Second Preference: 20 minute - Paper Session

Hawaii International Conference on Education
Honolulu, HI
January, 2017
This paper is a revised version of a manuscript currently under review for publication: (Vicich, J, Kimani, P. & Tan, E., 2016). The Teaching and Learning Triad for Nurturing Persistent Problem Solvers. Manuscript under review for publication.

The Common Core State Standards (CCSSI, 2010) have created a platform for the development of more rigorous, focused, and coherent mathematics curricula, instruction, and assessments targeting deeper conceptual understanding and reasoning as well as the development of skill fluency. These shifts — focus, coherence, and rigor — have encouraged educators to rethink how to teach mathematics. Problem solving is a large part of the new standards with an expectation for students to be adept in the selection and use of appropriate tools for solving problems, and to have an ability to persevere in solving problems using multiple representations. Furthermore, students are expected to verbally explain and defend their own approaches as well as to understand and critique the reasoning of others.

This paper presents the Teaching and Learning Triad for Nurturing Persistent Problem Solvers (referred to as the Triad). The Triad (see Figure 1) includes attention to teacher preparation and reflective practice both prior to and during classroom instruction. The Triad, an adaptation of Pat Thompson’s (2008) Teaching Triad, is consistent with the findings of Clarke and Hollingsworth (2002) which recognize that “teachers are themselves learners” who “´seek to change´ in an attempt to improve their performance or develop additional skills or strategies” in a non-linear fashion (p.948). The Triad is based on a synthesis of findings from a series of design experiments (as described by Schoenfeld (2014) and Cobb, et al. (2003)) for the purpose of having research inform teacher training as well as students’ mathematical performance. The paper also synthesizes the results of five MSP grants, high school district funded workshops, and current results of a $9 million NSF grant, [Arizona Mathematics Partnership referred to as AMP], focused on improving middle school mathematics. The following activities and perspectives are grounded in the analysis of class observations, teacher and student test data, teacher reflections, and facilitator reflections collected over the past ten years. The arrows in the Triad represent teachers’ reflective behaviors, changes in beliefs, or actions and indicate the interconnectedness of the three categories. For example, after participating in a professional development workshop that used the Diagnostic Instrument (See Appendix 1) to analyze the problem-solving behaviors of other teachers, a teacher created the first version of a problem-solving template to be used by his own students. The teacher instructed his students to use the template to solve several problems and observed their responses. The teacher shared his observations with the workshop facilitator and the facilitator made suggestions for improving the template, such as adding a rubric and including a comprehensive list of strategies. The final version is included in this paper (see Appendix 2).
Figure 1. Teaching and Learning Triad for Nurturing Persistent Problem Solvers
Professional Development and Philosophical Perspective on Perseverance

Research (Darling-Hammond & Richardson, 2009) supports professional learning that:
• Is content based and includes pedagogical issues of teaching and learning;
• Uses active learning;
• Includes reflection with colleagues;
• Is consistent with school, district, and state reforms;
• Is intensive and sustained over time.

Yet, according to Schoenfeld (1991), the perspective of the mathematical community is this:

‘We know how to teach, and can do it well if we devote the time and energy to it. (It’s a shame we’re as busy as we are and can’t spend as much time grading assignments, etc..) What we need is for people to give us the resources that make things easier --- means of keeping current and good materials, ready for use’” (pp. 270 – 271).

To bridge this seeming conflict of motives AMP has provided professional development to in-service middle school teachers aimed at improving their awareness of productive problem-solving behaviors and instructional techniques that encourage students to engage in the Mathematical Practices (CCSMI, 2010). Teachers are taught to act as a researcher observing another’s problem-solving behaviors by using Vicich’s (2014) Diagnostic Instrument (Appendix 1) which is based on Schoenfeld’s (1992) Theoretical Framework of Problem-Solving Behaviors and is adapted from the analytical techniques of Geiger & Galbraith (1998). Teachers are paired as problem solver and observer. Solvers are asked to think aloud while observers comment on the various categories of behavior such as initial engagement, planning, conjecturing, strategy selection, monitoring of progress, verification, resource knowledge, and beliefs and attitudes such as willingness to explore and perseverance. Teachers then present their solutions to the larger audience by white board or document camera. Audience members critique the mathematics and the researcher shares her/his observations as they unfold. While solving several problems the roles are reversed. In this activity, teachers develop 1) awareness of their own problem-solving behaviors; 2) awareness of how to diagnose students’ difficulties; and 3) empathy for the students’ experience as problem solver. Teacher reflections on this activity include the benefit of seeing alternative solution pathways and the power of accurately identifying givens and goals.

Perseverance is a part of the affective domain as described by DeBellis & Goldin (2006). They define Mathematical Integrity as an insistence that a solution is mathematically adequate
and makes sense; and Mathematical Intimacy as willingness to take risks, persevere, and have confidence. DeBellis and Goldin

“... conjecture that students with strong mathematical integrity structures have the potential to engage in powerful learning and problem solving especially if their mathematical integrity is interacting with their capability for mathematical intimacy.” 138 – 139)

To view perseverance and persistence as only a function of time ignores the ways in which problem solvers make progress through the various categories of problem-solving behaviors (Carlson & Bloom, 2005). Students can spend time on a problem without recognizing that they are engaged in a “dead end” solution pathway that does not move them closer to a goal or subgoal (Schoenfeld, 1992; Vicich, 2002). In contrast to a myopic view of persistence, we see five forms of persistence/perseverance in mathematical problem solving. We include problems that provide teachers and students opportunities to focus on productive problem-solving behaviors while attending to mathematical integrity and mathematical intimacy. The first Mathematical Practice defined by CCSSI (2010) and individual states’ standards is: Make sense of problems and persevere in solving them. Although we have selected problems to highlight aspects of perseverance, multiple Mathematical Practices can and usually occur during the problem-solving process in any one problem.

Circa 1875: Twelve ships will leave San Francisco, one per month, to travel around the horn of South America bound for New York. At the same time, twelve different ships will leave New York, one per month, along the same route bound for San Francisco. Excluding meetings in the harbors, how many times will ships headed in opposite directions pass each other on the open seas? Each ship will take six months to reach its destination.

2. Persist in finding an efficient strategy based on conceptual understanding to explore relationships: Source: (NCTM, 2015) Mathematics Teaching in the Middle Schools, August 2015, Vol. 21, Issue 1, NCTM, Reston, Va..

Provide a coherent, convincing argument to support your final answer. Provide a written check. What is the smallest positive integer n so that n + 125 and n + 201 are both perfect squares? What is your plan? Can you make an initial conjecture about the final answer?
3. Persevere/Persist at implementing a rigorous, time consuming, solution pathway:

Make a separate, labeled drawing of each of the twelve isosceles triangles. Provide sufficient explanation of how to determine the length of each side of every triangle. Given, CM = CN = 2, compute the sum of the twelve hypotenuses. Source: Adapted from Mathematics Teacher, 108(1), 2014. NCTM. Reston, Va.

3. Is this assertion true: A semicircle constructed on the hypotenuse of a right triangle is equal in area to the sum of the areas of the two semicircles constructed on the legs? Explain how you know. (Hint: Don’t forget Pythagoras.)

Extension/Exploration: Does the assertion hold true for replacing the semi-circles with equilateral triangles?
5. Persist in verification and monitoring of progress (metacognitive reflection of moving toward a valid answer, and establishing subgoals).

First make a conjecture as to the nature of the answer (large or small number, rational or irrational, or close to 1) and then write a plan for solving the problem. Be sure to identify any subgoals and also appropriately label drawings used in your subgoals (that is, focusing and redrawing a selected portion of the original drawing). Source: Chris Benton, Scottsdale Community College (2010)

The two identical, adjacent squares have sides of one unit. Find the area of the oblique (that is slanted) rectangle. Show all steps. Hint: An excellent strategy is to label all vertices and redraw smaller sections of the larger figure for detailed subgoal analysis. (Adapted from the NCTM 100 Favorites Calendar)

Reflective Practices & Resources that Precede Instruction

We use a broad definition of reflective practice, adapted from Schön (1983) to describe the practice by which professionals become more aware of their professional knowledge and learn from their experiences. “Engaging in reflective practice enables the teacher to learn from, and potentially enhance, their teaching practice” (Saleh & Hussin, 2011). As described by Clarke and Hollingsworth (2002), the reflective process enables teachers to grow in the artistry of teaching via multiple networks and experiences.
Prior to instruction the teacher must set the goal that students will develop deep, well-connected conceptual understandings. Hiebert and Carpenter (1992) suggest a theoretical framework for learning and teaching mathematics with understanding. They define mathematical understanding in the following way: “a mathematical idea or procedure or fact is understood if it is part of an internal network” (p. 67). A network may be a vertical hierarchy where one concept may be represented as a special case of another idea. The vertical network may be narrow and deep showing many hierarchical relationships. Sfard (1991) describes a network that is shallow and wide known as the "mother with too many sons" model (p. 27). A network may also be thought of as a web showing multiple links allowing one to identify similarities and differences between ideas (Hiebert and Carpenter, 1992, p. 67) (See Figure 2 below). The web helps students build a coherent mental network in which all pieces are joined to others with multiple links. The degree of understanding is determined by the number and strength of the connections that a student is able to make within her/his network.

Prior to instruction the teacher must design a “mathematics classroom culture” in which students will have the experience of doing mathematics with the following characteristics (Arcavi et al., 1998):

- Development of a mathematical point of view – using mathematics to symbolize, abstract, model, prove or disprove conjectures, perceiving connections across problems and results, and creating knowledge that is new to oneself or the community.
- Emphasis on process as well as results – explanations of how ideas are generated are highly valued even when they do not produce solutions.
Leadership and Authority – the teacher leads the class towards assuming responsibility for standards of completeness, coherence, and the conviction of mathematical arguments. Here the mathematics itself is the ultimate authority.

Communication – the classroom setting encourages written and oral communication. Students are encouraged to evaluate, question, and critique each other’s suggestions and work. [Note: In this culture be sure to establish the norm that ideas, not the person, are critiqued ([Redacted], 2007).]

Reflective mathematical practice – Is your argument convincing? How could you arrive at the same answer using a different solution pathway? Can this result be generalized?

We suggest that implementation of the eight Mathematical Practices (CCSMI, 2010) and students’ productive struggle (NCTM, 2014) occur in a student-centered classroom that has the following characteristics: (Source: Redacted for a blind review)

Students will:

- Be engaged in mathematical discourse with the teacher and fellow students.
- Be explaining their mathematical thinking.
- Be justifying their reasoning mathematically.
- Critique the thinking of others.
- Be engaged in problem-solving.
- Be communicating (verbally and in writing) mathematical thinking coherently and precisely (language).
- Be sharing alternative solution pathways.
- Embrace mistakes and remain persistent when problem solving.
- Routinely seek, examine, and verify patterns, structures or repeated reasoning to make connection to problem solve.

In such a classroom culture, mathematical reasoning will be the ultimate authority to determine the validity of a claim and students will need to convince their own classmates through sound and logical reasoning.
How should a teacher select tasks that promote the development of productive problem-solving behaviors and attitudes? Arcavi et al. (1998) described Schoenfeld’s Criteria for problem selection:

- Problems should be accessible on the basis of prior knowledge.
- Problems should be solvable or at least approachable in more than one way.
- Problems should illustrate important mathematical ideas in terms of either the content or solution strategies.
- Problems should be constructible without tricks.
- Problems should serve as first steps toward mathematical explorations and springboards for further problem posing.

Writing about the importance of one’s belief system, Schoenfeld says that one’s beliefs about mathematics can determine how one chooses to approach a problem, which techniques will be used or avoided, and how long and how hard one will work on a problem (Schoenfeld, 1992).

Teachers must create learning experiences that directly attack the following unproductive beliefs:

- Experts move directly from the problem statement to the solution.
- There is only one way to solve a math problem (usually the teacher’s way).
- It is **not** OK to stop and start over using a different approach once I’ve started.
- I just need to get an answer; it does not have to make sense to me.
- If I cannot solve a problem in 5 minutes or less then I cannot solve it at all.
- The best way to learn math is to memorize.
- Every problem uses a formula to arrive at an answer.
- Making unsuccessful solution attempts is **not** a natural part of doing mathematics.

Adapted from Carlson & Bloom (2005), [Redacted] (2002) and Carlson & Buskirk (1997)

**Reflective Practices That Occur During Instruction**

Within the classroom the teacher must reflect on the effectiveness of instructional techniques and adjust accordingly. The following active learning techniques place an emphasis on individual accountability while creating a community of mathematicians in which the mathematics itself is the ultimate authority.
Facilitating and Assessing Students’ Oral Presentations

An effective practice to implement oral presentations is to 1) pair students by ability, a stronger student with a less able student; and 2) make student presentations an everyday classroom practice. Within the pairings, students are introduced to new patterns of thought, such as alternative solution paths or strategies, as a result of engaging in dialogue with peers. (See Vicich (2007, 2002) for more on Paired-Board Work).

Give students five simple guidelines for their oral presentations: 1) Provide a neatly organized, thorough written solution; 2) be poised, look and sound confident; 3) use proper body position so that the audience can easily see both your written work and your face; 4) maintain eye contact with the audience; and 5) use a voice that is clear and appropriately loud for the setting.

Give feedback to students on their presentations. First compliment the elements of the performance that are admirable, and then suggest ways to improve any weaknesses. In the classroom, this means the teacher should first find something he/she likes about the student’s solution, (e.g., neatly organized, axes of graphs labeled correctly and with proper units, good body position); then ask the class for suggestions on how to improve any weaknesses of the presentation. Very quickly, the qualities that the teacher and students recognize as desirable in this public forum become the established mathematical norms of your classroom practices. For those teachers who prefer a quantitative assessment, we recommend the following Rubric for Grading Oral Presentations:

- Neatness, 1 point;
- Thoroughness, 2 points;
- Mathematical Correctness, 1 point;
- Verification, 1 point. Total = 5 points

Note: A major challenge for students is to shift the belief that their solutions are only for themselves rather than for the purpose of convincing everyone else.
Camera ready specifically refers to the form a solution should be in before it is presented to the class via a document camera. While what constitutes camera ready can vary from classroom to classroom, here are some elements of camera ready that we have found necessary for it to be effective:

- Solutions should be neatly organized, thorough, and coherent.
- Explanations should consist of mathematical arguments, not simply procedural summaries of the steps taken to solve the problem.
- All figures should be labeled and referenced.
- Students should exhibit very good oral presentation skills. (Poise, Voice Eye Contact & Body Position)

Use of Problem Solving Template & Rubric With Students

The problem solving template (Perales & Vicich, 2014) (Appendix 2) is used as a formative tool to increase students’ awareness of productive problem-solving behaviors. A rubric is used to reinforce the importance of various behaviors. For example, early on in a semester students may need to earn more points for verifying that their solution makes sense until that behavior becomes a habit. Note, final answers are required to be written as a complete, grammatically correct sentence.

Schoenfeld (2015) has developed a set of questions for teachers to ask that help students move forward if they are having difficulty. When students say, “I don’t know what to do next?”, the teacher can respond with several prompts:

- What do you know?
- What are you trying to do?
- What have tried so far?
- Can you think of a helpful representation?
Conclusion

Foundational knowledge teachers may lack about productive problem-solving behaviors can be learned through actively engaging in appropriate professional development activities. We suggest that perseverance is not measured exclusively by time spent solving a problem but rather by attending to a willingness to persevere in all categories of problem-solving behaviors. The authors call for teachers to reflectively engage in the professional development experiences described in this paper and solve the problems for students prior to classroom implementation.

NCTM. 2014. Principles to action: Ensuring mathematical success for all. Reston, VA

Questions for getting unstuck:

Have I tried the strategies and followed my plan?

Am I getting closer to solution?

Can I break this problem into smaller pieces?

Other questions I asked myself:

Conjecture (reasonable guess):

Plan: What will you do to solve this problem? (I am going to … so that I can …)

Strategy Selection:

1. Draw and label a diagram.
2. Examine special cases.
3. Simplify the problem.
4. Consider equivalent problems.
5. Consider slightly modified goals and subgoals.
6. Act out the problem/ use manipulatives.
7. Identify what does NOT work.
8. Work backwards.
(Adapted from Schoenfeld (1998))

Underline the givens and circle the goals.

Name

Date Hour
Solution Pathway (Not just what you did, but WHY you did it. Remember, your work is for everyone!)

Answer (Stated in a complete sentence, referring to the question, units included as necessary):

Check (verification): Use mathematical reasoning to prove that your answer is correct.

I know my answer is right because…

1) Title: Preschoolers Improve Phonological Awareness Skills with Short Duration Instruction

2-5) Names of Authors, Affiliation, Address, and E-mail:

1) Karissa Marble-Flint, MSEd, CCC-SLP, Doctoral Candidate, Communication Sciences and Disorders, Wichita State University, 401 Ahlberg Hall, 1845 Fairmount, Wichita, KS 67260-0075, kjmarble-flint@shockers.wichita.edu

2) Kathy Strattman, PhD, CCC-SLP, Associate Professor, Communication Sciences and Disorders, Wichita State University, 401 Ahlberg Hall, 1845 Fairmount, Wichita, KS 67260-0075, Kathy.Strattman@wichita.edu
6) Abstract:

There is a strong relationship between phonological awareness abilities, early reading instruction, and later reading skills. When Phonological awareness (PA) instruction occurs before learning to read, advances appear in reading development, advances greater than those from other types of pre-reading activities. Advantages of PA instruction have been shown up to four years later. [1] The current study determined the effects of short duration, low intensity PA treatment of typically developing preschoolers (26) and 14 preschoolers with identified speech/language impairments in a literacy-based playgroup. Results comparing pre- and post-test scores indicated that both children with speech and language impairments and typically developing children improved. When compared with 91 age-matched, peers from a local preschool program for typically developing children, those in the playgroup scored significantly higher following the PA treatment.

Summary:

We know benefits of Phonological Awareness in preschool [2], especially for children with speech/language deficiencies [4]. With so much to include in a preschool curriculum, how much time is needed for explicit instruction in PA? Are children in a typical preschool already gaining phonological awareness through the regular curriculum? Our study investigated results in phonological awareness development from a literacy-based playgroup for preschoolers and their parents/caregivers at an urban university’s speech-language clinic. The playgroup provided a multi-sensory approach for emergent language, literacy, and writing skills. This program was a 28-week program (considered short duration), which included one hour and thirty minutes of treatment once a week. A portion of the treatment was a 15-minute (considered low intensity treatment) phonological awareness learning lab, [3] with the child and parent/caregiver. Pre- and Post-treatment testing utilized, the Assessment of Primary Literacy Skills (APLS) [5] that included both syllable level and phoneme level tasks.

Participants in this study were 40 children in the playgroup (PG) 21 males and 19 females ages 2:5-5:10 and 91 children, 39 males and 52 females who attended a typical preschool (TP) from 3:0-5:11. [6]

When examining the relationship between the pre-test scores of the children in the playgroup and scores of the TP group prior to intervention, the group’s scores were strongly correlated ($r = -0.983$). Following intervention, scores were significantly higher for children in the PG group in the 4:6-4:11 age category, $t(13) = 8.78$, $p < .001$, and the 5:0-5:5 age category, $t(30) = 8.264$, $p < .001$. There was not a significant difference between the children in the PG group in the 5:6 age category and the TP 5:6 age category, $t(6) = 1.235$, n.s. However, in the PG group in this age category there were only seven participants, while there were fourteen participants in the TD group, potentially limiting the statistical power.

In comparing scores of children in PG identified with speech and language disorders (N=14) and children in PG without identified speech and language disorders (N=40), both groups made gains from pre-test to post-test. Results of a repeated measures t-test showed a significant difference existed in the APLS scores of the children, $t(53) = 17.09$,
p < .001. In addition, the results of a paired sample t-test indicated there was not a significant difference in the gain scores between these two groups, t(52) = 1.11, n.s.

Additionally, data analysis was conducted to determine the difference between gain scores of boys and girls in the PG group and to compare the current study to previous research. An independent sample t-test indicated no significant difference between the gain scores of girls and boys, t(52) = .982, n.s., which was inconsistent with results of previous research [3].

In summary, children who had short duration, low intensity PA treatment when matched with same age children who had typical preschool experiences showed significantly different scores in PA activities. Not only did children with short duration, low intensity PA treatment demonstrate significant differences in PA scores from age-matched peers in a typical pre-k, but they did this with a minimal amount of treatment. The current findings are important for preschool programs demonstrating positive results even when PA skills are taught in short, fifteen minute learning center activities (examples will be included in this poster presentation). Additionally, parents were a key component to these children’s emergent literacy development.

Abstract.

In far too many elementary classrooms today, teachers are tied to curriculum mandates that address disciplines in isolation, which thwarts students’ understanding of important key concepts. A compartmentalized approach creates difficulty for teachers to be cross curricular in their instruction which, in turn, limits the opportunities for students to closely relate content and make real world connections. Teaching disciplines independent from one another does not promote students’ ability to engage in meaningful and relevant activities toward delving deeper in the content and naturally making important connections between the disciplines.

With the current overwhelming expectations placed on educators to create pathways for student understanding across the plethora of required curriculum standards, teachers must be intentional in their instructional approaches. Developing multidisciplinary integrated curriculum units that support students in higher levels of understanding with the ability to exhibit superior mastery of content standards is imperative in today’s assessment-driven classroom. Field tested and vetted through scholarly circles, the authors of internationally published integrated curriculum units have developed an innovative approach that is a recipe for ensuring students’ deeper understanding with a guaranteed demonstration of greater levels of proficiency on key curriculum content.

Pulling from the scholarly literature, authors of the integrated curriculum units capitalize on the benefits associated with research-based best instructional practices to create learning opportunities that serve to heighten student learning, as evidenced by the
overwhelming success on student outcomes time and time again. The unit design evidences many and varied grouping structures, plentiful opportunities for meeting diverse learning styles and modalities, and an abundance of authentic texts, tasks, and assessments to facilitate student understanding of learning goals in content areas. Another key facet of multidisciplinary instructional units planning is to be mindful of offering opportunities that allow for student choice as this serves to engage learners toward the cultivation and retention of knowledge.

Unit planning tools such as a standards crosswalk, customized graphic organizers to highlight options for showcasing student understanding, matrices delineating authentic print and non-print inquiry tools and resources, and grouping structures were put through a rigorous vetting process and deemed highly beneficial in supporting educators who plan multidisciplinary units. Integrated curriculum unit tools by design allow teachers the freedom to use their professional judgment in determining the best avenues to support student ownership in the inquiry process, construction of knowledge across key concepts in creative ways, and unique platforms to share understanding of content in authentic settings.

Teachers must be efficient and effective in optimizing student learning, and therefore, it is imperative that students be engaged in a high volume of authentic, meaningful, and relevant learning experiences through the use of integrated curriculum units. In doing so, teachers are in a position to enable students to develop a deeper understanding of many and varied content area topics that promote meaningful connections across disciplines and facilitate making real-world connections.

In this era of high stakes assessment, it is more important than ever before that teachers purposefully plan with a multi-disciplinary approach to foster fervent learning.
Delving Deeper into Depression: An Examination of Pre-Service Teachers’ Understanding of Depression, and the Implications for Policy Recommendations

**Topic Area:** Teacher Education

**Presentation Format:** Paper Session

**Abstract:** Families for Depression Awareness (n.d.) states that depression in young adults between the ages of 12 and 17 has risen at startling rates. From an educator’s perspective, this news is distressing as students’ depression can negatively impact their lives in multiple ways (NIMH, n.d.). Fifty-five pre-service teachers in teacher preparation programs were administered the Depression Multiple Choice Questions (Gabriel & Violato, 2009). Results and implications are discussed.

**Introduction**

With roughly 14.8 million annual adult victims within the United States alone, depression has been cited as the leading cause of disability in the U.S. for individuals between the ages of 15 and 44 (ADAA, 2014). While mood fluctuations and negative emotions in response to life’s obstacles are normal and short-lived, depression presents itself as a much different opponent. According to the National Institute of Mental Health (2016), a person must have persistent signs and symptoms for at least two weeks, which may include: continuous sad or empty moods, fatigue, difficulty concentrating, feelings of worthlessness, physical pains with no clear cause, and thoughts of suicide, among others. Families for Depression Awareness (n.d.) states that depression in young adults between the ages of 12 and 17 has risen at startling rates. In addition, suicide reigns as the second leading cause of death for individuals from the ages of 15-29 (WHO, 2016). From an educator’s perspective, this news is distressing as students’ depression can
negatively affect their school performance, disrupt both their personal and professional relationships (NIMH, n.d.), and ultimately, end their lives.

**Literature Review**

Fortunately, there are a multitude of effective treatments available for depressed students. Unfortunately, as little as 21% of Americans afflicted receive care compliant with the American Psychiatric Association guidelines, while 50% receive no treatment at all (Gonzalez, H.M., et. al., 2010) In addition, minorities--especially Mexican Americans and African Americans--yield even lower percentages. The major obstacle in seeking or receiving treatment is ultimately the lack of knowledge about depression, which often leads to stigmatization and high levels of misconceptions regarding the subject (DNA Learning Center, n.d.).

Treatments available include antidepressants which may adjust brain chemical levels to help control mood or stress, psychotherapies (talk therapy), or the herbal medicine “St. John’s Wort” (NIHM, n.d.). Effective treatment of depression is not immediately gratifying; in the case of antidepressants, it typically takes two to four weeks to reach therapeutic levels and several different medications to find the correct “fit”. If treatment is effective, it is still vital to continue unless otherwise advised by a healthcare professional, especially in the case of antidepressants as withdrawal symptoms may occur. Positive benefits from each of the aforementioned treatment options have been reported; however St. John’s Wort has not been FDA approved and there exist “serious concerns about its safety” (NIHM, n.d.). Beyond treatment, there are several lifestyle changes that may provide aid during treatment such as exercise and surrounding oneself with loved ones. Yet 70-80% of young people and young adults do not receive the appropriate mental health care (Wei et al, 2015).
With that in mind, depression, especially in the younger population, still remains an area in dire need of addressing. Among adolescents and young adults, untreated depression is a strong indicator of lower occupational achievements, dysfunctional interpersonal and family function, as well as decreased life expectancy due to an increase associated medical conditions (Wei et al, 2015). Currently, ¾ of US high schools implement a mandatory suicide prevention program; however, these programs typically do not address mental health nor its correlation to suicide risk (Swartz et al, 2007), yet 70-75% of mental health problems identified in adults began to manifest during their adolescence or early adulthood. During this time, students typically spend a significant portion of their day at school with their teachers rather than at home with their parents and thus teachers may see more indicators than those in the household. Therefore teachers occupy a special position in which can provide this early identification and intervention that is vastly important as it can significantly reduce depressive symptom as well as depression’s effects on academics and occupational performance (Kuo et al, 2013). In addition to teachers’ advantage in early identification, schools also provide a setting that can better serve students with a wide variety of backgrounds who may otherwise have limited access mental illness resources. The fact that depression often manifests during adolescence and the importance of early intervention combined with teachers’ advantage in acting upon the situation highlights the critical role that teachers may play in mitigating the upsurge of student depression.

As of now, there is a dearth of literature regarding teachers and their knowledge of depression. However, in order for teachers to fulfill their potential as front-line intervention personnel, they must show an acceptable level of competence in the area. Thus, educational programs regarding depression and intervention might need to be implemented for teachers. These programs would be doubly beneficial as they will also help destigmatize depression and
treatment thus reducing an additional barrier for students seeking help (Swartz, et al, 2007). Having a baseline knowledge indicator would allow program developers to tailor a more effective training course for pre-service teachers and those already in the field.

**Methods and Data Sources**

**Participants**

The participants in this study were 55 undergraduate students (pre-service teachers) in the fall semester of their junior year at a university in the Southwestern USA in the elementary education teacher preparation program. The pre-service teachers’ demographics included female \( n=50 \) and male \( n=5 \). The pre-service teachers ranged in age from 18-34 (See Table 1).

Table 1. Age of Preservice Teachers

</tbody>
</table>

Racially, the demographics were reported as the following: White (57.5%), American Indian/Alaska Native (9.6%), Asian (9.6%), Biracial/Mixed (9.6%), or Other (13.5%).

Ethnically, 67.9% described themselves as Not Hispanic or Latino and 32.1% identified as
Hispanic or Latino. All of the pre-service teachers were enrolled in the elementary teacher education program, with 74.5% enrolled in the general program and 25.5% enrolled in the Bilingual/English as a Second Language endorsement program. We are in the process of collecting additional data which includes participants in secondary education.

Instruments

This study employed a mixed methodology design with data collected from two sources. In this proceedings paper, we will only be reporting on the quantitative data sources since we are still in the processes of analyzing. Qualitative results will be shared at the HICE 2017 conference presentation.

Surveys. The primary data source was the Multiple Choice Question (MCQ) Instrument to test knowledge of depression and its treatments in individuals suffering from depression developed by Gabriel & Violato (2009). The MCQ was developed using items based on empirical evidence from an extensive review of the literature, theoretical knowledge, and in consultation with national and international psychiatry experts. The survey consists of 27 items and is reported as having an internal consistency of 0.68. The instrument consists of 27 multiple choice questions that were broken into the following subscales: “Definition (5 items), risk of relapse (2 items), etiology (2 items), presentation and symptoms (6 items), and biological and psychological treatments (12 items).” Due to a technical difficulty, responses to question number 21 were not recorded and thus are not reported in the results.

Qualitative data source. Data were collected through two focus groups using a semi-structured interview protocol, each lasting 30-40 minutes. Interviews were recorded and later transcribed verbatim.

Analysis
Qualitative data sources will be analyzed using induction methods to identify common themes across the pre-service teachers’ responses to the focus group questions (LeCompte & Preissle, 1993). Data triangulation, peer review, and member checking were used to support the trustworthiness of the data, and a search for negative cases. Descriptive statistics are reported for the survey data.

Results

For the MCQ survey data, we report the percentage of correct responses for each question as well as the percentage of responses for the three incorrect responses (see Appendix B). In addition, we have identified four categories based on the responses (see Table 2).

</tbody>
</table>

These categories were split in this fashion in order to better understand the baseline knowledge of what depression is, its causes and symptoms, and treatment options and processes. These aspects are important, especially to pre-service teachers, because in order for them to make a meaningful impact in depression intervention among their students, they must have a solid understanding of what depression is and who is more likely to be at risk, how to recognize it via symptoms/signs, and what the process of recovery is like so they can be understanding and provide support from an educated point of view.
Discussion

At the present time, data was collected and analyzed only for preservice elementary school teachers. Although most often, the approximate onset of depressive disorders is at about 11 to 14 years. (JUSTIFY WHY ELEMENTARY)

The authors argue that given the levels of misconceptions that exist among the future teacher population, opportunities for depression awareness education through teacher preparation programs or professional development should be offered to pre-service and in-service teachers. In addition, policies should be developed that would require mental health education programs at the middle and high school level, thus equipping all students with knowledge about depression prior to their college experience. Currently, a number of US high schools mandate some type of suicide prevention program; however, these programs often neglect to explain depression or mental health and their association with suicide (Swartz et al, 2007). As educators, it is critical that classroom teachers understand depression in the case that it may arise among their students.

Implications

Teachers should act as a front line intervention-personnel for the reasons described above; however, their role is not to provide counseling as their priority is still educating the class as a whole and they are not professionally trained to do so. The role of teachers in terms of depression among students would be to identify depression as early as possible, refer them to appropriate resources, and, if need be, act as a bridge between home and school. Their current knowledge of depression, bolstered with knowledge from training programs, would better prepare teachers for this role.
However, the data collected limits baseline knowledge to pre-service teachers in elementary while need is highest in secondary education. More research would be needed in gathering a baseline for those pursuing a career in high school and middle school teaching. Once data for these demographics are accumulated, programs can be implemented and teachers would have the ability to act as front line interveners, resulting in early treatment for students and subsequent improvement in their condition and academic achievement.

Multiple Choice Question (MCQ) Survey to Test Knowledge of Depression and Its Treatments in Patients Suffering from Depression

(Survey Administered Through Google Forms)

From:

Thank you for taking the time to fill out this survey on knowledge about depression. We appreciate your time!

Demographics Questions (section added to original MCQ survey)

1. What is your age? _____ (Text Box)

2. With what gender do you identify? (Choice)
   a. Male
   b. Female

3. How do you identify racially? (MC)
   a. American Indian/Alaska Native
   b. Asian
   c. Black or African American
   d. Native Hawaiian or Other Pacific Islander
   e. White
   f. Biracial or Mixed

4. How would you describe your ethnicity? (MC)
   a. Hispanic or Latino
   b. Not Hispanic or Latino

5. What is your current teacher education program? (MC)
   a. Early Childhood/Special Education
   b. Elementary Education
   c. Elementary Education/Special Education
   d. Elementary Education/STEM
   e. Elementary Education/BLE or ESL
   f. Secondary Education
g. Educational Studies
h. Education Exploratory
i. Other

6. In what term of your program are you currently in? (MC)
   a. Term 5
   b. Term 6
   c. Term 7
   d. Term 8

Multiple Choice Knowledge Questionnaire

1. Which of the following statements about clinical depression is FALSE?
   a. It is a medical disorder.
   b. It is a weakness of character.
   c. It is a common psychiatric disorder.
   d. It affects both males and females.

2. What is the risk of death by suicide among depressed patients?
   a. The risk is very minimal.
   b. The risk is between 15% and 50%.
   c. The risk is below 15%.
   d. The risk is above 50%.

3. What are the lifetime chances of becoming clinically depressed?
   a. One in 1000
   b. One in 50
   c. One in 3
   d. One in 1

4. Which of the following is TRUE about the age of onset of depression?
   a. Depression does not begin in adolescence
   b. Depression can start in childhood or adolescence.
   c. Depression appears for the first time in middle-aged people.
   d. Depression does not affect young children.

5. Which of the following, about sex differences in depression is TRUE?
   a. Only women get depressed.
   b. Clinical depression is more common in women than men.
c. Clinical depression is more common in men than women.
d. Only men get depressed.

6. Which of the following is FALSE about the relapse of clinical depression?
a. The number of previous episodes of clinical depression increases the chances of subsequent episodes.
b. After the first episode of clinical depression, there is an increased risk of a second episode.
c. Maintenance treatment can reduce the chances of relapse.
d. After recovery, there is zero risk for recurrence.

7. Which of the following behavior is associated with poor outcome?
a. Taking antidepressant treatments regularly
b. Being involved in talk therapy (psychotherapy)
c. Staying sober
d. Stopping antidepressant medications if feeling well

8. What factors may trigger the onset of clinical depression?
a. Biological factors, such as genes
b. Psychological factors such as having marital problems
c. Social factors such as losing a job
d. All of the above

9. Depression may be triggered by all the following EXCEPT:
a. Prolonged severe grief over loved ones
b. Taking antidepressants
c. Certain medical conditions
d. The birth of a new baby

10. The following are indications of clinical depression EXCEPT:
a. Changes in sleep patterns
b. Poor concentration
c. Frequent crying for no obvious reasons
d. Occasional sadness

11. Which is NOT true about the differences between depression and a passing blue mood?
a. People with depression can "pull themselves together"
b. Depression can be much more disabling in day-to-day functioning.
c. Patients who are clinically depressed look sad.
d. Without treatment, symptoms of clinical depression can last for weeks, months, or years

12. All of the following are recognized symptoms of clinical depression EXCEPT:
a. Marked loss of interests.
b. Excessive sleep
c. Loss of energy
d. Good concentration

13. Which of the following is NOT a symptom of clinical depression?

a. Restlessness
b. Changes in appetite
c. Good decision making
d. Lack of energy

14. All of the following are typical of patients suffering from clinical depression EXCEPT:

a. Negative thinking that can lead to self-defeating or suicidal behavior
b. Mental fatigue and the inability to solve complicated problems
c. Marked forgetfulness
d. Normal memory

15. Which is NOT a common symptom of clinical depression?

a. Poor motivation
b. Normal energy
c. Guilty thoughts
d. Fatigue

16. Which of the following statements about the speed of response to the treatment with antidepressants is FALSE?

a. Symptoms improve immediately after treatment is begun.
b. Many antidepressants may take several weeks to start to work.
c. It is important to continue taking medication even if there is initial improvement.
d. Not all symptoms respond to antidepressants at the same rate.

17. If medication does not improve depressive symptoms, one should:

a. Stop taking all medication.
b. Talk to a health care professional.
c. Double the pills.
d. Ask friends about what to do.

18. Which is NOT a recognized treatment for clinical depression?

a. Medication
b. Talk therapy.
c. Light therapy (photo-therapy).
d. Kickie therapy
19. Which is NOT a common side effect antidepressant drugs?

a. Upset stomach
b. Sleep disturbances
c. Sexual side-effects (e.g. problems with sexual desire or orgasm)
d. Feelings of depression

20. Which is FALSE about the effectiveness of antidepressant medications?

a. About 30-40% of patients do not respond to the initial treatment.
b. Moderate symptom improvement may take few weeks to be achieved in those who will respond.
c. Using more than one antidepressant may be necessary for some patients.
d. Recovery of symptom can be achieved in all depressed patients

21. What should one do if one's first antidepressant medication fails?

a. Consult one's doctors
b. Take sleeping pills
c. Drink more alcohol
d. Use magnetic therapy

22. Which is FALSE about Electric Convulsive Therapy (ECT) for treating clinical depression?

a. It is proved to be effective.
b. It is a safe method.
c. It is no longer used for treating depression.
d. It is given under general anesthesia.

23. If one feels better during the course of treatment, one should

a. Stop taking antidepressant medication.
b. Discuss the course of antidepressants treatment with doctor.
c. Reduce the antidepressant dose by half.
d. Start a course of herbal treatment.

24. Which is NOT a common occurrence during treatment with antidepressants?

a. Gaining weight
b. Severe continuous headaches
c. Feeling sleepy
d. Sweating

25. Which is FALSE about the response to treatment with antidepressants?

a. Up to 80% of people with depression do get better with the right medication.
b. Most people with depression need to be treated for at least six to nine months to prevent relapse.
c. For some people, it is necessary to stay on medication for long-term maintenance therapy.
d. If the acute depressive symptoms are relieved, the patient should stop antidepressants.

26. Which is FALSE about selecting the right antidepressant for someone with depression?
   a. There are no available laboratory tests to guide doctors' choices for treating clinical depression.
   b. Different people have different responses to antidepressants.
   c. Doctors can tailor antidepressants to suit the symptoms of individual patients.
   d. Doctors can always tell beforehand how a person is going to respond to the medication they prescribe.

27. Psychotherapy can help many people with depression. Which of the following statements about psychotherapy is FALSE?
   a. Both individual and group talk therapy provides an opportunity to express and discuss thoughts and feelings with the therapist.
   b. Therapy may help to resolve life issues that may contribute to depression.
   c. All depressed individuals benefit from psychotherapy.
   d. In psychotherapy, negative, and self-defeating thoughts can be replaced by more positive, realistic thoughts.

Worldviews and Conceptualizations of Teaching, Learning, and Inquiry in Two Teacher Preparation Programs

Dr. Penny L. Hammrich  
School of Education  
Drexel University  
plh33@drexel.edu
Overview
This study analyzes the worldviews and conceptualizations of teaching, learning, and inquiry held by students in an education major, and in a teacher preparation program for non-education majors. It dives deep in analyzing the intricate relationships between worldviews, conceptualizations, and metaphors. Understanding these relationships can inform teacher preparation programs in development of methodologies by which to engage students in critical reflection regarding their own worldviews and conceptualizations in which their teaching practices will be grounded.

The purpose of this study is to investigate the nature of worldviews regarding teaching, learning and inquiry held by students in two different forms of teacher preparation programs. An investigation along these lines was conducted by Hammrich (1998) to investigate worldviews in teacher preparation programs following Shuell’s (1992) finding of two worldviews:

In 1992 Teaching and Teacher Education published an article entitled, ’The Two Cultures of Teaching and Teacher Preparation,’ by Thomas J. Shuell. In this article, Shuell investigated the existence of two different worldviews in prospective secondary education teachers. He sought to examine the orientation of students majoring in the sciences and mathematics versus students majoring in English, literature, and history. Shuell’s analysis revealed the presence of two distinct worldviews among the students majoring in the different disciplines. He found that students majoring in science and mathematics valued worldviews aligned with traditional positivists views of scientific thinking and devalued the learning of the humanities and more aesthetic studies such as Art, history, English. (p. 19)

Hammrich’s study found that “pre-service elementary teachers showed two very distinct worldviews based on whether they were in a four-year traditional education program or a five-year education program where their major was outside education” (p. 32). Since those studies, research on worldviews and conceptualizations of teaching, learning, and inquiry have contributed to the literature (Vosniadou & Mason, 2012; Hager & Hodkinson, 2009; Alger, 2009). Furthermore, there is evidence that despite decades of progress, students’ worldviews and conceptualizations often do not align with those held by experts (Meyer, Shanahan, & Laugksch, 2005; Kincheloe, 2005).

Like previous studies, this study analyzes the worldviews and conceptualizations of teaching, learning, and inquiry through analysis and comparison of rich data from students in two teacher preparation programs: an education major, and a teacher preparation program for non-education majors. However, it dives deeper by analyzing the intricate relationships between worldviews, conceptualizations (of teaching, of learning, and of inquiry), and metaphors.
Theoretical Framework
A theoretical framework was developed by the authors to describe the relationships between metaphor, analogy, worldview, and practice.

Worldviews
Research on worldviews and conceptualizations of teaching, learning, and inquiry have contributed to the literature (Vosniadou & Mason, 2012; Hager & Hodkinson, 2009; Alger, 2009). Furthermore, there is evidence that despite decades of progress, students’ worldviews and conceptualizations often do not align with those held by experts (Meyer, Shanahan, & Laugksch, 2005; Kincheloe, 2005). Worldviews are mental frameworks of assumptions, ideas, and behaviors informing the way reality is perceived (Kearney, 1984).

Metaphors and Analogies
Worldviews consist of constellations of metaphorical concepts covering a particular domain (Lakoff & Johnson, 1999). Worldviews are dependent on metaphors and analogies (Lakoff & Johnson, 1980; Kearney, 1984; Hofstadter & Sander, 2013).

Many researchers in education and related fields have conceptualizations of learning grounded in a construction metaphor of learning: meaning is individually, collaboratively, and collectively constructed (e.g., Bruner, 1996; Collins & Halverson, 2009; Kafai & Burke, 2014; Papert & Harel, 1991; Stahl, Koschmann, & Suthers, 2014; Bransford, Brown, & Cocking, 2000; Kincheloe, Steinberg, & Tippins, 1999; Hofstadter & Sander, 2013; Lakoff & Johnson, 1980; Kearney, 1984; Deignan, 2010). People outside these domains tend to have conceptualizations of learning grounded in a transfer/acquisition metaphor of learning (Bruner, 1996; Kincheloe & Steinberg, 1998; Papert & Harel, 1991; Freire, P., Freire, A. M. A., & Barr, 2014).

The transfer/acquisition metaphor sees knowledge as consisting of discrete entities, and learning as the transfer of those entities from authoritative sources such as teachers and books into the minds of learners. This metaphor is the dominant metaphor in society today (Hager & Hodkinson, 2009) and is rarely recognized as a metaphor: “So fixed are acquisition and transfer in the popular mind that this conceptual lens can be dubbed the ‘common-sense account of learning’” (p. 622).

The construction metaphor of learning has origins in the work of Piaget who saw learning as the construction of meaning within learners’ individual minds (Kincheloe, Steinberg, & Tippins, 1999). Vygotsky and Bruner introduced a social dimension: “The ‘reality’ that we impute to the ‘worlds’ we inhabit is a constructed one. . . . Reality construction is the product of meaning making shaped by traditions and by a culture’s toolkit of ways of thought.” (Bruner, 1996, p. 19).

Worldviews, Metaphors, and Practice
The relationship between metaphors, worldviews, and conceptualizations of learning can be interpreted through an iceberg metaphor (see Figure 1). The structures and processes of the subconscious mind—the part of the iceberg beneath the surface—consist of metaphors, worldviews, and conceptualizations. These structures and processes are fueled by analogy. Observable phenomena—the tip of the iceberg—such as what we do, what we say, what we can and cannot see, and what we deem relevant are the operationalization of our conceptualizations and the worldviews and metaphors in which they are grounded.
People with a *transfer/acquisition* metaphor of learning (Figure 2) tend to have substantially different worldviews and conceptualizations from people with a *construction* metaphor of learning (Figure 3), leading to observable phenomena in the domains of practices, communication, cognitive
filtering, and values. For instance, a person with a *transfer/acquisition* metaphor of learning may tend toward learning practices involving lectures, drill-and practice, and tests. Communications regarding learning may tend to be dominated by terms such as acquire, achievement, assessment, measurement, outcomes, evidence, and standards. Cognitive filtering may prevent this person from seeing multiple perspectives and socio-historical context, but instead may focus on proven facts and learning which can be objectively observed and analyzed. Values regarding learning may tend to emphasize rigor, high standards, accountability, evidence, and a system of rewards and punishments (Kliebard, 1995; Collins & Halverson, 2009; Croft, Roberts, & Stenhouse, 2016; Freire, P., Freire, A. M. A. j., & Barr, 2014; Hager & Hodkinson, 2009).

Figure 2: Prototypical Person with a Transfer/Acquisition Metaphor of Learning
A person with a construction metaphor of learning (Figure 3) may tend toward learning practices involving collaboration, project-based learning, student-directed learning, and metacognitive practices. Communications regarding learning may tend to be dominated by terms such as collaborate, construct, interpret, creativity, engagement, and motivation. Cognitive filtering may prevent this person from seeing absolutes and “common sense reality,” but instead may focus on exploration, deconstructing socio-historical reality, and critical analysis. Values regarding learning may tend to emphasize learner agency, diversity, social justice, creativity, and individuality (Kincheloe, 2003; Kincheloe, Steinberg, & Tippins, 1999; Ohanian, 1999; Papert & Harel, 1991).

Figure 3: Prototypical Person with a Construction Metaphor of Learning
Understanding these relationships can inform teacher preparation programs in development of methodologies by which to engage students in critical reflection regarding their own worldviews and conceptualizations in which their teaching practices will be grounded (Kincheloe, 2003).

**Research Questions**

What is the nature of the worldviews regarding teaching, learning, and inquiry held by students in each teacher preparation program?

What are the similarities and differences between the worldviews regarding teaching, learning, and inquiry held by students in the two types of programs?

What is the nature of the relationships between worldviews, conceptualizations, and metaphors?

**Research Methodology**

This study uses multi-case study methodology with grounded theory coding strategies.

**Data Collection**

Teacher candidates enrolled in two different teacher preparation programs will be asked to do two things:

1. Give two short (2-3 minute) audio responses answering the questions: “What is learning?” and “What is inquiry?”
2. Write papers describing themselves as learners in two different discipline courses—one in which they did well, and one in which they did less well. Regarding each course, they will be asked to address a) their background knowledge and experience, b) how they go about preparing for class and assignments, c) the learning strategies they used, d) mode of instruction (i.e., inquiry-based, direction instruction, collaborative learning), e) the role played by their feelings and emotions about each subject, and f) the impact (both good and bad) that teachers and/or other persons made to their learning.

Audio responses will be transcribed and the audio files destroyed.

**Analysis**

Data from the two teacher preparation courses will constitute the two cases in this study. Analysis will be conducted at three levels: 1) individual participant response analysis, 2) within-case analysis, and 3) between case analysis. Responses will be coded in MAXQDA qualitative analysis software. Grounded theory techniques will be used, including constant comparative analysis, open coding, axial coding, and selective coding. Analysis will be conducted independently by all researchers and compared for inter-rater reliability. Grounded theory analysis will attempt to identify themes and categories to describe the nature of the worldviews regarding teaching and learning within and across the two cases. In addition, metaphor analysis will be conducted to identify and describe the metaphors of learning, metaphors of mind, and metaphors of education which may relate to particular worldviews of teaching and learning. Overall findings will be compared to findings of a similar study conducted two decades earlier (Hammrich, 1997).

**Potential Findings**

We expect our findings to contribute to the literature in understanding the complex relationship between worldviews, conceptualizations, and metaphors held by future educators. Our analysis may
also reveal potential strategies for engaging students in critical reflection regarding the worldviews, conceptualizations, and metaphors upon which their teaching will be grounded.

Overview
This study investigates the impact of a cooperative controversy activity on participants’ conceptions of the nature of science. Conceptions teachers hold has a direct impact on their practices and thoughts regarding doing, understanding, and teaching science. Engaging them in critical reflection is a crucial aspect of preparing the next generation of teachers to cultivate conceptualizations of science more closely aligned with those held by scientists and to engage their students in transformational critical constructivist learning.

This study will investigate the short-term impact of a cooperative controversy in-class activity on participants’ conceptions of the nature of science. Conceptions teachers hold about the nature of science has a direct impact on their practices and thoughts regarding doing, understanding, and teaching science (Smith, 1990; Kearney, 1984; Lakoff & Johnson, 1999; Kincheloe, 2003). Helping students in teacher preparation programs to engage in critical reflection regarding their conceptualizations of science is a crucial aspect of preparing the next generation of teachers to cultivate conceptualizations of science more closely aligned with those held by scientists (Meyer, Shanahan, & Laugksch, 2005) and to engage their students in transformational critical constructivist learning (Kincheloe, Steinberg, & Tippins, 1999). Instructional strategies aimed at facilitating conceptual change are the subject of increasing research interest (diSessa, 2014; Kalra & Baveja, 2012; Sinatra & Chinn, 2012; Vosniadou & Mason, 2012).

Instructional strategies aimed at facilitating conceptual change are the subject of increasing research interest (diSessa, 2014; Kalra & Baveja, 2012; Sinatra & Chinn, 2012; Vosniadou & Mason, 2012). Cooperative Controversy is an instructional strategy which has been shown to be an effective approach to engaging students in critical reflection, often leading to conceptual shift and enhanced critical thinking (Jacobs, 2010; Hammrich, 1998; Johnson et. al. 1985; Scharman, 1990; Solomon et al. 1992).

This study will analyze participant conceptualizations of science before and after engaging in a cooperative controversy activity. Furthermore, it will compare findings between participants who are students in an education major teacher preparation program and those in a non-education major teacher preparation program.

Research Questions
How do participants define their conceptualizations of science prior to engaging in a cooperative controversy activity?
How do participants define their conceptualizations of science after engaging in a cooperative controversy activity?
Does participation in a cooperative controversy activity have a short-term impact on participants’ conceptualization of science?
In what ways are conceptualizations of science (both prior to, and after engaging in a cooperative controversy activity) different and similar between participants who are students in an education major and those who are students in non-education majors.

Research Methodology
This study uses multi-case study methodology.

Data Collection
Students in one course each in two teacher preparation programs will participate in a cooperative controversy lesson designed to reveal and challenge their conceptions of the nature of science. Participants will write down their conceptions of the nature of science prior to and immediately following the cooperative controversy activity.

**Analysis**

Responses will be analyzed by content analysis measuring patterns and trends on how students define the nature of science. Analysis will be conducted independently by both researchers and compared for inter-rater reliability. Pre-intervention response analysis findings will be compared to post-intervention response analysis findings to determine short-term impact (change over time). Findings will be compared between participants who are students in an education major teacher preparation program and those in a non-education major teacher preparation program. Findings will also be compared with literature in the fields of conceptual change and conceptualizations of science, including Thagard & Findlay (2012), Thagard (2014), Sinatra & Pintirich (2003), Pintrich & Sinatra (2003), Koponen (2014), Jaber & Hammer (2016), Gentner et al (1997), and Amin (2009). Overall findings will be compared to findings of a similar study conducted two decades earlier (Hammrich, 1998).

**Potential Findings**

We expect our findings to contribute to the literature in understanding the nature of conceptualizations of science along three dimensions: 1) conceptualizations before engaging in critical reflective activity regarding conceptualizations of science, 2) conceptualizations after engaging in critical reflective activity, and 3) conceptualization patterns between education majors and non-education majors.

Importance of the Piano Repertoire and the Attitude towards its Formation - Approach, Figuration, Options

Dr. Mina Yordanova IVANOVA
School of Music, Department of Music Performance, Assumption University of Thailand

SUMMARY
This work aims to assist the performer in compiling, figuration and maintaining a repertoire fund. The presented cogitations and conclusions are based on the author’s long personal experience as a pedagogue and a concert pianist.

The artistic results prove that the chosen method functions correctly, which gives the researcher a reason to recommend it and put it in practical use in her teaching and concert activities.

OBJECTIVES
Research objective is to help build a broad-spectrum profile covering a repertory in a large historical range, as an overview of classical music in the broadest sense. A conscious repertoire "policy" is of great importance for the professional and also for an amateur, who, under certain circumstances could transform his or her "hobby" into a "profession". (Ivanova, 2009)
It also is a kind of management and marketing of the intellectual property, which our repertoire in fact is.

METHODOLOGY
Using the holistic approach in our methodology, we are looking for a comprehensive vision regarding the repertoire, which will help us rethink it in perspective and depth. We emphasize not on the quantity only, but on the quality of the products, according the individual abilities, (Ivanova, 2015) whether address it to professionals or hobbyists, similar to small or large construction works, with adequate project, materials, investment and work required.

ANALYSIS
If we are allowed to paraphrase God’s Word, we come to the following parallel:"By their repertoire ye shall know them!" Indeed, its selection fully reveals the taste, the preferences, the nature, and ultimately, the personality of the musician. The basic positions that we highlight here are related to the formation, structuring and storage of the personal piano repertoire, as archive and reserve. Its accumulation lasts a lifetime and it should, in conscious age, and before that - with the help of the educator be methodically organized and meaningful over time. It is desirable that the teacher has "played through" almost the entire piano literature in order to know it. The teacher’s ability to react a prima vista-at a glance- and his or her suggestive example of a practicing pedagogue (Neuhaus, 1958 ) (except if a personal desire or "force majeure" reasons
have not suspended his or her performers practice) is crucial for building a lasting paradigm in
the mind of the young pianist. J. S. Bach’s teaching method was often expressed by the removal
of the student from the chair and taking position in front of the instrument by himself, instead of
rushing in excessive reflections. The personal and artistic paradigm of my teacher Professor
Nikolai Evrov/Bulgarian National Academy of Music, Sydney Conservatorium/ as an outstanding
pianist and a wonderful pedagogue remains integral to us, who have had the chance to be his
disciples, like an endless source of inspiration and reflection. The urge and the idea of cultivating
a repertoire I also owe to my teacher.

Our goal here is not only to audit the vast piano literature funds, but using it as an inexhaustible
reservoir to be able to select a repertoire according to our preferences and to situate it
respectively combining and systematizing the available resources, including intended to be
absorbed in the future. In this sense, we should try to build a solid but flexible structure by using
its components, similar to building materials, such as bricks, panels, fixtures. We are not only
talking about the undergone repertoire played before, but mainly about the always available one,
including the standard testing and competition catalogue.

Therefore, the performor, and also the teacher need to have "read" and played, possibly, the entire
piano literature or to have tried to explore in depth. The material presented here is based on that
over the years has been sharpened and accumulated, subsequently to be created as selection,
structured in categories-a model reflecting the personal choice and the nature of the pianist. This
is the representative, the best of his/her production, which would act to promote and manifest the
musician in the best way. The artist should feel satisfied and fulfilled in the environment of a
preferred repertoire of favorite pieces, which provides and maintains creative confidence. That is
the "honey" of personal experience accumulated throughout challenging process of labour and
creativity until the present moment. Thus is formed a collection of masterpieces and at the same
time represents reserved trademark.

FINDINGS

On the management of the repertoire massif, we would recommend that it should be organized
and divided into several groups, respectively the classification of genres and formats, outlining
possible concert programs, depending on the timing and frequency of upcoming and regular
events. Each category could be considered as a segment with a corresponding core.

Due to the frequency of sharpening of a certain musical piece, we can create a system analogical
to a rotation around a fixed center of gravity: a wider orbit would mean a lower frequency of
work, and a smaller one, respectively – a higher frequency. As measure of time and a basis for
organization of the work process could serve a week. To achieve optimum levels of quality and
competitiveness in the creation and marketing of our products is essential to identify goals and
opportunities and thus to prioritize and sort your tasks in a strategic and tactical plan. To take into
consideration the needs of the moment, but also to be able to maintain minimum repertoire,
which we are able to perform at all time, without undue burden upon our psyche or altering dramatically our daily routine, except in special cases. To know the capacity and the amplitude of our repertoire storage, what is the maximum amount it can take and "bear", without becoming an extra-load or in "mission-impossible". The main thing we aim here is to rationalize our work process, to make it as effective as possible (Kurteva, 2006).

From the standpoint of our experience and concert practice, we would subdivide the repertoire massif to several main blocks and segments, providing at the same time by the proposed matrices unlimited options and models to be combined and regrouped in different categories.

1. Basic Piano repertoire - which we use in exams and competitions, and also as raw material for "construction" of recitals and themed concerts.

Here are meant full cyclic pieces, not just individual movements.

Under certain circumstances, however, it is acceptable to perform them such as independent pieces entered in certain aggregate programs or encores.

2. Shorter piano pieces of all genres, with duration in the range of miniature of 2-3 min. and not to exceed 5-6 minutes each.

I. Solo piano repertoire.

It includes solo pieces and sonatas, as well as highly artistic instructive literature, such as Etudes by F. Chopin, F. Liszt, C. Debussy, S. Rachmaninoff, A. Scriabin, I. Stravinsky, as well C. Czerny, M. Clementi, M. Moszkowski, etc.

II. Chamber Music

1. Sonates, Trios, Quartets, Quintets, etc.
2. Piano Ensembles - 4 hands, duos, etc.

III. Concertos with orchestra, including other solo instruments or vocals.

IV. Accompaniments of singers, instrumentalists, choral and other ensembles.

V. Entertainment repertoire - Lounge music

The object of this study is mainly piano repertoire, reflecting the programs outlined in the Appendix at the end. The samples list, illustrating our views on its formation, covers all major periods, styles and genre directions, conventionally structured in a manner, subjected to the specific field of expression or to another principle. In our overall repertoire we have at our disposal musical pieces that are not mentioned here, but we quote mainly what has been realized as videos or recent concert programs in the last few years, based on own solo participations’ experiences and ongoing activity. We express our views on the scheme of the available fund from the position of formatting, arranging programs, not on formal, even less, a commercial, but on an ideological principle.
Compilation of a concert program is an Art and responsibility.

Programming must be read and complied with the audience and the case, but considered on the binary principle of contrast or polarity (a term from linguistics), which maintains traction between the listener, respectively, the viewer and the artist, on one hand, as well as the very freshness of their perceptions on the other.

In regard of repertoire, as artists, we are going to allow ourselves several analogies and references to the primordial universal behaviors as related to clothing or food consumption and approach to them. There are unwritten fashion rules defining good taste of colors, silhouettes, jewelry and accessories selection, combining them with the appropriate for a certain case discrete or more intense makeup, all that shows class and style. Such is the workmanship in program compilation. The idea could be provocative, outrageous, and simply elegant or conservative in the conventional, but always distinguished.

The same applies, as simplistic as it may sound, to the repast, as appropriate, depending on the occasion. The menu should be varied, and the dose and the portions must comply with the quantity and necessary "calorie rates". For example, in front of public, which is away from things or its attention is engaged by a side event, like reception cocktail, speeches-needs a concert "assorted mix" of popular pieces where here and there could be "sprinkled" less listened plays with educational or aesthetic purpose, but embedded "mosaic" in the structure of the event rather than randomly. It also must be avoided accumulation (and intrusion) of the same taste sensation, though pleasant separately, like presented one after another, but too many wonderful sweets as the basis of a dinner. The same goes for too much salt. The food at a banquet should be easily digestible, and the concert program, too. Another analogy with nutrition, this vital process, focusing on life itself is: the audience should not be saturated. Whatever masterpieces are being served to the public, when the duration and taste range is exceeded disrupting the proportion, the result is poor—even opposite to the expectations. The audience should always be "thirsty" for more, and not sated and exhausted, looking forward to the end of the concert as masterly as it is, same the magnificent and varied, but too generous "heavy" dishes. The sense of measure is the benchmark of the class and wisdom, as always. What matters is the audience to become "hungry" for "more" what the word "encore" exactly means. Even served masterfully when the point of saturation is reached, this depreciates the process itself. In this connection, it is recommended we respect the golden rule of “golden mean”. The program generally should not exceed more than 60 minutes pure playing, divided into two relatively symmetrical parts, or in a "monolithic" form, without pause, respectively from 45 up to 50 minutes, unless other duration is explicitly requested. Such exceptions are allowed in certain cases, due to the organization of the event, according to its specificity. The program modifications depend on the case, genres, country, costumes, show-business practices, for ex. in Japan and China usually one and a half hour, variety shows 3X50 min. acts, etc. And respectively,—as a mini recital of 20-30 minutes within a
A seminar, illustrating a lecture, workshop or other parallel format, but surely having a thematic subject or landmark. The duration of maximum one hour is the optimal period to maintain the fitness of perceptions, the concentration and psychomotor endurance and freshness before the drop of the physical and emotional charge, both for performer and the audience. With all my respect and admiration for colleagues, creating great achievements within the reach of a few, performing integrals like 32 Sonatas by Ludwig van Beethoven or 48 Preludes and Fugues of Johann Sebastian Bach, here we do not reflect similar formats. Normally, such a project is subdivided into several concerts or recitals cycle. Here I must mention an exploit under whose impression I am still: the concert of the great Bulgarian Pianist Dr. Tsonka Al Bakri, Assoc. Professor at University of Jordan: In one evening she performed phenomenally in the First Part-J.S. Bach-Goldberg Variations (usually plaid by the other distinguished pianists but as unique composition in one concert) - and in the Second Part-the whole Opus. 28-Twenty Four Preludes by F. Chopin.

In this context, paying tribute to the integrated programs, it is better such sets to be recorded, so the listener should have a choice to select or stop, by own discretion, which is not possible in live concert. Therefore, it is necessary the two "genres" to be distinguished and respectively their content, too.

You must have at least three musical pieces for an encore, no matter how many times we will be acclaimed. If it comes to performance of all three of them, it is now marked success. If more is strongly desired we must be ready, anyway. Probably after the third time we must retire behind the stage with dignity and gratitude in order to keep desire for reunion with new or loyal audience. It is not necessarily for an encore pieces to be from the authors represented in the program, unless the intention expressly requires it. But it no need to be mechanically "sewn" simply for the convenience of the performer or concession towards the mass taste, although the latter should not be ignored, but following the concert outline as a whole, without creating the impression for its own sake “diversity” only and tastelessness. By all means, the encores must be unifying thematic thread of the program logically interwoven into it and better not exceed five minutes each.

The program content has to present the performer in a favorable light, but not at the price of negligence of the artistic creed and aesthetic appearance (Stoyanov, 1954). Elements alien to the concept of the program should not be tolerated. In all cases the performer has to control the process, knowing the psychology of the audience, its tendencies and traditions and to respect them, because the music is created for the people. The mission of the artist is to be a messenger, a mediator between the genius of the composer and the audience for whom this music was intended. But there must be feedback: to feel the place, the customs, "the subtleties" in communication between the musician and the environment in the hall. In any situation performer must fall into homogeneous, "coherent" mode to fit in it, to make contact and not to be in conflict. Like acts of egocentrism and originality focused on themselves, not in accordance with the specific trends, what threaten the intimate, fragile relationship podium-auditorium.
In front of strictly professional audience the criteria are different, with a view to the increased precision and expectations, where the selection should be organized upon an adequate basis. In any case, there must be the idea. We should not resort "mechanically" to programming clichés that would be more appropriate for an exam or competition. The chronological order is not always mandatory. Sometimes an atypical perspective that combines seemingly incompatible and incomparable pieces appears very appropriate in a more unfamiliar context.

The diversity, even in thematic programs should be leading principle, but always subjected to a certain invention, sometimes paradoxical, but justified. This rule must also be valid when making a selection of the so-called lounge music. It is known that its top examples, among which many masterpieces, are created in that time on demand and carried in their quality of "lounge music" in palaces halls and ballrooms.

The binary system- through the principle of contrast can be set as universal algorithm of correlations: on the format-large scaled or miniature, cyclic or sonata: regarding tempo and rhythm-opposing slow or fast plays, in terms of psychodynamics subsequent plays, such as slow-fast. It is better to start with a moderate in pace and articulation piece, for accommodation. Thus the pragmatic approach could be discreetly embedded in programming, for adaptation to the instrument, stage and acoustics. By all means, leading is the requirement for balancing style amplitude. The creative imagination, applied here, successfully coordinates the purposes and method. The paradox is that the more things we play, opposite in nature and amplitude, the more they complement and support reciprocally. Induction between various in shape and age pieces is schooling for forging a sense of style, art measurement as a whole, acquaintance with the gallery of personalities of the composers (Ilievksa, 1978). This differentiates the performer’s approach, giving it a real perspective and making the work interesting, thorough and skillful. Dealing with such a large musical spectrum, it constantly streamlines the growth of the pianist as an artist-virtuoso. Thus, with the experience acquired the concepts become mature.

Concerning the repertoire content, its components and maintenance, with good labor planning and organization, even the gap in time between learning time-period, performance moment is a positive factor to detect and eliminate "the loopholes" in the mind. Thus useful "fermentation" process is formed, generating new, straightforward motivation, which refreshes the repertoire of the upcoming stage presentation. (Al-Bakri, 1998). This aspect, contributing to the interpretation of the piece, is useful for the pianist’s development. So the outlined panoramic vision of the repertoire has a decisive impact in shaping the character and the creative individuality and uniqueness, in certain cases. This masters a sense of connection and belonging with "our" works, which helps the ability to "manage" the repertoire fund entirely and its constituent units.

We should be able to judge correctly about our capabilities and strength, how and what we can support. Our ability to plan our efforts is crucial for our readiness to respond to the moment. The pieces must be stored in such a condition and fitness so that we are able to present them in minimum on "demand"-that should be our management mode-to think over our repertoire in
perspective. It is good for the pianist to have at least two major solo programs available. I.e., as we mentioned above, the performer must be able, even on a "kaleidoscopic" manner, but necessarily analytical, to draw on the reserve, which refreshes, sharpens and maintains permanently. It might be an ad hoc program, expedient and reactive to the requirements of the occasion, and able to present the composer except through major concert form, but also through his miniatures, for example, the works of Beethoven, Chopin and other authors with a wide creative range (Shushulova, 2007).

Building a reliable system is the key concept for accumulation of repertoire for a certain period of time and maintaining it permanently. In practice, this might look in the following way: the pianist can form several groups of music literature, each of which to reflect a certain artistic intention, for example: for technological development – with artistic task sketches – Chopin, Liszt, Rachmaninoff, Scriabin, Stravinsky and others., piano exercises, plays with virtuous character – "development" plays, Toccata type or "Perpetuum mobile", as following:

- Polyphonic pieces
- Major works
- New material
- Concertos with orchestra
- "Quick Response" plays, available at any time.

Our goal is to help build such an organization and "hygiene" so that maintaining a large repertoire can be carried out by normal daily routine and efforts. The main point here is to embed and educate a sense of good condition and reliability in the personal options. We have to work in stages, properly dosed according to the individual specifics. The important thing is to make the schedule relatively to the macro- and micro- frames within a single period: year, month, week, and to establish the pattern of regular daily working load in this aspect. The essential is to keep practicing systematically and the presumption what to be included in the determined daily norm of the repertoire maintenance: technique exercises, polyphony, new pieces for learning, current concert program, preparation for new performances. No matter the specific parameters of the program matrix, the model must be structured in a way that allows us to change it periodically and adjust it flexibly to certain circumstances, compressed or expanded in time. How to develop our pianism is a subject to other works of the researcher.

**RECOMMENDATIONS**

A concert artist and a playing one, in general, should be in a state of permanent mobilization, alert and ready to react quickly to the commitments that arise ad hoc – here and now. Apropos, not a small number of global careers began catching a chance precisely in such a way. Every professional pianist with self-respect should be in a state of “stand by” and capable to play at
least a half, better-an hour-by heart. The author is in the permanent condition to play approximately 100 titles, or several hours live music. The latter requirement, or, desire, means that the performer masters and stores the music, which is a prerequisite for his or her stage confidence and hence - to the success. It is not good for the “pianistic honor” to refuse performance at the moment, asking for excuses or using the pretext of being in the process of preparing for the upcoming recital, followed of invitation to listen to the piece then. Often the real reason is the lack of courage due to creative discomfort, even for capable people that would be really unfortunate. Therefore we would be pleased if this present is useful to overcome such problems caused by the lack of experience in dealing with it. The key solution of this issue is to approach consciously in strategic and tactical plan.

We need to practice slowly and calmly, with motivation that every moment is essential for keeping lifelong what is once learned and reviewed. A solo repertoire is good to be memorized and maintained regularly with this attitude. It is recommended to work on the pieces in the same order against upcoming concert program. The recovery of a material to be approached with extreme caution, from the very initial learning of the musical text, knowing that absorbing the piece is for a lifetime with vision of its proper storage and preservation. Our work environment is an extremely important factor. The order of a well managed note lists, providing access at any moment to the desired composition, similar to an immaculately maintained household would have brought clarity same in our mentality.

In our opinion, the pianist must have in his or her repertoire "saved" at least similar to those presented as examples of each category, most of which were documented by 165 live video recordings published in the channel www.youtube.com/yurdanic, also Piano concerts with Orchestra and recitals performances, already performed live before audience or in a period of preparation for future realization. Here are meant memorized pieces only. On the other hand, Chamber Music and accompaniment experience and corresponding repertoire accumulation is strongly recommended again as indispensable for a solid musical and professional foundation, as presented to the end.

I Baroque Period

It is good to be familiar with the German Baroque and the Old Masters, but also French, Italian and Spanish, English and other authors from this epoch, as for instance, the recommended examples:

From Preludes and Fugues of the "Well-Tempered Clavier" by J. S. Bach:

Prelude and Fugue № 2 in C Minor of Volume 1

Chromatic Fantasy and Fugue

Italian Concerto in F Major

Some frequently performed pieces such as:

Invention № 8, F Major, by J. S. Bach

Chorale from Cantata 147 "Jesus, Joy of Man Desiring"

And the colossal Goldberg Variations, mentioned above.

Sonatas by D. Scarlatti – Sonata in C Major, Sonata in D Minor

Domenico Cimarosa - Sonata in G Minor,

Padre Antonio Soler – Sonata in F sharp Major

and other musical forms:

J. F. Rameau – "La Poule"("The Hen")

C. Daquin – "Le coucou"("The Cuckoo"

Passacaglia in G Minor of G. F. Handel

We will mention here the famous Canon by J. Pachelbel, whose numerous "cover versions" enjoy great popularity, along with the “hit" of all times, "Fur Elise".

II Viennese Classics:

Sonatas by F. J. Haydn, W. A. Mozart and Ludwig van Beethoven, at least one Sonata from each of his three creative periods:

It is appropriate to master compositions by all these three great authors. May we recall that it comes to an operative repertoire that is managed constantly, with a view to fast reconstruction and readiness for podium performance, when is necessary.

Here we offer two sonatas by F. J. Haydn: the whole № 42, C Major and № 5 in C Major, First Movement.

As well as two Sonatas by Mozart: The whole № 13, KV 333 in B flat Major and the First Movement of the so called "Sonata facile" (which, of course, is not “easy” at all) N.16, KV 545, and the Third Movement of Sonata in A Major, Rondo "alla Turca", known to everyone as the famous "Turkish March".

By Ludwig van Beethoven here we recommend the whole sonata op. 27, № 2- the “legendary” "Moonlight Sonata" or at least its first Movement, and the two parts last Sonata № 32, op. 111, in C Minor.
From the Major Romantic works by:
Carl Maria von Weber, F. Schubert and F. Mendelssohn-Bartoldi:

Carl Maria von Weber – "Invitation to Dance"
Franz Schubert – Fantasie "Wanderer" Impromptu A flat Major, and others
Felix-Mendelssohn-Bartoldi "Rondo-capriccioso" and "Serious Variations" op. 54
R. Schumann - Toccata op. 7, Carnival op. 9
E. Grieg - Sonata in E-Minor
F. Chopin - Fantasie op. 49 in F-Minor, Impromtu in A flat Major and
Fantasie-Impromtu in C sharp Minor, Polonaise in A-Major,
Valses in D flat Major and C sharp Minor, Prelude op. 28, N.24 in D-Minor
J. Brahms - Rhapsody Op. 79 in G-Minor
M. Mussorgsky - “Pictures from an Exhibition”

From Impressionism and modern Music:

C’ Debussy - “Pagodes” from Estamps
S. Rachmaninoff - Preludes in C sharp Minor and G-Minor
A. Scriabin - Sonata N.6, Etude op. 65, N.3
B. Bela Bartok - Sonata 1926, “Ostinato” from “Mikrokosmos”, Allegro Barbaro
S. Prokofiev - Sonata N.7, “Montecchi and Capuleti” from “Romeo and Juliette” Suite
I. Stravinsky - Tango Piano solo
D. Shostakovich - Prelude and Fuge N.24 in D-Minor

The frame of the construction of the repertoire consolidates through the set of concertos or concerto pieces for piano and orchestra covering the major eras and stylistic trends, as offered here:

1. J. S. Bach Concerto in D Minor

2. W. A. Mozart – Concerto №23 in A Major, KV488
3. W. A. Mozart Kammerkonzert in A-Major, KV 414-very convenient opportunity in case only chamber orchestra in disposition without wind instruments is available.

NB Other Concertos are recommendable, as Concerto N. 20 in D-Minor, KV 466, etc.

4. L. van Beethoven – Concerto №4 in G Major, op.58

All Five Beethoven’s concertos are strongly recommended to be learned.

That would be the basic look of an "operational available classical repertoire, applicable to events of different nature in which we are ready to participate at any time.

Here should be added also fundamental concertos, like by J. Brahms N1 in D-Minor, op.15, P. I. Tchaikovsky N1 in B flat-Minor, E. Grieg-in A-Minor, Andante Spianato and Brilliant Polonaise by F. Chopin, and others, like the concertos of R. Schumann, F. Liszt, S. Rachmaninoff, M. Ravel, S. Prokofiev, G. Gershwin, and other famous authors. As Bulgarian musician I introduce the national greatest composition of this genre-Concerto N.3 in B flat Minor by Pancho Vladiguerov, also performed live.

CONCLUSION

In conclusion, the following maxima must be underlined and noticed: the repertoire selected as the essential personal choice, should be just a small part, the core of the whole material learned by the concert pianist during his/her entire education and career.

On the basis of the long years of professional experience, I am convinced that it is natural and quite possible to design an optimal collection, a private capital, stored in the vault of our creative bank, and drawing from it in each case according to its special characteristics. Final decision about the repertoire fund might even reduce the number of performed before audience pieces.

Must emphasize that the choice of repertoire should not be given to chance, but by its content it should reflect and defend highly valuable artistic ideas, selected style and finesse of an outstanding creative talent.

The conscious attitude towards the repertoire is the main concept and the subject of this paper and its achievement improves and turns the pianist in a true artist of great magnitude.

APPLICATIONS

Here are a few examples of program ideas as well as some related short annotations from the past few years or more recent events:

Piano Recital - Singapore, 27.03.09 dedicated to a number of great anniversaries in 2009

I Part
J. S. Bach - C. Gounod - "Ave Maria" (Annunciati - 25.03.) (Based on The Prelude № 1 in C Major from the "Well Tempered Piano", Book I, inspired by the discovery of the prototype of the contemporary Piano "Das Wolltemperierte Klavier" in 1709-its 300th Anniversary)

G. F. Handel - (250 years from the decease of the composer)
Passacaglia in G-Minor

F. J. Haydn - (200 years from his decease -1809)
Sonata № 42 in C-Major
Allegro
Adagio
Allegro molto

F. Mendelssohn - Bartholdi (200 years from the Birth-1809)
"Spring Song" ("Fruhlingilied genannt") - op. 62, №6

I. Albeniz-"Sevilla“(150 years from the Birth-1859)

E. Villa-Lobos-"Acordei de Madrugada“ (50 years from the decease-1959)

S. Obretenov-Prelude-(100 years from the Birth)
P. Vladiguerov-Rhapsody „Vardar“-(110 years from the Birth)

II Part

M. Mussorgski-"Pictures from an Exhibition" (170 year from the Birth)
Promenade
"The Gnome"
Promenade (2nd)
"The Old Castle"
Promenade (3rd)
"Tuileries (Children's Quarrel after Games)"
"Bydlo" "Cattle"
Promenade (4th)
"Ballet of Unhatched Chicks"

"Samuel Goldenberg and Schmuýle"

Promenade

"Limoges. The Market (The Great News)"

"Catacombs (Catacombæ-Roman Tomb-Sepulchrum Romanum)"

"The Hut on Hen's Legs (Baba Yaga)"

"The Bogatyr Gates (In the Capital in Kiev)"

**Piano Recital “The Great Piano Sonatas” at the Goethe Institut in Bangkok, Thailand, 07.12.2012**

Dedicated to the Memory of Prof. Ludwig Hoffmann, under whose leadership I was honored to work on such significant pieces on the Piano Seminar in Hochschule für Musik Franz Liszt- in Weimar, Germany, the spiritual center of Bach, Goethe and Liszt), composed of two iconic for piano literature sonatas.

F. Liszt – Sonata in B Minor

L. van Beethoven Sonata № 32, op. 111, in D Minor.

Maestoso. Allegro con brio ed appassionato

Arietta: Adagio

The unique structure and dramaturgy of Beethoven’s late op.111 assigns the role of a bridge between the Viennese Classics and the early Romanticism, logically “preparing” and “foreshadowing” the monothematic one-piece sonata dramaturgy of Liszt who admired the Genius and initiated the construction of his Monument in Bonn.

Comprehensive analysis of the topic would become the subject of a treatise: but there should be also mentioned the unusual construction of two-movements of the cycle and the "rhapsodic" character of its design theme – Arietta with free variations, represented as the second movement. Even today, we do not cease to marvel at the innovation that these musical ideology revolutionaries generated and integrated into the musical forms and languages, tracing the main trends, benchmarks of the present time.

In this sense, a new, more unconventional chronologically approach to show the works –first Liszt, then Beethoven, would lay more emphasis on this organic connection of theirs, and this way presenting the two colossuses of humanism, music and pianism.
Further you can imagine a promenade through epochs, genres and styles, a menu of emblematic Piano compositions of so-called entertaining repertoire – for every occasion and taste, titled "Evergreens", covering music from the Baroque to "Pop" and Jazz. This compilation includes a large number of favorite pieces-what the literal translation of the word “play” is. The idea to collect such “treasures” was suggested and inspired by the marvelous a long playing vinyl record compiled by my Piano Professor Nikolai Evrov called by himself "Pearls of The Music". There is nothing more to be added to this motto.

J. S. Bach – (C. Gounod) - "Ave Maria"
J. S. Bach-Chorale Joy of Man's Desiring from Cantata 147
J. S. Bach- Invention № 8, F Major
G. F. Handel- Passacaglia in G Minor
D. Scarlatti – Sonata in C Major
H. Purcell-The New Ground in E-Minor
D. Cimarosa - Sonata in G Minor
P. A. Soler-Sonata in F sharp Major
J. F. Rameau –“The Hen”
F. J. Haydn-Sonata № 5 in C Major, 1st Movement
W. A. Mozart-"Sonata facile", №16, in C-Major, 1st Movement
L. van Beethoven - "Fur Elise"
L. van Beethoven - "Moonlight Sonata" 1st Movement
F. Schubert – “Ave Maria”
Musical Moment” in F Minor
R.Schumann - "Dreaming"
F. Mendelssohn-Bartholdy - "Spring Song"
E. Grieg - "Brucklet", “The Little Bird”
A. Dvořák-“Humoresque”
P.I.Tchaikovsky - "Kamarinskaya"
“Seasons”-March-“Lark Song”, April - "Snowdrop"

N. Rimsky-Korsakov – "Flight of the Bumblebee"

F.Liszt - "Love Dreams" № 3

I. Albeniz - "Sevilla"

C. Debussy - "Moonlight"

S. Joplin- "Entertainer", Paragon Rag

H. Arlen - "Under the Rainbow"

J. K. Gershowin – Piano Preludes

L. Denev –“Rainy Day in San Francisco”, Invention-from “The Rhythm’s Hour”

D. Brubeck–“Blue Rondo à la Turk”

H.M. King Bhumibol Adulyadej of Thailand-“Phiromrak” (“A Love Story”) from Kinari Suite

Thai Popular Song-"Tepankon"("In the previous life")

J. Pachelbel Canon

A. Piazzolla-« Street Tango »

H. Mancini - "Moon River"

A.C. Jobim-Desafinado »

J. K. Horner - "My Heart will go on" ("Titanic" soundtrack)

Yiruma-"River flows in your", “Kiss the Rain”

J. Lennon - "Imagine"

Rosemary Hancock-Child-“Leo” from “Zodiac-12 Preludes”

A. Lloyd Webber-« Jesus Christ Superstar” Suite

Jan-Tiersen - "La contine d'un été " ("Amelie Poulain")

O.Toussaint – P. de Senneville - "Ballade pour Adeline"
Chinese Popular Song-“The Moon represents my Heart” 月亮代表我的心

Kozaburo Y. Hirai-“Sakura”

Nguyen Van Nam-“Bamboo Song”, “Thousand Faces Buddha”, “Children Game” from “The White Stork”

Yuyama Akira-“Mozart is a Friend of Mine”, “Warabeuta”, “Amma Natto”, “O-Koto-no Hibiki”.

Following suggestions could complete the above programs by the works of Bulgarian composers, plus the mentioned above, since the researcher is Bulgarian by origin and citizenship:

D. Nenov - "Bagpipes", Toccata
V. Stoyanov-Nocturn
L. Pipkov-Studio N.1
M. Goleminov - "Fresco"
P. Hadjiev - "Burlesque"
A. Raitchev - "The Bells of the old Monastery"
D. Hristov-“Prestissimo in Extasi” from Miniatures concertantes
V. Kazandjiev - "Toccata"

(NB: Some of the compositions might be subjects of Copy Right Regulations.)

An opinion on this type of aggregated program that could accompany a lecture or to be included in the workshop was expressed above. It is noteworthy that all samples of this "historical musical walk" enjoy lasting popularity, and are accepted even by those who are "a priori" more distant from the environment incorporated into the so-called Classical Music in a broad plan.

Shown above was demonstrated as compilation by 2-3 miscellaneous Programs within

**China 2016 - Piano Concerts Performances and Master Classes Demonstrations**

The next selections imply the unusual strong spiritual connection of Schubert and Beethoven, as well Bach and Mozart, which carried the historic transition from the era of Classicism to the vast horizons of romanticism, through the impressionism to the modern music.

L. van Beethoven –Bagatelles op. 11.

F. Schubert - Fantasy in F Minor for 4 hands
M. Ravel-My Mother the Goose

Piano Duos presented here were performed by Students and Teacher.

**Prof. Nikolay Evrov Anniversary Concert**

As a reminiscence of the unforgettable play together with the beloved Teacher Prof. Nikolay Evrov, to whom this study is dedicated, in the occasion of his 70-th Anniversary, with each of his devoted Students. Our duo-piano ensemble was I. Stravinsky-Tango and Circus Polka for Young Elephant.

**Soloist of Chamber Music Orchestra “Orfey”, Bulgaria**

J. S. Bach- Concerto in D Minor

W. A. Mozart – Kammerkonzert in A Major, KV 414

To the pianist a performance of these two giants of the music in one night is a challenge. Besides the differences is important to us to discover the common between these two geniuses of humanity: their universality and connection with the Primary. And the fact, that Mozart, Beethoven and Schubert also belongs to the genius polyphonic composers.

In terms of "ideological" plan the differences are obvious: In Bach we have: Religious parable (an attempt to restore the relationship with God, broken by the Fall, narrative and depth, solidity, power, "universal" tempo-rhythm, elevation, objectification, communication with the Transcendental: If we can express through music, even a fraction of this "absolute", that would have lead us closer to the "Divine". In Mozart there are: drama, action, i.e. the opera-etymologically the semantics of the three concepts is common-as Mozart perceived his composer’s vocation most "powerful" there: an ensemble of characters, recitativo and tutti, vitality and optimism, grace and vocal, "laughter through tears"...

Finally, it’s worth mentioning that my students already perform some of listed Piano Works, which is more than a happy fact and a real creative satisfaction for educator.

Spark: A Case Study on Teachers’ Perceptions Regarding Creating for Passion Learning

Pam Winn and James E. Gentry

Tarleton State University
Abstract

This qualitative study examined four self-selected educators working from a transformative, conceptual framework (Spark) to develop their own educational model to enhance learning passion and creativity. The four educators’ perceptions regarding the role of passion and creativity in student learning were examined. The four Spark educators’ pre-brainstorming short-answer prompts, post-Spark interview experience reflection transcripts, field notes and photographic evidence were analyzed using open coding, axial coding and selective coding. Researchers reported 12 codes from reviewing narrative pre- to post-narrative data. After peer debriefing, researchers agreed all codes were valid, with 100% agreement. Five categories emerged from the data; two themes emerged: Theme One (T1), Learning Creatively is an Interactive Social Experience and Theme Two (T2) Positive Relationships with Fellow Educators were Critical to Accomplishing Spark Goals.

Keywords: teachers, perceptions, creativity, social emotional learning, relational trust, relationships in learning
Introduction

Since educational reform beginning in the 1980s, quantifying learning and student achievement has increasingly become the central focus of most educational forums. Standardization of learning objectives, learning outcomes, and measurements currently drive the curriculum and school calendar. Yet, invariably, almost every school mission statement includes the goals of producing lifelong learners and well-rounded citizens, creating disconnection among the educational goals. Increased rigor and standards have both educators and parents expressing concern about the amount of time focused on test preparation and the loss of quality of student engagement and passion for learning. Much research is concentrated on Bloom’s Taxonomy of the Cognitive Domain (Krathwohl, Bloom, & Masia, 1973) which links to the development of intellectual skills including: remembering, understanding, applying, analyzing, evaluating, and creating (Bloom’s Taxonomy Revised) (Krathwohl, 2002). However, much learning is connected to the Bloom’s Taxonomy of the Affective Domain which focuses on developing feelings or emotional aspects of learning; including internalizing values, organizing, valuing, responding to phenomena, and receiving phenomena (Krathwohl et al., 1973). The lack of literature and study in the Affective Domain supports a need for greater insight into the “softer” side of learning.

Spark, a transformative, conceptual framework embracing discovery, passion for learning, and creativity, acknowledges the importance of the Cognitive Domain, but places greater emphasis on the Affective Domain in the learning process. The underlying tenet of Spark is classrooms and schools do not have to be lifeless and concentrated on content alone. While the framework of Spark does not negate the need for quality training and staff development in content or curriculum and instructional strategies and techniques, it does support the development of the often ignored affective elements of learning. The Spark framework focuses
on developing quality relationships among students, parents, and other educators, and reintroducing a passion for learning into the classroom. In addition, the framework places an emphasis on creative and critical thinking as necessary for successful thinkers and future workers.

The framework melds the curriculum and instruction strategies and techniques that guide adequate coverage of content and development of process skills with a focus on strategies and techniques to build relationships and develop a passion for thinking and living. At the same time, the framework design supports the health and well-being of all learners, whether they are students, educators, or parents. No one can “produce” from an inner feeling of hopelessness.

The concept for Spark evolved from the following premises:

- Everyone has value.
- Everyone has a gift to offer.
- The education process is never finished; it can always be improved.

Furthermore, Spark was founded on the following beliefs:

- Schools can be dynamic, engaging places.
- Schools can be places of joyful learning.
- Schools can be places of great innovations that benefit students.
- Schools can be these kinds of places because they are filled with caring passionate people.

The goals for Spark are:

- To nurture wellness of educators and students
- To investigate a passion for living and learning in every educator and all students
- To develop and expand quality relationships between and among educators and students
- To promote and develop critical thinking and creative thinking in educators and students
To promote the development of quality learning environments and opportunities through the advancement of research proven curriculum and instructional strategies and techniques

The Spark Academy was created when a group of educators were given an opportunity to create a summer academy embodying the principles of Spark. The study focused on the experience and passion of the educators as they participated in the creative process and the specific goals of developing “Passion for Living and Learning” and “To Promote the Development of Quality Learning Environments and Opportunities through the Advancement of Research Proven Curriculum and Instructional Strategies and Techniques.”

**Review of Literature for Spark**

*Spark Goal:*

**To Invigorate Passion for Living and Learning in Every Educator and All Students**

*Passion*

If energy, inspiration, and emotion are essential to one’s ability to move forward and embrace new things, the value of nurturing passion for learning is clear. Merriam-Webster defines passion as a type of motivation containing extreme energy and emotion; it may also be connected to spirituality (Merriam-Webster Collegiate Dictionary, 2008). The French philosopher and educator Foucault (1996) described passion as the ability to move a being to a new state. Robinson (2009) further expanded the role of passion with the concept of the Element, which is the point natural talent meets passion, and people feel most like themselves and most inspired to achieve at their highest levels. Collectively, passion is described as motivational properties manifested as behaviors and based on relationships to internal emotions (Roeger, 2012).
Closely related to passion is the term *zest*, which is also tied to energy and enthusiasm and noted as one of the five characteristics necessary for a positive life (Seligman & Csikszentmihalyi, 2000). McGovern and Miller (2008) connected *zest* to teaching and learning, identifying it as a demonstration of passion for teaching and learning grounded in reflective practice focused on deliberate well-being and a sense of priorities. Another closely related topic to passion is Flow Theory, which identifies intense engagement as “the zone.” Csikszentmihalyi (2008) acknowledges *flow* as the experience that makes life worth living. Neumann (2006) used Flow Theory to examine the relationship of passion and scholarship of higher education faculty. Flow Theory uses a 13-point attribution scale to describe Ultimate Flow as a basis to sort and categorize educator passion. Neumann identified four distinct traits of passion: peak emotion, absorption, heightened physical and psychological awareness, and intense interest in the subject of study. Scholars who were in complete flow experienced heightened physical and psychological awareness. Neumann purported passion led to discernment, sharper thinking and increased focus, and creativity.

**The Importance of Passion in Teaching and Learning**

Literature on passionate teaching often theoretically correlates to passion and student learning. Palmer (1999) notes passionate teaching leads to greater connectivity to the subject and the educator. Wong and Wong (1998) indicate middle school students were more motivated, punctual, and cooperative when they perceived their educator cared about them. In *The Passionate Teacher, A Practical Guide*, Fried (1995) acknowledges two specific indicators of passionate teaching. First, passionate educators share their attractions of power and beauty for the subjects they teach with their students, offering a depth of engagement in the subject that motivates students to pursue other interests. Second, passionate educators express their passion
to the students by acting as partners in learning rather than an expert; this builds competence and active confidence in students who might otherwise be passive learners.

Passion can influence student learning and well-being intrinsically and extrinsically. Passion’s association with motivational and emotional properties (Vallerand et al., 2003; Vallerand et al., 2007; Patrick, Hisley, & Kempler, 2000; Carbonneau, Vallerand, Fernet, & Guay, 2008; Neumann, 2006) relates to an ability to channel people to action intrinsically or extrinsically (Vallerand et al., 2007). Intrinsic motivation (Vallerand, 2008) can be tied to Self-Determination Theory (SDT) (Deci, Vallerand, Pelletier, & Ryan, 1991) which promotes autonomy, self-efficacy, feeling good about oneself, and self-made decisions that strengthen overall well-being, creating a positive learning spiral (Fredrickson & Joiner, 2002). When a student successfully engages in learning, expansion occurs within the mind, creating an upward effect “spiraling” to higher and expanded learning.

Furthermore, intrinsically motivated individuals carry out actions with a sense of value, making it seem effortlessness and more seamless and increasing the likelihood of completing the action (Csikszentmihalyi & Csikszentmihalyi, 1988) impacting successful learning and well-being. For example, students who perceive their teacher to be excited and passionate may become intrinsically motivated and “catch the passion” through “emotional contagion” (Hatfield, Cacioppo, & Rapson, 1993), making learning more enjoyable and thus, more manageable. In addition, memory of content supported with emotional stimuli are more often remembered than non-emotional stimuli; therefore, students demonstrated greater capacity to remember concepts presented by an enthusiastic teacher (Sutton & Wheatly, 2003; Heuer & Reisber, 1992; Patrick et al., 2000).

Social Emotional Learning
Social Emotional Learning (SEL) is defined as a process in which individuals acquire knowledge, attitudes, and skills to assist them in recognizing their emotions, setting positive goals, demonstrating caring and concern for others, maintaining positive relationships, making responsible decisions; and handling interpersonal situations effectively (Durlak, Weissberg, Dymnicki, Taylor, & Schellinger, 2011; Payton, Weissberg, Durlak, Dymnicki, Taylor, Schellinger et al., 2008). The SEL conceptual framework combines behavioral, emotional, and cognitive development in order to prevent behavior problems by promoting social-emotional competence (Zins & Elias, 2006). The primary goals of SEL programs are to foster the development of five interconnected sets of cognitive, affective, and behavioral competencies including self-management, self-awareness, relationship skills, social awareness, and responsible decision making. Within school contexts, SEL programming incorporates educational strategies to enhance school performance and youth development (Collaborative for Academic, Social, and Emotional Learning, 2005). Quality SEL instruction provides students with a sense of belonging and opportunities to contribute to their class, school, and community (Hawkins, Smith, & Catalano, 2004).

A growing body of empirical research supports the impact of SEL programs both academically and behaviorally. A meta-analysis of 213 school-based, universal social and emotional learning programs encompassing 270,034 kindergarten through high school students found significantly improved social and emotional skills, behavior, attitudes, and academic performance (11-percentile-point gain in achievement) for SEL participants (Durlak et al., 2011). A technical report summarizing results from three large-scale review of research including 317 studies involving 324,303 students rendered in SEL programs yielded multiple benefits, including social-emotional skills, positive social behavior, and increased academic performance.
(11 to 17 percentile points) (Payton et al., 2008). Furthermore, research supports that SEL programs improve social and emotional competencies cross-culturally (Coelho, Sousa, Raimundo, & Figueira, 2015).

The educational process is collaborative in nature and framed by social, emotional, and academic components (Fischer, Giaccardi, Eden, Sugimoto, & Ye, 2005; Zins, Weissberger, Wang, & Wallberg, 2004). For most students, learning does not occur in isolation, but rather in collaboration with peers and teachers along with support and encouragement from their families. In addition, emotions can impede or assist in the learning process (Elias et al., 1997). Today’s students must be prepared not only to pass academic tests, but also to navigate the complexities of life. Social-emotional competence and academic achievement are related and key to a student’s success in life (Zins & Elias, 2007) Evidence-based SEL programs integrated into education practice can contribute to the development of the whole child.

**Building Relationships: Teacher-Student**

Research has documented that when educators build relationships with their students there is a deeper connection to learning (Jensen, 2005); furthermore, feeling safe in the learning environment creates a scaffold to develop both social and academic skills (Baker, Grant, & Morlock, 2008; McCormick, Cappella, O’Connor, & McClowry, 2013; McCormick, O’Connor, Cappella, & McClowry, 2013; O’Connor, Dearing, & Collins, 2011; Silver, Measelle, Armstrong, & Essex, 2005). In essence, teachers who create a positive, supportive learning environment can have a positive impact on social, emotional, and academic development including school-completion and employment (Baker et al., 2008; O’Connor et al., 2011; Silver et al., 2005). However, school failures and school dropouts increase when children are exposed to relational adversity over time (Spilt, Huges, Wu, & Kwok, 2012).
Building a positive relationship with a student is much more complex than being cognizant of previous scores and educator comments, superficial demographics, or even being able to call every student by name. An effective educator strives to gain insights on student interests, learning styles, and educational needs of each and every one of his/her students. Acknowledging or profiling each student as his/her strengths and weaknesses and building educator-student relationships create a positive learning environment that addresses both effective classroom management and collaborative instructional strategies. In terms of classroom management, Marzano and Marzano (2009) explained, “exhibiting appropriate levels of dominance; exhibiting appropriate levels of cooperation; and being aware of high-needs students” (p. 161) are behaviors of effective educators creating an effective classroom management environment. A positively managed classroom environment might utilize instructional strategies developed by Kagan and Kagan (2009) who have produced myriad structures to facilitate content learning and relationship building, simultaneously providing a platform to engage student interactivity while nurturing community and team learning experiences within the content.

Ron Clark embodies the phenomenon of building relationships and communities of learners. In fact, Clark (2003) developed “the essential 55” which is a collection of rules designed for relationship building and creating positive learning environments. These rules are currently used at the Ron Clark Academy (RCA) in Atlanta, Georgia. RCA’s first mission is for students to build relationships with educators and fellow students. Clark attributes his school’s focus on relationships as the defining characteristic toward academic and career-building success. Numerous educators visit RCA to acquire or enhance best practice for engagement of educator-student relationships. One such practice utilizes educators’ social and emotional
competence (SEC) and well-being to support implementation of social and emotional learning programs, to develop and maintain supportive educator-student relationships and applying effective classroom management techniques. The SEC model proposes utilizing the aforementioned factors to create a classroom climate that is more conducive to learning and promoting positive development outcomes among students (Jennings & Greenberg, 2009). Research supports building relationships as essential to student engagement; students who perceive teachers as creating a caring supported with a well-structured learning environment were more engaged (Klem & Connell, 2004). Furthermore, high levels of engagement yield higher attendance and test scores which are also prominent variables strongly related to predicting youth high school completion and tendency to pursue postsecondary education, achieving later economic self-sufficiency (Gambone, Klem, & Connell, 2002). Lee (2007) further noted positive teacher-student relationships not only impacted student performance, but also supported students in school adjustment and academic motivation.

Relational Trust among Teachers

A key component of creating an environment that fosters social and emotional learning and relationships is relational trust. Defining relational trust, as well as creating it in a classroom, is a complex process. Facets of relational trust include integrity, confidence, reliability, willingness to take risks, openness, and vulnerability (Byrk & Schneider, 2003; Mayer, Davis, & Schoorman, 1995; Tschannen-Moran, 2004). Byrk & Schneider (2003) note relational trust is grounded in social respect developed from the social discourse that takes place across a school community, the process of genuinely listening to the views of others, and respecting their opinions even if there is disagreement. Relational trust is a bonding agent between school members that encourages educational support, student success, change, and reform, and is
essential when creating an environment supporting creativity, collaboration, confidence and trust that implements change and advances initiatives (Tschannen-Moran, 2004).

The Professional Learning Community (PLC) model provides a framework for teachers to build relational trust within the context of their professional practice. A meta-analysis of empirical research on PLCs noted well-developed PLCs impact student achievement and teaching practices (Vescio, Ross, & Adams, 2008). PLCs encourage shifts in school culture (Andrews & Lewis, 2002; Berry, Johnson, & Montgomery, 2005), including positive impact on morale, more collaborative instructional practices, and movement away from an isolationist approach (Bolam, McMahon, Stoll, Thomas, & Wallace, 2005). Cranston (2011) found the following themes connecting relational trust and PLCs: building relationships is a key component to developing trust; establishing relational trust includes defined group norms that support risk-taking and change orientation; supporting effective collaboration processes increases relational trust; and developing leadership (principals) who foster a climate of trust is paramount to creating faculty trust. Creating a culture that cultivates relationships and builds trust among teachers can nurture student development and achievement as well as empower teachers to grow professionally. However, it should be noted relational trust must be intentionally fostered and developed.

**Creativity**

The process of creativity utilizes imaginative skills to generate new ideas, making connections between existing and new, or rearranging what is known in order to discover what is not known (Olatoye, Akintunde, & Ogunsanya, 2010). Literature on creativity noted three different kinds of creativity that served as the basis for research at the Institute of Personality Assessment and Research Laboratory (IPAR), Berkeley, California: artistic, scientific and
technological, and hybrid. Artistic creativity reflects the inner needs, perceptions, and motivations of the creator. Scientific and technological creativity focuses on solving problems and novel solutions without connection to the inventor’s personality; and hybrid creativity, which encompasses both novel problem solving and connection to the personality of the creator (MacKinnon, 2005).

Creativity is identified as one of the crucial skills for the 21st Century, yet little time or focus is given to creativity in the American traditional school curriculum. However, recent international studies found a statistically significant relationship between creative thinking and students’ academic achievements in terms of tests measuring processes of creative thinking (Anwar, Aness, Khizar, Naseer, & Muhammad, 2012) and their relationship to academic achievement (Nami, Marsoli, & Ashouri, 2014). Furthermore, a meta-analysis of 210 pieces of educational research noted the impact of creative learning environments on learners’ academic achievement: increased confidence and resilience; enhanced motivation and engagement; development of social, emotional, and thinking skills; and improved school attendance (Davies et al., 2013).

The benefits of creativity are well documented and support the need to provide a pedagogical environment in which creativity can thrive, including opportunity for play, collaboration, novelty, and authenticity. In terms of including play in the academic environment, much support can be found for the early years of learning; however, reasonable evidence exists to include more ‘playful’ or ‘games-based’ approaches into classrooms for all ages to support the development of creative skills (Cremin, Burnard, & Craft, 2006; Cumming, 2007; Jindal-Snape, Baird, & Miller, 2011; Miller, Hudson, Miller, & Shimi, 2010).
Sir Ken Robinson, in a conversation in Educational Leadership, noted the importance of collaboration in creativity by stating,

> Most original thinking comes through collaboration and through the stimulation of other people's ideas. Nobody lives in a vacuum. Even people who live on their own—like the solitary poets or solo inventors in their garages—draw from the cultures they're a part of, from the influence of other people's minds and achievements. In practical terms, most creative processes benefit enormously from collaboration. The great scientific breakthroughs have almost always come through some form of fierce collaboration among people with common interests but with very different ways of thinking (Azzam, 2009, p. 25).”

Student creativity is closely connected to opportunities providing peer collaboration elements (Burgess & Addison, 2007; Dillon, Craft, Best, Rigby, & Simms, 2007; Halsey, Jones, & Lord, 2006; Rutland & Barlex, 2008; Wood & Ashfield, 2008). Furthermore, the relationship between creativity and collaboration appears to be reciprocal since cooperation can foster creativity and creativity can foster cooperation (Miller et al., 2010).

Research supports student creativity is enhanced when a balance of structure and choice is provided, and students are given control over their learning and supported when taking learning risks (Burgess & Addison, 2007; Cremin et al., 2006; Halsey et al., 2006). Specifically, the aspects of novelty and authenticity are connected to student motivation and risk-taking. Students were more likely to be engaged and motivated when presented with new and exciting school activities (Gkolia, Brundett, & Switzer, 2009). Halsey et al. (2006) noted authentic student tasks were more likely to motivate and engage students if set in a real context and self-evidently worthwhile. In addition, creativity is derived from multiple experiences that are supported with the development of personal resources (Gandini, Hill, Cadwell, & Schwall, 2005). Thus, creativity in learning is connected to the environment and resources developed and shared by the teacher.
The pedagogical environment fostering creativity is formed by the teacher; this environment extends beyond the classroom, lesson design, and resources to include the relationship between the students and teacher. Key components for the teacher-student relationship are mutual respect, freedom/flexibility, and dialogue. Burgess and Addison (2007) found relationships encouraging mutual respect were a foundational component for promoting creativity. In addition, Gandini et al. (2005) reported creative attitudes encouraging flexibility, freedom, and open-ended options provided students with the possibility to invent and create in unexpected and surprising ways. Moreover, dialogue plays a key role in the student-teacher pedagogical relationship; routinely scheduled teacher-student conversations creates a framework to support the student’s work and products and create a classroom culture that fosters thinking, interpersonal exchange, conflict negotiation, and the exchange and development of ideas.

In summary, a systematic review of 210 scholarly articles related to educational research suggests creative teachers embrace a positive view of learner engagement and creativity/creative learning; they adopt the perspective of the “long-term view” of learning potential. Regarding their own professional development, creative teachers seek to continuously improve their knowledge and skills in order to further promote the development of student creativity (Davies et al., 2013).

**Summary**

In the American public education system, relatively no one questions the importance of the Cognitive Domain in learning; however, little emphasis is given the role of Affective Domain. Learning is a complex process involving multiple intrinsic and extrinsic components. A greater understanding of elements which inspire a passion for learning has many implications. Components such as teacher passion, social emotional learning, student-teacher relationships,
relational trust, and creativity are all factors associated with “softer side” learning, but direct ties to student achievement.

**Method**

The overall purpose of the study was to examine what happens when four self-selected educators are supported to develop their own educational model designed to enhance passion and creativity in learning. The four educators’ thoughts, ideas, and perceptions regarding the role of passion and creativity in student learning were examined as they planned, created, and implemented curriculum designed to motivate and inspire creative learning among unmotivated or disengaged learners. This study employed qualitative phenomenological-inquiry methodology to examine four educators’ perceptions of their experiences over a 10-week period (planning and academy implementation) while working with fifth and sixth grade students. The *Spark* curriculum was an open-ended curriculum designed by the four participating educators to encourage free thought and creativity within students who were identified by schools as disengaged or unmotivated for learning. *Spark’s* goals and curriculum were created and promoted by the participating educators as a means to revitalize students and engage them in an individualized, creative way.

**Participants**

Purposeful sampling was utilized to select educators for the *Spark* Academy summer learning experience. Teachers whose schools were members of the Effective School Project (ESP), a collaborative between public schools and Tarleton State University, responded to a call for participation. Six teachers attended the initial information meeting; eventually, four teachers self-selected to participate in the academy and the study. Two researchers held advanced doctorate degrees: one in educational leadership and one in curriculum and instruction. Both
participants and researchers attended the Ron Clark Academy National Conference in Atlanta, Georgia during January 2015. The teachers collaborated online and some face-to-face sessions to design the Spark Academy experience for the targeted student population of disengaged learners. During the planning phase, teachers responded to several pre-brainstorming short answer prompts by the researchers regarding their reasons or interest in working with students who have engagement in learning challenges and their beliefs about quality learning, passion, and education beyond standardized tests. The prompts were:

- Quality learning is like…. Create an analogy and explain and explain your comparison.
- What would learning look like without standardized test as emphasis?
- Passion comes from within or does it? What are your thoughts?

Brainstorming Planning Activity

- Please design your idea Spark Academy.

While these discussions did not remove teacher participants from the study, the interaction and alignment or misalignment in thoughts and beliefs among the teachers resulted in two participants removing themselves from the study in April 2015; the Spark Academy actually occurred in June 2015.

The final four teacher participants included three Caucasian females and one Caucasian male. Together, these educators had 67 years of teaching experience. The female educators were in leadership roles in their respective school districts. The female educators’ leadership roles were assistant principal (Spark Administrator), Response to Intervention (RTI) intervention specialist, and fourth grade team department head, respectively. The male educator was a professor at a regional university and had served as a special educator and curriculum director
with various public school districts prior to his appointment as a college professor. Spark educators’ levels of education varied from Bachelor of Science degrees to the doctorate of education degree. One of the educators was completing her Master of Science degree in Educational Administration. The male educator and two of the female educators had experience with children who were challenged with autism. The female educator who was working to complete her Master's degree in leadership had experience working with children challenged with behavior disorders.

In addition, all teacher participants completed the Myers-Briggs Type Indicator, a personality inventory designed to facilitate application of Jung’s theory of psychology types noting seemingly random variation in the behavior is actually quite orderly and consistent due to how individuals use to use their perception and judgment (Myers & Briggs Foundation, 2016). The following types were identified with a brief summary of their Myers-Briggs type’s characteristics:

Spark Director - INFP
Imaginative, independent, helper, reflective, inquisitive, empathetic, loyal to ideals, more interested in possibilities than practicalities.

Spark Administrator - ENFP
Warmly enthusiastic, planner of change, imaginative, individualistic, pursues inspiration with impulsive energy, seeks to understand and inspire others

Intervention Specialist - ESTJ
Fact-minded, practical, organizer, aggressive, analytic, systemic, more interested in getting the job done than people’s feelings.

Teacher Leader - ISFJ
Analytical manager of facts and details, dependable, decisive, painstaking and systematic, concerned with system and organization, stable and conservative

**Professor - ESFJ**

Practical harmonizer and work-with-people; sociable, expressive, orderly, opinionated, conscientious, curious about new ideas and possibilities.

**Data Analysis**

Open coding and axial coding, content analysis procedures, were employed using four *Spark* educators’ pre-brainstorming short-answer prompts and post-*Spark* interview experience reflection transcripts. Concepts, categories, and, ultimately, themes were discovered by individual separate coding of three solo researchers using pre and post narrative data (Creswell, 2016). Three peer debriefing sessions allowed researchers to collapse categories and form themes from the findings (Spall, 1998). Before coding, researchers agreed narrative data must be supported across all *Spark* educators’ statements to be considered a category or, ultimately, a theme. Researchers decided this imposed restriction would help reduce bias during the coding process and provide a framework to discover themes from the narrative data.

The *Spark* research team determined possible themes (Creswell & Miller, 2000; Creswell, 2016) after researchers completed solo content analysis procedures. Categories were collapsed as comparisons between researchers’ findings continued from content analysis. Themes or categories without support or deemed unsubstantiated by fellow content analysis researchers were not reported. Selective coding from researchers’ notes, artifacts, and pictures representing various *Spark* experiences were utilized to further substantiate themes found from coding of narrative data sources (Price, 2010). Before researchers’ notes and/or photographs were selected as theme representations based on the findings discovered from the content
analysis of narrative text, researchers determined that unanimous agreement must be obtained before using this selected data. Also, the four Spark educators participating in the study reviewed the researchers’ findings via peer debriefing sessions (Spall, 1998). The four Spark educators’ review of the findings provided the participants a “voice” of the experience they planned, created, and implemented (Creswell, 2016; Spall, 1998). Educators were asked to make final comments related to the findings during peer debriefing sessions, and these comments were reported. Researchers used field notes to record behaviors and conversations between Spark educators and students, and these behaviors and conversations were reported.

Frequency counts and percentages of the four Spark educators’ narrative responses were recorded. Pre-brainstorming, short-answer responses and post-Spark interview experience reflection transcript narrative statement totals and percentages by discovered theme were reported. Krippendorff’s alpha (α) was used to determine interrater reliability between three solo raters (Krippendorff, 1980, 2004b, 2007). Quotes identified as representing identified themes were reported.

**Results**

**Quantitative: Spark Educators’ Perceptions**

The overall narrative statements generated from the Spark educators’ pre-brainstorming documents (120; 28% sentences /3,227 or 38% words) and post-interview transcripts (306; 72% sentences/5,279; 62% words) comprised 426 statements and 8,506 words. From these data, researchers were able to code 130 (30.5%) supporting statements, which comprised 2,158 (25.3%) words. Researchers reported 12 codes from reviewing narrative pre- to post-narrative data. After peer debriefing, researchers agreed all codes were valid, with 100% agreement. Five
categories emerged from the data; two themes emerged after the collapsing of categories (See Figure 1).

**Figure 1.** The 12 codes organized into one of five categories within two themes. Researchers organized 12 narrative text based codes into two themes through peer debriefing sessions (Creswell & Miller, 2000). Note. For each code generated, supporting text was identified. Theme one has four categories and ten codes while theme two produced one category and two codes.

Theme One (T1), Learning Creatively is an Interactive Social Experience, represented most of the statements and word coding support, respectively, with 98 (23%) and 1,636 (19.2%). T1 represented a complex array of ideas that support the theme of learning creatively. For example, building trusting relationships between students/peers and between educators and students were perceived as foundational by educators (Klem & Connell, 2004). Spark educators reported the need to know students’ personalities and interests before commencing an individualization curriculum to promote learning creatively (Burgess & Addison, 2007; Davies et al., 2013; Jenson, 2005). This led Spark educators to create an interest discovery inventory related to the Spark goals. Researchers’ discussion during peer debriefings with the Spark
educators led researchers to a deeper finding, thus, T1 (Byrk & Schneider, 2003; Mayer et al., 1995; Tschannen-Moran, 2004).

Theme Two (T2), Positive Relationships with Fellow educators were Critical to Accomplishing Spark Goals produced 32 (7.5%) statements, which comprised 523 words (6.1%). T2 had supporting statements from all Spark educators and led researchers to the finding that Spark educators perceived the need of having strong relationships between each other. Spark educators’ statements mentioned trust and the need to depend on each other in an environment seeking to meet individualized learning goals of students (Byrk & Schneider, 2003; Davies et al., 2013; Mayer et al., 1995; Tschannen-Moran, 2004).

Although the number of statements supporting T1 and T2 was small with 130 (30.5%) statements from narrative data, these statements were represented in all four of the Spark educators’ pre- and post-statements, thus, creating a pattern. Therefore, researchers were unwilling to identify a theme without pattern support within statements between all Spark educators pre- and post-narratives. Three researchers’ content analysis coding produced adequate internal reliability as determined by Krippendorff’s $\alpha = 0.834$ (Krippendorff, 2004a; Lombard, Snyder-Duch, & Bracken, 2002).

**Qualitative: Spark Educators’ Perceptions**

The four Spark educators shared ideas and planned together all the experiences students encountered with the Spark experience. This represented a reflection of their “voice” (Creswell, 2016). The samples provided here were selected as the best representatives of their respective themes.

**T1: Learning creatively is an interactive social experience.** Learning as social phenomena is well supported by seminal research (Vygotsky, 1978). In the age of computers,
learning with creative expression remains a social experience, and creativity is bolstered by peer interactions and discussions (Fischer et al., 2005; Yurt & Pilots, 2015). Several statements supported this finding:

Educator 1: “Talent Show where kids get to research something they like (on their own or in teams) and make a song, skit, dance, etc. about it. It is not all about technology. Humans with humans is important.”

Educator 3: “The students learned more the more they were invested in the day - the days that had to do with what they were researching were full of questions and discovery. They learned to do things differently than before by listening to each other… That made this unique and I guess Spark like.”

Educator 2: “Focus being on gradual release of control, educator as part of the team in role of facilitator to create a positive, nurturing environment. The students need to have input always if creativity is wanted.”

T2: Positive relationships with fellow educators were critical to accomplishing Spark goals. Educators valued their teaching peers’ input and ideas in the work to meet Spark goals.

The statements below represented this finding:

Educator 1: “We could share opinions and look at options without worrying about hurting feelings or personal agendas because we knew we were absolutely all in 100% for the same goal...kids”

Educator 4: “The students needed us to be together and with it… When lost, I was ready to tag team with my teaching buddies.”

Educator 2: “Creative activities that were individualized for each one placed us in a stress filled spot. I know I learned to listen to [Educator 1 named], so we could be ready and meet each kid’s individualized Spark goal.”

Educator 3: “When I look at that yucky behavior, I read between the lines and see the person and the needs.”

Selective coding: Educators’ statements from peer debriefing with researchers and researchers’ field notes. Educators reviewed data and the “story” elements behind some of the statements researchers deemed to support T1 or T2. Spark educators agreed with researchers’ selections and added more statements to support T1 and T2. Researchers and the Spark educators unanimously agreed that the peer debriefing sessions were beneficial. Three of the four Spark educators shared that peer debriefing should be a daily practice for educators in the field to
discover findings and make changes in classroom educator practices. Some of the peer debriefing statements supporting T1 and T2 were reported in Figure 2.

Figure 2. Sample statements from Spark educators during debriefing sessions with researchers to validate findings from pre- and post-narrative data (Spall, 1998). Note. Spark educators offered comments related to researchers’ findings that emerged into themes 1 and 2.

Researchers noted peer debriefing Spark educators’ statements supported the results from content analysis procedures. This further confirmed researchers’ results as a valid representation of the educators’ perceptions of the Spark teaching experiences. The comments were offered freely and not elicited nor modified in any way by researcher.

Also, researchers noted the content and length of time for the end-of-day conversations between Spark educators. The Spark educators’ conversations ranged from one to two hours per day. Often Spark teachers’ conversations centered on methods to engage students identified as disengaged with the day’s activities. New plans and techniques were discussed by Spark educators for implementation the next day. These plans were frequently unique and individualized for the students in need, respectively. Researchers observed this became a pattern for the Spark educators at each day’s end.
Selective coding for T1 and T2 from pictorial evidence. Researchers, educators, and students had access to cameras at various times throughout Spark. After themes were established from the content analysis process with narrative textual data, researchers examined photographic data that would support the results found in this study. For photographs to be used as representations of T1 or T2, researchers unanimously agreed upon their use (See Figures 3 and 4).

Figure 3. Pictures from the Spark experience representing Theme One (T1), Learning Creatively is an Interactive Social Experience. The pictures represent the various creative, individualized projects students chose to express their ideas and learning during their Spark experience.
Figure 4. Pictures from the Spark experience representing Theme Two (T2). Positive relationships with fellow educators were critical to accomplishing Spark goals. The pictures show the teachers and the organizational ideas they created with students for students to express and plan creative projects and learning expressions. The top left photograph was a plan the educators developed for students to discuss and organize ideas while determining their creative learning project and creative artifacts. The bottom left picture and the top right picture represented the plan Spark educators implemented for students to share their creative ideas and artifact representations from the Spark experience with parents and community.

Selecting pictures as best representations of the Spark experience for T1 and T2 proved challenging. There were over 2,390 photographs from the Spark experience. This was a small representation of the experiences that influenced Spark educators’ perceptions. Many photos were excluded since permission to use photos was not granted nor obtained by parents and participating Spark students.

Discussion
Because the actions of educators flow from their respective views and perceptions of students, it is important for educators practice reflection often. Educators need to question their perceptions regarding reluctant/disengaged learners before engaging in any instructional activity with them. Since the educator serves as the engagement model for students, the perceptions guiding educators’ application of creative expression, relationship building, and social interaction are of paramount importance. Learning socially is needed for creative learning experiences (Burgess & Addison, 2007; Davies et al., 2013; Vygotsky, 1978). Both students and educators need to be observant. As one Spark educator said, “The students needed us to be together and with it.” Creative projects are connected by peer-to-peer dialogue and collective inquiry. A student's creativity is best served in a supportive learning environment built on trust (Byrk & Schneider, 2003; Davies et al., 2013). Trust between students and peers is a byproduct from positive relationship building.

However, the start of building relationships with students for all educators begins with the desire or perception to be flexible and work with students, regardless of students’ attitudes and behaviors. Spark educator three shared, “When I look at that yucky behavior, I read between the lines and see the person and the needs.” Therefore, the perceptions behind the actions of educators prompted researchers to investigate the perceptions of a group of educators who expressed an interest in working with and meeting the instructional challenges of reluctant, disengaged learners. A student's creative expression is enhanced in schools with reflective educators who are willing to build relationships with challenging learners (Davies et al., 2013).

1. Educators felt for students to be creative, the learning experience needed to be both social and interactive: teacher to student and student to student.
2. Educators perceived that positive relationships were needed among educators to receive the desired outcomes.

3. The school setting focused on standardized achievement does not create a pedagogical environment supportive of creativity.

   Creativity is not spontaneous but must be a part of an overall plan allowing choice within an atmosphere providing learners time to discover personal learning interests and ideas. Also, educators, at Spark and any other school, must have the desire and ability to be leaders. The Spark educators wanted to do something different from the norm and were open to the challenge of engaging reluctant/disengaged learners. Educators envisioning reluctant learners as engaged learners is a salient teacher disposition requisite with today’s diverse student population.

**Conclusions/Recommendations**

Recommendations from this study include an examination of educators’ dispositions, educators’ desire to impact disengaged learners, and self-reflective practices in terms of enhancing creativity. When working with disengaged learners, educator disposition is everything. Dispositions guide preferences, and educator preferences guide actions in classrooms (Davies et al., 2013; Gandini et al., 2005). The education of today’s diverse population requires educator-leaders. Findings in this study support the need for leadership experience as well as a desire of educator-leaders to improve instructional environments for disengaged learners. Leadership and the desire for positive change for disengaged learners are essential for improving perceptions related to the process of “sparking” creativity thinking (Davies et al., 2013). Disengaged learners are challenging and require special teaching techniques and relationship building to ensure success and to inspire creativity. Creativity experiences and other individualized learning choice experiences may be denied or neglected by educators who do not
have the motivation to build relationships with disengaged learners. Educators’ perceptions regarding the building of relationships and fostering said relationships with fellow educator peers and students were the hallmark perceptions of the *Spark* educators in this study.

The challenges to engage the disengaged, reluctant learner require teachers with perceptions of determination and desire to meet said challenges directly with a sense of hope for engagement growth within disengaged students. Simply, educators must want this task or educators risk becoming reluctant educators (Fredrickson & Joiner, 2002). Therefore, a flexible, individualized curriculum, such as the *Spark* curriculum, remains an option for teachers to design learning experiences focused on individual creativity and a love for learning. Perhaps, educator professional development could include reflective practices for educators to examine their perceptions regarding reluctant learners.

A key to working with disengaged learners is developing and supporting teachers who show interest and aptitude in this area. Teachers in this study engaged in self-reflective practice in the pre-brainstorm short-answer prompts, planning phase, and at the daily closure of the *Spark* Academy. At the end of each day, teachers lingered for one to two hours to reflect and plan for the next day. There was a sense of camaraderie and trust building during this time. It should be noted, any in-service related to creativity expression and interactive social learning experiences could be enhanced by educator self-reflection of personal perceptions and peer discussion.

Furthermore, the development of any educational model designed to enhance passion and creativity in learning begins with educators who have relational trust (Byrk & Schneider, 2003; Tschannen-Moran, 2004). Providing time to reflect and discuss is essential to this process. In addition, to have a creative, classroom environment, the atmosphere must be in place to support these interactions and open communication protocols, which is also supported with reflection.
and discussion (Davies et al., 2013). The classroom environment is then directly impacted by educators’ perceptions of disengaged learners in those environments.

Thus, much of learning is connected to the Bloom’s Taxonomy of the Affective Domain, the “softer side” of learning. The underlying tenet of Spark revolved around the idea that classrooms and schools do not have to be lifeless and concentrated on content alone, but should instead focus on the growth of the educator as well as the student in order to build relationships and develop a passion for thinking and living. Positively influencing educators’ perceptions of disengaged learners’ capacity for creativity via educator self-reflection and peer debriefing have the potential to be transformative, putting the passion back into learning for students and educators alike. It all begins with a “Spark.”

Limitations and Further Research

This study examined four educators’ perceptions regarding disengaged learners while participating in the building and implementation of a curriculum designed to improve disengaged learners’ creativity expressions and overall experiences with learning. This does not represent the perceptions of all teachers who may participate in similar projects. Therefore, the results of this study cannot be generalized to all teachers. Simply, this was a snapshot of the perceptions shared by this group of educators who chose to participate in this experience. It is important to note the educators in this study chose to participate and could have dismissed themselves from the planning to the implementation of the Spark curriculum at any time. This study adds to the body of literature regarding the influence of educators’ perceptions while serving disengaged learners and the idea of empowering creative expression in learning. Although this was a small representative sample of educators who had leadership experience, it is important to note this
study represented one experience with a group of students and, thus, needs replication with different teachers and students.

Future research will be needed to study the complexities of educators’ perceptions while building curriculum designed to influence creativity and passion for learning within disengaged learners. Because teachers’ perceptions influence the reality of teaching techniques used in their respective classrooms as well as the affective elements within such environments (Davies et al., 2013), more studies examining educators’ perceptions and student learning outcomes are warranted. A study focused on the perceptions of disengaged learners who experience a “Spark” like curriculum would be an interesting addition to the results determined from this study, which focused solely on the educators’ perceptions.

Topic Area: Higher Education

Presentation Format: Paper Session

Description. Often doctoral programs in research-intense universities prepare graduate student to enter the professoriate with the skills and dispositions needed to be successful researchers with little or no training to teach. This session will share our experiences as faculty at a research intensive university in developing and teaching a course to prepare future education faculty. We will share the findings (across surveys, interviews, and document analyses) from our ten participants in this yearlong experience. We will present graduate student feedback about the usefulness of features this class as well as the instructor feedback that will inform future iterations of this course. Key findings included a misalignment between graduate student and instructor goals for the course and central constructs perceived as useful for current and future teaching endeavors.

Introduction

The focus of many Ph.D. programs in research-intense universities across disciplines is to prepare its graduate students to enter the professoriate with the skills needed to be successful in regard to meeting institutional research expectations. Although teaching and service commitments are commonly part of the expectation as a new assistant professor, these two areas are rarely systematically addressed through coursework nor are graduate students mentored when assigned teaching assistantships. Boden, Borrego and Newswander (2001) claim that “higher education institutions in which graduate students are trained are ill-equipped to facilitate
interdisciplinary research, teaching, and other aspects of interdisciplinary graduate training” (Boden et al., 2011, p.742). Furthermore, only about 26% of Ph.D. students in the United States move into tenured or tenure-track positions and even then, the time to get into these positions can take much longer than Ph.D. candidates expected (Gould, 2015). Many graduates find themselves taking positions in which their primary responsibility is to teach while they seek out tenure-track positions. There are few resources that are available to guide future faculty through the process of transitioning from teaching at K-12 setting to the university classroom. Although many Ph.D students in colleges of education may have experience teaching in K-12 settings, there is an adjustment in terms of pedagogy, student issues, and university expectations and oversight that needs to be taken into consideration. Furthermore, working with university colleagues presents its own sets of challenges and opportunities different from K-12 settings. For faculty from culturally and linguistically diverse backgrounds, the challenges can be even greater (Hernandez, Murakami-Ramlho, & Rodriguez, 2015).

**Context and Purpose**

At our institution in the U.S. Southwest, we were invited to design and implement an elective course within the college of education aimed at preparing future faculty to teach in a university setting. Currently, the Graduate School in our University offers support to future faculty through Preparing Future Faculty (PFF) and according to its website, it is recognized nationally for its professional development program for doctoral students, MFA students and postdocs who intend to pursue a faculty position. Admission to the PFF two-semester, one credit per semester course is limited in enrollment (currently 56). Teaching is addressed as one of the roles of becoming a future faculty member. However, it is stated clearly on the website that although teaching is covered, it is only one part of the agenda. Typically in the PFF, only one of 12 sessions focuses on teaching.
The purpose of this project was to study individual’s perceptions of and the processes related to learning to teach at the university/college level with a group of third year doctoral students, this study addressed the following questions: 1) How do participants perceive their knowledge, confidence, and usefulness of constructs around teaching at the post-secondary level? 2) What aspects of a pilot course do students find most and least helpful in their preparation to teach at the post-secondary level?

**Theoretical Framework**

Bronfenbrenner’s (1979) Ecological Systems Theory provides a structural framework for analyzing and understanding how various contexts interact with and influence educators. He delineated various systems (microsystem, mesosystem, exosystem, the macrosystem, and the chronosystem) of influence on an individual’s development. Each system is embedded within the previous system(s). As an educator who is either new to the teaching at the postsecondary level or new to teaching altogether, it is critical to understand how the various systems intersect and influence one another. Our study is grounded in sociocultural theory, which asserts that learning is an inherently social activity (Rogoff, 1990; Vygotsky, 1978). The microsystem that is the university setting presents an environment in which doctoral students’ developing understanding of their roles as educators at the post-secondary level is co-created and negotiated through their interactions with their professors and peers (Bronfenbrenner, 1979).

**Literature Review**

There is a gap in the literature and professional trade books in training education faculty and all future faculty for teaching at the university level. One identified text addresses general teaching practices for all faculty (e.g., Svinicki & McKeachie, 2014); however, it is less appropriate for future faculty with a teaching background. Within our own MLFTC, many of our
doctoral students have experience in the K-12 school system while others enter our Ph.D. program with no classroom experience. Education faculty, in particular, need to learn how to balance teaching time with research time and service time (which is different from K-12 teaching) as well as developing teaching skills/experiences in higher education contexts with diverse student populations and unique challenges. Students and new faculty members may be currently receiving an unintended message (personal communication with ASU LLT PhD student on September 15, 2016) that teaching is less important than other responsibilities of faculty members.

Socialization of graduate students into higher education, the discipline of education in our case, is a useful and commonly used framework for understanding graduate students experiences (Golde, 1998). Socialization, as it applies to graduate students, has been defined by Weidman, Twale, & Stein (2001, p. iii) as “the processes through which individuals gain the knowledge, skills, and values necessary for successful entry into a professional career requiring an advanced level of specialized knowledge and skills.” According to Golde (1998) it spans from moving from a novice to a full-fledged member of a professional community. Furthermore, Tierney (1997) argues that an organization’s culture “teaches people how to behave, what to hope for, and what it means to succeed or fail (p. 5). From the first year in a graduate program, students’ experiences provide important lessons for how they should perform as researchers, educators, and citizens within their institutional communities (Neumann, 2009). The primary means by which graduate students are being socialized is through their interactions with professors and other students (Lovitts, 2001). If graduate students are being socialized into a culture in which teaching should be prioritized behind research and service, this poses a challenge to preparing graduate students for their future roles in the university classroom during a time when their time
and energy is already limited. In order to shift the culture, institutions need to have faculty who are exceptionally passionate about the topic in question (Boden, Borrego, & Newswander, 2011), teaching in our context.

Graduate students and professors established in their academic careers have commented on the lack of attention to their development as educators. Austin and McDaniel (2006) found that graduate students and criticisms of their training generated five recommendations, one of them being the need for developmentally oriented teaching opportunities.

**Methods and Data Sources**

**Participants**

The participants in this study were third year doctoral students at a university in the Southwestern USA participating in the first year of this study and at the onset of their preparation to teach at the university level. Participant demographics included female (n=7) and male (n=3) students who identified as having ethnic backgrounds as Caucasian (n=8), Latino/a (n=1), South Korean (n=1). Four graduate students indicated that they had no K-12 teaching experience, while the other students reported years of teaching experience at the K-6 level as 1, 2, 3, 4 or 20 years (M=4.1, SD=6.5) and at the 7-12 levels of 2, 3, 4, 5, 9, or 10 years (M=3.6, SD=3.6).

**Instruments**

This study employed a mixed methodology design with data collected from four sources.

**Qualitative data sources.** Data were collected through three qualitative sources: (a) four formal semi-structured interviews (spread out across the academic year), each lasting 20-40 minutes (with one participant only completing three interviews); (b) class observations with field notes and (c) document analysis of completed course assignments, in-class presentations, and
other materials (e.g., guest presenters notes and handouts) etc. Interviews were recorded and later transcribed verbatim.

**Surveys.** The fourth data source was pre and post survey based on the Bronfenbrenner Ecological Systems (1977) along with the Knowledge-Confidence-Usefulness (KCU) first used by Barton-Arwood, Morrow, Lane, & Jolivette (2005) and more recently by Lane et al. (2015). The topics covered in the course were identified from the content covered in the two employed textbooks (Gray & Drew, 2012; Svinicki, & McKeachie, 2014) and a course reading (Bain, 2004) to track perceptions related to their knowledge, confidence; and the usefulness of the experiences designed to help prepare them for teaching at the higher education level across the academic year. There were 24 topics identified that were covered in the course based on the course developed from the two aforementioned textbooks including: (a) use of eportfolios; (b) understanding university culture; (c) meeting a class for the first time; (d) understanding academic rank; (e) models of best teaching; (f) teaching styles; (g) coteaching; (h) working with Academic Associations and Teaching Assistants; (i) technology and social media in teaching; (j) online teaching; (k) student engagement and motivation; (l) learning styles and cognition; (m) physical activity breaks/movement differentiation in the classroom; (n) preventing and addressing faculty and student issues; (o) issues of cultural difference; (p) FERPA issues; (q) dealing with controversial topics; (r) balancing research, teaching and service; (s) active learning; (t) balancing work and home life; (u) being a good citizen, (v) negotiating teaching loads and responsibilities; (w) transferring skills; and (x) ethics in higher education. Each of the aforementioned topics had three questions addressing: (1) knowledge, (2) confidence, and (3) usefulness of the perception items (i.e., 24 x 3 or 72 items). The instrument design and use of these three questions on each topic were based on the KCU instrument first developed by
Barton-Arwood, Morrow, Lane, & Jolivette (2005). For each course topic, graduate students were asked the same questions for each of the three outcome areas (knowledge, confidence, and usefulness). For example, “please rate your knowledge using the criteria below: Knowledge: 0 - I have no knowledge of this concept or strategy. 1 - I have some knowledge of this concept. 2 - I have more than average knowledge of this concept or strategy. 3 - I have a substantial amount of knowledge of this concept or strategy.”

Analysis

Qualitative data sources were analyzed using constant comparison and analytic induction methods to identify and extract common themes across participants and data sources during the year (LeCompte & Preissle, 1993). Several techniques were used to support the trustworthiness of the data, including data triangulation, peer review, member checking, and a search for negative cases.

Descriptive statistics were used to analyze all of the survey data (means, standard deviation frequencies). Summative variables were created for the 3 outcome areas of knowledge, confidence and useful for the pre and post results from graduate students.

Results

Our group of graduate students, with the majority having been K-12 teachers, had high self-ratings of their current abilities to teach at the university/college level ranging from 6-8 with 10 being extremely confident [with one student who did not self-rate]. Comments related to their confidence or potential as university teachers. Ester stated, for example, “I don't really foresee any problems with it. I like teaching. I generally have a very good rapport with students and I think as long as I'm teaching some kind of content that I know enough about, I'll be fine.”

Graduate students also talked about their potential to be effective university teachers, Bill
mentioned “…I think I have all the basic building blocks in place, but from being a teacher I know that there's no substitute for experience. I feel confident that I can get up to a 9 or a 10, but it's going to take some time of course, just actually being in the trenches and doing the work…there’s always more to learn.”

One of the major themes that emerged from the qualitative data was a mismatch between expectations of the course and what was accomplished by the end of the semester. Interview data revealed that students had expected to know what specific course they would be teaching the following semester early in the course. Consequently, they assumed that most of the class would be devoted to developing their own course syllabus reviewing and/or developing their own course readings and assignments. As course designers, that was never our intended goal. Scheduling issues did not allow for assignment courses to doctoral students as instructors until very late in the semester. One of the course assignments required that the graduate students shadow an instructor/professor in a course they would be interested in teaching. Nine of ten students expressed that it would have been helpful to know what course they would be teaching in order to determine which instructor/professor to shadow.

The course assignment that was identified as most useful was developing a teaching philosophy statement. In interview 4, after their semester of teaching and one semester after initially writing their philosophy statement, eight of the ten participants stated that their basic philosophies had not changed and that having had time to reflect on their teaching philosophy had made them more effective instructors. Addressing the research question of what student found the least helpful in the pilot course, seven of the ten participants did not find the course readings helpful nor useful and strongly suggested that we eliminate the course texts. This was most strongly expressed by those participants who had substantial teaching experience. In
addition, although the participants generally stated that they had benefitted from the guest
speakers, they expressed frustration at the limited time that was devoted to opportunities to
interact with one another in order to share and discuss course topics and completed assignments.
They also felt that they had not had adequate time to interact with us as seasoned professors with
substantial teaching experience.

Graduate students were also asked opened ended questions about course reflections on
the following topics: their goals, questions they had, additional topics that they would like to see
in the course, changes they recommended for the course and their take away thoughts. Table 1
presents the most frequent responses from students in the aforementioned areas.

What additional topics would you like to see in this class? (post survey) 
5/10

More time spent on the importance of active learning

More time spent on different ways of teaching

What changes do you recommend for this class? (post survey) 
8/10

Shorter guest lectures

Course to better reflect student needs (prepare to teach)

Take Aways (post survey) 9/10

Like discussion boards

Reduce work needed for the course

Great assignments

Examining the quantitative data, graduate students indicated their perceptions of the knowledge, confidence and usefulness of the topics covered in the course were quite positive. For the pre survey, they rated 64% of the items with a 2 or 3 (or better than average or highly for knowledge, confidence and useful). This number increased overall for the posttest to 86%. The topic five items across all three areas were all related to usefulness and included: (a) Negotiating Teaching Loads and Responsibilities, (b) Preventing and Addressing Faculty and Student Issues, (c) Student Engagement and Motivation, (d) Understanding University Culture, and (e) Ethics in
Higher Education. Internal consistency reliabilities for the perceptions items were Alpha=.94 and .96 for the pre and post survey items, respectively.

![Graduate Student Perceptions of Teaching Course](image)

**Discussion**

We would like to share our thoughts after the end of the fall semester in regard to our co-teaching of DCI 791. Attached in the fall 2015 syllabus for the course and a copy of the fall 2015 Course Evaluation. During the semester, we collected pre and post surveys as well as pre and post interviews (with IRB approval for all) to help us document how our students perceived the course. We hope to have the opportunity to teach the course again and are prepared to revise and improve the course based on the data we acquired and the lessons learned.

**What worked well?**

- Content directly related to helping them teach in spring 2016
- The three major assignments were seen as relevant and helpful by the students
- Time spent on learning how to develop a syllabus
- Exposure to a wide-breadth of MLFTC and ASU faculty
Modeling different types of instructional methods

Modeling co-teaching

What did not work well?

Differing expectations of course content. Both faculty members had understood that the course was to discuss various teaching philosophies, teaching strategies, and other issues that impact teaching at the university level (e.g. FERPA issues, diverse learners, etc.). Students believed that the course was for them to work on their syllabi and prepare for the course they would be teaching in the spring 2016 semester. Students expressed frustration in class, in interviews, and in the course evaluations regarding the late notice about the specific courses they would be teaching in spring 2016. They wanted the class to focus on developing their syllabi, understanding the assignments, and preparing to teach the class. If given the opportunity to teach this class again, we need to rectify this disconnect.

Course textbooks. Given that this is the first time either faculty member had taught a course like this, we conducted extensive research on the texts used in similar courses across the country. The two most popular texts were the ones we adopted for this course. Students, in general, did not find the textbooks useful. This is probably due to the fact that the textbooks assumed very little background in teaching whereas 70% of our students were former classroom teachers. The texts did address topics that they probably had not encountered in their K-12 experiences (e.g. large lecture classes, preparing for university culture, ethics, balancing research, scholarship, and service, etc.). In retrospect, future iterations of this course should include more articles specific to areas that they should know more in depth and include the textbooks as resources for those with limited or no classroom experience. On the course pre surveys, the students indicated that
they were already very confident in their teaching. The readings need to address how K-12 teaching differs from teaching in university settings, with discussions on the overlap of K-12 teaching but an emphasis on transitioning from K-12 classroom settings to university settings.

Restructuring the class. Given that this was only a one-credit class, the syllabus was designed with the goal of exposing the students to as many different types of teaching and to as many faculty that we viewed as excellent university instructor as possible. After outlining the course content for each session, we identified a faculty member to be a guest speaker and address some of the session topics. Although we had asked the presenters to limit their presentations to 45 minutes, all of the presentations ran longer than expected. Given that the presentation were engaging and students interacted positively with the speakers, we let the presentations run longer than planned. This, in turn, impacted the time allotted for class discussions on other topics slated for each session. Students expressed that they had hoped to have more time to work on their syllabi as well as to engage with us as instructors and with our key areas of teaching and research. In retrospect, we should have limited the time of the presentations. In future iterations of this course, we recommend using guest speakers to expose students to various models of teaching but would limit the time used for this purpose. In addition, since this class met once per month, we returned assignments at the following class session. If there was a problem with a submitted assignment, we communicated with the student as soon as the assignment was turned in. However, students indicated that they expected quicker feedback and so part of the restructuring of the class would encompass providing students with immediate feedback.

Additional course development required. Before this course is offered again, the following suggestions should be considered.
The most common concern was the mismatch regarding the course expectations between faculty and students. This issue needs to be addressed. If the course is about preparing students specifically for the course they will teach in the spring, then a streamlined process for assigning students to courses needs to be discussed so that students know which course they will be teaching as early in the semester as possible. If the purpose of the course is to prepare students more in general for teaching at the university level, then we strongly advocate for a 3-unit course that would allow for deeper discussion of teaching philosophies, strategies, and understanding university culture and its impact on teaching. If the course is limited to 1-credit then the course needs to be refined to cover less material in the time allotted than its present iteration. Perhaps the ideal course would cover a balance of these two purposes, in which case, a 3-credit course may be most appropriate. Based on what is decided regarding the purpose of the course, the class time needs to be restructured.

Depending on the agreed purpose of the course, new course readings need to be identified.

Clear processes for assigning students to the courses they will be teaching the following semester.

Given that this was the first time that this course was offered, this was a learning experience for all involved. Both of us would appreciate the opportunity to teach this course again and would welcome any feedback from your perspectives. We look forward to assisting in any way we can to provide our students with this valuable opportunity that not only demonstrates our program’s commitment to quality teaching, but also provides students with mentoring as they begin their journey as excellent university educators.
Conclusion

To summarize, both quantitative and qualitative data sources provide evidence that doctoral students preparing to teach at the university level can benefit from a course focused on teaching. Their preparation in a research-intensive doctoral program should include an opportunity to develop as course instructors given that most tenure-track positions in education include teaching responsibilities that are evaluated as part of progression towards tenure. The results of this study have implications for theory, research, and implementation of school-wide change initiatives.

Role of Form-making Exercises in Design Education for Creative Thinking

Based on analysis of art workshops with primary and secondary school design and art teachers.

**Topic Area:**
Art Education

**Format of Presentations:**
Paper Session

**Paper Description:**
Design Thinking is nowadays widely applied not only in design industry but also in other areas such as business, healthcare and so on. Based on this trend, design is considered as a problem-solver, while role of form-making before concept development is scarcely considered and studied. This paper suggests, under this condition, to explore the possibilities of various form studies and connect form and function in education to extend students’ creativities and applications in professional fields.

Abstract

Recently people consider design as a problem solving process. Therefore, today’s design approaches and processes are focused mainly in finding out the problems in our daily lives, proposing the necessary design concepts and making the objects to solve those problems. However, looking back how living culture has been shaped around our daily objects, it is far from the design process as we usually think of as mentioned above. At the beginning of human civilization, primitive men found objects around them which fit their purposes and utilized them as tools. That is, people designed the tools by taking advantages of properties of diverse objects around them. These days, however, by taking design as a problem solver, designers try to create a novel form that follows functions assigned by them. Thus there are relatively insufficient studies and practices regarding form-making exercises to build ideas upon naturally shaped forms. Therefore, the purpose of this study is to explore practicability of form-making exercises in design education and professional fields, and suggest a design ideation toolkit to develop further design concepts. We conveyed four workshops with primary and secondary school design and art teachers in order to see how form-making exercises along with the design ideation toolkit can be applied in art classes, as well as a workshop with elementary school students in fifth grade. Throughout the five workshops, we referenced cognitive psychology theory of affordances, to explain actions inherent on natural objects and environments. At the workshops, we tested the design ideation toolkit which take use of 1) Different Viewpoints and Scales, 2) Properties and Functions, to imagine various affordances of forms. By making patterns out of creative thinking processes and outputs of participants from the five workshop sessions, we will discuss how these combinations of form-making exercises followed by the design ideation toolkit have educational effects in schools to develop students’ creativities. Furthermore, we will find possibilities of design education methods that apply abstract forms of objects into solid design concepts which could be used in the professional fields.

keywords: form-making, design thinking, affordance theory, ideation toolkit, creative thinking, design education

1. Introduction

As design has been regarded as a problem solving process, several design thinking methods have been developed and utilized. That is, today’s systemic design approaches and processes are focused mainly in finding out the problems in our daily lives, proposing the necessary design concepts and making the objects to solve those problems. However, tracing back how tools have been designed in human civilization, it is also true that living culture was built upon discoveries of surrounding natural objects. At Triennale di Milano in 2016, Japanese designer guru Kenya Hara and Italian architect Andrea Branzi have co-worked to hold an exhibition called “Neo Pre-History - 100 Verbs.” The show displayed the design history of tools with
verbs describing them from Stone Age till today. And the show has shared the perspective that people designed diverse tools by taking advantages of natural forms of objects around them, and this is the beginning of design. In this context, the purpose of this study is to explore practicability of form-making exercises in design education and professional fields, and suggest a design ideation toolkit to develop further design concepts. To this end, we reviewed the existing design education and toolkits, and cognitive psychology theory of affordances which is to explain actions inherent on natural objects and environments, to set the theoretical foundation. And to imagine various affordances of forms, we suggested the design ideation toolkit which take use of 1) Different Viewpoints and Scales, 2) Properties and Functions, to imagine various affordances of forms. To test the toolkit, we conveyed five workshops with art and design educators of primary and secondary school and primary school students.

2. Theoretical Review

2.1. Design Curriculum

Current design curriculums are comprised of two core courses; one is a foundation course to study three-dimensional form and train five senses to exercise visual relationship of forms in space, and the other is a professional practice course to exercise systemic thinking process of problem recognition and solution in design. Foundation curriculum at Pratt Institute in New York, which became famous by Rowena Reed Kostellow’s revolutionized curriculum to bring abstract elements emulating Bauhaus tradition in 1939, defines three-dimensional form into six presentations as Rectilinear Volume, Curvilinear Volume, Planar Construction, Lines in space, Convexity, and Concavity. Then the presentations are practiced with concepts, ratios, and modules which later are integrated into projects [1]. Charles L. Owen, a Distinguished Professor Emeritus at Institute of Design, the Illinois Institute of Technology (IIT) in Chicago, the incubator of neo-Bauhaus, has taught and conducted research on Structured Planning of design, which emphasizes human-centered creative thinking process. The goal of Structured Planning is to deduct design concepts of more complex product systems by defining, analyzing and reconstructing problems. Furthermore, there are growing interests in design thinking process to become innovative for winning business [2,3]. While there are several toolkits developed to help design thinking process for innovative solutions [4], there are relatively less pursuit in design research in the process of making concepts with form visualization.

2.2. Affordance in Object

Affordance, which explains the relationship of form and function, is a theory that describes information of the perception of surfaces in an object which function the form affords [5]. The information afforded by objects are not only dependent on its properties, but also the experience, knowledge, or culture of the user [6]. In other words, depends on users’ experiences and needs, there are a lot of possible ways that affordance of objects can be interpreted and practiced. Affordance appears when a direct link between perception and action is found and utilized [7]. It can be applied as a methodical frame to draw a design.
concept from two core axes of design curriculum; 1) three-dimensional form, and 2) process of solving problems. This is because affordance provides a fundamental theory to connect the properties of objects and function as a problem solution.

3. ‘Form to Function’ Ideation Toolkit

Based on affordance theory, we have composed the ideation toolkit into three tools (as a form of worksheet) to connect form (unintended product) to function in order to discover new possibilities of the object. With the first worksheet, participants imagine the object from different viewpoints in order to perceive information afforded by its form. Then, with the second, they examine it from anthropometry perspective whether there are other possible functions the object can afford depends on scale changes. At last, in the third stage, participants are able to connect people’s actual daily behaviors and functionality inherent in the form deducted from imagination exercises through previous processes. Thereby, the third sums up the toolkit. By taking use of this ideation toolkit following three stages, we believe that form to function connection link can be made.

3.1. Tools to Generate Ideas with Viewpoint & Scale Tools

Seen from Fig.1 and Fig. 2, viewpoint and scale tools of the ‘form to function’ ideation toolkit is lenses to perceive mundane objects with a fresh look. Viewpoint tool allows us to examine objects from five different viewpoints (bird’s eyes, top, side, cross-side and front view), and Scale tool let us imagine the objects from five different scale-levels (on hands, knee, waist line, eyes and building-height levels). Through these lenses, we are able to discover what affordances could exist on the object when conceived from different views and scales. These tools were suggested in this study to help people to extend their boundaries of imagination on ‘offerings or action possibilities in the environment’ of Gibson[2], and ‘suggestions or clues as to how to use the properties in objects’ by Norman[6].
3.2. Tools to Discuss Properties and Behaviors of Objects

Design is in the process of shaping our daily lives on the basis of the available properties of objects. There may be errors or failures in this process of users interpreting the information afforded by the objects in different ways [8]. For this, in this study, we have provided the Property and Behavior of Object Tool [Fig. 3] to create a link of properties of the objects drawn from previous exercises to actual daily behaviors. Also we asked participants to use this toolkit that a group of two people could discuss and develop concepts together. Having a chance to consider different perspectives of others to discuss about practicability of the product from the workshop has widen views of participants, and each pair completed the form together as Fig.3.

![Figure 3. Property and Behavior of Object Tool](image)

4. Case Studies: Art and Design Workshops

We have conducted five workshops; four with educators and a workshop with primary school students to review availability of the suggested ideation toolkit. Each workshop was delivered for four-hours. During this time, participants produced three-dimensional form using plaster of Paris and ballon to exercise concavity and convexity, referencing form presentations of Rowena Reed’s curriculum for form-making design [9]. As a result, we tried to seek a possibility of the ‘form to function’ ideation toolkit into use. Fig. 4 shows a production process of three-dimensional balloon plaster form that we did as an easy-and-quick form-making exercise in workshops.

![Figure 4. Production Process of Plaster Balloon Form](image)
4.1. Workshops for Educators

During four workshops with primary and secondary school art/design educators, we have led them to produce free forms as many as they want without imposing any purposes on them. This was to help them focus in the form itself rather than how it could function. Many of them made two to three three-dimensional forms within the time. The first and second workshop were done in 19 January and 15 February 2016 respectively. Fig.5 is a final image presentation of what participants had created during the workshop.

Although we asked them to create forms freely without putting any intentions ahead of creating, different approaches of participants were observed. These could be categorized into three directions; Group A focused in making spontaneous forms excluding any intentions, and Group B concerned to shape objects which deliver creator’s intentions. Group C utilized objects around them to shape a form. One of them designed a form that could support her smart phone, functioning as a smart phone stand. Seen from Fig.6-1., of workshop 1, #16 (B and C combined) shows a shape of a phone that a maker pushed and hardened on a balloon plaster. The maker described that she wanted to create a form that could be only shaped with a single tool (her smart phone) without putting any other artificial forces. Also she wanted to produce a form that assembles a bean bag chair. She already set several boundaries of her own before generating ideas with the object. We asked her to examine her object with the ‘form to function’ ideation toolkit so that she could break her rules and extend her creativity. With Viewpoint and Scale tools applied on her object, she could think of an artificial ski slope design (“Building-height Level” Scale) or a public furniture design (“Eye Level” Scale) for a rest inspired by a big slopy form looks like a back support. Meanwhile, Fig. 6-1. #19 participant wholly focused in creating a form that shows asymmetric structure. Through the toolkit application on her object, she described it as a dumb bell (“On hands” Perspective) that her father uses when exercising at a gym, or a ride on playground (“Eye Level” Scale) that children can climb up and play. # 27 and # 33 shown on Fig. 6-2. of workshop 2 belong to Group C using scissors and hairband to shape
their forms. It was interesting to see several different forms being created when participants use objects around them not only their hands to shape the form.

Fig. 7 is the result of the third and fourth workshop conducted in 2 July. We suggested them to use watercolors to mix them with liquid plaster as seen from the left image of Fig.8. Furthermore, we added a new manufacturing method to use a second balloon to blow into the mixture of plaster [Fig.8; center image] which created a vessel shape [Fig.9]. In these workshops, some created their own way of producing a form. Seen in the right image of Fig. 8, one of the participants used a hardened plaster mold to shape the form. Through these workshops of which a couple of tools of expression were added, we discovered there are more possibilities to generate creative ideas than just proposing a toolkit composed of guideline worksheets.

Fig. 8. (Left to Right) Mix Color and Liquid Plaster, Blowing Second Balloon into the Mixture, use a Hardened Plaster as a Mould

Fig. 9. Outputs of Double Blown Balloon Manufacturing Method with and without a Mixture of Watercolors
4.2. Workshops with Primary School Students (5th grade)

In 28 May 2016, we had an art workshop with 5th grade students. The results are shown in Fig.10. They were allowed to use their watercolors and brushes to draw on their plaster form. This was an attempt to provide a new tool besides their hands and objects around them (mostly smart phones which is most adjacent to our body) to express their ideas and display their imagination. However, in the end, this tool limited down their creativities resulting into only illustrating characters they like or coloring the form that instantly inspire them with their organic shapes [Fig. 11].

![Figure 10. Students with their own work of art](image)

![Figure 11. Donuts and Character Illustration by Students](image)

5. Conclusions

This study proposed a ‘form to function’ ideation toolkit which is composed of three parts to connect and show directions for 1) form-based design education, and 2) problem recognition and concept driven-based design education. The toolkit was explored in its practicability through five workshops with educators and primary school students. Through examining workshops, this paper suggests that the toolkit could show the way for design education to create a link between form-making and people’s daily life. Namely, this is a method to turn problem finding, analyzing, abstract conceptualizing into a solid design concept. However,
the toolkit and facilitation guide have to be more specified to reflect the process of perception for interpretation and utilization of information inherent in the object affordances. Furthermore, by exploiting various forms, we need to conduct more researches on form production and composition that extend availabilities of design.

Abstract

With rising interests on design thinking methods in resolving social and environmental problems, there have been many experimental practices with human-centered design approaches in solving problems in our local communities. However, in April 2016, the mural of Ewha Maul (Village), which was considered as a successful example of collaboration between local residents and external design experts, was vandalized by residents themselves. In the meantime, new discussions on the role of design in overcoming social issues have started. In this paper, we aim to draw implications of human-centered design for social issues through studying a case redesigning the local “stairway” with Haesong Local Child Care Center, located in Changsin-dong, Jongno-gu, Seoul, in which surrounded by sewing factories. Initially, this project aimed to improve the environment of unorganized neighborhoods with help of the center’s children. We took notice on the “stairway” leading up to the center as our object of design. To scout the spot and look for loopholes of this place to improve, we planned to hold workshops with children using design thinking toolkits every second week over the next 10 weeks from April until June, 2016. However, we soon came to realize that how inconsiderable and lack of understanding we were on children, the main user of the place. After experiencing errors and failures to communicate with these children, we decided not to use design guidelines for the remain workshops, but to play with them. Drawing beautiful murals on the walls or cleaning the staircase was not a solution, but a temporary installation or an event. Hence, our goal for the project had changed to make children feel connected to the space through designing games that could imprint their fun memories on the place. Based on this project with the Haesong center, we also conveyed a design thinking workshop with educators to seek applicability of the experience toolkit we developed in schools.

The outcome of this project was a process of activities, the intangible experiences. The lesson we got from this study was that we were able to discover “true user experience design” by which practiced with self-motivated users. Namely, user experience is not given by external experts nor designed by technology-driven products, but it is designed by sharing experiences and memories of the users of the space.

**Keywords:** experience design, intangible design, self-motivation, public design, design education

1. Introduction

Rittel and Weber (1973) defined social, environmental, and cultural issues intermingled together as ‘wicked problem’ [1] because those issues are interconnected and that complex relationship make them hard to solve with a single approach, although they are worthwhile to resolve. In the recent times, as many put efforts on these hard-to-solve problems, design thinking with human-centered approach received attention as a champion for those projects. Many of recent design projects tackled problems of education, water shortages, lack of daily necessities, and environmental improvement of the third world. However, many questions on how sustainable the outputs of those projects are with local people and surroundings.
In May 2016, the mural of *Ewha Maul* (Village) in Seoul which was considered as a successful example of collaboration between local residents and external design experts, was vandalized by residents themselves [Fig. 1]. Due to this event, critics started to talk about validity of public design. One of the main reasons for the conflict in *Ewha Maul* is that routine life of local residents whom the main stakeholder of the design, was violated by the change of their living environment as many tourists visited their community and even their front yard.

In this paper, we would like to raise a questions, if then, how should design approach be to consider various stakeholders of different interests and sustain well within the context of use in terms of design education. Based on reflection from a term project to redesign the long curvy stairway leading up toward the *Haesong Local Child Care Center* [Fig.2], an after-school located in Changsin-dong, Jongno-gu, Seoul, with their students, this research aims to discuss issues of human-centered design approaches and search for an answer for the previous question. In this regards, we will reflect on how the project aim and process had changed with three phases through the course of conducting five workshops with them. As a result, we will review implications of the output of this project compared to existing design thinking toolkits for educators.

![Figure 1. (Left) Before and (Right) After of Ewha Maul](image1)
![Figure 2. The Haesong Local Child Care Center and the curvy Stairway](image2)

2. Process of “Stairway Redesign Project”

2.1 Phase 1: Initiative

The long curvy stairways, our design target, is the path to school, main streets, and the old fortress, and has many passers-by. At the same time, however, it was the place that nobody cared for. Therefore, we found it was important to make participants to have a sense of ownership to the place to solve the problem. This project initiated from ideas to develop ‘Design Thinking Toolkit for Children.’ The aim was to practice methods in the toolkit with children and redesign the stairway from solution discovered from toolkit workshops, and as a result develop a design thinking toolkit to fit the eye-level of children like *Khandu* [2]. *Khandu* is a kid-centered design thinking toolkit in the form of card game which kids ultimately share their solutions and other resources on online community, designed by *Seven Thinkers*, a Madrid based service design and design thinking studio.
Most of the parents who sent their children to Haesong Center, are working in sewing factories until late at night so that they have little time to spend with their children. In that context, these children lacks outdoor experiences to stimulate their creativity unlike their peer-group in school. This redesign project started coincidently when we met a teacher who is in charge of the center while we were roaming around the area in search of inspiration. In the beginning, our ideas for the project was not that much different from Ewha Maul Project, to clean off dirty garbage bags and place a nice installation on the wall of the staircase with children to make it look more attractive.

In the first workshop, we played icebreaking game and built a tower with marshmallow in order to be friend with them as well as to see their creative possibilities [Fig.3]. Then in the second workshop, to discover problems of the staircase, we put a map on the wall and handed out post-it to children to write down troubles they have with the place and stick them on the map[Fig.3; right image]. Our approach using post-it just like grown up design thinkers were not successful, although we found that these children have negative impressions on the staircase and would like to escape from the space as soon as they could. We soon realized that this 2 hours of workshop without playing any games just killed their interest on the project and left them as passive viewers to the situation.

![Figure 3. (Left to Right) Ice Breaking, Marshmallow Tower, and Map Tree with Post-its](image)

### 2.2 Phase 2: Empathy with Users (Local Children)

After two workshops, we realized how inconsiderable and lack of understanding we were for children to deliver our ideas, the main user of the staircase. From the previous workshop, children received this problem finding approach using post-it as an another boring and dull classwork which has do be done under control and step-by-step instructions. Accordingly, we decided not to follow existing design thinking approaches, instead we prepared tools and games that children could play in the stairway in order to build fun memories at the place. And throughout the play sessions, we expected them to feel connected to the place. We believed that designing positive experiences for the children is the ultimate goal of this project. In this regard, we tried to understand the stairways from their perspective for the following workshop. As a
result, we have concluded that letting the children to play at the site is the best way to overcome this situation[Fig.4]. It will make them naturally feel comfortable with the space, therefore become to like it. One of those games we played was paper-rock-scissor at the stairway without rules but only guidelines so that children could create their own. We brought dozens of washable sidewalk chalk to help children to draw rules, but first express their thought about the stairway on the wall. Before the third workshop, we were excited to bring this new game and play it with children. However, these children, unlike our expectation, went crazy with the chalk in their hands.

Through this experience, although we did not complete what we have prepared for, children by themselves discovered new patterns of the space as they were examining and observing it with a new given tool. In this workshop, children created their own game, like a map on the bottom to the secret place of which led us to his friend’s home. That is to say, with self-motivated act of playing, they were able to discover unknown aspects of this space. They even fully enjoyed cleaning off time playing with water sprays and smashing a mop on the floor as a new way of cleaning. From this example, we have learned it is more important to design a right platform that users could start playing rather than lock them up in the fixed processes of design. In terms of design education, educators should not push students to follow a certain guideline, because it will only kill their creativities.

2.3 Phase 3: Design a Toolkit to ‘Be a Friend with Stairway’

With lessons from the third workshop, the object of this project have changed to design a playing experience toolkit that children to ‘Be a Friend with Stairway.’ The experience toolkit is to connect users to their surroundings by helping them to see the place with a fresh look through exploiting the space. Through this journey, we were finally able to search for a meaning of the space and design from users’ perspective. In fourth and fifth workshop, we conveyed other play sessions at the stairways to deepen children’s attachment to the space. In order to help children to have a fresh look on the space, we brought rubbing tools that children could print any hidden patterns they found interesting [Fig.4; pattern 1,2,3]. On our last day with the Haesong Center children, we simulated as if the day is a rainy day with a water spray gun, and children played with decorated poly vinyl umbrella with markers, color velcro, and kitting wool [Fig.4: bottom lane]. In the end, the outcome of the project was not an installation that could be easily seen from other
public design examples, but a process of activities and intangible experiences that will be remembered for a long time. And this is how we defined sustainability of design. By experiencing this whole workshop process, children had grown affection and created an attachment relation to the space which was the ultimate goal of the project. For children, the experience at the stairway became a chance to discover various possibilities of expressing their selfness. For us, we experienced the power of self-motivation in design education for extending creativity. While reviewing the project and process we have been through with children, we were able to summarize the project into five steps and three phases as arranged in this section [Fig.7].

![Pattern 1, Pattern 2, Pattern 3](image)

Figure 5. Discover New Patterns of the place, and have Playful Experience on Rainy Day at the stairways

3. Workshop with Educator based on Activities : ‘Play with Your Surroundings’

Based on the Haesong project, we conducted a design thinking workshop for educators in 25 June 2016. One of the main goal of this workshop was to design a new game to play after experiencing icebreaking and pattern seeking to help them to see the classroom(a routine space for teachers) with a new perspective. Differences between this workshop and the Haesong project were that the workshop was an indoor activity with educated grown-ups who can be easily controlled while those children at the center had freedom to do many activities outside such as smashing a color ball to the floor to tear up paper and draw murals as much as they want on the wall (since they used washable chalk) and they were also way more wild in reaction which we found as their hidden possibilities for creativeness.

This workshop with educators were conveyed with four steps which are 1) Icebreaking, 2) About myself (Create a Manual of oneself), 3) Discover the Place a new, 4) Design a Game based on Activities. Since it was the first day of 10 days of workshop, icebreaking game was a great tool for participants to be familiar with each other. We did the classic paper-scissor-rock train play in the classroom as the first icebreaker, and as the second we played ‘Guess my Number,’ the game 5% Design Action [3] of Taiwan developed
[Fig.6: first two images]. After then, we asked people to draw each other’s faces (5 faces within 5 minutes) on post-it without looking at the drawing paper [Fig.6; third image]. With these quick drawn portraits, people created a self-introduction manual of themselves to classmates.

The third step to discover the routine space a new was to find new possibilities for art and design education which was the main purpose of this workshop. From the experiences with children, we applied this curriculum to seek new patterns of the classroom environment by rubbing them on paper with watercolors [Fig 6; fourth image]. Participants were excited to discover new patterns, signs and textures of the indoor space, and imprint them on a paper. After this exercise, we asked them to design a game based on activities and objects discovered in space. As a result, we found that there are new possibilities for this kind of art/design classes based on activities and processes to foster active and self-motivated students(users).

![Figure 6. Icebreaking Game to become Friend with each other, and Rubbing Game to seek Sew Patterns of the Place](image)

4. Conclusion

Current design education is mostly focusing on presenting decent looking results or superficial outcomes. Hence, in this paper, through sharing the experience with the Haesong center children with educators, wanted to bring up those problems of current art education in Korea to discuss practicabilities of connecting students and their surroundings as a new possibility for creative education.

The outcome of the Haesong project was a process of activities, the intangible experiences. Through analyzing this project, we learned about the power of “true user experience design” based on self-motivated participations. Namely, user experience is not given by external experts nor designed by technology-driven products, but it is designed by sharing experiences and memories of the users of the space. Furthermore this principle can also be applied on current art and design education. As a result, this study suggests that the essence of human-centered design is to build design concepts and designing action plans to create shared memories with users. Otherwise, it has no meaning.

Abstract

Given the developments of recent times it has become a widespread educational goal to make students more globally orientated. Opportunities such as: study abroad programs and student exchange programs are part of this process and attract many university students every year. It has been shown that study abroad programs can widen students’ horizons, promote self-confidence and develop their career paths. However, the bulk of research so far has been conducted on university students. Additionally, these studies suffer from a disproportionate over representation of certain ethnic, racial and socioeconomic groups who have been able to participate in international education. The situation is even more pronounced at the secondary level where high school students of underserved communities are severely under-represented in study abroad programs.

As such, this paper examines the study abroad experience of a group of underserved youths in a transfer high school in New York City. Preliminary findings from our research show that study abroad participation builds students’ confidence, expands their world view and changes their perception of self as global citizens. It can also enhance their interest in academic study and empower them to dream of new career paths. Further, it can increase their understanding of their own cultural biases and prepare them to work more effectively with diverse groups of people. In providing a discussion of the personal growth/ transformation of students who have studied abroad, we hope to promote early international education awareness for minority groups while advocating for an education system with inquiry learning and expeditionary learning at its core.

Title: Calling all Nurse Educators! Addressing Challenges Associated with Recruitment and Retention of Participants in Nursing Education Research

Topic area: Higher Education

Presentation Format: Paper Session

Description: The purpose of this presentation is to discuss recruitment and retention issues related to nurse educator participants in research studies. First, we present a review of pertinent literature. Secondly, we share the challenges experienced while undertaking our research study and possible reasons for these. Thirdly, based on our experiences, we offer potential recommendations, solutions, and suggestions to guide further research. The audience will be engaged in a discussion based on their respective experiences.

Title: Nursing Students Critical Thinking and Research Utilization

Topic area: Higher Education

Presentation Format: Paper Session

Description: Our presentation will focus on Critical Thinking Dispositions and Research Utilization (RU) of undergraduate baccalaureate nursing students enrolled at a university in Western Canada. We will also present qualitative findings related to RU which we categorized using the PARIHS framework’s evidence, context and facilitation elements. Findings disclose some key facilitators barriers to students’ use of research in practice. Finally, we will share some of the key challenges in using a mixed methods research design.

Topic Area: Other Areas of Education (Multicultural)

Presentation Format: Paper Session

Presentation Description:
Through the use of testimonio methodology, a young scholar and a senior researcher examine their involvements with educational experiences with cultural empowerment as a central tenet. Experiences teaching in various educational programs as a young educator are examined through a critical lens. The senior researcher shares her experiences teaching in a charter middle school designed to empower Latino/a youth. Challenges and strategies for addressing those challenges using a community wealth framework are addressed.

Introduction
It is important to note that educational attainment among U.S. Latinos/as has been changing in recent years (Fry & Krogstad, 2014). According to the Pew Research Center (2014) the Latino/a high school dropout rate has dropped significantly from 32% in 2000 to 14% in 2013. Furthermore, the number of Latinos/as enrolled in two- four-year colleges has more than tripled since 1993 (Pew Research Center, 2014). Despite these important gains, a gap in educational attainment persists for this student population. The high school graduation rate for Latino/a students for the 2013-2014 school year was reported at 76% compared to 87% for White, 73% for Black, and 89%
for Asian students (U.S. Department of Education, 2016). SAT scores, critical to the college admissions process, show a gap between various Latino groups and White students. Furthermore, Latinos continue to lag behind White, Black, and Asian students in obtaining a four-year degree. When looking at Latinos/as between the ages of 25-29, only 15% of Latinos/as have a bachelor’s degree or higher compared to 40% of Whites, 20% of Blacks, and 60% of Asians in the same age group (Pew Research Center, 2014).

As Latina scholars, activists, and first-generation college students, we have chosen to work in various educational settings that show promise for addressing the achievement gap for Latino/a youth. As a junior in college, Melody has worked in several settings that seek to engage Latino/a youth through empowerment. In some cases, the cultural empowerment has been the goal. In others, exposure to STEM content has been the target. Although all of these programs have targeted inner-city socio-economically disadvantaged youth from culturally and linguistically diverse (CLD) backgrounds, the majority of her colleagues in these programs have no shared backgrounds in terms of ethnicity, language, or socio-economic backgrounds with the students they serve. Melody, on the other hand, would have qualified as a participant for any these programs. Margarita has been teaching for over 25 years in K-12 and university settings. Twenty years ago she was part of a group of teachers who established the first bilingual charter middle school in California. A central tenet of the school was cultural empowerment. Although the school served 99% Latino youth from an inner-city, the vast majority of teachers were white, monolingual, and from socio-economically advantaged backgrounds. As part of a college of educational faculty at the
present time, Margarita now finds herself as part of several projects focused on CLD students in which she is the only minority faculty involved.

Cultural empowerment can be defined by Freeman and Cohen (2001) as the following and describe the process in detail:

the procedures through which a group of people develop a belief system in their capabilities—that is, their ability to achieve. Individuals who are culturally empowered first and foremost understand the importance of history and heritage of their culture. Next, they take pride in those contributions made by ordinary individuals as well as individuals of their culture who have made significant accomplishments. Being culturally empowered creates a sense of psychological well-being that enables individuals to take pride in their culture, clearly understanding that there are varying views and actions among individuals who make up the cultural group. Being culturally empowered is enormously important, particularly for groups who are underrepresented in a society (i.e., smaller populations), because not to feel empowered culturally can create feelings of inferiority, hopelessness and despair, entrapment, and disenchantment among members of the group (p. 587)

Although cultural empowerment is most often used in African American communities, there are implications for other represented communities. The most direct way in which the process of cultural empowerment to occur is through education (Freeman & Cohen, 2001).

Related to the concept of cultural empowerment is the idea of culturally relevant pedagogy. The importance of culturally relevant pedagogy in education is a topic long discussed by educators who work with underserved and marginalized groups. It is projected that by the year 2050 minorities will constitute around 54% of the population in the U.S, yet the histories of people from historically underrepresented groups are consistently left out of many mainstream curriculums (Edmin, 2016). By teaching students from underrepresented backgrounds about their own culture and histories we can help to cultivate a society founded on principles of, “Social justice…crucial to the
long term survival of participatory democracy,” (Osborne, 1996). Statistically, students are more likely to be engaged in classroom content and perform higher academically when they are presented with material they can relate to (Edmin, 2016). For instance, when Latino high school students in Tucson, Arizona were presented with a new cultural studies program that touched on the histories and cultural relevance of Mesoamerican groups like the Olmec, Aztec, and Maya, test scores and graduation rates dramatically increased as students were engaged with the lessons being taught in class, and excited to pursue their studies (Romero, 2008).

Furthermore, students who are not exposed to curriculum content that they can relate to may interpret the omission of their histories to mean that their cultures or traditions are not as important as the traditional Anglo-Saxon histories included in mainstream curriculums. For instance, by omitting the cultural relevance of Native American history in curriculums, not only might Native students interpret this to mean that their traditions and ancestors were not important, but it denies students from mainstream backgrounds the opportunity to, “deepen their knowledge,” of cultural groups other than their own (Milner, 2010). The inclusion of culturally relevant pedagogy in curriculums allows for students to develop their critical thinking skills and, “Challenge the status quo of the existing order,” leading students to feel important, and empowered in the classroom (Osborne, 1996).

In this paper and presentation, Melody and Margarita share their experiences in their various educational settings using testimonios. According to Delgado Bernal, Burciaga, & Flores Carmona (2012), testimonio is a methodological tool that “incorporates political, social, historical, and cultural histories that accompany one’s life
experiences as a means to bring about change through consciousness-raising (p. 364). It goes beyond oral history or autobiography. The explicit goal of testimonios is to elicit social change. Benmayor, Torruellas, & Juarbe (1997) emphasize that testimonios link “the spoken word to social action and privileges the oral narrative of personal experience as a source of knowledge, empowerment, and political strategy for claiming rights and bringing about social change” (p. 153).

Data collection and analysis took place simultaneously and was a collaborative process using grounded theory methods (Corbin & Strauss, 2015). We met six times to write and analyze our testimonios. As we wrote our testimonios, we identified areas of focus. These included (1) understanding how we view our roles as educators, (2) describing how our own educational experiences have shaped our roles as educators, (3) identifying challenges faced in our various educational contexts, (4) identifying strategies for addressing those challenges, (5) how we have been mentored and how we mentor others, and (6) future goals. After writing, we coded our testimonios using open coding (Saldana, 2013), then placed codes in categories, meeting to discuss and continue with analysis.

Preliminary analysis of our testimonios suggest that our own educational experiences have influenced how we engage professionally and personally. One consistent strand is the pull between developing and growing within the culture in which we were raised and negotiating the cultural capital (Bourdieu, 1987) valued within mainstream society. In examining the themes that arose, we found Yosso’s (2005) concept of community wealth helpful for understanding and discussing our experiences. Community cultural wealth identifies six types of capital that students possess:
aspirational, linguistic, familial, social, navigational, and resistant (Yosso, 2005). For example, we discuss the challenge of straddling our culture at home and the cultures of the various institutions in which we work using Yosso’s concepts of social and navigational capital. Our work as activists is grounded deeply in the resistant capital we possess, much of which we have acquired through valuable mentoring. Furthermore, we have often found ourselves as the sole minority teacher in settings that serve minority youth. This has made us feel the pressure to speak up and question pedagogical and curricular choices. In one instance, Melody raised questions about using African-American literature to empower Latino youth and was told, “as long as you teach one minority group’s story, you’re good.” Other themes that emerged from the data will be further discussed in the presentation and forthcoming paper.

Our testimonios are discussed in the context of community cultural wealth. Community cultural wealth identifies six types of capital, or resources, that students possess: aspirational, linguistic, familial, social, navigational, and resistant (Yosso, 2005). Community cultural wealth values the cultural knowledge, abilities, skills, and contacts that individuals in socially marginalized individuals possess. This is in contrast to the deficit view often applied to these individuals. Figure 1 displays the various components of Community Cultural Wealth.

Figure 1. Community Cultural Wealth Components
Findings and Discussion

A number of important themes emerged from our testimonios and will be shared and discussed below. A more complete set of findings and further discussion will be shared at the HICE 2017 conference presentation.

Our Roles As Educators: Privilege, Impact, and State of Mind

When examining how we understand and view our roles as educators, three themes emerged 1) our acknowledgement that we have been privileged in our own education, 2) impact as a personal and professional goal, and 3) seeing our roles as a state of mind.

As first generation college students, both Melody and Margarita stated that they acknowledged that their opportunity to go to college was a privilege not afforded to many of their peers from their neighborhood. Furthermore, Melody discussed how her
participation in a research-intensive university impacts her approach to being an educator.

As an educator, I first have to acknowledge that it is a privilege to be able to attend a large research university, and access the information and opportunities that are at my disposal as a result. I view being an educator as a two part methodological approach. As a self-identifying member of the subaltern, I find it my responsibility to go back and share the knowledge that I’ve acquired in professional settings with members of my community that may not have access to the same educational resources. However, I find it just as important to educate members outside of my community and outside of the subaltern by bringing awareness to issues marginalized people and underserved communities face by starting discussions, posing questions, and documenting narratives that bring about consciousness raising for the purpose of collective economic, social, and political growth.

Margarita talked about the responsibility to being afforded the privilege of having attended Harvard’s Graduate School of Education.

I applied to seven graduate programs and was accepted to six. When I received the acceptance to Harvard, I felt very honored and privileged to be given this opportunity but also a great sense of responsibility. Nobody from my high school had ever attended an ivy league institution. As far as I knew, no one at the college where I graduated had ever gone on to Harvard. As the only Latina in my graduating class in high school and one of only a handful of Latinas in my graduating class in college, I felt like this was an opportunity that I could not pass up - both for myself and as a Latina representing my cultural community.

Both Melody and Margarita repeatedly used the word “impact” to describe how they saw their roles as educators. Melody described the importance of developing cultural empowerment in regard to impact as follows:

Elementary and middle school students are still at a point in their education where the mentors in their lives can have positive impacts on how they see themselves and navigate the world around them. By sharing stories and literature they can relate to and exposing them to their culture and history in curriculums, educators can empower students to achieve their goals and take pride in their
cultural histories. They can create lasting impacts that extend far beyond the facts and figures students memorize in the classroom.

Margarita described her reasons for being part of a group of teachers that started a charter middle school with a focus on cultural empowerment in this manner:

For many of the middle-school students in the community, I was the first teacher they had seen who shared their language and culture. We wanted to impact these students beyond their three years in the middle school. By helping them become culturally empowered through education, we were not only impacting individual students, but also their siblings, their parents, and the community.

Furthermore, another interesting theme that emerged was that the role of being an educator is not simply a job, but rather, a state of mind. Melody comments:

I’ve heard far too many teachers in my time say things like, “It’s not my job to be liked. I’m there to provide information, it’s up to the students to listen to me.” Ultimately, being an educator is not some 8-5 job, and tutoring is not some part time gig someone picks up on their down time. Being an educator is a way of life, it is the way you see and interact with the world. It means seeing a student struggle with a specific problem and trying to get at the root of what they don’t understand rather than blaming the student’s intellectual ability. It is being a mentor to peers that want to give up mid way through college because they feel defeated. It’s sharing theories and complex thoughts with those around you, and life experiences and understanding and love.”

Margarita feels similarly:

Throughout my 25 years of teaching, I have been accused by white administrators and peers of being too much of a mother to my students. It’s true, I worry about and advocate for my students 24/7. I can’t - won’t - turn off my role as a teacher when I leave the classroom. When students accidentally called my mom, it always made me smile. I think that’s why it hurts so much when issues related to bilingualism are dismissed - this isn’t about the latest buzz words or funding sources for me. What I do is who I am.

Paying It Forward: Examining Our Own Educational Experiences
When sharing past educational experiences, both Melody and Margarita shared their lack of mentors and how they are both committed to “paying it forward” by mentoring others. Melody notes:

As a Latina, I’ve always found it difficult to find role models who looked like me and had similar experiences. Even in college it seems I’m only ever exposed to male professors of color, or white female professors—but I’ve yet to have a Latina professor (even in courses specifically about Mesoamerican and Latin American culture). In high school, I had a similar difficulty finding mentors and administrators I could look up to. Most of my high school counselors left after a year or two of working there—always using our high school as a springboard for some better educational opportunity. We were temporary. Transitional in their quest for something better paying and permanent. In order to look up to mentors, students must first be able to trust them. A very difficult endeavor in my school district knowing that our superintendent stole money from the school district and fled to Africa, and that our high school’s principal was accused of molesting multiple girls on the volleyball team. The biggest part of the issue was that half the time, I didn’t know what I did not know. As a result, it was always really difficult to ask questions even when there was a mentor around.

Melody approaches mentoring in the following way:

More than providing important knowledge, I’ve come to realize that in an American society where political figures like Donald Trump constantly belittle Hispanics, and film and the media still lag behind empowering representations of minorities, one of the most important things I can do as a mentor is make sure my students know their potential. A lot of my students will be first-generation college goers with parents that don’t really know how to navigate the college admissions process. As a mentor, I help my students realize that college is attainable for them, and that their voices and contributions to our society are relevant and beautiful. Knowing that administrators, campus security, and a lot of teachers tend to be interrogational, condescending, and dictatorial on inner city campuses, some of the most powerful things I can show my students is kindness, respect, and trust. I aim to show them that there is someone out there who will listen to their opinions, who cares about how they feel on certain issues, who shows them the importance of their own voice.

Margarita also described her experience lacking mentors but has found ways to create a “patchwork” of mentoring for herself.
In middle and high school, I never had a Latina/o teachers. I actually became a Teacher in large part because I felt like no teacher had never understood my struggles learning English. In college, I also didn’t have any professors who were Latina/o, not even my Spanish teachers. Through the years, I have created a patchwork of mentors who I go to for specific advice. One of my Latina colleagues is who I go to about balancing being a mom with helping with my parents and sandwiching my career in-between. I have a white colleague that I go to for advice about building in writing time into my hectic schedule. I have an African-American colleague that I go to when I need to discuss the micro-aggressions that are all too common in my workplace.

Margarita runs several mentoring programs in part due to her own lack of mentoring:

I meet with new professors regularly to support them in their teaching, service, and scholarship. Especially for those who are mom, who are from minority groups, who are first generation themselves trying to navigate through the world of academic -- I make myself available 24/7, on weekends, over breaks. Sometimes they just need someone to listen and sometime I can provide professional advice. I currently run a writing group for non-tenure faculty who are not supported at our college in terms of their scholarship. I run another group for Latina scholars who want support as they try to raise their children as Spanish/English bilinguals. For students, I run a Spanish club for students like myself who grew up speaking Spanish but need to develop their academic Spanish.

“People Will Always Tell You Can’t. Smile and say ‘Watch Me’”: Challenges Faced and Overcome

One of the most common themes throughout the prompts was that of challenges faced. Numerous times, strategies for overcoming those challenges were also shared.

Melody described “disconnects” as one of the challenges:

Both with my work at JEP (the Joint Educational Project) during the school year, and Freedom School during the summer, I’ve had to work in settings where the majority of employees/interns are from dominant (middle class/Caucasian) backgrounds working with students from lower middle class, Latino backgrounds. They constantly spoke about how to refer to the students in a “politically correct” way and reinforced a “color blind” mentality to the student’s education. The notion here is that lower middle class Latinos can achieve just as much as middle class whites because they are “no less capable.” As progressive as this seems, it reminds me of the “myth of meritocracy” where the implication is that hardworking students of any background can achieve their goals if they are intelligent enough and hard working. The problem with this “myth” is that it does not recognize a lot of the systematic oppression
minorities still go through in society regardless. Studies have shown that even if a Latino has the same educational background and opportunities available to them as a Caucasian candidate/employee, they still tend to be paid less and face workplace discrimination.

There is a constant push to treat our JEP and Freedom School students the same way one would treat Caucasian students, but no push to teach our Latino students about their own culture or history. In sum, this problem stems from a disconnect between the school administrators, the teachers/interns, and the students themselves. At Freedom school, the mentality was that “As long as you teach one minority’s story, you’re good.” During my time at Freedom School, I began to stray away from the required reading list, incorporating some of my own books from home into lesson plans. Each of these books dealt with complex issues that were relevant to the background of my Chicano students. Instantly, I could see that they would get excited at the site of Spanglish sentences (especially when I pronounced the words correctly) and pictures of flautas and sopes on the pages of my poetry books. One of my students pointed to the cover of my copy of, “How Tia Lupe Came to Visit/Stay,” and said, “Hey, I have a Tia Lupe too! And she kind of looks like that too.”

Margarita described her recent work with preservice teachers who are seeking elementary education certification with an endorsement in bilingual education or in English as a second language. She views her role in that work as one of culturally empowering future teachers in this group, many of whom are first generation college students and come from culturally and ethnically diverse backgrounds.

I see such a disconnect between the students I have in this program and those in The regular elementary education program. Many of my students want to serve in Title 1 schools that are highly diverse. They want to be role models for their students and work with the families by helping them navigate the educational system. They want to help them overcome language barriers that exist. But that program keeps shrinking in part due to the disconnect that exists between administration and the those students. Our program requires a full school year of student teaching and that is a serious hardship especially for my students. I had to balance student teaching and working nights but only had to do so for one semester. I am not sure I could have done it for a year. They have to balance the responsibilities they have with their families and those at school. For my students that come from border communities, this is especially challenging. They feel the pressure to keep going home. And some professors make them feel bad about going home. I try to help them balance the many role in their lives. I want them to see their families as a strength and not a deficit. They have community wealth that they need to tap to help them be successful.
Looking Ahead

Both Melody and Margarita spoke extensively about future plans. Melody was recently accepted for a study abroad program and wants to pursue graduate degrees.

Moving forward, I’m really looking forward to comparing the education system in America to New Zealand when I study abroad in the Spring of 2017. Specifically, I’d like to take a look at how they incorporate indigenous studies (Maori culture and pedagogy) into their curriculums. I’d like to pursue a Masters degree in Education in the near future and hopefully go into educational administration after working in the classroom for a few years. My role as an educator is constantly in flux, molding and catering to the most pressing needs of my community whether it be through activism, constructing narratives, mentoring the youth, or teaching in traditional academic settings. Being an “educator” is not merely a job title or something someone does across one summer, it is a state of mind and a way of life.

Margarita is in the process of applying for new academic positions.

I have put myself on the market for a new position. I would like to have more of a role in designing academic programs. I want cultural empowerment to be considered as we design curriculum. I want to work with populations that I can mentor through the system. My present institution doesn’t use words like social justice, addressing the needs of first generation students seems to be done Out of pity, not from perspective of community cultural wealth.

Our testimonios addressed each of Yosso’s (2005) types of community cultural wealth: aspirational, linguistic, familial, social, navigational, and resistant. In sharing their own stories, we see how each of these areas has played out in their roles as educators who seek to culturally empower their students.

Conclusion

There are a number of implications for various policy areas as well as teacher educators, community activists, and other key stakeholders in the education of Latino/a
youth. For example, recruitment and retention of culturally and linguistically diverse educators needs to be addressed from multiple parties. As stated previously, the goal of testimonios is to bring about social change. By critically analyzing our own experiences, we hope to address the achievement gap that still exists for many of our community members through the concept of empowerment. The concept of cultural empowerment holds promise, but it begins with us as educators feeling culturally empowered to speak up when we may be the only voices who share linguistic, ethnic, and socio-economic backgrounds with the students we serve from a community cultural wealth perspective.

Paper presented at the 15th Annual Hawaii International Conference on Education (HICE),
Honolulu, HI
January, 2017
Abstract

This paper/presentation addresses one small segment of a larger and more complex technology / privacy issue in the counseling profession – the use of electronic (mental) health records (eMHRs) in the counseling profession and preparing future counselors to use them. The counseling profession now faces a challenging balance: How can the counseling profession remain on the cutting edge of technology while still protecting clients’ privacy? And, how can counselor educators prepare new counselors to fully understand this balance of privacy and technology in their day-to-day practice when technology is so common place that it is often overlooked? This discussion paper is based on a review of the literature about electronic health records, and nearly three decades experience as a professional counselor and counselor educator. This conceptual paper discusses important aspects of transitioning to eMHRs and raises potential questions for counselors and counselor educators to consider in this process and into the future.

Keywords: technology, counseling, recordkeeping
Introduction

The age of digital information continues to shape the counseling profession in all aspects from how counselors recruit and contact clients (American Counseling Association [ACA], 2014); to on-line and technology-assisted treatment options (e.g., Aguilera & Munoz, 2011 as cited in Lawley, 2012); to recordkeeping and reimbursement procedures (e.g., Wilkinson & Reinhart, 2015). This paper addresses one small segment of this large and complex technology / privacy issue in counseling – the use of electronic (mental) health records (eMHRs) in the counseling field and preparing future counselors to use them. This conceptual paper discusses important aspects of transitioning to eMHRs and raises potential questions for counselors and counselor educators to consider in this process: How can counselor educators prepare new counselors to fully understand the balance of privacy and technology in their day-to-day practice?

Nearly all counseling internship sites now use some form of electronic mental health records (eMHRs) for scheduling clients, documenting case notes, and/or documenting supervision. After graduation, new counselors are further expected to use and fully understand the impact of technology on counseling and client privacy as most clinical practice sites now use eMHRs for billing and reimbursement. Acknowledging the digitalization of the counseling profession can be seen in Federal and state guidelines like the Health Insurance Portability and Accountability Act (HIPAA), the Health Information Technology for Economic and Clinical Health (HITECH) Act, and state laws such as Texas House Bill 300 (HB 300; HIPAA, 2009; HITECH, 2013; Browning, 2011). Now 20 years post-HIPAA and eight years post-HITECH, the counseling profession still struggles to address the potential impact technology is having on the counseling profession (e.g., Hill, 2013; many common ethical violations involve privacy and
technology-related issues). Unfortunately, there a gap between the training that counseling students receive about recordkeeping and technology in the counseling field and what is expected of these same counseling students in their internship sites and in their post-degree clinical experiences.

So, why has the profession of counselor education failed to robustly address the need to prepare students to meet these technology expectations? While little empirical research exists to specifically address this issue within the counselor education field, similar experiences in other helping professions can inform the process of implementing and embracing technology in the counseling profession. There is now extensive research in the medical profession (including psychiatry) about the use of electronic health records and digital records systems and this body of research may provide important insights for the counseling profession (e.g., Palma, 2013; Tsai & Bond, 2008; Madden, Lakoma, Lu, & Soumerai, 2016).

Counseling culture – is it anti-technology or just slow to adapt?

It might be helpful to look at some aspects of the culture of the counseling profession and consider how this counseling mind-set might be positively and negatively influencing the advance of technology. For example: How are counselors trained compared to other clinical practitioners? How might this information inform the acceptance and implementation of technology in the counseling profession? What might the counselor education training process say about how counselors are trained? As a group, perhaps counselors are not as interested in technology as other professions? Perhaps the very desire to work closely with individuals in the therapeutic milieu makes counselors less likely to desire or appreciate the unique benefits of technology in the workforce? How might this “counselor identity” or mind-set influence the culture of the counseling profession? Or, perhaps counselors prefer human interaction over
 While we may never fully know the answer to these questions, it might be helpful to consider each of these questions in better understanding why the profession of counselor education has not robustly addressed the need to prepare counseling students to embrace technology more forcefully because the inclusion of technology without forethought and planning opens the door to haphazard implementation.

An examination of several aspects of the counseling culture or counselor identity may shed light on the possible impact these might have on technology within the profession: (1) Counselor education as separate sub-profession; (2) diversity within the counseling profession; (3) counselor-training emphasis; and (4) funding within the counseling profession.

(1) Counselor education as separate sub-profession

There are many pathways to education and licensure in the helping professions (e.g., counseling, social work, psychology, marriage and family therapy), but in many states counseling has dominated at the master’s level in the last decade (see state licensure websites for details). While most counselors practice at the master’s level, the profession of counselor education is accredited only at the doctoral level (the Council for Accreditation of Counseling and Related Educational Programs [CACREP], 2016). Counseling is the only helping profession which considers (counselor) educators as a distinct sub-profession rather than merely an extension of the (counseling) profession. The profession of marriage and family therapy similarly accredits educators at the doctoral level (see AAMFT.org for additional detail), but doctoral level marriage and family therapists do not hold the title of “educator” within the profession as counselors do. In comparison, the field of social work credentials at the doctoral level, but still allows master’s level professionals to train and educate social work students (see NASW.org for more detail). The field of counselor education has a separate code of ethics,
separate professional affiliations, separate professional journals, etc. Perhaps this is due to the unique development of the counseling profession having come from the profession of education and guidance? It may be helpful to consider how this history may be impacting the profession today. While there are differences between master’s level and doctoral level training in counseling, the differences may not be as great now as in previous decades with a growing number of students going straight through master’s and doctoral level training (e.g., ACA.org). However, this growing trend may be creating other unknown challenges within the counseling profession. What might this indicate regarding a unique mind-set in counseling and counselor education?

Even with training standards documented at two differing educational levels, the profession of counseling does not mandate counselor educators to remain active in clinical practice skills or seek clinical licensure (CACREP, 2016). While clinical licensure for counselor educators is certainly desired, it is not mandated of all counselor educators, and similarly there is no mandate in CACREP for counselor educators to maintain practice skills. Could this lend to an increased likelihood that counselor educators are not as current on changing needs or expectations in the counseling field as they could/should be?

(2) Diversity within the counseling profession

The counseling profession is often described as an inclusive profession – welcoming students from a variety of undergraduate training programs and backgrounds (e.g., psychology, social sciences, and even professions such as business and military). Training students with such diverse educational backgrounds is challenging for any profession and the length of counselor training programs (now generally 60 graduate credits; CACREP, 2014) makes this even more challenging. This diversity within the counseling profession is even more complicated because
of the wide variability of potential counseling settings and expectations – counselor educators must maintain a wide scope of training to ensure counselors are well-rounded and ready to practice as generalists within a variety of settings in the helping field. Today, counselors are placed everywhere from elementary schools to prisons to nursing homes. Perhaps the lack of specificity in focus has hurt the flexibility of the counseling profession? The responsibility to train broad-generalists to independently treat cradle-to-grave mental health issues is a very heavy burden on any profession.

On a positive note, inclusiveness translates into a very diverse group of professionals within the counseling profession – hopefully able to address issues and challenges from multiple perspectives. However, at a policy-making level, this diversity may make it more challenging for the profession to agree to potentially needed cultural changes such as advances in the ethical code or training practices to address technology needs/changes. For example, the most recent revision of the American Counseling Association’s (ACA) ethical code included an entire new sub-section devoted to the use of technology in counseling (Section H: Distance Counseling, Technology, and Social Media, ACA, 2014); however this addition was primarily focused on the delivery of counseling services through technology and failed to adequately address technology in each of the sub-sections of the ethical code (e.g., B.6. Records and documentation – which still generally assumes the profession is using paper records). Additionally, the counseling profession’s premiere accrediting body, CACREP, made only a minimal attempt to address the need for technology-driven curriculum in counselor education programs in their most recent revision of accreditation standards (e.g., Standards F.1.j., F.5.d., and F.5.e.; CACREP, 2016).

(3) Counselor-training emphasis

On an entirely different issue, in general clinical documentation including case notes has
not been a priority in many counselor education programs (evidenced by the lack of emphasis on recordkeeping in popular counselor education textbooks and the limited focus on recordkeeping within accreditation standards). Unlike social work training programs which can focus on administrative responsibilities, counselor education programs emphasize licensure preparation or intervention skills and de-emphasize administrative duties such as recordkeeping (CACREP, 2016). Perhaps the lack of emphasis on technology in counseling recordkeeping is merely a result of this more narrowed focus on intervention skill-building? If clinical case documentation was of greater importance in counselor-education programs, this would be reflected more in the CACREP standards and in sample course syllabi for core courses such as practicum and internship.

(4) Funding within the counseling profession

Finally, the profession of counselor education is not as well-financed as many other helping professions. Has a lack of money kept counselor education from smoothly moving into the digital world? Other helping professions (such as social work or psychology) have historically had a stronger connection to government policies and institutions and therefore more access to lobbying and federal grant opportunities. In general, counseling is not a well-researched profession because there is limited opportunity to monetize the counseling process. Many who access counseling or mental health services in community-based agencies do so without insurance reimbursement and those who access counseling services within governmental agencies may not require payment or billing services (e.g., the Veteran’s Administration, or the prison system – two of the largest mental providers in the country). Overall, there are no deep-pockets with interests in counseling and therefore modernizing the counselor education
profession has also been slow. Because of this, there are often limited grant funds available to counselor educators to help modernize or update counselor training programs.

Why transition to eMHRs?

One might ask, if there is a sluggishness to embrace eMHRs in the counseling profession and no funding to support this change, why even bother to make this technological leap? Or, more aptly stated, why transition to eMHRs? While some states are requiring this type of transition (e.g., Minnesota; Lawley, 2014), most states are not currently interested in mandating this process. How should a specific agency or counseling clinic make a decision about the choice to move to digitizing counseling records? The answer to this question can be informed by the literature about digitalizing health records in the medical profession over the last two decades. Four major selling-points have come from the body of research available on digitizing health record including: (1) cost savings, (2) advances in safety or quality; (3) increased access to records; and (4) increased research opportunities.

(1) Savings

First, the move to electronic health records was driven primarily by a desire for cost savings (e.g., Quality Technology Services [QTS], 2013; Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016). Many of the potential cost benefits sought by digitizing (health) records would be comparable with the introduction of eMHRs in the counseling/mental health profession. The use of digital records reduces the cost of physical labor to file, move, and store charts; reduces the need for record storage space; and decreases the number of lost or misfiled records (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016) - all potential benefits that would easily transfer to counseling records. Space is often at a premium in counseling practice offices or community-
based counseling agencies, and reducing the need for personnel to handle records clearly saves money.

(2) Safety or quality advances

The use of a digital record system also allows for electronic, in-house referrals and contact between providers, allows for electronic prompts and reminders for contact (which can improve prevention and early intervention), and allows records to be quickly reviewed and co-signed (digitally) by a supervisor/licensed provider (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016). Again, all of these are potential benefits for counselor education programs and counseling agencies where supervision needs to be documented. For example, this would allow for faculty supervisors to access records of their counselors-in-training perhaps from their offices or elsewhere on campus, as well as field-placement site supervisors to access records from their offices which may not be physically collocated where the counseling occurs.

(3) Access to records

Digitizing records has been shown to improve accessibility to records – without a physical record or chart, important data can available at all times and at multiple locations (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016). In counseling, this would be helpful for managing client data across multiple sites (e.g., county mental health agencies in rural areas).

(4) Research opportunities

Finally, the opportunity to improve research in the field can also be seen as a potential benefit of eMHRs (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016 discuss this phenomenon regarding medical records). Even simple digitization of counseling records can create informative data about client demographics, the number of sessions required for differing presenting problems, client no-show rates, and a host of other issues that could save clinician
time and agency monies. As described, the profession of counseling lacks adequate research funding so any ability to document and track data trends could make it easier to implement changes in staffing and intervention to improve measurable outcomes in the field. However, before eMHR data can be used for any secondary purpose such as research, informed consent must be considered. Counseling clients should ethically have the option to opt-out of research using their data without losing the opportunity for counseling services.

Over the last couple of decades, clinical recordkeeping quickly went from hand-written notes to typed notes, then computerized notes, and now case management systems or eMHR systems. Based simply on potential cost savings, counseling will continue to move towards wide-spread use of eMHRs and therefore counseling students and practitioners will require more and more training in this area to adequately address this changing and developing need in the profession. While change is constant, it is sometimes overlooked when those changes which seem a part of daily life or normal progression. In some ways, technology has become so infused in everyday life, that without considerable thought, it is challenging to fully understand how technology has changed nearly everything counselors do. This is especially true in the area of clinical recordkeeping and the potential impact digitalization has on counseling and client privacy (Wilkinson & Reinhart, 2015).

Lessons Learned

Unfortunately, very little empirical research is available to fully describe the increase in eMHRs and how this has affected the profession of counseling to date. There have been multiple large studies documenting the process of instituting electronic health records (including one study of more than 5,000 records [Madden, Lakoma, Lu, & Soumerai, 2016]). Based on this body of research, in some ways digitizing health records lived up to expectations and promises
made, but in other ways the process of digitizing health records has failed to meet expectations e.g., (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016; QTS, 2013).

(1) Savings

Research is clear that there has been a cost savings in lowered labor and storage costs associated with digital charting systems (Palma, 2013; QTS, 2013). Tsai and Bond (2008) conducted a small study involving less than 200 client records of mental health care. Tsai and Bond reported that “documentation in electronic records was found to be significantly more complete and faster to retrieve than paper records” (2008, p. 138). However, this must be counter-balanced with significant increased costs associated with starting a new digital record system (purchasing, implementing, maintaining, and training employees to use digital record systems; [Palma, 2013]).

Overall the body of research regarding the digitization of health records is very positive regarding cost savings. While this medical record research may be helpful in informing the digitization of mental health records, it still should be examined closely before making assuming transferability to the counseling profession or potential cost savings for any specific counseling agency. For example, a quick digital search will reveal that much of the research documenting the positives aspects of taking recordkeeping digital are supported or funded by companies that sell digital recordkeeping systems or similar support (e.g., QTS, 2013). This could create a hidden conflict of interest that could easily be overlooked. Additionally, other “hidden” costs may outweigh potential cost savings. For example, Palma (2013) found that there was a 25-33% drop in initial productivity when instituting a digital recordkeeping system and that this significant decline in productivity might continue beyond initial training and if the system is not used regularly or if digital recordkeeping is considered an “added” duty. This loss of
productivity can be even greater when clinicians are required to enter data that is not related to their counseling work or using systems that are not intuitive or cumbersome.

Finally, despite the promise of potential cost savings, some aspects of recordkeeping may not be well-suited to the digital format. For example, a treatment plan or process that requires multiple updates (e.g., documenting each phone call attempt or email sent) may require duplicative and repetitive digital entry motions. All digital entry can be much more time consuming in a system that requires logging on, waiting for an encrypted system to open. Also, on-line systems may be slow when there are multiple users accessing one database. The process of converting paper documents or signatures to a digital footprint can also lead to unique challenges as some reimbursement processes mandate a hard-copy original signature thus requiring two storage processes (Palma, 2013). Additionally, digital notes may actually increase practitioner workload as hand-written notes tend to be briefer than typed notes and if the system used for documenting the note is time consuming (logging in, etc. as described above), this may lead to a greater time lag between the time of the service and when the note is entered – which has long been known to decrease accuracy of notes (Palma, 2013).

(2) Safety or quality advances

The jury is still out regarding potential improvements to patient/client care created by implementing electronic records. While digital records may allow the recordkeeping system to prompt prevention and follow-up appointments, this may not be as helpful in mental health as it is in medical care where multiple providers treat one patient. Palma (2013) warned that any digital recordkeeping system is only as good as the thought and planning that went into its original design and the quality and responsiveness of the tech support after implementation. While one might assume that larger case management or digital recordkeeping systems (such as
those used by state or federal agencies) are beyond reproach in terms of design and support, this may not be the case. For example, one national eMHR system currently being used to serve the mental health record needs of a population of more than one-half million was not even designed for counseling records. Additionally, while some case management systems may have been designed to meet national HIPAA and HITECH requirements, but they may not have taken in to account state laws in this area which can be more stringent (e.g., Minnesota law, and Texas HB 300). Finally, the institutionalization of checklists and “copy-and-paste” cheat sheets, thought to make digital records more accurate and useful, have actually been proven to decrease the accuracy of individual records (Morrison, 2016).

(3) Access to records

According to the research done on electronic health records, there are typically fewer lost or inaccessible records when using a digital recordkeeping system, but the risk remains in some systems to save records to a “wrong” system making them unlikely to ever be found (Palma, 2013; Madden, Lakoma, Lu, & Soumerai, 2016). In the mental health profession, this would open the potential for HIPAA and HITECH violations.

As mentioned above, despite the fact that large governmental agencies have adequate funding to create and maintain digital counseling record systems, they can easily fail to do so because counseling is not generally considered a core competency but rather a secondary or supporting service thus tech support for these systems can be in adequate or lacking. In the example described of a digital record keeping system currently being used to serve the mental health record needs of a population of more than one-half million, there are significant access issues - for example, allowing clinicians at multiple sites to access records for clients they are not currently serving.
(4) Research opportunities

The jury is also still out regarding the potential benefit of digital records to inform research and improve interventions (Palma, 2013). In trying to apply research opportunities to the counseling profession, one might consider the strict privacy regulations that require informed consent for use of most counseling records - even descriptive data (HIPAA, 2009; HITECH, 2013). Counseling records, even more so than similar health data, can contain information that if published could cause shame and embarrassment to clients as well as potential negative life consequences (e.g., loss of relationships, loss of jobs, income, or prestige). Privacy of counseling records is essential to the very process that allows therapy and growth to occur. There is a potential to misuse newly acquired digital counseling data without properly considering the potential ramifications of doing so. For example, even when client data is aggregated to protect clients’ rights to privacy, clients may not have opted to seek services if they fully understood that any data would be used for research.

Finally, an area not widely discussed in the literature of digitizing health records is the potential for ethical dilemmas to arise and the need to better train practitioners to address these potential problems more effectively. Any change in counseling recordkeeping not only brings the potential for HITECH violations (and similar state regulations) but this kind of change also brings up a plethora of informed consent issues. In counseling and other mental health fields, it is assumed that the practitioner is responsible for the safety of the record (see extensive notes on this topic on APA.org). But how can counselors fully be responsible for the safety of a client’s record if they do not fully understand how it is being stored or how this process makes it vulnerable. Over time, this would likely lead to unknowing violations of HITECH-type regulations or a shift in what counselors document (in an effort to make records safer). But in a
system using checklists or required fill-in-the-box systems, counselors don’t have as many choices as they might think.

What does this mean for counselor and counselor educators?

Whatever the reason, culture, fear, or lack of funding, there remains a growing need to train future counselors to better understand the impact of technology and digital mental health records on counseling and client privacy. The counseling profession needs to better train future clinicians to be ready and prepared to use electronic health (and mental health) records upon graduation (Wilkinson & Reinhart, 2015). However, before this topic can be adequately addressed across the counseling profession, counselors and counselor educators must fully consider what is potentially gained and lost by digitizing counseling records. As described, the counseling profession is quite varied and diverse; therefore, not all counseling organizations will benefit from the same path to implementing digital counseling records. The following questions may be helpful in identifying some of the issues that need to be considered in this very complex process.

What is the desired outcome for digitizing counseling records in this specific counseling agency/working with this agency’s population?

What is the benefit of pursuing this technology now?

What portion of records will be digitized? If not all portions of records will be digitized, will this change continue to require storage of paper files/records?

If all portions of a record will be digitized, how will client signatures be addressed? How might this process need to be scrutinized by legal (for example, to ensure viability of reimbursement later)?

How will data be encrypted and how will security of records be ensured?

How will digitizing records specifically benefit the clients served by this agency?

What does the research suggest about similar (health) records in a comparable system?
Will check-lists or forms be instituted/allowed in the digital records? Will there be portions that are required to fill/complete (e.g., DSM diagnosis, etc.)?

Will providers be able to copy and paste from eMHRs to other documents (such as writing treatment summaries)? If so, what additional security issues might this create?

Will providers be able to cut-and-paste from other sources or documents or will they need to create a unique entry?

How will client assessment results be documented?

Will there be a process to include other “scanned” documents such as client art work?

How will informed consent need to be updated to ensure clients are fully informed the digitalization of their records?

What other legal liability issues may come up with the digitization of records?

How will records be shared when a copy of a record is requested?

Will printing from records be possible? What added privacy issues or HITECH issues will this involve? (Lawley, 2012).

Are there any issues related to vulnerable populations and a greater sensitivity to protect their rights/privacy that need to be considered?

How might a digital record be more or less likely to lead to unintended disclosure of client information?

What resistance might there be within this system to moving to a digital platform for records? (resistance to change, resistance to technology, loss of administrative support jobs, etc.)

What specific costs are associated with this kind of technology change? (added hardware and software, support, cloud storage, etc.). For example, wiring may need to be upgraded and added digital storage space may be needed.

How will access to records be structured?

Will multiple clinicians be able to access the same record? Concurrently or consecutively? In less complex recordkeeping systems (e.g., glorified data bases) it may not be possible to determine who accessed or changed a record as easily as in a system specifically designed for multiple users or systems designed to track a digital footprint.

Who will be responsible for the process of researching available technology and support systems? Which system meets this agency’s specific needs best? How can this be
determined? Will the system be adjustable to meet the changing needs of this agency? (think about how many times paperwork has changed to address differing needs in the counseling profession).

Who will be responsible for preparing and training staff regarding this endeavor? Even if a recordkeeping system is dictated by outside sources such as an institutional or headquarters element, the providers and staff in each office will need to be trained and each location will need personnel to serve as a point-of-contact with expertise on the new system.

Who will be responsible for updates and support issues after moving to a technology-based recordkeeping system? This adds a differing skill requirement to supervisory and management duties.

How will these added costs be funded moving forward? (For example, at a university training facility, the recordkeeping system purchased was nearly $10,000 initially but required nearly $2,000 a year in perpetuity for upgrades and maintenance).

In light of the reliance on tech support, what must counselors do differently to mount an adequate defense against possible malpractice in the event of a data breach? (For example, in some states such as Texas, admin and tech support staff must be trained annually on privacy laws). Agencies must be careful to choose tech and support companies who can change and grow with their agency needs and who are likely to be in business over time to support their products.

Who will be responsible for destroying digital records? How can one be assured there isn’t a digital footprint left behind even after a digital record has been destroyed?

Counselor education and training facilities may need to ask additional questions such as:

Is there a need to implement eMHRs in counselor training facilities that do not use third-party billing? (e.g., some states are moving towards requiring digital records in counseling; Huggins, 2014).

What about counseling records created by counselors-in-training? Are they legally different in this jurisdiction? Will they be treated as educational records of the counseling student or eMHRs of a client?

Will records need to be able to support assessment data? How might this complicate recordkeeping needs? (For example, test security and need for multiple data entry points may require added user-licensing and resulting in added expenses.)

What added level of complexity is needed in a system that is needed to document supervision of unlicensed students or practitioners?
What added screening and capacity is needed in a system where supervisors may change frequently? (such as an educational system where differing adjunct faculty are used).

How can the counselor education curriculum be changed to support this new emphasis on technology in counseling recordkeeping? What added training and expertise might be needed on this faculty/in this program?
Will this institution adequately fund and support this technology into the future?

How will issues of ownership of “research” data be described? (often multiple faculty supervise or work in on-campus training facilities and there may be competition between faculty for research and publication opportunities.)

Summary

These questions only begin to scratch the surface of the complexity involved in implementing technology into counseling recordkeeping. Ironically, many institutions and agencies fail to consider these and other complexities and jump into digitizing counseling records without fully understanding how this change can impact legal liability or client privacy (Huggins, 2014). The best strategy for adding technology to an individual counselor’s private practice, a counselor training facility, or a large agency, is definitely proactive - planning before going digital can save resources, time, and headaches (e.g., Wilkinson & Reinhardt, 2015).

Clearly, there is a need for all counselors to be aware of how technology can benefit the counseling profession, but there is also a need to be wary of implementing technology without fully processing the potential benefits and risks involved for clients and the agency. The profession of counseling lacks best practices in this important area. Counselor educators must make time in the curriculum to fully address technology issues and adequately prepare trainees for the digital world in which they will work. However, this is not as easy as it sounds as most counseling programs are already lengthy. Counselor educators must prepare counseling students for electronic case management systems but they must still train counselors to be proficient at writing case notes “the old fashioned way” as counselors will always need critical
thinking skills. As a profession, counseling must fully embraces technology in its Code of Ethics and accreditation practices. Counselors must take the lead and advocate for and research how adding technology into their training programs can benefit their students and the clients they will serve. No recordkeeping system is perfect. When going digital, there is always a compromise between cost and efficiency and client privacy - each counselor or institution must appropriately understand the risk to clients’ privacy and restrain the desire to monitor and track data that oversteps on client privacy. All counselors, as professionals who are trained to advocate for clients’ rights, must steadfastly guard this right to privacy. Privacy should be afforded to all – not only those who can pay to receive services that safeguard it.

Discussion Paper

• Large/complex issue: Technology and its impact on privacy in the counseling profession.
  o Implications for counselor educators

• Based on a body of research on the call for and implementation of digital recordkeeping in the health profession (and other allied health professions).

• Presenter’s experiences in counseling and counselor education (nearly 3 decades in private practice, governmental counseling agencies, and various private and public universities).
Introduction

• HIPAA
• HITECH
• Texas House Bill 300 (and other state laws)

• Changes in the ACA 2014 Code of Ethics
• Changes in the CACREP accreditation standards

• Where are we as a profession in digitalizing counseling records?
Counseling Culture/Identity

Is the counseling profession anti-technology or just slow to adapt? Or, has counseling adapted too quickly without understanding the ramifications?

Aspects that may impact the culture of the counseling profession and how flexible counseling is towards technology and digitalizing records:
1. Counselor education as a sub-profession;
2. Diversity within the counseling profession;
3. Counselor training emphasis;
4. Funding within the counseling profession.
Why transition to eMHRs?

- “Everyone else is doing it…”
- Mandated in some jurisdictions?

What have we learned from the health field?
1. Significant cost savings;
2. Improved safety or quality advances;
3. Improved access to records;
4. Increased research opportunities.
eMHRs: Significant cost savings?

• Reduced physical labor costs (accessing, moving, storing files);
• Reduced number of lost or misfiled records;
• Reduction in the space needed to store files;
• Increased up-front costs to digitization;
• Significant loss of provider productivity while making changes;
• Decreased provider productivity for training.
eMHRs: Improved safety/quality advances?

• In-house referrals can be optimized;
• Digitization allows for electronic prompting and reminders;
• Increases ease in supervisor record-review;
• Drop-down menus and decision-making trees for differential diagnosis.
eMHRs: Improved access to records?

• Significantly improved accessibility to records;
• Data can be available at multiple sites or locations and viewed by supervisors more easily;
• Misfiled digital records are “easier” to find;
• Allows for counseling/mental health records to be integrated into health records.
eMHRs: Increased research opportunities?

• Creation of “new” data to track trends and needs in faster time;
• Digitization has not increased the quality or amount of research in other professions;
• Increased privacy concerns for sensitive client information
Summary:

Where does the profession of counseling go from here?

Need to advocate for more research in counseling and counselor education to:

• Be proactive in fully assessing the cost of implementing digital recordkeeping and other new technologies.

• Adequately prepare counseling students to be ready to work with technology in the field; and

• Fully examine the loss of client privacy when technology is added to the counseling process.
Submission of an Accepted Paper (ID # 408) for Publication in the Proceedings of the 15th Annual Hawaii International Conference on Education

Title: Narrative Analysis as a Research Methodology An Effective Model for Mining Personal Interviews

Name of Author: Linda F. Burghardt, Ph.D.

Affiliation: Scholar-in-Residence, Holocaust Memorial & Tolerance Center of Nassau County, N.Y.

Address of Author: 11 Stoner Ave. Great Neck, N.Y. 11021

E-mail address: linda.burghardt@gmail.com

Abstract and full paper:

Abstract

This paper presents a comprehensive framework for mining personal interviews using the powerful techniques of qualitative literary analysis, an interpretive approach to research. The ability to identify and evaluate the underlying concepts contained in a set of personal narratives can provide important insights for researchers studying a wide range of educational issues. Researchers who follow this model will be able to employ the full complement of narrative strategies to mine, organize, synthesize and interpret the rich material contained in personal interviews. The tools and strategies used in this research methodology are fully explained, and a model is presented to demonstrate how to apply them to a full range of educational concepts and audiences.

Introduction

Every personal interview contains a story, and the ability to find and analyze both the basic concepts and the nuanced ideas contained within these stories can provide abundant data to educational researchers. Professionals who learn to use the framework
presented in this paper will be able to successfully evaluate personal interviews on a variety of levels using the powerful techniques of qualitative narrative analysis, an interpretive research methodology. The comprehensive framework will enable researchers to mine the data from these rich resources, then organize and interpret them fully through applying a very clearly defined and dynamic set of sequential strategies.

This proven framework, developed through a study undertaken for my doctoral dissertation, can be applied to research in all areas of education, including those aimed at discovering new processes and programs, creating policies, evaluating the effectiveness of existing procedures, and shaping new proposals. It is fully effective in analyzing the interviews of students, teachers, parents, administrators, policymakers and members of other interest groups contained within the educational milieu.

What is Narrative Analysis?

Narrative analysis, also called literary analysis, is a popular research methodology containing a powerful set of techniques and strategies that enable researchers to effectively mine data in interviews (May 2002). It is centered on the basic tenet that every personal interview revolves around a story, and that parsing that story will enable the researcher to fully understand the multi-layered meaning of the interview. Personal interviews are recorded first-person accounts of life experiences, and these individual narratives, whether studied singly or in a collection, contain overarching concepts that can be effectively understood through this type of analysis, which can easily be applied once it is mastered.

Because many critical concepts and meanings are often embedded within the interviews rather than stated directly, researchers need to know how to find them, order them, and analyze them, both individually and collectively, before patterns can be detected and effective insights, inferences, and conclusions drawn. This study shows them how.

It is important to understand what narrative analysis is and what it is not. Primarily, it is a methodological system that searches for meaning, both literal and symbolic, by probing deeply into various aspects of narrative, including the elemental structure, style, setting, and plot in a given interview, and also by analyzing the characters who both tell about and take part in the drama as it unfolds (Reissman 1993). This type of literary analysis is basically a structural analysis of an interview, which is defined as a sequence of events that is constructed to form a story (May 2002).

Finding the Story within the Story

Because interviews provide a voice for human experience and emotion, narrative analysis focuses on the way in which people use stories to make sense of the world and interpret their experiences, as Richter (1996) explains. To do so effectively, narrative analysis includes reading between the lines to draw out the drama inherent in the words, the plot, the structure, and the characterizations contained within the story of the interview.

Frohmann (1994) considers this type of analysis to be especially useful in probing interviews of non-professional individuals, such as students and parents, who constitute
two of the most interviewed groups in educational research. This is because narrative analysis provides a means to investigate spoken communications using both the structures and functions of language to describe their experiences and also to reveal their deep feelings. The reason it is effective is often that the material comes from the unsophisticated and untrained voices of real people, voices that speak from the heart (Labov and Waletzky 1997).

Narrative analysis has been used as a qualitative research method since the 1960s and is based on a reworking of Russian formalism and the work of the French scholar Roland Barthes (Jensen and Jankowski 1991). It can provide a method of defining the grand narrative or meta-narrative that undergirds the structure of a set of interviews. Bringing together this set of attributes into a unified whole is one of the most effective ways of understanding the plight of the people whose stories are told in the interviews. This is the basic purpose of the model presented in this paper.

Creating the Methodological Framework

The investigation in which this model was developed was undertaken with the objective of creating a useful set of tools for educational researchers. The methodology used to develop this model was based on a tried-and-true research framework that brings together a very old method of gathering historical data -- the person interview -- with the newest digital technology and communications media for preserving and presenting it.

The model was created by analyzing a set of personal interviews from the world-renowned Shoah Visual History Archives, the largest digital video collection of Holocaust testimonies in the world, and then testing and evaluating a variety of methods and strategies to determine which were most effective, most powerful, easiest to use, and most widely applicable to the diverse set of voices, media, and materials in today’s educational world.

The outcome of the investigation demonstrated clearly that qualitative narrative analysis can add a vital and human dimension to research studies containing personal interviews, and that educational researchers could gain significantly by learning how to apply these principles to their own studies.

How Does Narrative Analysis Work?

Narrative analysis is successful because it allows researchers to delve beneath the surface of an interview to glean the underlying meaning of an interview, helping them understand what the interviewee is saying on a variety of levels (Reissman 1993). It does this by enabling them to find the essential story that gives the interview shape and structure and provides a vehicle for the expression of their emotions.

In this way interviews become a powerful tool for understanding human experience and thus the world we live in. As the American poet Muriel Rukeyser put it (1968), “The world is made up not of atoms, but of stories.”

Thus by pulling out the story in the interview, researchers can get to the root of the issue that the interviewee is discussing, bringing them into his or her world and allowing them access to feelings and facts that will enlighten them and point to the solution to the problem that gave rise to their collecting the interviews in the first place.
The Natural Force of Narrative

To learn how to apply narrative analysis successfully, it is helpful to understand not only why stories matter so much in our world today, but also why they have always done so. When human beings in the ancient world told each other stories, they were engaging in one of the first known forms of information exchange. These stories, or narratives, provided a way for people to create and express their individual identities and join them together into a culture that was uniquely their own (Spaulding 2004).

By analyzing the stories through looking at the elements that structure them and those that are contained within, we are able to comprehend more deeply those components of the uniquely human information-sharing experience that transcends time and place (Richter 2007).

What Makes a Story?

All people need some form of organizing principle to turn their thoughts into action, and stories serve that purpose. These narratives enable us to group consequential events from the past in such a way that they provide a structure for us to tell about our lives. This structure grants meaning to our lives. Taking past events and actions and turning them into stories out of which we create our identities enables us to see who we are and understand those around us (Reissman 1993). In this way we impose order on our thoughts and thus make sense of our experiences.

Meaning is constructed in a variety of ways -- through plot, imagery, symbolism and style, to name just a few. Because narrative is the way this is accomplished, this mode of discourse contains the singular power to touch us in the ways that make us uniquely human (Burghardt 2011).

The word narrative comes from the Latin verb narrare, which means to recount or tell, and is closely related linguistically to gnoscere or noscere, to know, according to the Oxford English dictionary. And personal narratives are based on how the narrators or the interviewees interpret the events in their lives and are “rooted in time and place and personal experience and in their perspective-rich characters -- that’s why we value them” (Reissman 1993, 5). This type of qualitative research methodology embraces the personal and the subjective, and embodies a particular perspective that concerns perceptions of the nature of truth. Personal statement of this kind is often based on the emotional truth of a person’s experience and therefore carries significant weight for educational researchers who want to base their decisions on the real and truly felt experience of the group under study.

The movement in a story is always from disorder to order. One of the tenets of narrative analysis that the act of telling a story, the whole flow of the story being created, is a movement from a disorderly world to an orderly one (Reissman 1993). The events move from disorder to order in the telling itself. It is simply through the act of organizing the events in the teller’s mind and then as they flow out of his or her thoughts into a story that they become arranged and ordered.

Building the Framework, One Step at a Time
While in the past, narrative analysis was used primarily for literary study, today it is utilized in a variety of academic disciplines, including education, history, medicine, law, anthropology, psychology, and socio-linguistics (Snowdon 2002). This is because it uses interpretation as a means of understanding events told from the point of view of an individual. Personal narrative has a special power that transcends most other kinds of stories, because the honesty of the speaker sweeps the reader or listener into his or her world, adding layers of meaning to the actual text.

These layers become visible when interviews are dissected and analyzed through the narrative analysis techniques I created in my own study. My research using the Shoah Archives was done for a doctoral program in Information Science and sought to determine the relationship between information and survival in the Holocaust. Personal narratives in the form of interviews in the Shoah Visual History Archives were accessed and analyzed to provide data to help explore whether any such links existed, and, if so, what they were and how they operated.

Based on procedures that were successful in my own study, I created a framework for mining personal narratives that is explicated in this paper. There is a logical set of steps in narrative analysis, and researchers using this sequence of steps follow a process in which these elements are identified, data is gathered, ordered and analyzed, and conclusions are then drawn based on a rubric and a set of rules established early on in the study. This is the basic flow of my narrative analysis model, each step of which will be fully explained.

There are twelve building blocks or steps to this framework, and I will go over each on in its own section, but first, here is an overview of all of them together.

**Table 1: The 12-Step Model for Using Narrative Analysis to Study Personal Interviews**

We will now look individually at each step in the model so that researchers will be able to follow them one at a time to successfully mine the data in their interviews.

**Step One: Determine the Ideal Study Population**
How many interviews can you effectively analyze? This is often the first question researchers must answer after the narrative analysis methodology has been selected. The answer to this question depends on the resources you have available, the length of the interviews, and the time you have to complete your study. While it is always tempting to analyze everything you have, it is critical that you not take on more than you can handle, as you can become so bogged down in collecting and analyzing the data that you never reach the important part of your study, the one in which you determine conclusions and make action recommendations, and thus never finish your task.

The way to avoid this sad end is to find the right size for your study population. In my study, my search through the Shoah Archives identified 244 interviews that met my criteria and qualified for my investigation. Each one was about two hours long. I determined to study 10% of them -- 24 -- in depth. But which 10%?

The method I used to draw a sample for analysis from the full population was systematic random sampling, a typical probability sampling method. This works by selecting every \( n \)th person from the full list; the value of \( n \) is determined by the number of names needed for the sample (Berg 2007). For the purposes of my study, that number was 24, which comprised 10% of the full population. This meant selecting every 10\(^{th} \) name on the list.

**How to Select the Starting Point**

But where to begin? If I simply chose the first name, I would be introducing bias into the method, and thus I used a computerized random number generator to make the decision for me. I simply logged onto a recommended research integer randomizer website (http://www.random.org/integers), administered by the Social Psychology Network and highly respected by research professionals, and entered the number range that was correct for my study -- one to ten, in this case, since ten is the interval between names -- thus instructing the program to select one integer at random.

The number that came up was four. This meant that I was to start with the fourth testimony on the list, then the 14\(^{th} \), then the 24\(^{th} \), and so on. In this way I came up with the 24 names by the time I reached the end of the list of 244. These represented the 24 interviews that I would analyze, and they became my sampling units.

For a smaller study, with a tighter deadline or fewer resources, you could select ten interviews using the same method, or even five. Even though these are considerably smaller groups, you will still be able to generalize your results across the full population, since if used a scientific systematic random sampling method to choose the interviews.

**Step Two: Transcribe the Interviews**

Because the Shoah Archives interviews are preserved on videotape and on the archives’ servers but do not exist as words on paper, the selected interviews needed to be transformed into text before a narrative analysis could be performed on them. Narrative analyses require fixed sets of sampling units in an accessible form that can be mined consistently and referred to easily when necessary (Berelson 1971). Only when the sampling units are stable is it possible to see how the contents of the interviews relate to
each other, so that relationships become clear and plot, character, and style can be identified. In order to accomplish this, the interviews need to be transcribed.

Whether you use an established archive as I did or plan to analyze your own homegrown interviews, you will undoubtedly work from a video- or audio-taped interview, as this type of recording is necessary to insure accuracy, and transcription into words on paper will be necessary.

Deciding how much or how little of each testimony to transcribe is the first step in this process. To do this correctly, Schilling (2006) recommends considering whether the content should be summarized or the words transcribed literally, and he suggests weighing the amount of time it would take to do a literal transcription against the need for a high degree of specificity. Riessman (1993) points out that attempts to turn talk into text always involve a certain amount of reduction and choice, and recommends an initial or preliminary transcription to capture the broad strokes and a more detailed one on the second pass through the material.

In addition, it is important to decide whether to include non-words such as ah and um, and sighs, tears, or pauses. Some researchers use professional services to do the transcriptions, as the work can be lengthy and tedious; others find that software programs can help speed up the process enough to enable them to do the transcriptions themselves. In either case, a firm, solid transcription is the key to getting started with the narrative analysis.

**Step Three: Define the Elements of Analysis**

I then turned to the next task of defining the components of the interviews that I would analyze. This is accomplished by looking at how to define narrative in a way that is most applicable to the interviews that will be assessed. To do this well, it is helpful to understand literary structure and the parts of narrative that make an interview a story.

One very effective way of defining narrative is as a set of stories about a particular event that contains a protagonist, movement or conflict, and a culminating event (Reissman 1993). Another way is that a story is a narrative structure containing a beginning, a middle, and an end (Richter 2007). But the simplest way is to look at the three most basic characteristics as outlined by Aristotle in his *Poetics*, written in the 4th century, B.C.E. (Richter 1996). These characteristics are plot, character, and style. These are the three components that I used in my study and the ones I recommend for researchers following the model I developed from it.

**Step Four: Create an Organizational Structure**

Most likely your transcriptions will be many single-spaced pages long, perhaps even ranging into the hundreds of pages, as mine were. The tasks of identifying, collecting, assessing, culling, arranging, and grouping the data require an organizational structure firm enough to guide the process. This begins with the development of a set of rules -- the organizational structure -- that outlines the goals of the data search and the manner in which it is to be conducted.

Development of this organizational structure begins by defining the narrative elements or categories which you selected in Step Two: usually plot, character, style and
form. It states the number of interviews you will analyze. Will you study all of them, or have you selected a number from the overall pool of interviews? You will state what reading method you plan to use to help you identify examples of the components in each of the four narrative categories. For example, will you read each interview for one component at a time, or will you look at all the components in each interview in one pass?

Since narrative analysis is qualitative research, you will want to look through the interviews several times, as each time you do you will find something new that might change your perspective (Nachmias and Nachmias 2008). Next you need to consider how you will organize the list of elements once you have identified them. Finally, you will determine how the data, once it is collected, will be analyzed, and how you will look for common themes, patterns, and concepts from a literary or narrative point of view (Eagleton 2008).

Don’t get too bogged down in creating this structure, as it is only a guide and not a hard-and-fast rulebook. Since this is qualitative research, you are permitted to go back and change aspects of it as you do your research if you find it is too constraining or too loose.

Step Five: Develop an Efficient Data Collection Instrument

Alongside the organizational framework, and closely aligned with it, is the form on which data is gathered. This is created to utilize the techniques and strategies of qualitative research most effectively (Busha and Harter 1980). The data collection instrument must be open and flexible enough to accommodate several passes through the data, passes in which new material might be discovered and added to the form. Simplicity and fluidity are key in creating this instrument, and the one used in my study reflects those critical values.

You will need a separate page for each interview, and on each page you will require a place to note each narrative element you find. Later these will be grouped and analyzed, but for now your task is to create a form on which to enter the data. You will need space for each of the element categories -- plot, character, and style -- and room for a summary for the overall story. In addition, it is good to create an area in which to note any additional sub-stories you find that might prove useful later, just in case there is an intriguing sub-theme that you identify after reading several of the interviews.

Step Six: Create the Narrative Elements Rubric

In order to identify and evaluate the narrative elements you find, you will need a narrative rubric that is developed around the core interview story. A rubric is simply a listing of a set of literary components that are common to all the interviews, with a selection of the levels at which a particular piece of text exhibits them and a way to organize the information you find (Richter 2007).

For example, in my study, I created a rubric with three categories within each literary component. My goal was to grade each interview for richness, texture, and effectiveness plus a well-told story, based on my three primary narrative elements -- plot, character, and style. To do so, I developed a spreadsheet with several rows and columns.
My plan was to have an interactive and readable table so that I could use to evaluate and compare the elements.

I thought about each component and came up with appropriate categories for each one, based on my study. I did this by reading through all the interviews and listing the elements I found, then organizing them under each heading. For example, I noticed that the interviewees nearly all mentioned an awareness of danger, several action/turning points in their story, and a resolution that ended the tale. All three of those went under the first component, plot elements.

**A Useful List of Categories**

Under character elements, the next entry, I listed point of view, internal resources, and the insight and change that came about through the interviewees’ experiences. Several items grouped naturally together under the style element, which I labeled imagery, use of language, and symbolism, as these elements were mentioned most often in the interviews.

I then assigned three levels of use of each of the elements: high, medium and low, to signify how fully each was represented in the interview. I created a point system so that the use of the elements could be rated and compared: three for high, two for medium, and one for low.

Finally, I created a box at the end of each row so the scores for each criterion could be noted. Along the bottom of the page I wrote the scoring values: 19-27 was excellent, 10-18 was very good, and 1-9 was good.

**Step Seven: Collect the Data**

Next I gathered the data from each interview. I went through them one at a time, looking for examples of each of the nine types of narrative material I had laid out in the rubric. As I had determined in the organizational structure, I had a separate page for each interview. When I found a plot element, I marked it on the data collection sheet. I did the same when I located a character element or a style element.

With qualitative research, it is always a good idea to read through each interview at least three times, as new data becomes apparent with each pass through the material (Berg 2007). I found it easier to go through each interview looking for only one narrative element, say, plot, than for all three at once. After one deep reading, I found that markers often told me that a plot element was about to take place; the same was true when looking for character elements.

In studying the interviews for style, I found it best to try to keep a sense of the language, the imagery, and the symbolism together as they tended to reinforce and deepen each other, and this helped me find the areas of vividness and color in the interviews. I also found it useful to visualize the events as I read them, as this enabled me to tease out the story more easily and watch as the characters and events blossomed and bloomed into life and allowed me to become immersed in the data.

With this process I made my way fully through the testimonies. When I felt I had identified all the narrative elements on each data collection form, I wrote up a short summary of the action of the story and entered that on the form.
Step Eight: Apply the Rubric

Once I identified and organized the narrative elements on the data collection instrument, I then took out one copy of the rubric form and laid it side by side with the first interview. The rubric was organized along two lines -- one, the narrative elements that were to be assessed, and, two, the criteria for evaluation. The same nine areas that formed the main areas of the data collection instrument constituted the rubric. This was intentional, as it served the purpose of enabling me to directly relate one set of data to the other.

I went through the interviews one at a time, assessed each element and filled out the rubric form for each one. I scored each of the nine categories of every interview -- three for plot, character elements, and style -- on a point scale of one to three, with three for high effectiveness, two for medium and one for low. Once this was accomplished, I added up the total score and applied the scoring values. A score of 19-27 points was excellent, 10-18 was very good and 1-9 was good.

Step Nine: Analyze the Data and Draw Conclusions

The first step in analyzing the data is to look at the overall distribution of the scores and count how many are in each group (Franzosi 2010). Are most in the excellent category, or the very good? If so, you should be pleased. A tight distribution like this says that the interviews were effective as stories and that the major narrative elements were of high quality. Next, look at the distribution within the specific categories. Are the score numbers within the plot and character elements similar? If so, this can be interpreted to mean that the interviewees were successful in using plot and character elements to their advantage.

You should also compare the numbers of elements in each of the three major areas (plot, character, and style), and determine what it means if there are a higher number of elements in one group than another. For example, did your interviewees concentrate more on plot than character growth? Were the numbers highest in the style area? Does this speak in any way to the level of verbal ability among the narrators?

Using style elements well requires a higher level of sophistication than expressing plot and character elements in the telling of a story, and these numbers are likely to be lower. The ability to understand how to use imagery and symbolism, for example, usually only develops in adulthood, so it is critical to keep in mind the age and educational level of the interviewees when determining the success of these two elements. The same holds true for the language category, as it is difficult to use language with flair and richness without sufficient education (Richter 2007).

Synthesizing the Data Effectively

Putting the data together and drawing valid conclusions requires the ability to reason from the part to the whole (Nachmias and Nachmias 2008). Here are some questions to ask to accomplish this: Does the data in one interview when coupled with
another show a similarity? Does insight gleaned from looking for comparisons and contrasts within ten or twenty interviews come to light?

Are there several plot elements that tend to repeat themselves over and over?
Grafted together, do all the interviews tend to contain one strong story line or one specific type of character that grows in a particular way? Are there similar action points in several of the interviews? Do these turning points tend to lead to the same results, or are they significantly different?

Another important area to clarify is the way the interviews ended, as a strong resolution is a necessity for any story; without it, the reader is left unsettled and unsatisfied. Ask yourself: Did the interviewers show strong storytelling power? Do the interviews end in a way that feels finished? Did the emotional power of the story hold sway over your feelings up until the very end of the interview, or did the story start out strong and then fail to follow through with a satisfying conclusion? If the conclusions are muddy, can you identify where on the narrative arc the story stopped moving properly?

Next you might determine this: Is there a type of symbolism that you found recurring from one interview to the next? If so, can you determine the meaning it has to the speaker? Does it answer any of the questions that are likely to be swimming below the surface of the actual words the interviewee uses? Are there images that surface time and again?

Themes, Patterns, and Motifs

You will want to determine if there a meta-narrative or grand story that comes clear when setting several stories side by side (Gorman and Clayton 2005). This core feature of every narrative exists on a higher plane than the story itself, and often contains the common structure that unites all narratives of the same type. It is an over-arching story that is situated behind or beyond the narratives, transcending them but joining them together at the same time (Eagleton 2008). Finding this one element that binds the interviews together can be a key part of the analysis, as it helps the researcher find the underlying meaning of the material, often revealing new dimensions that can imbue the investigation with significant weight.

Finally, it is useful to search for the underlying themes, patterns, and motifs embedded in the interviews. Are there dominant or central ideas that keep recurring? How do they drive the content of the interviews? Do these themes taken together form a conceptual scheme that provides additional meaning to the personal narratives? Once you have identified the themes, you might be able to group them based on their common ideas. These ideas and themes, taken together, sum up what the interviewees were trying to express, and thus form the conclusions of the study.

Step Ten: Present the Findings

Once you are done with the analysis, it is time to figure out how to most effectively offer the findings to your readers. Synthesizing data into narrative can be challenging, but this is arguably the most important part of the study -- and concomitantly the one in which researchers struggle the most.
Most likely, your findings will take several forms, from exposition to charts, graphs, tables, and diagrams. It is good to aim for a multi-layered, integrated set of ideas and concepts that is diverse yet cohesive and shows that you have a dynamic group of conclusions that work together as well as individually (Jensen and Jenkowski1991).

Different types of conclusions lend themselves with more or less effectiveness to different formats. For example, inferences drawn from the data analysis are generally best presented in expository or narrative form, while items that lend themselves best to visual interpretation need to be expressed in graphic form.

Charts, Tables, and Diagrams

Ask yourself this: Do your themes influence each other? If so, you might want to present them as a diagram with arrows between them identifying which ones have an effect on the others, or perhaps in a central drawing showing them all moving among each other in a circular pattern. You should also include your rubric in the findings, either in the text of the work or as an entry in the appendix.

Numbers are best understood when expressed as a table with an accompanying narrative to explain them. Even though this is qualitative research, it is helpful for the comprehension process of your readers if you discuss the numeric relationship of the various narrative elements and their subsets based on how often each area was identified in the interviews.

In order to integrate the research results into a meaningful presentation, keep in mind the basic goals of the study and the original questions you set out to answer, and let them be your guide in presenting your findings.

Step Eleven: Establish Validity, Reliability, and Authenticity

All scientific studies, including qualitative ones, need to be evaluated after they are done to make sure they are valid, reliable, and authentic (May 2002). Various techniques exist to help insure these qualities in your study and boost the chance that it can be replicated correctly. This will significantly increase the prestige of your study and add weight and gravity to its conclusions.

The first step is to go back to the original research questions to see if they have been fully answered. Next, consider whether the study has been grounded; you can do this by looking to see whether the findings are cross-validated through the study itself. Do any of the results or conclusions contradict one another? If so, why might that be? Contradictions need to be compared and addressed and the cause determined.

Check if all the sources that relate to the material are reported accurately. Finally, it is necessary to determine if there are other studies on your topic and, if so, whether they support or contradict your major findings.

Step Twelve: Create a Path to the Future

It is a common maxim in qualitative research that what comes after your study affects what went into it (Ritchie 1995). Although this may sound counterintuitive, it is a valid point. This is because your research will be much more impressive if you find a
way to carry it forward into the future. To do so, you should always try to end your projects with fresh ideas for future studies. This way scholars and students who find your investigation intriguing will have a way to become involved in the research and extend it, sometimes even bringing it a higher level.

This also grounds the research in the larger conversation about the specific topic you have been studying and enables other researchers to further mine the rich cache of data that you have gathered. Other researchers might find another perspective on the conclusions that were reached or another way to present the results in future studies. Possibly you yourself might be the researcher who follows it forward, finding within this research project the seeds of your next one. This is how new knowledge grows, and how to become – and remain – a part of it.

Conclusion

Implementing these twelve steps in studies which rely on mining personal narratives or individual interviews will go a long way toward creating a strong, positive research project and provide meaningful insights that you can apply toward developing your educational policies, programs, and processes.

Once you master the techniques and strategies of narrative analysis, you will find them useful across a broad range of goals and with a wide variety of research subjects, whether you are gathering opinions about a new curriculum or trying to figure out how to implement a series of format changes in a popular program. In virtually every case, using personal interviews to gather data and analyzing them using literary techniques will bring you insightful conclusions and worthwhile results.

Abstract

Eighth-grade students experience significant difficulties as they transition into a high school setting (Weiss & Baker-Smith, 2010). To ease the transition to high school, many districts offer solutions such as freshman academies and an emphasized focus on 8th grade students, such as additional counseling and parent meetings (McCallumore & Sparapani, 2010). However, with average freshman graduation rate (AFGR) at 80% for all students and 75% for Hispanic students, the inadequacies among freshmen academic achievement in the United States is evident (Stetser & Stillwell, 2014). In addition, the disparity between the AFGR for Hispanic students is more prevalent when compared to the 84% AFGR for White students. Therefore, this quantitative study intended to add knowledge to current literature by statistically testing data from a predominately Hispanic South Texas rural school district. The purpose of this pre-experimental research study was to determine a set of predictors that related to the criterion of the 9th grade English I STAAR EOC exam. The independent variables were 8th grade data: Reading test scores as measured by STAAR, overall grade point average, attendance, socioeconomic status, and English proficiency status. The dependent variable was the 9th grade English I STAAR EOC exam. To measure the predictability of the independent variables on the ninth grade English I EOC exam, a multiple regression analysis was conducted. Descriptive statistics and gender differences would also be evaluated. All the data analyses were conducted using SPSS version 22.

In testing the three null hypotheses, the regression equations indicated significant predictions toward the STAAR ELA EOC exam scale scores among all students: F(5, 350) = 83.88, p < .001, among female students: F(5, 173) = 47.50, p < .001, and among male students: F(5, 171) = 37.52, p < .001.
### Table 1

</tbody>
</table>

GPA added the most to the prediction of student success in all three areas of investigation (.50, .50, .48) whereas Language Proficiency was the area that devalued the score the most (-.33, -.35, -.30).

Specifically, Olmedo (2009) denotes a linguistic phenomenon, code switching, as a common occurrence among border town residents such as those from the Valley. In this case, bilingual education, in its true sense, becomes more of a challenge. The unyielding concern in this matter is the fact that students are not sufficiently developing either of the two languages. The data gathered from this study may provide school leaders with the needed inquiry to create or enhance the necessary transition systems that could ensure that social, procedural, and academic concerns are minimized.

6. Abstract:

   This presentation will focus on current methods of instruction most commonly used today for healthcare professionals. Discovering ways to teach medical terminology online that keeps students interested, attentive, and highly engaged can be a challenge. Previously, students studying medical terminology had communicated using text-based synchronous and asynchronous discussion only. This is why the Quality Matters Rubric Standards were implemented into the course. A common criticism of text-based media is the lack of non-verbal communication.
This research was supported through funding provided by Alberta Education and the Canadian Career Development Foundation.

Abstract

Career Education is meant to foster the development of critical skills imperative to attaining a meaningful future career. Encouraging self-exploration at an early age is critical to effective career education. Early intervention can be successfully implemented through integration of a career planning unit. This article includes a detailed description of how a Career Planning unit can be integrated into the current Alberta Health and Language Arts curriculum, as well as student feedback on the effectiveness of the activities. Student feedback indicated the following: 70% reported that unit helped them learn more about themselves; 90% reported that the unit helped them learn more about different careers; 90% felt excited about future possibilities in their life as a result of the unit; 90% were eager to learn more about different careers. The large majority of written feedback from students stated that they particularly enjoyed learning about different jobs and were eager to choose a specific career as a research topic. Students were also quite interested in learning about the jobs their peers chose to research. Nondirective, socially-oriented activities were a marked success in the unit’s activities.

Career Exploration at the Grade 5 Level: Introducing Career Planning Skills Through Curriculum Integration Into Health and Language Arts

Introduction

Career Planning is an important skill in achieving future career goals. Effective Career Planners are individuals who are highly self-aware, sensitive to the dynamics of their environment, open to exploring career possibilities, have the ability to attain and utilize valuable life/work information, seek to continue their education, uphold a positive self-image, effective time managers, and are purposefully goal-oriented (Borgen & Hiebert, 2006; McMahon, Patton, & Tatham, 2003). Introducing these skills to students at an early age can--with a sufficient amount of time--lead to mastery of these skills (Magnusson & Bernes, 2002; Magnusson & Bernes, 2004; Palladino Schultheiss, 2008). Many individuals may remain unaware of the personal dimensions that govern the possibilities of attaining a meaningful career. It is not uncommon for these individuals to frequently change occupations and as a result, remain personally unfulfilled. Introducing career planning skills could effectively alleviate--or at the very least--decrease the uncertainty and confusion for this generation of students by building self-awareness and encouraging career exploration at an early age (Bardick, Bernes, Magnusson,
& Witko 2006). Early intervention through career education allows for greater reflection and skill-building over a greater period of time regarding the student’s choice of potential careers that most appropriately suits his or her personal strengths, interests, and values; this can be done by integrating a Career Development unit into the existing curriculum (Harkins, 2000). The following intervention is a unit based on a cross-curricular model that accomplishes successful integration by fulfilling learning outcomes within the Health and Language Arts curriculum.

**Context of the Teaching Environment**

**Student Demographics**

The career planning unit was implemented within a grade 5 classroom of 23 students over the span of two weeks. The elementary school was located in a rural community in Central Alberta. The classroom contained a fairly large range of children of diverse learning abilities, ranging from students that required continuous aid, to highly advanced learners. Two students were considered to have a developmental disability; both students were assigned a full-time educational assistant. The large majority of the grade 5 class came from middle-class caucasian families.

**Learning Objectives of the Unit**

The learning outcomes of the career planning unit are as follows.

- Students will:
  1. Identify their interests, skills, and attitudes.
  2. Discover a variety of possible career choices available.
  3. Understand how individuality relates to career choices.
  4. Discover a potential career ideally suited to their individuality.
Language Arts Objectives Achieved by the Career Planning Unit

The following objectives as outlined by the Alberta curriculum were effectively met by the Career Planning unit.

• General Outcome 1: Students will listen, speak, read, write, view, and represent to explore thoughts, ideas, feelings, and experiences.
  1.1 Use appropriate prior knowledge and experiences to make sense of new ideas and information.
  1.1 Read, write, represent, and talk to explore personal understandings of new ideas and information.
  1.1 Use own experiences as a basis for exploring and expressing opinions and understanding.

• General Outcome 2: Students will listen, speak, read, write, view and represent to manage ideas and information.
  2.1 Comprehend new ideas and information by responding personally, taking notes and discussing ideas with others.

• General Outcome 3: Students will listen, speak, read, write, view and represent to manage ideas and information.
  3.3 Organize ideas and information to emphasize key points for the audience.
  3.3 Combine ideas and information from several sources.
  3.3 Connect gathered information to prior knowledge to reach new conclusions.

• General Outcome 4: Students will listen, speak, read, write, view and represent to enhance the clarity and artistry of communication.
4.3 organize ideas and information in presentations to maintain a clear focus and engage
the audience.

4.3 use effective openings and closings that attract and sustain reader or audience
interest (Alberta Learning, 2000).

Health and Wellness Objectives

The following Health and Wellness outcomes were met through the implementation of the
intervention:

- Life and Learning Choices: Students will use resources effectively to manage and explore life
  roles and career opportunities and challenges.

  5.2 affirm personal skill development.

  5.5 relate personal skills to various occupations.

  5.6 assess how roles, expectations, and images of others may influence career/life
  interests (Alberta Education, 2002).

Detailed Description of the Lesson Plans

Lesson 1: Career Profiles--School Subjects Directly Related to Specific Careers

This lesson served as an introduction to the career planning unit. Every student received
the Career Profiles handout that contained the names of various careers which were divided
among, and listed under associated school subjects (see Appendix A). Prior to the
commencement of a subject, the teacher directed the students’ attention to the Career Profiles
handout. The teacher took the time to explain the job descriptions of every listed career that was
relevant to the subject they were about to study. Students were also given the opportunity to
discuss how a particular school subject was important to becoming successful in one of the listed
professions. This lesson introduction was to help students understand how their proficiency in a subject could lead to success to a certain career.

**Lesson 2: Skill Stars--Identifying Skills and Interests**

The purpose of this activity was for students to employ their self-reflective skills in order to identify personal skills and interests. The teacher emphasized and discussed the importance of self-knowledge when finding a suitable career. The activity sheet contained a large star where students were to write their name, and list as many personal qualities, skills and interests that they could fit inside (see Appendix B). The star was then coloured, and displayed upon a bulletin board.

**Lesson 3: The Best Job in the World Ad--Integrating Themes From Lesson 1 and 2**

The purpose of this lesson was to combine information learned from Lesson 1 and 2 to create an ideal job that reflected the student’s individuality. The job was allowed to be completely imaginary, and was to complement the student’s skills and interests. The lesson’s main task was to create a newspaper job advertisement that provided specific details about the student’s “perfect job” (see Appendix C). The advertisement was to include the job title, and a description of the job’s responsibilities, working environment, perks, hours, and an explanation of why the job was “perfect.” The students were told to be as persuasive as possible in their descriptions, in order to attract someone like themselves to respond to their advertisement.

**Lesson 4: My Career Research Project--Exploring Careers Through Research and Inquiry**

This lesson’s activity served as one of the major activities of the entire unit. The teacher provided each student with a list of websites on a handout (see Appendix D) and an Exploring
Careers booklet (see Appendix E1). The booklet contained step-by-step instructions that outlined the tasks for each section of the booklet (see Appendix E2).

**Step One: Planning.** The students were to explore the websites provided on their handout and find three careers they were interested in. Upon choosing three career interests, the students were to write down a job title and job description within the given fields in the handout (see Appendix E3). The students were then to narrow down their three choices to two favourites, and explain why they favoured the two careers.

**Step Two: Retrieving.** A graphic organizer was utilized by the students to help them find and organize information about each chosen job. The organizer had blank fields containing questions pertaining to the career’s job description (see Appendix E4). All of the fields had to be completed by the student. This activity was similar in nature to the newspaper ad (Lesson 3).

**Step Three: Processing.** The two careers were to be compared and contrasted by drawing a venn diagram with Microsoft Word’s *shapes* and *textboxes* feature. This step necessitated continuous monitoring and assistance from the teacher, and required the teacher’s approval before the students were allowed to print out their diagram. Once the students received their printed venn diagrams, they were to highlight information they believed was important, and circle any facts that attracted them to the job. Finally, the diagram was to be stapled and included into their career booklet.

**Step Four: Creating.** Each student was to narrow down their career choice to one career, and pick a particular method of presenting his or her collected information on their chosen career. The suggested mediums were: a powerpoint presentation, a brochure, a short story, a short essay, or a medium of the student’s choosing that was approved by the teacher. The child’s presentation required the following criteria to be fulfilled (see Appendix E5):
• Why the career was picked. The child was required to defend his or her reasoning by appealing to personal skills and interests.

• Relaying discovered information from the effective use of the graphic organizer.

• How the career was similar or different from the second career choice (hence the use of a venn diagram)

• An explanation of the student’s perception of the career

• If the student believed he or she would enjoy the career

• Additional information not covered by the aforementioned criteria

**Step Five: Sharing.** Every student was allotted a date and time to share his or her presentation with the class. A rubric was created and provided for the students so that they knew how they were to be graded and what was expected of them (see Appendix F).

**Step Six: Evaluation.** The students assessed their peers through the provided rubric (see Appendix F). Each student also completed a self-evaluation of their performance and participation in the unit (see Appendix E6). Lastly, a summative evaluation of the unit was conducted and completed by the students (see Appendix H).

**Method of Evaluating the Effectiveness of the Career Planning Unit**

**Formative Assessment Method**

Information provided through formative assessment was used to effectively modify the unit to the students’ learning needs. The following methods were used for the purpose of gauging levels of student interest, and not used to determine the students’ grades.

**Job Journal.** Students kept a daily logbook where they were able to record their thoughts and feelings about the content of the unit (see Appendix G1). Evaluations of some of the activities, as well as responses to Career Profiles was the focus of the journals.
**Self-Reflective Survey.** This evaluation was specific to the research project in Lesson 4 (see Appendix G2). The purpose of this survey was to provide the teacher with insight on how the students felt about the research project and reveal if the activity’s methods achieved the desired goal.

**Summative Evaluation Method: Student Evaluations**

Upon completing the unit, the students were asked to rate the usefulness of each lesson as it applied to career planning. The evaluation consisted of three segments (see Appendix H):

**Part 1.** The first segment of the student evaluation asked whether or not each activity was completed. The participating student was to check a box under the column “I did it” if he or she completed the activity, or the check the box under the column “I didn’t do it” if the activity was yet to be completed.

**Part 2.** The second segment of the student evaluation required the student to rate the helpfulness of each activity. Helpfulness was defined as how personally relevant and useful each activity was. Students were to circle either a sad face for “Not good at all,” a neutral face for “Good,” or a happy face for “Great.” Moreover, Part 2 contained open questions that asked for written feedback.

**Part 3.** The third segment of the student evaluation asked students whether they believed they had achieved the learning outcomes by responding to each statement by circling a sad face for “I Don’t Agree,” a neutral face for “I’m Not Sure,” and a happy face for “I Agree.”

**Summative Evaluation Results**

Of the 22 participating students, 20 students completed the summative evaluation. Two students who were unable to complete the evaluation due to disability.

<td>1 (5%)</td>
<td>19 (95%)</td>
</tr>
</tbody>
</table>

*Note: Overall on average, 95% of the students completed all of the activities.*

The following table displays student feedback on the perceived helpfulness of each activity.

**Table 2**

Part 2: Perceived Helpfulness of Each Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Not good at all</th>
<th>Good</th>
<th>Great</th>
<th>No Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skill Stars</td>
<td>1 (5%)</td>
<td>11 (55%)</td>
<td>8 (40%)</td>
<td></td>
</tr>
<tr>
<td>Best Job in the World Ad</td>
<td>3 (15%)</td>
<td>3 (15%)</td>
<td>13 (65%)</td>
<td>1 (5%)</td>
</tr>
<tr>
<td>Career Research Project</td>
<td>0 (0%)</td>
<td>4 (20%)</td>
<td>16 (80%)</td>
<td></td>
</tr>
<tr>
<td>Career Presentation</td>
<td>0 (0%)</td>
<td>4 (20%)</td>
<td>16 (80%)</td>
<td></td>
</tr>
</tbody>
</table>

*Note: Overall on average 94% of the students rated all of the activities either Good or Great.*

The majority of students commented on the written portion of the evaluation that they especially enjoyed learning about different careers and being allowed to pick any career they wished.
Moreover, many students also enjoyed learning about the skills and interests possessed by their peers.

<th>I Agree</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 (5%)</td>
<td>1 (5%)</td>
<td>18 (90%)</td>
</tr>
</tbody>
</table>

Note: Overall on average 85% of the students agreed that this unit met all of the objectives.
Written feedback on how the unit could have improved revealed fascinating comments. Many students requested more writing projects to be included within the unit. However, there was also a sizable amount of negative feedback regarding the job journals. This dichotomy was especially notable because it indicated that the students were eager to learn but only if the material was amenable to their learning needs. We will expound on this dichotomy further within the subsequent discussion of our findings.

**Discussion of Effectiveness and Future Directions**

Introducing each subject with the Career Profiles was notably effective, particularly for students who typically struggled with staying attentive. Every student at one point either raised his or her hand to ask a question or share a story relating to the career that was being discussed. The students’ level of engagement and eagerness to learn about careers may have been due to the novel idea that proficiency in a particular school subject could lead to a successful career. The students were already naturally curious about possible future careers, and relating these possibilities to school subjects was an unfamiliar but readily welcomed interconnection. Discussions were lively and enthusiastic, and made for easy transition into the school subject as well as the Career Planning unit.

The research project and presentation was well-received by a large majority of the class. The students looked forward to researching their careers on the internet and easily stayed on task. The teacher encouraged the students to talk to one another and help fellow classmates in their research. A cooperative but self-directed learning environment was thus fostered by providing students the opportunity to freely explore career paths of their choosing and allowing them to combine their efforts in retrieving resources. The students were especially interested in their fellow classmates’ careers of choice and comparing others’ choices with their own.
The job journals did not achieve their desired outcome. Many students were largely apathetic towards their journals, most of whom did not complete them due to a lack of time. The teacher was able to gather greater information for her formative assessment by simply observing and holding individual conversations with every student. Daily job journals were viewed as a redundant task due to disinterest. Student disinterest can also largely be attributed to the nature of the questions asked by the job journals. Most of the journal questions did not ask the students to creatively synthesize new information, but simply asked the student to discuss why a certain dimension of the unit was considered to be his or her favourite. Due to the intimate nature of the classroom’s social climate, the journals did not foster a more interactive atmosphere that would have been both socially and creatively amenable to the children’s learning needs as previously exhibited when the students were engaged in their research projects. Should job journals be implemented again within a similar unit, the journal’s content should be far more explorative in its desired content by requiring more from the child’s imagination, self-reflection, and even abstraction.

One journal activity suggestion would be to have students imagine an ideal day set in the future, where they could describe how they pictured themselves 15-20 years from the present. For example, they could envision and write about what personal qualities they possessed, what job they were employed in, what hobbies they enjoyed, what their family looked like etc. The teacher could also encourage the students to share their imagined information with each other, as they similarly did with their research projects and presentations. This sort of journalling activity would have addressed the students’ request for more writing activities. Requests for more writing activities certainly suggests that the students enjoyed learning the subject material, but their eagerness to learn was dependent upon the medium by which the subject material was presented.
As previously observed in the students’ research projects, activities that required creativity, imagination, dreaming, and self-reflection were highly amenable to their learning needs. More importantly, this type of exercise makes the writing activity more personally meaningful, thus enhancing student engagement.

**Conclusion**

Despite the fact that grade 5 students are not at an age where they must decidedly commit to a career path, it does not diminish the need to impart career planning skills at an early age. Early intervention within the curriculum (of this unit) was successful because the school subjects were made personally relevant by integrating career education into the subjects’ content. As evidenced by this intervention, career education can foster a love for learning because the subject material is perceived as useful. Subjects should also be infused with activities that can allow students to harness their imagination to creatively generate new information that will satisfy their imaginations. As evidenced by the success of the research projects and presentations, students are eager to share new-found information with each other, and are intently curious to receive such information from their peers. Furthermore, natural curiosity at a young age should thus be nurtured and directed to building critical skills that can equip this generation of students to be successful adults who make well-informed decisions regarding their futures. Over a sufficient amount of time, our hope is that students can eventually come to master these skills. A career planning unit can be easily integrated into almost any curriculum for the purpose of teaching students the strategies and techniques that will be conducive to their future career success. The key to effective teaching is to find what is personally meaningful for students so that they are personally motivated to practice what they believe is immediately useful in the present and is of eminent value to their futures.

‘The Best Job In The World’ Ad
You are a newspaper writer working for The Townsville Logbook. Your boss has just come to you and given you your next assignment for the paper. You have two classes to complete your assignment and have it in to your boss so it can be printed in next week’s paper. Here is your assignment:

**The Townsville Job Assignment:**

**Role:** Newspaper writer.

**Task:** to write an ad for the best job in the world.

**Requirements:**

1. the job title
2. the duties and activities that the job requires
3. the working environment
4. any perks that come with the job
5. the hours that the job requires you to work
6. an explanation of why this is the best job in the world

Remember, this is what YOU think the best job in the world would be. Not only do you have to give the required information, but you have to do so in a way that convinces the readers of The Townsville Logbook that this truly is the BEST JOB IN THE WORLD!

Are you up for the challenge?

Appendix E2

Exploring Careers Project

BIG QUESTION: What types of careers are out there that I might be interested in?

Step One: Planning
You will begin by choosing three jobs that you think you may like based on your interests. You will then use the internet to research the jobs and find out some interesting information about each of the jobs. Then, narrow your choices down to your two favourites. State why you chose those careers as your favourites.

Step Two: Retrieving
Next, you will use graphic organizers to research more information about the two jobs that you chose. This will help you find out more details about each job and if they are really something that you can see yourself doing in the future. It is OK if you find out that you may not enjoy either of these jobs – remember, finding out what you don’t like can help you find out what you do like.

Step Three: Processing
Then, you will use the information that you found about your two career choices to compare (what is the same?) and contrast (what is different?) the jobs. You will make a Venn Diagram to show what is the same and what is different about these jobs. Print out your final product AFTER it is checked by a teacher. This will be handed in with your project. On your copy of the Venn Diagram, highlight the important information about each job, circle any facts that make you really like either job.

Step Four: Creating
Next, you will be choosing a method to share the information with your classmates. You may choose one of the choices on your “Creating” page, or you may ask a teacher if you have any other ideas. Make sure you are following all instructions so that you have all of the information that you need to be able to share these careers with your peers.

Step Five: Sharing
You will present your career information to your classmates and teachers. More information about the presentations will be given closer to the date of the presentations.

Step Six: Evaluating
Once the whole process is complete you will do a self-reflection about your participation in the Exploring Career Process. You will also be evaluating a peer while they do their presentation so that they can have feedback on how they presented their information. This means that you will be getting evaluated by a peer during your presentation! We will end the whole project by doing an evaluation for Miss Brewer about how you think the project helped you start to think about the different careers that are out there.
Appendix E3

**Planning:**
Exploring Career Choices

Choose three careers that you think you might enjoy doing. Think about your skills and interests when you choose these careers. If you need help thinking of some job titles, talk to your classmates or ask a teacher.
On the internet, find out one or two things that you would have to do if you had this job. Write a one or two sentence summary of the job. Next, narrow your choices down to the

Creating and Sharing Our Career Exploration

Choose one of the following ways to present the information that you have found on the careers that you chose to explore:

Powerpoint, poster, brochure, short story (a day in the life...), short essay,
However you choose to present your information, you must include the following:

1. Why you picked this career. Defend your reason by linking it to your interests and skills.

2. The information that you found out about your career. Use the information from the graphic organizer.

3. How it is similar and different from your second choice career.

3. If the career was what you thought it would be. It is OK if you found out that it might not be the job for you, but explain why.

4. If you still think this is a career that you would enjoy.

5. Anything else that you may have found out during your research, you can be creative!

Good luck and have fun!

This lesson helped me to learn a lot about myself. 😞 😞 😊

This lesson helped me learn a lot about careers 😞 😞 😊

This lesson made me excited about what I could do with my life 😞 😞 😊

This lesson made me want to learn more about different careers 😞 😞 😊

Thank-you very much for your help!

Abstract

The following article presents the effectiveness of a Career Education unit integrated within the Art, Language Arts, and Information and Communication technology curriculums at the grade 5/6 level. The unit was delivered to a classroom largely comprised of students who demographically belonged to an ethnic minority group. Many of the students had just recently immigrated to Canada and were learning English as a second language. Overall on average, 95% of the students reported the unit’s activities to be helpful, personally relevant, and conducive to attaining personal career goals. Approximately 92% of the students stated that the unit was effective in helping them learn more about available careers, and 92% of the students were eager to learn more about different careers. Despite the enthusiastic reception to the unit’s activities, 67% agreed that the unit helped them learn a lot about themselves, and only 50% indicated that they were excited about what they could do in their life; the rest were mostly unsure. Career Education is shown to be most successful in culturally diverse classrooms when employing artistic mediums compared to language-heavy activities.

Keywords: elementary career planning, curriculum and career education, multicultural classroom education
Career Education In a Multicultural Classroom: Integrating Self-exploration and Goal-setting Lessons Into the Curriculum Through Artistic Mediums at the Grade 5/6 Level

Introduction

The process of Career Education is a lifelong initiative characterized by the development of critical skills which can begin in early childhood and take fruition in adulthood (Magnusson & Starr, 2000). Furthermore, the conception of a meaningful, lifelong career should not be defined upon whence an individual has concretely formulated a career path, but rather when an individual begins to explore and reflect on personal strengths for the purpose of finding a career amenable to his or her personal strengths and individuality (Kosine, Steger, & Duncan, 2008). Individuals who have attained a considerable level of self-knowledge, particularly in the area of metacognition, are also more likely to be vocationally decisive (Symes & Stewart, 2007). The overarching premise of the following unit plan posits that Career Education begins from an understanding of oneself. This foundational dimension of understanding can be introduced at an early age through artistic activities integrated into any curriculum. Artistic mediums are particularly effective in discovering facets of personal identity, and one’s value within a community (Pöllänen, 2011). The importance of self-knowledge, knowledge of available career
options amenable to one’s individuality, and discovering meaningful life-goals are the primary objectives of the proposed unit plan. The processes of envisioning, dreaming, and imagining through artistic mediums are integrated into various dimensions of the following unit plan in order to facilitate the exploration of thoughts, ideas, feelings and experiences. Correspondingly, goal-setting facilitates in the management of these thoughts, ideas, feelings, and experiences obtained from the artistic processes.

**Context of Teaching Environment**

**Student Demographics**

The unit plan was implemented in a combined grade 5/6 classroom comprised of 13 grade five students and 10 grade six students located within a small inner-city elementary school within a large urban populace. The school serves families within the surrounding community, most of whom belong to ethnic minority populations and low-income groups. Naturally, the student population was culturally diverse. Approximately half of the school’s population was comprised of newly-enrolled students that had recently immigrated to Canada. A school-wide census was conducted prior to the commencement of the unit-plan implementation, and revealed that 39% of students learned English as a second language, 24% were special needs, and 7% were First Nations.

**Learning Outcomes of the Proposed Unit**

The Proposed unit endeavoured to attain the following objectives:

1. **Self-discovery:** recognize, appreciate, and understand personal qualities, thoughts, ideas, feelings, interests and experiences in oneself and others.

2. **Career-discovery:** explore and understand various career options available that will complement one’s individuality.
3. Goal-setting: effectively manage and aggregate thoughts, ideas, feelings, and experiences to create realistic and meaningful goals relative to one’s future career.

**Language Arts Objectives Achieved by Proposed Unit**

The following learning outcomes as per outlined in the Alberta Language arts curriculum were attained by the proposed unit:

Within the Organization of the program, it is expected that students will listen, speak, read, write, view, and represent to:

1. Explore thoughts, ideas, feelings, and experiences.
2. Comprehend and respond personally and critically to oral, print, and other media texts.
3. Manage ideas and information.
4. Enhance the clarity and artistry of communication.
5. Respect, support, and collaborate with others. (Alberta Learning, 2000)

**Information and Communication Technology Objectives Achieved by the Proposed Unit**

The teacher operated under the assumption that technology is best learned within the context of applications, activities, projects, and problems that replicate real-life situations. The Information and Communication Technology (ICT) curriculum seemed to be an ideal fit for career exploration. The following objectives were attended to within the proposed unit. The ICT objectives addressed by the unit include the following:

Students will:

1. Access, use and communicate information from a variety of technologies.
2. Seek alternative viewpoints, using information technologies.
3. Use organization processes and tolls to manage inquiry.
4. Use technology to aid collaboration during inquiry.
5. Electronic research techniques to construct personal knowledge and meaning.

6. Understand the role of technology as it applies to self, work and society. (Alberta Learning, 2003)

Art Objectives Achieved by the Proposed Unit

As previously mentioned, artistic activity was the primary medium employed to offer students a creative outlet to express their views, and visions. The specific art objectives accomplished by the proposed unit are as follows:

1. Reflection: responses to visual forms and artwork

2. Depiction: development of imagery based on observation of the visual world

3. Composition: including organization of images and qualities in the creation of unified statement

4. Expression: use of art materials as a vehicle or medium of saying something in a meaningful way. (Alberta Education, 1985)

Detailed Description of Proposed Unit Plan

Lesson 1: Career Journal--Personal Edification Through Reflective Writing

Students received a career journal where they were to record dreams, poems, or events that made them happy or unhappy. The journals could also include entries that addressed what they learned about themselves throughout the course of the unit. The purpose of having a journal was purely for the advancement of self-knowledge and personal edification for the students, and thus the journals remained in the students’ possession and were not collected for marking. The efficacy of maintaining journal was evaluated by the students themselves at the conclusion of the unit. Students were to share entries only if they were willing. They were also allowed the opportunity to decorate and personalize journals. Five to ten minutes, three times a week, over
the course of 9 weeks, were allotted to complete each entry. Upon completing the entire unit, students had the opportunity to review and compare each of their entries in order to recognize and observe their own personal growth.

**Lesson 2 Task 1: Interest Inventory--Discovering Meaningful Career-related Activities**

Each student was provided with an Interest Inventory worksheet, retrieved from the Saskatchewan Education (1995, Module 3, Activity 6) website. The worksheet consisted of various common career-related activities that the students were possibly interested in. Students were instructed to complete the worksheet by writing “Yes” if they believed the listed activity was interesting, and “No” if they were disinterested in such an activity. The purpose of completing the worksheet was to initiate a self-explorative process for the students and examine why such an activity would be appropriate to their individuality.

**Lesson 2 Task 2: Adjective Checklist, and Interview--Attaining Knowledge of Oneself and Others**

The teacher provided each student with an Adjective Checklist and Interview worksheet. On one side of the worksheet was a checklist of descriptive words that were grade-level appropriate (see Appendix A1), while the opposite side contained blank fields to be filled for the purpose of conducting an interview (see Appendix A2). An additional worksheet containing only the Adjective Checklist (identical to the aforementioned checklist) was also provided. The purpose of this lesson was not only to promote self-discovery but also to appreciate the qualities in others.

**Adjective Checklist.** Every listed adjective on the checklist was reviewed in a class discussion prior to the commencement of the activity. Once the students were familiar with the definition of each word, they were to complete the worksheet (containing only the checklist, not
the interview form) by placing a checkmark beside the words that they believed were accurate
descriptions of their character. Students were also provided with a dictionary if they needed
further clarification on, or struggled to recollect the meaning of a particular word.

**Interview.** The students were instructed to find a partner they did not know well or did
not regularly associate with. Once the students divided themselves into pairs, the teacher then
facilitated a brainstorming activity that required students to generate meaningful questions to ask
their partner regarding his or her strengths, interests, and personal qualities relative to the
aforementioned adjectives. Question-ideas provided by the students were discussed and written
on the board. Students were then instructed to complete their double-sided worksheets by
choosing five questions from the board to ask their partner, and writing their chosen questions
onto their interview worksheet. Upon completing their interview, the students were to turn to the
reverse side of the worksheet and check-off the words they believed described their partner.
Once the second checklist was completed, the students could then compare both checklists to
determine if their perception of their partner accurately reflected their partner’s self-perception
(and vice versa). Discussion of findings amongst partners was also encouraged. Furthermore, the
teacher demonstrated how a Venn diagram could be employed to compare and contrast their
partners’ list of adjectives with their own, as relative to the words on their completed checklists.
The purpose of the Venn diagrams was to reveal how individuals were uniquely different, but
also shared similarities. This lesson was concluded by having each pair present their partners to
the class by describing what they had learned about their partner’s personal characteristics.

**Lesson 3: Perfect Day Timeline--Conception of Goals Through Imagining and Dreaming**

Students were to develop a timeline that represented a “perfect day” set 20-30 years into
the future. The purpose of this activity was to encourage further self-exploration and to begin the
process of conceptualizing and formulating goals. The teacher instructed the students to close their eyes and get comfortable in their desks as she read aloud a guided-imagery script to aid them in envisioning their perfect day (see Appendix B). Once the visualization had ended, the students were to construct a timeline that depicted the events they imagined during the guided-imagery exercise. Small drawings and short descriptions were to be included on the timeline. The students were also to colour and decorate their timeline as they wished with provided art materials. On the reverse side of the timelines, the students were to answer the following questions: “Explain what your favourite part of the day was and why”; “Why did you enjoy doing those activities?” and “What does that say about what is important to you?”

**Lesson 4: Personal Puzzle Piece--Combining Previous Themes**

The Personal Puzzle Piece was an art project that sought to aggregate learned material through visual representation. Each student was provided with a Jigsaw cut-out (see Appendix C) that was to be decorated and personalized. Using the information from the Interest Inventory, Adjective Checklist, Interview, and Perfect day activities, students were to personalize their puzzle piece so as to accurately represent their individuality. One side of the puzzle piece contained only visual representations of their individuality; magazine pages, construction paper, colouring tools, and various art supplies were provided for this purpose. The other side of the puzzle piece was for the students to write a short paragraph that described why they chose specific images, colours, and cut-outs to represent themselves. The overall purpose of the lesson was to review and reinforce previous lessons. Lesson 4’s content was thus not included as part of the summative evaluation administered at the end of the unit.

**Lesson 5: Tests on Work Habit--The Importance of Work Ethic**
In order to emphasize the importance of strong work ethic and understanding of what it means to “work”, two quizzes retrieved from the Labor Market and Career Information (n.d.) website were employed: a True/False quiz (p. 38) and a Work Habits questionnaire (p. 33). The quiz consisted of a list of statements of which the students were to determine was either true or false. If they believed the statement to be false, they were to justify their reason for their answer on the reverse side of the quiz. Once every student completed the quiz, the teacher reviewed every statement and elicited discussion from the class as to whether or not each statement was true or false. Following the quiz was the Work Habits Questionnaire, which required students to evaluate themselves on a scale of 1-10 on statements that included various tasks indicative of the students’ conscientiousness and sense of work ethic. Lastly, students were to identify and write down two personal areas in need improvement as revealed by the questionnaire.

Lesson 6: Looking Into a Crystal Ball—Envisioning the Future

Similar to the Perfect Day Timeline activity, this activity sought to aid students in further formulating their future goals and aspirations. Every student was provided with a worksheet that contained an image of a crystal ball, divided into three sections (see Appendix D1). Each section of the crystal ball was to contain a picture that represented the student’s life at a certain point in time. The first, second, and third sections were to depict how the student envisioned their lives 5, 10, and 20 years into the future, respectively. A complete set of instructions, including questions to ponder, was also provided to the students (see Appendix D2). Students were asked to share their thoughts and views in a class discussion following the completion of the activity. The teacher paid special emphasis to the idea that different people possess different values, personal strengths, and goals, therefore everyone’s future will naturally vary as depicted by the crystal balls.
Lesson 7: Goal-setting Strategies

Discussion on the relationship between goal-setting and self-knowledge. The lesson began with a class discussion on how individuals change, and grow over time. The teacher had the students examine how their interests, ideas, and values have changed and evolved since kindergarten. The teacher then explained how this evolution of character would continue, and would profoundly affect the goals the students would form throughout their lives. The purpose of the discussion was to convey the idea that long-term goals—similar to interests, ideas, and values—can change or become more salient over time as a result of greater self-knowledge. Additionally, the teacher explained that in order to achieve these goals, effective goal-setting skills must also be developed and improved upon over time.

Implementing goal-setting strategies. The students were to create a personal goal, and create a plan of action for achieving it. The teacher provided an outline of how a goal could be achieved and facilitated a discussion on achieving goals (see Appendix E1). Additionally, the teacher provided the class with an example of a specific goal that could be achieved using the provided outline, as a template to follow (see Appendix E2). Finally, the students were then tasked to formulate an action plan in achieving a particular goal of their choice, by following the provided template.

Lesson 8: Career Exploration Through Research

Exploring careers by using internet sources. Students were to explore the City of Calgary Youth Employment Centre (1997) website (www.nextsteps.org) and browse through the video section by clicking on the link titled “Career Planning”, and then explore either the “Career Videos” or “Career Profiles” section of the website. These webpages included a lengthy list of careers with accompanying job descriptions and/or videos. Each student was required to select
from the list, three occupations they desired to learn more about. Students were also given the option to work with a partner who had similar career interests. The students were to narrow down their careers of interest to a single career by determining which of the three they felt were most suitable to their individuality. The teacher provided each student with a worksheet that asked questions pertaining to the research that the student conducted (see Appendix F).

**Exploring careers by interviewing community members.** Students were tasked to interview a family member, friend, or member of the community whose profession they thought was particularly interesting. An interview template with a list of questions was provided (see Appendix G); interviewee answers were to be recorded onto the worksheet by the student.

**Unit Conclusion: Presentation**

The final task required each student to create a presentation of their chosen career that was to be shared with the class. Students were given the freedom to present their information in any format they wanted, so long as the format was approved by the teacher. Presentation formats included PowerPoint slideshows, brochures, and posters. Some students even had a community member assist in their presentations.

**Evaluating the Effectiveness of the Unit Plan**

**Student Evaluation Form Results**

Students were to complete an evaluation form (see Appendix H) consisting of three parts:

**Part 1: completion of activities.** The student was to simply report whether or not a particular activity was completed by placing a check in either the column “I did it” or “I didn’t do it.” All of the unit’s activities were included in this checklist.
Table 1

Part 1: Completion of Activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>I didn’t do it</th>
<th>I did it</th>
</tr>
</thead>
<tbody>

<tr>
<td>Career Interview and Research</td>
<td>0 (0%)</td>
<td>24 (100%)</td>
</tr>
</tbody>
</table>

Note: Overall on average, 98% of the students surveyed completed all of the activities

Part 2: perceived helpfulness of the activities. The student was to indicate whether he or she believed a particular activity was helpful by circling a sad face for “Not good at all,” a neutral face for “Good,” and a happy face for “Great.” Helpfulness was defined by how personally relevant the activity was, and if they felt the activity was conducive to attaining future career goals.
Part 2: Perceived Helpfulness of the Activity

</table>
Note: Overall on average, 75% of the students agreed that this unit met all of the objectives.

Discussion of Results and Future Directions

Challenges in language and comprehension were quite evident due to language barriers since many of the students had just recently immigrated to Canada. Students responded rather favourably in regards to the helpfulness of the given activities despite their apparent language difficulties. Lessons were required to be continuously modified for students with special learning needs relative to language, reading ability, and developmental level. Naturally, such modifications required the teacher to spend substantial amounts of time in preparation. Intimate knowledge and understanding of every student’s learning needs and language competencies should be gained as soon as reasonably possible within the context of a highly diverse classroom.

Despite the students’ warm response to the provided activities, only 50% of the students felt excited about their future career prospects. Similarly, despite the inclusion of a number of self-exploratory activities and the students’ enthusiastic engagement in completing them, only 67% of the students felt they learned a lot about themselves. These surprising results may be due to the language difficulties and cultural barriers present within the classroom. It may very well be that the students simply did not understand the purpose behind the activities—that is, to gain an understanding of oneself—despite having successfully completing the self-exploratory activities. It is not surprising then that most students did not indicate that they were not excited or did not learn much about themselves—many were simply unsure. This finding suggests a rather interesting implication for teachers who wish to undertake a culturally diverse classroom with significant language barriers: what constitutes as self-knowledge in one culture does not necessarily translate comparably into another culture. Similarly, in a broader sense, the
objectives of learning and education in general differs from culture to culture. Thus, teachers in culturally diverse classrooms might expect that students may not actually know that they have attained the learning objectives. This may certainly have been the case in this classroom, considering the activities were warmly received and perceived as highly useful. Moreover, the teacher’s formative assessments indicated evidence of students gaining ample amounts of self-knowledge, and that students were successful at connecting their self-knowledge to their career goals. Furthermore, Students were eager and excited to learn about careers, yet they were unsure about their own career prospects. This sense of uncertainty be due to the fact that most of the students were very recent immigrants, and were still largely apprehensive of living and working in a new cultural context. Overall, these aforementioned findings further suggest that career education be continued, particularly for newly immigrated students.

Activities involving artistry and the engagement of the imagination were noticeably far better-received in comparison to activities that involved quizzes, questionnaires, and inventories. Students were continuously engaged when undertaking artistic activities but found the various test-like worksheets to be somewhat difficult to understand. For the future, such language-heavy lesson material should be minimized in classrooms that contain a high number of students still learning the language.

**Conclusion**

Artistry, dreaming, imagination, and creativity are exploratory processes that do not require any sort of spoken language in order to be used effectively. The artistic mediums employed in the proposed unit plan were particularly effective in transcending cross-cultural barriers and language limitations. It is thus important that we as educators foster this sense of wonder when promoting a greater realization of the inner workings of the students’ self and the
world they live in. By doing so, school subjects can be made more personally meaningful, long-term goals can be made more salient, and excitement over future life prospects can take hold. Selecting a suitable career requires that students channel their natural curiosities effectively to both their inner world and outer world. For the new, immigrant child still largely unaware of the strange world they have recently come to inhabit, nurturing his or her curiosity and creativity is of profound importance. Effective communication is imperative to a child’s education--but communication need not be transmitted in words, but through a child’s hopes and dreams for the future. Career Education endeavours not only to encourage these hopes and dreams, but turn them into reality.

Appendix B

Guided Imagery Script

Instructions:
1. Think about your perfect day.
2. Close your eyes and picture your perfect day as I read a script to guide you.
3. Open your eyes and think about what was most important to you about that day.
4. Choose 3-5 activities that are very important to you.
5. Make a timeline of when those activities happened during your perfect day.
6. Draw the activities on your timeline.
7. Think about…
   ▪ why were those activities so important to you?
   ▪ what does that say about you?

Answer the questions above on the back on the timeline.
Appendix C
Appendix D1
Appendix D2

**Looking In to A Crystal Ball Activity:**
1. We are going to have the opportunity to look into a crystal ball today and see what our lives will be like.

2. Think about your life in 5 years. 10 years. 20 years. How old will you be then? Write those ages in the three squares on the worksheet.

3. Fill in the space above the age with a picture of what you see yourself doing when you are that old.

4. Complete your crystal ball for all three ages.

5. What is different about yours from others? What is the same?

Appendix E1

Instructions:
Students will review goal-setting steps to create a goal developed from ‘Work Habits’ activity. Once student have created a goal following the following steps, they will input
goal into their electronic portfolio. Students will reflect on this goal once a month and document thoughts in ‘Career Journal’ and/or through voice recordings within the portfolio.

**HOW TO SET GOALS**
1. Define the goal.
2. Outline the steps needed to achieve it.
3. Consider possible blocks and ways of dealing with them.
4. Set deadlines.

Not every wish can be a goal. For instance, you may wish you could live and stay young forever, but since there's nothing you can do to make that happen, it could never be considered a goal.

In order for something to be a goal:
• It has to be important to you, personally.
• It has to be within your power to make it happen through your own actions.
• It has to be something you have a reasonable chance of achieving.
• It must be clearly defined and have a specific plan of action.

**DISCUSSION QUESTIONS**
- Do you ever set goals for yourself? What are some goals you have right now (short term and long-term)?
- Agree or disagree: It's better to set lower goals than to risk failure by setting higher ones.
- What's the difference between a wish and a goal?
- How do you decide what your goals are?
- Have you ever set a goal that was unrealistic? What happened? What did you learn from that?
- Is it ever okay to take risks? What kinds of risks are okay? What kinds of risks are not okay?
- Have you ever gone out on a limb and risked failure in order to achieve a bigger goal? (describe) Are you glad you took that risk?
- Has there been a time when you turned a failure into a success? (describe) What did you learn from that?
- What's the difference between failing and being a failure?
- If you don't accomplish all your goals does that make you a failure?
- What are some good ways to deal with disappointments?
- What is your personal definition of success?
- Is it a good idea to set goals? Why, what do goals do for you?

Appendix E2

Goal Example:

1. Define the goal.

I want to finish a 10 km marathon.

2. Outline the steps needed to achieve it.
• Take a class on running
• Exercise daily
• Eat nutritious food
• Buy running gear
• Run with a friend
• Get advice from someone who has done a marathon
• Obtain a gym membership

3. Consider possible blocks and ways of dealing with them.

• The weather might be too cold to run outside
• Buying gear costs money
• A gym membership costs money
• Exercise is can be difficult
• Eating healthy food can be difficult
• You may not have a friend to run with

4. Set deadlines.

Ten months from now. Every month I will run one extra kilometer.
Appendix F

Career Research

Use the Internet and the library to help you answer these questions.

1. What kind of schooling do you need to get this job? (Example: High School Diploma, College Degree, University Degree)

2. On average, how much money would a person in this career or job make? Be sure to include if this amount is hourly, monthly or yearly.

3. Where can you live if you have this type of job or career? Is there a certain city, area or region? Would you have to live in a rural community or urban?

4. Would this job be a good fit for you? Tell us why you think so. What have you learned about yourself that might make you think this?

Prepare to present this information from the Career Interview and your Career Research to the class. Include all your answers and conclusions. Tell us about the person you interviewed, what they do for a career, then explain the information you uncovered in your research. Finally, tell the class if this is a career for you and why or why not.
Appendix G

Career Interview
I would like to do a career interview. It is easy—just answer these questions.

1. What is the name of your job?
   ______________________________________________________
   ______________________________________________________

2. Do you work inside, outside, or both?
   ______________________________________________________
   ______________________________________________________

3. Do you work with people, information, and/or machines?
   ______________________________________________________
   ______________________________________________________

4. What do you do on your job?
   ______________________________________________________
   ______________________________________________________

5. What do you like about your job?
   ______________________________________________________
   ______________________________________________________

6. What do you dislike about your job?
7. What kinds of tools or equipment do you use on your job?

8. What school subjects help you in your job?

9. Do you have other comments about your job?
Appendix H

Career Coaching Across the Curriculum: Student Evaluation Form

Thank you for participating in this unit plan! I would like to know if it was helpful and how it could be made better. Please answer the questions on this sheet to help me with this.

Part 1: Please let me know if you did the activities.

<table>
<thead>
<tr>
<th>Activity</th>

General Information about the Presentation

Research Presentation Title:
What's the harm? Examining the stereotyping of Indigenous people and educational interventions for Indigenous cultural safety.

Time Format: Workshop 90 minutes

Presenter Information

Speaker Bios & Contact Info

A. Cheryl Ward, EdD. Candidate MSW, RSW
Cheryl Ward is Kwakwaka'wakw from northern Vancouver Island and a member of the 'Namgis First Nation. An experienced educator, curriculum writer and e-learning developer, she is committed to social justice education and de-colonizing anti-racism work. Over the last fifteen years, Cheryl has worked on several projects related to Indigenous specific racism and cultural safety. In 2008, Cheryl joined the Provincial Health Services Authority (PHSA) Aboriginal Health team as Provincial Lead for San'yas: Indigenous Cultural Safety Training. In 2013 Cheryl was awarded the British Columbia Health Care Hero Award for PHSA. Cheryl brings with her comprehensive knowledge of the theory and practice of cultural competence and cultural safety and their importance to effective praxis, and recognized expertise in the creation of innovative and transformative education programs. In 2011 Cheryl returned to university and is currently completing doctoral research at Simon Fraser University specializing in Indigenous-specific racism and decolonizing pedagogy. Cheryl is currently the Director of Indigenous Health for the province of BC in Canada.

Suite 201-601 W Broadway, Vancouver BC V5Z 4C2; T: (250) 754-3385; E: cward-02@phsa.ca

B. Laurie Harding, EdD. Candidate, MSWI, RSW
Laurie Harding is a lead facilitator with the San'yas: Indigenous Cultural Safety (ICS) Training program in Canada. Laurie is a White woman with Scottish and English Settler ancestry. She lives on Coast Salish territory, also known as Victoria in the province of British Columbia (BC) Canada. Laurie is presently conducting research on Indigenous stereotype harm in a doctor of education program from Simon Fraser University and has a Master's degree in Social Work with an Indigenous specialization. She has been working with the ICS program for the past seven years as a facilitator and describes herself as a social justice advocate. Laurie believes that a gap in Indigenous Cultural Safety education across all levels in North America and in other colonized continents is contributing to systemic problems that lead to inequities for Indigenous people. It is because of these inequities that she works as a researcher and an educator specializing in anti-Indigenous racism, stereotype harm, and transformative education.

Suite 201-601 W Broadway, Vancouver BC Canada V5Z 4C2; T: (250) 710-6380; E: lharding2@phsa.ca

Affiliation: British Columbia Provincial Health Services Authority, Canada

Topic: Curriculum, Research and Development
Abstract

Across the world, colonization is a root cause of the inequities in education, health, housing and economic opportunity experienced by Indigenous people. Drawing upon two critically-oriented qualitative and quantitative research studies and extensive experience in delivering Indigenous cultural safety training, this presentation aims to unpack the way colonial ideologies in mainstream organizations perpetuate inequities and harm to Indigenous people.

Particular attention will be paid to the ways in which colonial ideologies embedded in the education system can promote harmful stereotyping of Indigenous people. Laurie will present data from her doctoral research with the San’yas: Indigenous Cultural Safety training program to illustrate the relationship between stereotyping and discrimination, and the impact on inequities experienced by Indigenous people. The findings from this study can inform educational contexts internationally.

Cheryl’s doctoral research emphasizes the role of educators in interrupting pathways to harm, with a view to exploring how such active interruption can be an intervention to reduce inequities across systems. Specifically, she will share ways in which enhancing knowledge, self-awareness, and skills related to Indigenous Cultural safety helps learners make sense of the inequities experienced by Indigenous people and mitigate the risk of reinforcing colonial ideologies that lead to ‘blaming the victim’. This session will particularly benefit educators and practitioners who wish to enhance their cultural safety skills by connecting theory to praxis.

Colonization has been identified as a root cause of the individual and structural inequities experienced by Indigenous people around the world. Historical and intergenerational trauma from ‘education’ policies, such as the mandatory enrolment of Indigenous children in Indian Residential Schools/Boarding Schools, continues to impact the lives of many Indigenous people and communities today. Yet, many educators do not have an accurate or adequate understanding of colonial history. The gaps between Indigenous and non-Indigenous Canadians, therefore, tend to be viewed in terms of deficits inherent to Indigenous people, rather than as a consequence of the ongoing impacts of colonization. Settler groups continue to rely on colonial ideologies to inform and reinforce the ‘Othering’ of Indigenous people, in an effort to rationalize actions that disadvantage, oppress, and harm them.

Notions of White superiority often drive colonial ideologies. Historically, these ideologies enabled settlers to rationalize the occupation of Indigenous land through doctrines such as terra nullius and the doctrine of discovery. We continue to see these ideologies contribute to the inequities experienced by Indigenous people through the perpetuation of settler narratives and stereotyping of Indigenous people.

Learners in the online San’yas educational program have provided thousands of comments that describe incidents in which Indigenous people were stereotyped and have experienced various levels of harm across educational, health, employment, child welfare, and justice systems. A case study approach was used to code this textual data and generate themes. Results from this analysis will be presented, including preliminary findings on the sites of harm within the healthcare system.
So You Want To Write A Grant: Lessons Learned About Writing and Implementing Grants Focused on Preparing Teachers of English Learners

Conference Proceedings

Description: This panel session features five presenters representing six grants totaling almost $20 million. Scholars, researchers and educators will share lessons learned when writing and implementing grants targeting preservice and in-service teachers of English learners. Presenters will discuss key components to be considered when writing grants. This will be an interactive session with opportunities to share ideas among participants and with panelists. Come prepared to share projects you would like to see funded.

Panel Session Group 1: Speed Dating for You and Your Grant Idea: Understanding Various Sources of Grant Revenue (ITEACH ELLs Project & AZGA STEMSS Institute)

Presenter: Margarita Jimenez-Silva – Center for the Art and Science of Teaching, Arizona State University

Abstract:

There are numerous sources of grant funding that exist to fund various projects focused on preparing teachers of English learners. In FY 2016, the primary area of emphasis for federal spending in education was listed as increasing equity. This emphasis resulted in the investment of $773 million for English Language Acquisition grants and $15.4 billion in Title I programs and grants (USDE, 2016). The U.S. Department of Education English Acquisition State Grants, provided over $732,144,000 in funding in 2012 with the range of new awards being $500,000–$150,058,414 (http://www2.ed.gov/programs/sfgp/funding.html). Several of the grants highlighted in this panel presentation were funding by Department of Education Office of English Language Acquisition National Professional Development Grants whose latest round of grant proposals were reviewed in the summer of 2016 and who are expected to award $23,850,000 (https://www.gpo.gov/fdsys/pkg/FR-2015-12-11/pdf/2015-31290.pdf). Furthermore, additional government funding sources exists at the state and local level. Numerous foundations and private organizations also provide opportunities for grant funding. This session will walk participants through the process, using the ITEACH ELLs and AZGA STEMSS grants as examples, of beginning with a key idea and then seeking funding. We will provide participants with various tools to help them identify possible funding sources.

Presenter: Cathy Coulter -- University of Alaska, Anchorage
Irasema Ortega—University of Alaska, Anchorage

Abstract:
It is a common complaint among teacher educators: Candidates just want strategies for teaching ELLs (something they can do tomorrow) while teacher educators want them to engage in the deeper work of partnering academic rigor (understanding theoretical underpinnings, examining research) with professional reflection (Jacobs, Assaf, & Lee, 2010). For teacher educators, it is akin to the saying, “Give someone a fish and you feed her/him for a day; teach someone to fish and you feed her/him for a lifetime.” In this era of high-stakes testing and scripted curricula, the demand is even higher for strategies, but for strategies that work within this or that district-based mandated curriculum. As a result, grant partners can find themselves at odds in terms of the kinds of classroom practice they want to promote. Using Project LEAP as an example, we will explore the tensions and outcomes of this mismatch. Drawing from a scholar practitioner approach (Distefano, Rudestam, & Silverman, 2007), we will show how theory, research, and reflection is the ultimate in strategy, akin to teaching them to fish. Finally, we will use an interactive approach to discuss possible solutions for designing professional development that is based in solid theoretical underpinnings and research-based classroom practice while also meeting the needs of district partners and grant participants who work within specific federal, state, and district mandates.

Panel Session Presenter Group 3: Unpacking an RFP: Blending Your Expertise with The Call (ARTEL)
Presenter: Dawn Lambson -- Arizona State University

Unpacking an RFP: Blending Your Expertise with the Call (2016 NPD Grant)

One of the critical first steps to writing a successful grant proposal is carefully unpacking the request for proposal or RFP. When a funder such as a public organization or government office issues a new grant program, it sends out an RFP outlining specific project specifications
and application procedures as well as specifying evaluation criteria. Meticulous attention to significant features including eligibility, submission dates and procedures, and details regarding formatting and organization can mean the difference between success and rejection. According to Harris (2015), as many as 50% of submitted proposals are rejected for not following RFP instructions.

Before beginning the proposal writing process, it is crucial to read and unpack the RFP document thoroughly in order to understand what is being requested and what criteria will be used in reviewing the proposal. The RFP will spell out all program requirements, goals, target dates, budget requirements, organization, and formatting requirements such as proposal sections, headings, page limits, and font size. To ensure that all of these details are synthesized into your final proposal, it is helpful to start with creating a summary document or checklist outlining all requirements in brief which can be used as a guide when creating and writing up the proposal. Every piece of the REP must be understood and addressed in order to ensure that all parts of your proposal conform to the requirements and have the highest chance for acceptance.

According to communitygrantsnow (2010), there are a number of key items to pay attention to when reading and making sense of an RFP:

1) *Knowing when, where and how the grant is due.* This may seem simple and direct, i.e. the recent National Professional Development RFP from the U.S. Department of Education, Office of English Language Acquisition clearly stated upfront, “Deadline for Transmittal of Applications: February 19, 2016”. However, the process is not as simple as it seems. Combing through the lengthy document, we found that there was also a Deadline for Notice of Intent to Apply which was December 31, 2015, and the application had to be submitted online via the Grants.gov website and received no later than 4:30:00 p.m.,
Washington, DC time. Further scouring of the RFP revealed a full page of instructions regarding submission information including the requirement that in order to submit the application, we had to be registered with the website, a process that can take several weeks. Creating a timeline that included a sufficient timeframe for the lengthy submission process was crucial to meeting the deadline requirements.

2) **Understanding the formatting requirements:** Grants generally have specific requirements for both content and form of the application. The 2016 NPD grant from the U.S. Dept. of Ed. included a page limit as well as requirements for margins, font style and size, and spacing. As indicated by communitygrantsnow.com (2010), such standardization makes the application easier to read and provides a means for disqualifying applicants in order to narrow the field. Specifically the RFP for the 2016 NPD grant included the warning, “We will reject your application if you exceed the page limit or if you apply other standards and exceed the equivalent of the page limit.” It is crucial to give time and attention to knowing and understanding these small but significant details as outlined in the RFP.

3) **Clarifying the goals and purposes of the RFP.** One of the first things to read through carefully and understand thoroughly is the goals and purposes section of the RFP. According to communitygrantsnow, com (2010), it is crucial that your grant application respond to the funder’s requests, and careful perusing of the goals and purposes outlined in the RFP will help you identify these specifics. The goals and purposes also provide a framework for organizing your proposal. Specifically stated, “A good proposal response should always show why it is consistent with and furthers the goals and purposes of the RFP” (communitygrantsnow.com, 2010).”
The RFP that our 2016 NPD Grant proposal responded to began with a description of the purpose of the program, specifically “to support professional development activities that will improve classroom instruction for English learners and assist educational personnel working with such children to meet high professional standards.” It went on to specify the types of programs that would be funded through the grant and outlined the specific program elements that the department had determined as significant to their goals and purposes. These were stated as competitive funding priorities and identified what was most important to the department in terms of program design. The RFP for the 2016 NPD GRANT specified one absolute priority which all proposals had to meet, that was, to provide professional development to improve instruction for English learners, two competitive preference priorities related to providing moderate evidence of effectiveness and improving parent, family and community engagement, and two invitational priorities, dual language approaches and supporting the early learning workforce to support ELLs. The competitive preference priorities and invitational priorities offered opportunities to accrue additional points towards evaluation of the proposal and highlighted key goals/priorities of the grant.

Careful reading of the priorities revealed that this new call for programs had shifted significantly towards more evidence-based projects utilizing research designs quite different from previous calls. Comparing the RFP’s goals and priorities to the program design that we had created in anticipation of the grant call, we found that only the absolute priority was already intact. To address the other priorities and align our proposed program model to that of the call, we would need to reconsider and revise our initial plan in significant ways. This is where it becomes critical to carefully and creatively align one’s
own expertise and goals with the goals and purposes of those called for in the RFP. Specifically for the 2016 NPD Grant this meant reshaping the program to include a quasi-experimental design and finding published research evidence that supported our proposed program model and implementation. It also meant reshaping the program to incorporate a dual language focus and incorporating a stronger emphasis on parents and community. We found that some of these modifications were an easy shift and fit well into the program we had already outlined. Others required networking with experts in other fields and tapping into new expertise and resources in order to design a program that would align as closely as possible to the call of the RFP.

4) **Identifying the points.** As part of the review criteria, RFPs spell out the specifics of what needs to be included in the proposal and specify point values for each portion. These point values reveal which parts of the proposal are most significant and likely require the most time and effort to develop. These knowledge can be used to guide the proposal writing process as well as assess the strengths and weaknesses of the proposal. Paying particular attention to the section on review criteria and evaluation helps in understanding what parts of the proposal may require the most attention and ensures that all elements are addressed. For example, the REP for the 2016 NPD Grant provided the following point values for a total of 100 points:

(a) Quality of the project design (up to 45 points)
(b) Quality of project personnel (up to 10 points)
(c) Quality of the management plan (up to 25 points)
(d) Quality of the project evaluation (up to 20 points)
Using these as a guide, along with the specifics of each as outlined in the RFP, it was possible to put together a proposal that met the requirements of the RFP and aligned well to the criteria that would be used by the proposal review team in evaluating the grant.

Conclusion:

While the initial encounter with a lengthy and dense RFP can seem daunting, unpacking and processing the document can be made more manageable through reading and rereading the entire document several times with a lens focused on each of the significant elements of the request – the timeline, purpose, goals, formatting, organization, and evaluation criteria. Developing a clear understanding of each aspect of the RFP and creating a checklist of requirements will go long way towards helping you develop a strong and viable grant proposal. In addition, creating a timeline for completing each part of the proposal and allowing sufficient time for submission is a success strategy that will help the process unfold as smoothly as possible. While responding to an RFP will most likely always be challenging and time consuming, the best way to ensure that one’s efforts will be met with success is to carefully and thoroughly make sense of every aspect of the call and take time develop strategies for compiling all aspects of the proposal in a timely and organized manner.

Panel Session Presenter Group 4: If I Build It, Will They Come?: Designing Optimal Program Models, Management Plans, and Project Budgets (TELAC)

Presenter: Anthony Trifiro -- College of Liberal Arts and Sciences, Arizona State University

Abstract:
In this interactive session, participants will consider their grant project idea from the perspective of: program model, the proposal’s key personnel and project milestones, and budgeting for successful implementation. Effective, high quality PD programs that implement a new (reform) teaching practice are programs that engage participants’ participation, support active learning, foster salient connections to classroom context, and are of longer duration (Garet, Porter, Desimone, & Yoon 2001). A program model considers the program scope, its participants, organizational impact to participants and schools, and intended outcomes (Authors, 2015) A project’s management plan considers the project team’s capabilities, addresses the overall personnel needed to support the entire project, defines budget parameters relative to the RFP, and includes milestones relative to the project’s timeline (ASU Knowledge Enterprise Research Administration). The budget aligns the project scope, meets internal university requirements, meets funder’s requirements, and supports a complete evaluation. The budget and its narrative provide the funder with an understanding of how funds are employed and financial framework supporting project’s success. Components of a budget that include student support and U.S. Department of Education parameters will be used.

Arizona State University, Knowledge Enterprise Development Research Administration Proposal Information/Resources  https://researchadmin.asu.edu/proposal-information-and-resources

(Authors, 2015)

The successful implementation of a sponsored project relies on program development, managing project objectives and budgeting for its successful implementation. Key guiding questions for the project, in the sponsored project development stage are:

Question 1) (Program Model) What elements of the program model are necessary to support participant learning and participant outcomes through the professional development initiative?

Question 2) (Management Plan) What are the key elements of the management plan (personnel and activities) that will support the project?
Question 3) (Budget) What budgetary requirements must be fully included to support the project for its duration?

Addressing these fundamental questions aids in developing these three areas. Using guiding questions preliminarily helps in making important decisions to these areas while formulating the proposal.

When responding to all the requirements of a grant call or request-for-proposal (RFP) for teacher professional development, researchers must consider which characteristics of the grant call or competitive priority in the NPD 2016 Grant will be addressed. Regardless of which competitive priorities are addressed, the program model must be one that provides a high quality program, supported by research, and in the case of NPD 2016, supports teachers in developing new (reform) teaching practices. Primary importance of a professional development program model/program design is supporting participant learning and maximizes effectiveness. Garet et al (2001) suggest that programs that engage and encourage participants’ participation, supports active learning, fosters salient connections to classroom contexts, and are of longer duration become key characteristics for an effective professional development (Garet. Porter, Desimone, & Yoon 2001).

In developing a program model for the 2016 NPD Grant as well as other grant program, the research team routinely considered the following criteria: program scope (intended outcome), its participants and their learning objectives, organizational impact relative to how will participation support their school or their PLC, and the extant the program positively impacts teaching and learning of students. When formulating a program model for the 2016 NPD project proposal, guiding Question 1 supported the research team by considering similar grants, academic literature and Arizona State Department of Education endorsement requirements.
In developing the curricular framework, researchers considered the need for participants to develop broad based knowledge. Researchers identified weak areas within the structure citing the differentiated needs for dual language teachers as a means for participants teaching in dual language contexts to develop expertise in delivery of K-8 content in both Spanish and English. These components included an understanding of the political context of language minority education, knowledge of EL students, their communities, aspects of language development and connections to first language literacy, ways of modifying instruction using appropriate sheltered instruction methods and to use assessments and scaffolding to support second language learners (Echavarría, Vogt & Short, 2009; Faltis & Coulter, 2008; Lucas, Villegas & Freedson-Gonzalez, 2008; Lucas & Villegas, 2012; Walqui, 2008; Walqui & Van Lier, 2010; Villegas & Lucas, 2002a; Villegas & Lucas, 2002b) The program focus sought to build on supporting teachers' practice changes that were culturally and linguistically centered. Learning about practice and reflecting on practice then becomes a foundational part of learning activities within the broader scope of the program design.

Proposed Curricular Model
In developing the curricular model, the research team considered a number of theoretical perspective such as Embodied Understanding of Practice (Dall’Alba and Sandberg, 2008) to support the program's curricular plan. Teachers’ understanding of key instruction for ELs is evidenced through teachers' implementation of new practices and refinement of current practices to support English Leaners and Dual Language Leaners as well as their PLC. Regardless of participants’ experience as a teacher of students who first language is other than English (LOTE), the curricular model employed establishes a solid grounding in
fundamental core knowledge relative to: language policy, EL students’ parent and community involvement, second language acquisition, literacy and bi-literacy practices, assessment, and methods of sheltered instruction. The practicum offers participants support for implementing and guiding others in practice changes.

Figure 1  The Sample Program Model-- Foundational Concept Map
From the program model, a curricular guide is established that can be easily communicated to the funder, potential districts and to potential program participants.

| **Course 6**  
| **Strategies for English Leaners and Dual Language Learners** | Focus on modifying instruction. |
| **Practicums & One-to-One Coaching (Cognitive CoachingSM)** | Two semester practicum supported with Cognitive CoachingSM. |

While Question 1 supports development a preliminary building a model, there are subsequent questions that researchers should ask of the research team during project meetings. These questions might include: How can the program be more flexible to participant’s needs? What elements of proposed curriculum insure the project is meeting participant learning objectives? In reviewing the overall model, how does the practicum component fit into the courses offered? And similarly how do the courses build upon each other? To complicate the matter further, it is very important to obtain feedback from neutral parties when possible, but of great importance is to obtain feedback from potential district participants. Building a program model requires many sources of input and valued input from district participants is integral and is one way to gain program buy-in.

**Management Plan**
A project’s management plan considers the project team’s capabilities, addresses the overall personnel needed to support the entire project, identifies how the project will be implemented, as well as identifies milestones relative to the project’s timeline. The management plan also informs key budget areas.

In developing the management plan, guiding question 2 “What are the key elements of the management plan that will support the project?” supports the research team working together to develop a plan. Subsequent questions might include: Who are the key personnel on the project and what will be their roles? How will the project select recruit and select participates? What professional development might be needed for key personnel? What is the overall timeline?

**Key Personnel**

When addressing key personnel, the primary concern, which is also budgetary, is to first address roles with respect to the project such as project oversight/control, budget oversight, instructional, program delivery/recruitment, research and evaluation. The research team must also address who within the personnel matrix will have a 12 month, full-time role on the project and who will have less while meeting all of the funding and university requirements. Identifying roles also addressing expertise and how expertise is leveraged within the project’s scope.

Oftentimes the Project Director and the Principal Investigator are the same individual (ASU Research and Sponsored Projects Manual, October 2017). Generally this position is best defined as 12 month academic faculty member or department leader who is responsible for many activities associated with the grant including: program implementation, school district relationship management, participant recruitment activities, program continuation and broad project management of research activities including evaluation from a compliance perspective. There are many factors that may cause for additional personnel leading to separation of roles.
where there is a Primary Investigator and Project Director. More often than not, on larger funded
sponsored projects with expansive scope, larger employed funds annually, expansive research
and project work, the research team may identify both the need for separation and for adding
personnel.

Non-essential staff are considered individuals who are not directly related to the project on a
day-to-day basis and will be brought into the project for a specific task and at a specified time.
However, non-essential does not imply not important. Generally a consultant to a project as
well as a project’s evaluator are considered non-essential personnel and do not appear as staff on
the project. Their role is by no means diminished on the project but is important relative to
university policies for staffing and budgeting.

The scope of the project may determine the need for additional full or part-time staff. With
respect to the NPD 2016 Project, additional staff included a full-time faculty member also
serving as co-PI and an Administrative Coordinator. The project did include an Advisor whose
role would not be limited, but rather take on an important role relative to program development,
project evaluation and project dissemination of work. This was considered to be an essential
while the evaluator was considered non-essential and did not appear as related staff to the project
but contracted services.

It is highly suggested that a simple chart be developed to address all potential personnel
members, roles, responsibilities and expertise. This can be easily communicated to the funder
and members of the department.

Getting Participants: Recruitment, Selection and Retention
Recruitment efforts, selecting participants, and retaining participants to complete a professional development program is not only an important criteria to be met for continued funding, but also has implications for a professional development study especially with control groups. As a best practice, shared by other NPD grantees and used extensively on other NPD projects, recruitment is identified as an integral activity requiring uniformity. As also shared by other NPD grantees, can be a project activity requiring extensive effort. It is therefore best to consider ways to maximize recruitment efforts through an overall organized way. In the case of the NPD 2016 grant, recruitment activities occurred at institutes, large program orientations at different IHE campuses as well as partner district school sites. Target recruitment also included email and internet recruitment. It is extremely important to also identify how the project will address diversity in their recruitment activities. This will require recruitment outreach beyond the district offices and school sites. For the NPD 2016 grant, recruitment included activities to agencies and non-profits targeting potential teachers addressing specifically diversity of color, race and sexual orientation. Recruitment efforts for this grant begin early, approximately eight months prior to the summer session in order to provide ample time to meet with districts and reach potential participants. Recruitment timeline will depend extensively on many factors including the type of professional development program that is being offered as well as district support for these programs.

As a best practice, the selection process for program participation must be consistent for all potential participants. This would require participants to have equal access such as a university website dedicated to the project as well as pre-established rubric to select participants. As a best practice from other NPD grantees, selection should have some rigor. The selection rigor should seek to address each participant’s interest in the program and specific goals for participation.
Selection for the 2016 NPD grant required completion of an online application including responding to essay prompts, providing three references and completing a program overview orientation.

Retention efforts facilitate reaching pre-established participant recruitment and program completion targets. Retention efforts begins as soon as the participant is accepted into a cohort through completion of the last part of the program. Best practices from other NPD grantees have included frequent contact with participants prior to start of the first day and addressing all concerns throughout the program. For the 2016 NPD grant, retention also included program surveys on their learning experience each semester. This has been a best practice implemented in previous NPD grants as well.

Evaluation

The outside evaluator will work with the research team to determine instruments used for data collection and how they are to be collected and analyzed. The evaluator will also assist in completing the required reports for the funder. In the case of 2016 NPD grant, the evaluator is highly involved as an outside consultant to the grant providing guidance with data collection, establishing of control groups and project evaluation parameters relative to program effectiveness and meeting established objectives. The evaluator also meets on a regular basis to review program progress.

Project Timeline

The research team might consider completing an overview of project implementation and project events relative to the overall program for each year. While this is primarily an internal tool, it can be modified as a document for communication with school districts and internal departments
within the IHE relative to global project activities. Generally, the research team would consider a
start date based on what funders communicated relative to award notification.

Budgeting
The budget aligns the project scope, meets internal university requirements, meets funder’s requirements, and supports a complete evaluation. In developing the budget, the research team addresses Question 3 “What budgetary requirements must be fully included to support the project for its duration?” The budget and its narrative provide the funder with an understanding of how funds are employed and the financial framework supporting project’s success. Having a completed program model and management plan will allow for the development of a complete program budget for the project’s duration. The budget cannot exceed the RFP’s annual budget cap. For the 2016 NPD, this budget cap was $500,000 and no more than $2,500,000 over a five year period. Similarly any additional costs such as cost of evaluation and indirect cost must be included in this yearly cap.

In order to build an accurate budget all the parameters of the program plan must be identified; and with the help of the research team and others at the IHE, the goal is to project the project’s future potential expenditures. The budget planning process is to most accurately cover all potential expenses as a means to eliminate potential risks to the project. Once a budget is submitted and approved by a funder, it is nearly impossible to have it changed. This is the most difficult part of the budgetary process. The following addresses parameters that researchers developing budget might consider.

Staff Personnel

· **Actual Staff on Grant.** How many individuals will be covered on grant funding? This will mean that 100% of staff effort will be grant related. Staff working on a different grants cannot have 100% of their effort on just one grant. Their percentage of effort must be reflected accurately also in the staff budget.

· **Hire of New Staff:** If the new project is considering the hire of new staff for a particular sponsored project, it is highly suggested that the designated PI work with HR staff to determine compensation policies, and of great importance, average salaries for a particular hire. A Project Director hire might require extensive outreach for paid recruitment sites. These costs will be charged to grant generally.
For example, if the project seeks to hire a project director, a PI maybe advised that a project director salary range from $70,000 to 100,000, however, it is up to the discretion of the PI to hire up to $90,000. However, these salary figures cause the budget to exceed its cap.

Salaries of outside personnel added to a potential grant may often require returning to the management plan to redefine the project roles. It may also require elimination of potential new hires such as graduate assistantships, student workers, or staff. Conversations with the department as to what type of support can be provided from existing staff, with an effort share from the new grant, may be the appropriate solution. Effort shares can be as little as 10% but are generally 50%.

Oftentimes, it may be required to return to the original guiding questions to gain clarity of staff roles and budget.

- **Annual merit.** Merit is always added in and is reflected in the following year’s based pay. For example, the project seeks to hire a Project Coordinator earning $40,000 has the potential of earning up to 4% merit per research administration budget guidelines. For example: Year 1 Base Pay = $40,000 and Year 2 Base Pay plus potential merit pay = $41,600. Please note you must budget for the potential merit not the generally expected or given merit in any one department.

- **Employee Related Expenses (ERE).** ERE will vary depending upon the employee’s classification. These numbers are reported usually on the research administration website under budget proposal development. Faculty generally have lowered ERE percentages than university staff. Hourly employees will have the same ERE generally as salaried staff. Student workers always have the lowest percentage.

*Other Budgetary Considerations*

The research team, when planning the budget should consider any cost related to data collection such as research instruments, hire of special consultants to provide specialized training for the professional development program, any specific type of technology for participants to be used for participation in the program and not returned, any type of specialized materials needed for instruction, requirements to attend national conferences to report on research findings as well as annual meetings that are required by the funder. Often times, other budgetary considerations are based on the number of participants planned per cohort.
Materials: For the 2016 NPD grant, the grant identified several instruments that would require purchase as well as training to be able to use the instrumentation. Cost is $85 per person. Initial training is $800 per person plus travel out of state.

Technology: For the 2016 NPD grant, participants would receive a Dell notebook at a cost of $650 per participant.

Consultant Services. A consultant would be hired to provide training on School Reform Initiative for $200 per person as part of their practicum experience.

Indirect Costs are those cost passed through to the university from the grant and are utilized by the university to support the sponsored project. For professional development projects, indirect costs are generally pre-established with the funder. For example, in writing the 2016 NPD grant, the research team had to determine the exact indirect cost percentage agreed upon with the university and U.S. Department of Human Services. The indirect cost is based on the proposal’s modified budget. There are established guidelines as to what is excluded for a modified budget and is suggested to refer back to the university’s sponsored project website on proposal budget development. In the case of the 2016 NPD grant, tuition payments to cohort participants are included in the budget which are reduced from the overall budget for determining the modified budget

Indirect Cost. These cost are based on the modified budget. For example, for a professional development program, it is determined that the entire budget for Year 1 is $489,000. However, this budget includes the cost of tuition support/grant scholarship for year 1 which is $289,000. The modified budget for Year 1 is now $200,000 and the indirect cost percentage would be applied for this grant.

For continued illustration purposes, the indirect cost in this example just happens to equal $10,000. Therefore for Year 1 the total budget is $489,000 program budget plus $10,000 in indirect cost for a total of $499,000 as the Year 1 Program Budget. The year 1 budget would be allowed as it did no exceed the funder’s original yearly cap. If it exceeded, the researchers would have to determine which costs could be eliminated.
Planning for successful project requires considerable time and effort by the research team to insure that the program model, management plan and budget are working cohesively to fully support the project’s efforts for its duration.

Did it Work?: Key Considerations in Developing an Evaluation Plan (Teachers of Language Learning Learning Community – TL³C)

Evaluating grant-funded initiatives centered on teacher or student learning is a complex task. Grant awardees often employ educational action research plans (Carr & Kemmis, 1986; Corey, 1953; Elliot, 1991; Noffke, 1997) that aim to enact some kind of educational change, require collaboration between higher education teachers and researchers and K-12 classroom teachers and administrators; and utilize mixed methods of data collection and analysis. While quantitative measures are often necessary to fulfill grant requirements and compete for future funding, qualitative measures offer the opportunity to better understand not only the outcomes, but also the processes of teaching and learning embodied in a grant.

Using the TL3C NPD Grant as an example, in this session, we will discuss ways to balance data collection and analysis across methods (qualitative and quantitative) and across resources (time, money and personnel), so that through ongoing and summative analysis, grant awardees will be better prepared to answer the question, “Did it work?” but equally as important, prepared to answer the question, “How did we get here?”

Setting the Stage: Defining what you are looking for

TL3C NPD Grant Example: Participants Served, Participant Completers, and Participant Certified Completers

One of the most challenging aspects of grant design, data collection and data analysis is creating a shared language that bridges the requirements of the grant (GPRA targets) with the lingo that is used in your institution/project. With the TL3C grant, it was clear the language used to describe participants in our original grant narrative did not align with the language (terms) the government wanted us to use for reporting purposes. In order to come up with shared terms with clear definitions, we had to go back to our project and using the terms required for reporting,
define what these terms would mean for each of our three populations (pre-service teacher, in-service teacher and paraprofessionals) participating in grant activities:

- What does it mean to be serviced by the grant?
- What does it mean to be a grant completer?
- What does it mean to be a grant certified completer?

The table below offers one set of definitions for these terms, for our pre-service teachers.

<table>
<thead>
<tr>
<th>GPRA Term</th>
<th>Definition</th>
<th>Period of Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>PST Serviced</td>
<td>Number of PST that committed to participating in grant activities (take/pass specific courses, complete X of service learning hours and attend a TL3C event)</td>
<td>Per Semester</td>
</tr>
<tr>
<td>PST Completers</td>
<td>Number of PST that meet all participation requirements (take/pass specific courses, complete X of service learning hours and attend a TL3C event)</td>
<td>Per Semester</td>
</tr>
<tr>
<td>PST Certified Completers</td>
<td>Number of PST that completed the course of study for the grant certification requirement (took students between 2-3 years to complete all course requirements for certification)</td>
<td>Per reporting year (starting in Y2)</td>
</tr>
</tbody>
</table>

Once we knew we could define these terms based on our grant goals (which our project officer clarified for us during the Year 3 meeting), using the terms and gathering data to assess these targets no longer seemed like something we had to figure out (in addition!) to our project goals, but rather, that as we were assessing our project goals, we could report out on the required GPRA targets.
Assessing As You Go: Qualitative and Quantitative

TL3C NPD Grant Example: Preservice Teachers Numbers and Narratives

One of the TL3C objectives is that 80% of PST serviced will complete the semester requirements for grant participation and the requirements for competition are threefold: students must pass their course, they must complete a certain number of service learning hours in schools and must attend at least one TL3C Grant event. After year one, we reported a startlingly low number of PST completers. When you look at numbers alone, it reads as though we totally failed at reaching our goal. Yet, when we started to pull the numbers apart - we realized that the problem lied with the service hour requirements. 80% of PST serviced passed their courses and attended a TL3C event, yet only 24% of serviced PST clocked the required service learning hours across the semester. Conducting a group interview at a TL3C PST meeting allowed us to determine why this requirement was hard for students to meet. PST reported that it was hard to earn their service learning hours because:

- They were limited to three schools to volunteer at; only one was geographically close to the college campus and many students did not have personal modes of transportation, this added an additional burden of time for student to take public transportation to and from the schools; and
- For PSTs who worked and went to school, completing 150 service learning a semester was next to impossible, our grant expectation was too high!

After the group interview and discovering some of the hurdles PST had with the service learning requirement, the grant objective was modified to require less hours each semester (the time was cut in half from 150 to 75 hours) and to allow for exceptions for school placement, pending a PST’s needs. While the NPD report that year (and in future years of the grant) placed a stronger emphasis on numbers rather than narrative, without taking the time to gather the narrative internally, our grant would have continued to miss the mark of meeting the targeted objective, but more importantly, of meeting our PST’s needs. The opportunities to weave in qualitative data collection methods with quantitatively measurable goals provided the narratives to expand the view of what was happening in the grant at the time.

Using Your Resources Wisely: Funds, time and personnel

TL3C NPD Grant Example: Why, when and how to use an external evaluator

TL3C employed an external evaluator for all five years of the grant, at the same rate of pay for time and services each year. Looking back across work of the external evaluator, we have
learned some lessons as to how we would recommend future grants make best use of this role. These include:

- Utilize the external evaluator more so in the first and last year of the grant. The first year the external evaluator should be essential to ensuring targets are measurable and tools for measuring targets are accurately chosen and used. The last year the external evaluator can also play a larger role since it is in the final year that the cumulative report is written, combining outcomes from all five years.

- During the middle years of the grant (for us it was years 2-4) the external evaluator should be used more sparingly, meeting with the grant team three to four times a year to check data collection and at the end of each year to second level data analysis.

- Protect the role of ‘external’ evaluator by not included the evaluator in regularly scheduled meetings with the core grant research team. We learned that when involved on a biweekly basis with meetings and grant projects, our external evaluator had a hard time playing the role of the outsider. It became difficult for her to recognize concerns and to be critical of aspects of data collection and analysis when she had developed an intimate relationship with the grant and grant personnel.

An external evaluator can be helpful when designing objectives and data collection, data analysis methods. But in order to allow them to play the role of an outsider raising critical questions, grant directors should take the necessary steps to plan out when and how the external evaluator will be involved with the grant activities.

References:
“First Writing Since” is a poem written by Suheir Hammad, a twenty first century Palestinian American poet, author and political feminist activist. She wrote the poem as a reaction to the attacks on the United States on the morning of Tuesday, September 11, 2001. Hammad e-mailed the poem to 50 friends. The poem took a life of its own and it was sent to 50,000 people. The poem became one of Hammad’s most famous and often anthologized poems. The main reason behind the poem's success, perhaps, is that it offered an outlet for people who were affected by the 9/11 tragedy. However, the poem also has qualities that appealed to people’s sensibilities and emotions and make it capable of evoking feelings of empathy, through various techniques and approaches, so much so that people not only read it but also contributed in spreading it all over the U.S.

What is empathy? What does it exactly mean?

Empathy is “the capacity to understand and respond to the unique affective experiences of another person” (Lamm 42). It’s “an other-oriented emotional response consistent with the perceived welfare of another.” So “if the other is oppressed or in need, empathic feelings include sympathy, compassion, tenderness, and the like” (Batson et al. 1656). It’s often confused with sympathy and the main difference between the two is that sympathy, unlike empathy, does not involve a shared perspective or shared emotions,
However, in order for empathetic feelings to be experienced by readers or audience, an overlap needs to occur between the audience and the character of the text or the speaker whose voice is expressed in the poem. In other words, there is a need to experience “a sense of similarity between the feelings one experiences and those expressed by others” (Lamm, Batson and Decety 42).

The fact that the poem is inspired and based on a real event, and such a well-known tragic event to be specific, helps in eliminating any sense of skepticism that might cause readers to distance themselves from the emotional impact of the poem and regard its details as fictional or imagined. Moreover, Hammad herself has been closely touched by the tragedy. She lives in New York and has experienced the whole event first hand as the details of the poem tells us. (Researchers) Batson et al. have found through their experiences that less empathy is reported, when participants are aware that the person they empathize with is fictional (1666). The authenticity of the experience described in the poem, therefore, predisposes readers and audience towards belief and empathy. It also encourages them to put themselves in the speaker's place (the poet) and share her feelings because all those details that she mentions in the poem are true.

“First Writing Since” uses several techniques to engage its readers emotionally and evoke empathy in them. It consists of seven sections, each of which includes two or more stanzas written in “deliberately loose, apparently improvised from of free verse.” The result is that the poem reads like “a confessional or a series of diary entries outlining the impact of the terrorist attacks on herself, her family, and the various, unnamed people she meets or imagines on the streets of New York City” (Gray 482). Hammad’s use of loose and seemingly improvised form of free verse makes readers feel that this is a spontaneous outpouring of
emotions and this, in its turn, encourages them to be open to its effect and sensitive to feelings of empathy that such confessions can arouse.

There are various techniques that can be used to evoke empathy in its audience & usually different techniques would elicit different types of empathy, such as perspective taking (cognitive empathy), memory-based empathy and emotional contagion or what is sometimes called empathic mimicry. Perspective taking entails “imagining how that person is affected by his or her plight” (Batson et al. 1656). Memory-based empathy entails remembering, rather than imagining, feelings and situations similar to those experienced by others. Emotional contagion is “the tendency to automatically mimic and synchronize facial expressions, vocalizations, postures, movements with those of another person and consequently, to converge emotionally” (Hartfield, Cacioppo and Rapson 81). In the poem, we would notice that Perspective taking and memory-based are the types of empathy that Hammad employs most frequently. I’m going to focus mostly on the first three sections.

A noticeable approach that Hammad employs in her poem, which helps in involving the audience in perspective-taking, is the use of a first person narration, an empathetic narrative technique that “best promotes character identification and readers’ empathy” (Keen 219). It is evident through the use of the first-person singular pronoun “I” (all through the poem) and also plural first-person pronoun “we” (see sections 3, 5). The whole poem is presented through the eyes and feelings of its speaker, thus maximizing the opportunity for the audience to imagine or relive (in the case of those who were touched by this particular tragedy or a similar one) the speaker’s pain and experience.

-Let’s check the poem again and for time’s sake, I’m focusing here mainly on the first 3 sections.
The first instance in which we, as readers, can be drawn into perspective-taking empathy is when reading the opening lines of the poem, in which Hammad questions the possibility to write about such a traumatic event, “there have been no words, i have not written one word,” she confesses. Like so many shocked people during that event, she is wordless. Moreover, such inability to express feelings or thoughts reminds readers through memory-based empathy technique of situations and traumatic events in which they felt similarly and were too stunned to put their feelings into words.

Through perspective taking and perhaps also memory-based empathy, readers can empathize with Hammad as she tells us “i feared for my sister’s life in a way never before” (section 1). We can remember moments in life when we were seized with fear for our loved ones because of an imminent tragedy or a situation in which they were in danger. However, even if we have never experienced such a moment, we can surely imagine how it feels to be so afraid for a loved one. Hammad, in fact, repeats this when she prays, “please, don’t let it be anyone who looks like my brothers” (section 1). In doing so, she expresses her fears for her sister and brothers’ sake and also engages the readers even more deeply to feel her plight and empathize with her. However, it goes beyond that for she prays for “anyone who looks like [her] brothers” and later on in section 6, we realize what her brothers look like: “their faces are of the archetypal arab man, all eyelashes and nose and beautiful color and stubborn hair.” By describing them, Hammad is initially encouraging readers to empathize not only with her brothers but also with anyone who looks like them. The effect is to enlarge the sphere of empathy to include Arabs and people from different ethnicities whose looks are similar to those of her brothers and different from that of the archetypal white American. In fact, Hammad makes this point clear as she writes, “most americans do not know the difference between indians, afghanis, syrians, muslims, Sikhs, hindus, more than ever, there
is no difference”(section 1). In pointing out Americans’ inability to differentiate among these different ethnicities, Hammad is also pointing to the danger that such an inability can create and at the same time she is eliciting empathy for these groups who can be easily mistaken for each other.

Another approach that Hammad employs to elicit empathy is by providing details about “the dead who are called lost” (section 3). And so she tells us about “iris, mother of three,” “priti, last seen on the 103rd floor. she was talking to her husband on the phone and the line went,” “george, also known as adel. his family is waiting for him with his favorite meal.” By providing those details about the “lost,” Hammad leads readers into imagining the feelings of the families of the “lost” or recalling similar feelings when they lost their loved ones. Readers can imagine, for example, the pain and the loss that Iris’s kids and family must be feeling. They can imagine how painful it must be for Priti’s husband to suddenly lose his wife. Readers can also imagine how worried George’s family must have been as they were waiting for him with “his favorite meal.” The details that Hammad provides about the victims make the whole experience more real to readers and also make them realize that those who were lost were people like themselves who have families and loved ones that are traumatized by the loss. It also drives home the fact that none of us is safe and that a tragedy can occur at any moment.

**Other approaches**

There are other approaches evident in the poem that help in stirring people’s emotions, engaging their empathy, and also drawing their attention to the ramifications of such a tragedy. There are many instances in which the poem promotes a more adequate model of human nature and the human condition. For one, it highlights human solidarity, which means “all persons are inherently and profoundly interconnected with others in three
Humans are connected on a practical level, as “no individual is capable of surviving without the help of others.” Additionally, “all humans are also connected with each other ontologically, through sharing a common, universal human nature.” All humans have bodies and brains and these are the basis for “the emotional-psychological-neurological attunement, care and concern for others” (Bracher 106, 109, 114).

This solidarity schema is activated early in the poem as Hammad emphasizes that the 9/11 tragedy involves not just those affected directly by it. Thus, when she tells us, in the first section, that she felt fear for her sister’s life, she concludes, “and then, and now, I fear for the rest of us.” In that way, Hammad manages to enlarge the sphere of empathy to include not only people who are closely related or loved ones, but “the rest of us.” One would assume that “us” refers, first of all, to all Arabs, who bore the burnt of American hostility after 9/11. It might also refer ultimately, to all those who are reading the poem; that is almost any human being and not just Americans.

The situationism schema is promoted when Hammad, through a perspective-taking technique, reflects on why the attackers would attempt such a heinous act. She declares: “I do not know how bad a life has to break in order to kill. /I have never been so hungry that I willed hunger/ I have never been so angry as to want to control a gun over a pen./ not really./ even as a woman, as a Palestinian, as a broken human being./ never this broken” (section 1). Here Hammad is indicating that the attacks must have been driven to a significant degree by the attackers’ circumstances and their pain. She reasons that they must be such broken human beings that it is beyond her comprehension, “even as a woman, as a Palestinian, as a broken human being” to understand what they must have gone through in order to be able to attempt such a crime and to choose “a gun over a pen.” Such passages help
readers to see how human behavior is affected by conditions outside of themselves and that’s what Hammad is trying to establish through this.

To conclude, the poem “First writing since” can be seen as an example of literature’s ability to evoke empathy in its audience. I have analyzed merely few parts to show that. However, I might venture saying that the poem’s success and the fact that it has received much attention and was widely circulated indicate that it actually appealed to people’s sensibilities and evoked their empathy in various ways.

Appendix

first writing since

1. there have been no words.
i have not written one word.
no poetry in the ashes south of canal street.
no prose in the refrigerated trucks driving debris and dna.
not one word.

today is a week, and seven is of heavens, gods, science.
evident out my kitchen window is an abstract reality.
sky where once was steel.
smoke where once was flesh.

fire in the city air and i feared for my sister's life in a way never before. and then, and now, i fear for the rest of us.

first, please god, let it be a mistake, the pilot's heart failed, the plane's engine died.
then please god, let it be a nightmare, wake me now.
please god, after the second plane, please, don't let it be anyone who looks like my brothers.

i do not know how bad a life has to break in order to kill.
i have never been so hungry that i willed hunger
i have never been so angry as to want to control a gun over a pen. not really.
even as a woman, as a palestinian, as a broken human being.
never this broken.
more than ever, i believe there is no difference.
the most privileged nation, most americans do not know the difference
between indians, afghanis, syrians, muslims, sikhs, hindus.
more than ever, there is no difference.

2. thank you korea for kimchi and bibim bob, and corn tea and the
genteel smiles of the wait staff at wonjo the smiles never revealing
the heat of the food or how tired they must be working long midtown
shifts. thank you korea, for the belly craving that brought me into
the city late the night before and diverted my daily train ride into
the world trade center.

there are plenty of thank yous in ny right now. thank you for my
lazy procrastinating late ass. thank you to the germs that had me
call in sick. thank you, my attitude, you had me fired the week
before. thank you for the train that never came, the rude nyer who
stole my cab going downtown. thank you for the sense my mama gave me
to run. thank you for my legs, my eyes, my life.

3. the dead are called lost and their families hold up shaky
printouts in front of us through screens smoked up.

we are looking for iris, mother of three. please call with any
information. we are searching for priti, last seen on the 103rd
floor. she was talking to her husband on the phone and the line
went. please help us find george, also known as adel. his family is
waiting for him with his favorite meal. i am looking for my son, who
was delivering coffee. i am looking for my sister girl, she started
her job on monday.

i am looking for peace. i am looking for mercy. i am looking for
evidence of compassion. any evidence of life. i am looking for
life.

4. ricardo on the radio said in his accent thick as yuca, "i will
feel so much better when the first bombs drop over there. and my
friends feel the same way."

on my block, a woman was crying in a car parked and stranded in hurt.
i offered comfort, extended a hand she did not see before she said,"we"re gonna burn them so bad, i swear, so bad." my hand went to my
head and my head went to the numbers within it of the dead iraqi
children, the dead in nicaragua. the dead in rwanda who had to vie
with fake sport wrestling for america's attention.

yet when people sent emails saying, this was bound to happen, lets
!! not forget u.s. transgressions, for half a second i felt resentful.
hold up with that, cause i live here, these are my friends and fam,
and it could have been me in those buildings, and we're not bad people, do not support america's bullying. can i just have a half second to feel bad?

if i can find through this exhaust people who were left behind to mourn and to resist mass murder, i might be alright.

thank you to the woman who saw me brinking my cool and blinking back tears. she opened her arms before she asked "do you want a hug?" a big white woman, and her embrace was the kind only people with the warmth of flesh can offer. i wasn't about to say no to any comfort. "my brother's in the navy," i said. "and we're arabs". "wow, you got double trouble." word.

5. one more person ask me if i knew the hijackers.
one more motherfucker ask me what navy my brother is in.
one more person assume no arabs or muslims were killed. one more person assume they know me, or that i represent a people.
or that a people represent an evil. or that evil is as simple as a flag and words on a page.

we did not vilify all white men when mcveigh bombed oklahoma. america did not give out his family's addresses or where he went to church. or blame the bible or pat robertson.

and when the networks air footage of palestinians dancing in the street, there is no apology that hungry children are bribed with sweets that turn their teeth brown. that correspondents edit images. that archives are there to facilitate lazy and inaccurate journalism.

and when we talk about holy books and hooded men and death, why do we never mention the kkk?

if there are any people on earth who understand how new york is feeling right now, they are in the west bank and the gaza strip.

6. today it is ten days. last night bush waged war on a man once openly funded by the cia. i do not know who is responsible. read too many books, know too many people to believe what i am told. i don't give a fuck about bin laden. his vision of the world does not include me or those i love. and petitions have been going around for years trying to get the u.s. sponsored taliban out of power. shit is complicated, and i don't know what to think.

but i know for sure who will pay.
in the world, it will be women, mostly colored and poor. women will have to bury children, and support themselves through grief. "either you are with us, or with the terrorists" - meaning keep your people under control and your resistance censored. meaning we got the loot and the nukes.

in america, it will be those amongst us who refuse blanket attacks on the shivering. those of us who work toward social justice, in support of civil liberties, in opposition to hateful foreign policies.

i have never felt less american and more new yorker, particularly brooklyn, than these past days. the stars and stripes on all these cars and apartment windows represent the dead as citizens first, not family members, not lovers.

i feel like my skin is real thin, and that my eyes are only going to get darker. the future holds little light.

my baby brother is a man now, and on alert, and praying five times a day that the orders he will take in a few days time are righteous and will not weigh his soul down from the afterlife he deserves.

both my brothers - my heart stops when i try to pray - not a beat to disturb my fear. one a rock god, the other a sergeant, and both palestinian, practicing muslim, gentle men. both born in brooklyn and their faces are of the archetypal arab man, all eyelashes and nose and beautiful color and stubborn hair.

what will their lives be like now?

over there is over here.

7. all day, across the river, the smell of burning rubber and limbs floats through. the sirens have stopped now. the advertisers are back on the air. the rescue workers are traumatized. the skyline is brought back to human size. no longer taunting the gods with its height.

i have not cried at all while writing this. i cried when i saw those buildings collapse on themselves like a broken heart. i have never owned pain that needs to spread like that. and i cry daily that my brothers return to our mother safe and whole.

there is no poetry in this. there are causes and effects. there are symbols and ideologies. mad conspiracy here, and information we will never know. there is death here, and there are promises of more.
there is life here. anyone reading this is breathing, maybe hurting, but breathing for sure. and if there is any light to come, it will shine from the eyes of those who look for peace and justice after the rubble and rhetoric are cleared and the phoenix has risen.

affirm life.

affirm life.

we got to carry each other now.
you are either with life, or against it.

affirm life.
Consulted Works

1. Introduction

The university students in various areas in Japan appear to show great diversity in English language proficiency. However, so-called test preparation courses for TOEIC®/TOEFL® seem to attract the most enthusiastic students toward learning to improve their English language ability.

One of the main reasons for this enthusiasm would be highly anticipated that the students are looking for the better job opportunities upon graduation from the university, as it is now considered by the companies in general that holding high test scores would be one of the convincing criteria for the job placement. However, there seems to be many students who are taking these courses for various different reasons, for instance, rebuilding their basis for their English proficiency including reviewing English Grammar supposed to have learned in their previous academic studies before entering the university, acquiring speed reading skills fully utilizing skimming and scanning and developing more effective ways for making effective presentations in English.

In addition to the reasons discussed above, particularly in the courses the author taught in the last semester of this academic year, there were considerably a lot of students who would like to learn even more comprehensible English skills such as reading the English newspapers, watching English TV news, and movies. I came to notice these students’ motivations and needs after I distributed and analyzed the answers for questionnaire on the reasons of their taking my courses.

Considering above realistic situation, the author was trying to effectively introduce making use of the Media English in TOEIC®/TOEFL® preparation courses.

2. Research question:

“Will the students’ listening scores in TOEIC®/TOEFL® be improved by introducing Media English through presentations into the classes?”
In order to making a survey on the above indicated research target, TOEIC®/TOEFL® preparation class was selected (n=36). The study itself was considered to be a form of practical research, since there was no intention of providing a control group. Taking the recent theoretical development of the second language acquisition, there was found to be acceptable research format, as the necessity of treating students fairly and equally had to be fully taken into consideration.

3. The relations of TOEIC®/TOEFL® preparation courses with the current English curriculum

IEC (International Education Center) at Tokai University offers the required English courses on the two skills combined basis for every student as follows:

- 1st and 2nd semesters students:
  - English Listening & Speaking 1 (2 credit)
  - English Reading &Writing 1 (2 credit)

- 3rd and 4th semesters students:
  - English Listening & Speaking 2 (2 credit)
  - English Reading &Writing 2 (2 credit)

Since these above indicated courses are mandatory for every Tokai University student, they are carefully and thoroughly designed so as to meet the students' needs in terms of the following three criteria: class streaming utilizing the placement test, unified final examination at the end of the semester, and the unified evaluation standards.

In addition to these required courses, there are a variety of elective English courses categorized in seven fields. Here are some examples:

- Basic English:
  - Basic English Grammar, Basics in English

- English Conversation
  - Introduction to English Conversation, Intermediate English Conversation

- English Interpretation:
Introduction to English Interpretation, Intermediate English Interpretation

• Preparation for English Certification:
  - Beginning TOEIC®, Introduction to TOEIC®, TOEIC® Intermediate
  - Beginning TOEFL®, Introduction to TOEFL®, TOEFL® Intermediate
  - STEP 2nd grade, STEP semi-1st grade
  - Tokai University English Certificate 1st grade

• Understanding American /European cultures:
  - Intercultural Communication, Sociolinguistics

• Media and Literature:
  - Media & Literature, Introduction to American and British Literature

• Others:
  - English Special Seminar

As the author stated earlier in this paper, of all the English elective courses introduced above, TOEIC®/TOEFL® preparation courses have attracted many highly motivating students especially over the last decade.

4. The different students’ motivations for taking TOEIC®/TOEFL® courses

The author gave out anonymous questionnaire at the beginning of the semester asking “Why have you decided to take these TOEIC®/TOEFL® preparation courses?”

The results from the previous semester were indicated as follows:

• By raising my TOEIC scores, I would like to have better job opportunity.

• I successfully completed the required English courses, now I would like to skill up my total English language proficiency by taking more English courses aiming at the TOEIC®/TOEFL® preparation.

• Because I completed taking mandatory four English courses, I would now like to keep up with my English proficiency.
Besides actively using TOEIC®/TOEFL® self-study materials at English Navigation self-study room, I would like to prepare for the real test situation by adding as course works. By this way, I can take additional credits for my graduation from the university and prepare for TOEIC®/TOEFL® simultaneously. I got a valuable advice from my friend who previously took these courses saying that studying the test preparation strategies as a course work is definitely the most beneficial way to raise test score. My friend improved the TOEIC® score approximately 200 over one semester by going through this way.

Above indicated reasons are understandably very common attitudes and motivations among the TOEIC®/TOEFL® preparation courses students. However, the author would say that below indicated reactions fairly reflect other true reasons for TOEIC®/TOEFL® preparation courses.

Since in high school days, I was too busy involved in the club activity as a school baseball team captain, so I didn’t study hard and before entering university, I am sorry to say but my basics of English is not strong enough including basic vocabulary, grammar, and so on, I’m afraid. As a consequence, I would now like to rebuild my English skills. However, rather than studying English Grammar and vocabulary by myself monotonously, I would like to study more active and stimulating way so that I can work toward the improvement of my English language proficiency and at the same time improve my TOEIC®/TOEFL® scores.

In addition to my effort to improve my TOEIC®/TOEFL® scores, I would like to enjoy stimulating daily and academic conversation with other Japanese and foreign students whose native languages are English. Through these practices, I think my motivation for studying English would be strengthened. In the required English classes, luckily, my class had several foreign students. By working for the research project with them, I learned a lot not only English language proficiency but also the intercultural communication skills and avoiding ethnocentrism.

I would like to be able to make three to five minutes presentations in English. When I was in high school, my English teacher gave us the task to make English presentations in front of the class. However, at that time, my teacher let us take a look at memos while making a presentation. I didn’t feel anything strange at the time of the presentation because everybody was doing the same way. But, if I recollect now, while
making presentations, it would be better not to take a look at or read the memos, but look at the audience by conscious eye contacts in order to make more persuasive speech. Therefore, this time, although I need to prepare a manuscript carefully, I would like to try to make good presentations without memos.

Besides studying for TOEIC®/TOEFL® on the designated textbook, I would like to study with even more authentic materials such as the English newspapers and English movies. I would like to learn English that can be used in everyday lives.

5. Possibility and feasibility of introduction of Four-skills integrated teaching method into TOEIC®/TOEFL® classes through Media English

Recently, the number of curriculum using four skills integrated method has been increasing. (Brown, 2007). Also, the importance of collaborative learning based on the students-centered or interaction-centered fosters the inter-reliability between the teachers and the students, and between students, and also reduces the various anxieties related to language learning. (Crandall, 1999, Brown, 2007). The author was trying to build up the course syllabus assuming the above underlying concepts.

5-1 pair-works
At the first day of introducing English presentation, the author introduced the following ice-breaking activity which encourages every participating students to get to know each other well. Every student in the class stands up and walks in the class so that they need to find the designated person and ask each other questions. Every student devotedly participated in this activity and responded positively.

Then, on the basis of the newspaper articles they selected of their own interests, they introduced the content each other together with their comments as pair works.

5-2 triple-works
After they realized the importance and pleasure of making conversation and exchanging ideas in English, the triple-works, which had one presenter plus two audiences they rotated, were introduced, since it is naturally considered that the presentation itself is designed to have more than one audience.

After they were acquainted with the discourse markers, which are, needless to say, crucial knowledge for TOEIC®/TOEFL® preparation and the presentation framework, and three components of the presentation, the introduction, the body, the conclusion,
they prepared a manuscript for the presentation on the newspaper articles they selected.

By going through this whole process, the students comprehensively experienced four skills of learning the foreign languages, listening, reading, speaking and writing. Also, they seemed to learn English comfortably and with confidence as the university students studying on the authentic English materials.

Some of the students’ comments are introduced below.

• Since I had never done the presentation in English, I had no confidence at all. However, after I learned the presentation framework and the discourse markers, and repeatedly kept practicing my presentation in class, on campus with other students, and at home with my family members, I came to realize how enjoyable it was to making presentations.

• Because I learned the presentation framework little by little, I was able to digest what I learned in class, so that I became confident as a consequence.

• To be honest, I had almost never read English newspaper before taking this course. So, at first, I had no confidence at all. But, due to the fact that I was able to select the article I got interested in, which was in my case sports section especially on base balls and soccer, I became absorbed in the content.

• I was, at first, surprised to know that the professor introduced the media English which was English newspaper into TOEIC®/TOEFL® preparation courses. But, after completing English presentation on the articles I personally selected according to my own interest, I felt I really improved my English ability, because I was able to understand better on TOEIC®/TOEFL® questions especially in the listening section even when I practiced at home by myself. Above all, in the real world after graduating from university, since I am planning to work in a multi-national corporation, having a plenty of opportunity to use English, I am sure that the content-based presentation experience will give me the enormous confidence.

6. The comparison of pre- and post-test TOEIC®/TOEFL® listening scores:

The author gave students the listening test before introducing and after introduced
the presentation and made a comparison.

The result is encouraging. In 36 students, more than 80 percent of students showed a considerable improvement between the pre-test and post-test in the listening section scores. No students showed a decrease in their scores. Throughout the entire process of introducing English presentation using the English newspaper articles, the author did not introduce so-called the test-taking strategy, for instance, read and check the written questions first before listening to CD, or the other various strategies written on the textbook. Consequently, the author finds that these improvements in terms of the listening test scores might be attributed to their positive experience throughout the entire process of presentation activities using English newspapers.

7. Conclusion and the implication for the future research

As discussed above, the author is firmly convinced that by introducing the alternative way to TOEIC®/TOEFL® courses, the students’ anxiety and affective filter towards speaking English appear to be a lot reduced. As a result of experience these process, what is called, confidence-building process, students’ listening scores in TOEIC®/TOEFL® showed a varying levels of progress. Therefore, the author might be able to say that it may be a positive small change to offer multi-skilled integrated approach in TOEIC®/TOEFL® preparation courses in the university.

For the future study, the author has a keen and urgent academic interest to make a comparative analysis of the pre-and post-tests of the students listening scores and its relations with their anxiety level changes.

In this study, the author tried to fully integrate the students’ needs towards learning English language into TOEIC®/TOEFL® preparation courses. If the certified tests preparation courses in the universities are simply instructing and repeating grammar, vocabulary and so-called test taking strategies, the class might not be so stimulating to the students. By actively introducing the small changes into the class activities based on the reflective teaching, we might be able to break the preconceived ideas (Fanselow, 1987). By carefully going through this valuable process, the author believes that these continuous small changes in language teaching can cause big changes in the future English language education in Japan.

ABSTRACT

This paper presents a conceptual and measurement model underlying the development of the Blended/Hybrid Learning Scale (BHLS) assessing student perception of hybrid course environments and instruction. The scale constructs were adapted from previously validated instruments including the Unified Theory of Acceptance and Use of Technology (UTAUT), Teaching and Learning Strategy and Motivation to Learn Scale in Virtual Learning Environments (TLSM-VLE), Computer Mediated Communication (CMC) questionnaire, and the Self-Efficacy scale.

The outcome of this study is the development and validation of a conceptual and measurement model termed the Blended/Hybrid Learning Scale (BHLS). This model can be used in evaluating and improving current blended/hybrid programs for higher educational institutions with both undergraduate and graduate programs.
Malaysian Student’s Perspectives on the use of English as Medium of Instruction

Daisy Jane C. Orcullo, Ph.D.

College of Arts and Sciences
Universiti Utara Malaysia

145 Jln 15, Taman Beringin, Changlun, Kedah, Malaysia
jane@uum.edu.my

Abstract: This study explores the perspectives of the Malaysian students in the use of English as medium of instruction in the university level. As Malaysia is aspiring to be the educational hub in the Southeast Asian region, the importance of the use of English language in public universities specifically to undergraduate students has call for an attention in this current study. This qualitative study implements the use of open-ended questionnaire, focus-group discussion, interviews, and data analysis. A total of twenty (20) undergraduate students participated in the study. Findings of the study revealed diverse perspectives of the use of English in the classroom, which include their individual experiences of using English in their daily conversations. The analysis found nine (9) themes, which are the following: In-favor to use English in the classroom, important to use English in the classroom, fear of low academic result, scared to speak English, challenge, lack of confidence, putting oneself in an embarrassing situation, prefer to open a conversation with the locals, rather than to foreigners, and teased by friends. Meanwhile, the respondents expressed their willingness to improve their skill in speaking and understanding the English language.

Keywords: Perspectives, English, Malaysia

Background of the Study

Learning a foreign language proves to be a coveted skill in the field of education, specifically the English language. The use of English is acknowledged worldwide and most universities use it because it is the first language of a particular western country or use as the second language in most non-English speaking counties. To be able to be understood and messages to be expressed efficiently, learning English becomes highly
commendable. In universities where the presence of foreign students is increasing, with the worldwide move of globalization, and to make conversations with other nationals properly relayed, attitude to learn a second language like English is personally duty-bound. The need to learn English however should not have its limits on daily ordinary conversations, but more importantly to the sharing and transferring of knowledge (Greenwood, 2002). Thus, many of the universities today used English as the medium of instruction and communication. Al Sharaeai (2012) said that throughout history several English language-teaching methods have developed. On the other hand, countries which have been colonized by the United States or by the United Kingdom, English become widely used as a second language (L2), and Malaysia is one of the countries in Asia that was once under the colony of the native English speakers (Thirusanku & Melor, 2012 as cited by Darmi & Albion, 2013). Apparently, bilingualism was adopted in the educational system.

Speaking on bilingualism, again it dates back to the presence of foreign colonizers. Initially before the colonization, these countries are using the mother tongue as the medium of instruction in their respective educational system, but with their presence they have imposed the use of English. In Asia, these are Malaysia, India, The Philippines, and Nigeria that have currently bilingual in their educational system as result to colonization (Thirusanku & Melor, 2012). English become the second most important language in Malaysia as it has been integrated in the educational system implemented in the primary school until the university level (Asmah, 1982). In 2005 (Sithamparam & Choon) mentioned that the proficiency in English is an important skill for the Malaysian students to be able to further their studies at local universities, as well as abroad. On
similar note, Gill & Kirkpatrick (2013), emphasized the case of Malaysia to adopt bilingualism in schools was aimed to establish a balance between national and international need and challenges manifested through linguistic educational policies, thus placing English as a second language in the Malaysian educational system.

Historical record shows that prior to the coming of the British colonizers, Malaysia was using the Malay language as the lingua franca for business communication purposes (Fe, Siong, Kim, & Azizah, 2010). The presence of the British was the starting point that English was used as medium of instruction for primary and secondary schools, and even became the lingua franca for daily business communication.

The implementation of the education policy in 1979 stated that English is taught in the school to empower students to use English in everyday situations and also to prepare them for higher education (Foo & Richards, 2004).

With the advanced of globalization and the rapid growth of information there is a great increase in international student exchange. Malaysian government is much concerned about the importance of English language.

The Malaysian government aspirations to achieve a developed nation by 2020, the Higher Educational Institution Act 1996 stated clearly that higher education plays an important role in training people necessary for academic as well as the manpower needed for the nation. English used for acquiring knowledge in higher learning. Malaysia is extensively involved in the global competition in higher education the fact that foreign students are on the rise.

However, historical record shows that there is a decline in the proficiency of English language among Malaysian students, and observed that the use of English in the
The classroom is hesitantly welcome by the local students. With that decline and observation, the current study aims to explore the perspectives of the Malaysian students of the use of English as medium of instruction. Specifically, the study was conducted at Universiti Utara Malaysia.

Research Objectives

The objective of this research was to explore the perspectives of the Malaysian students of the use of English as medium of instruction. As per historical record that there was a decline in the proficiency of English language in the country, the study aimed to investigate the current perspectives of the students.

Methodology

The study used qualitative research design. The findings presented in this study are based on a total of twenty (20) participants, who are all Malaysian undergraduate students of the Universiti Utara Malaysia, from the College of Law, Governmental and International Studies (COLGIS), and from the College of Arts and Sciences (CAS). Firstly, the data collection was in a form of a “focus group discussion”, with open-ended questions, and a follow-up face-to-face and in-depth interview to some of the participants, to further capture the deeper perspectives among the participants. Interviews were semi-structured to allow a certain degree of flexibility for the research to probe and prompt. A non-probability sampling method was applied, specifically purposive sampling. Qualitative research design prefers to apply purposive sampling because the intended participants of the study assured of having the needed information. The
interview was audio-recorded and was transcribed, categorized, and tabulated, and arranged into themes. Descriptive notes added to the data. In qualitative study, data collection and analysis are interrelated. The process is iterative and flexible. It involves several stages. Moreover, an interpretive paradigm was chosen to be able to reveal deep insights into the research problem on the current perspectives of the Malaysian students on the use of English as medium for instruction.

Findings and Analysis of the study

The findings of the study revealed diverse perspectives from the students. There are many of them who are in favor of the use of English in the classroom and feel the importance to improve their English proficiency. In the analysis, there are some participants who have expressed their sentiments towards the use of English, basically from their personal experiences. Findings of the study is organized into themes, namely: *In-favor to use English in the classroom*, *important to use English in the classroom*, *fear of low academic result*, *scared to speak English*, *challenge*, *lack of confidence*, *putting oneself in an embarrassing situation*, *prefer to open a conversation with the locals, rather than to foreigners*, and *teased by friends*.

In this segment, meanings of the themes from the data collected are presented in relation to the research question on what are the perspectives of the Malaysian student’s in the use of English as medium of instruction.

Transcriptions from the interview have found that most of the participants are in-favor of the use of English in the classroom. Participants have realized that English is a
global language and to use it in the classroom is simply a needed training for them to develop their English proficiency.

“Personally, i agree to use English as a medium of instruction. first, English known as international language, therefore using English as a medium ensure the message delivered to all students include local and international students.” (P17).

The importance to use English as a medium of instruction has been expressed as well by some participants. Since the university level is the period for a higher learning, it is but expected that English language is one area of their learning to be improved. One participant disclosed:

“Using English as a medium indirectly improve English communication skills among students. improving English communication skills enable students to communicate with the people all around the world.” (P14).

Scared to speak English. Further probing from participants revealed that speaking English has never been a practiced outside the school. At the outset that they know that the course is to be conducted in English, they are overpowered with fear, that their achievement is affected because the class will be conducted in English. More probing have found out that in as much that most of their classes are in Bahasa Melayu, to be in an English class becomes a burden and scary.

“I am so scared to know that the class is conducted in English. I’m thinking I might fail or will not be able to have high CGPA.” (P2).

“My English is weak, I do not speak proper grammar, so I am not comfortable if class is in English.” (P6).
Nonetheless, there are participants who disclosed that being “challenge” is the initial reaction they have had upon knowing that the class is in English. These participants chose to improve their English proficiency and having to attend in English class is the best possible venue for their improvement.

“I am not afraid instead I take it as a challenge to improve my English proficiency.” (P11).

“I like to learn English even in high school. Even I am not always using it, but I love to use it and to be in an English class is I am happy.” (P1).

Self-timidity is attributable to personality factor. Some participants expressed of their being too shy to speak in English the fact that it has never been a daily language use. They know the language, but their being extremely shy hold them to use the language.

“No, I am not going to speak English. I am not use to it, and I am just so fine using my mother tongue language the bahasa malayu. I know how to speak English, but why do I use it when bahasa melayu is the majority’s language. Easy to communicate and to understand. To foreign students, yes I do speak English to them just a bit, because I am so shy.” (P12).

Many of the participants also disclosed that of having “doubts” in their English usage made them fail to speak the language. This could be a factor of having “less confidence” as well. This theme was probed and according to their narratives it is basically for the fact that even then English is second important language in Malaysia, but it is not widely spoken. Additionally, these participants revealed that to initiate conversation with foreign nationals in order for them to use English, but they also not the type of making a first move to communicate with foreigners.
“Because I am doubtful of my language, I will not initiate a conversation with foreign nationals. If there is a circumstance, then I will answer them in English, but do I initiate. I am seriously having doubts of my English proficiency.”

“I accept that I have less confidence in speaking English, Im not used to it, I don’t speak it regularly even in the school, thus I know I have less confidence to use it, but then I understand the language.”

Whilst having through an embarrassing experience, is one cause of not speaking English anymore. Recalling a particular incident when the participant was put in an embarrassing situation, made him stop speaking English at all, which make him eventually forget the proper use of the language. He disclosed that a group of his friends laughed at him when he spoke English with an incorrect sentence. Worried for a similar situation may be repeated, the participant revealed he won’t be speaking English any longer.

“...maybe I could not just take to be laughed at again by friends, thus I avoid to speak English.” (P15).

Indeed, it is more comfortable and easy to use our own vernacular language to our own like. In Malaysia, behasa Melayu is the national language and it is but expected to converse using that language. But since the presence of foreign nationals are obviously increasing in the country and of course the local Malaysians definitely use English to these foreigners, however as they feel not excellently conversant in English, they tend to not initiate a conversation with the foreigners. The usual scenario is that the conversation becomes exclusive among themselves using bahasa melayu. It is not so much expected that the initiative to open a conversation with the foreigners will start from them.
“...I would not usually start a conversation to the foreign students. There are many things that I have in mind. Firstly, it is difficult as to understand their slang, so I assume we would not be able to understand each other because of pronunciation, accent, and intonation. It’s really hard. Thus I tend not to start a conversation with them.”

This is one area that Malaysian students’ proficiency in English decline since most of them would not initiate a conversation with a foreign student.

**Conclusion and Recommendations**

Many studies have conducted about student’s perspectives, factors causes students low in English language learning, and psychological factors on these causes, all points toward that English as a global language should be passionately learned (Khader & Mohammad, 2010). Based from the current study, although these participants have diverse perspectives in the use of English in the classroom, others are in favor and deemed it important to use English, some are challenged, but there are some who scared, they have low self-confidence, in doubt, and some others ceased to speak English due to their embarrassing personal experiences. Nevertheless, majority of the participants expressed their utmost willingness to improve their English proficiency and have realized how important English is when they will be in the working world in the future.

This study recommends a study to be in quantitative design, where a large number of participation from local students to understand profoundly the perspectives of the Malaysian students of the use of English as medium of instruction.

Title of Submission: Investigating Attitudes of Upper Primary School Students in Thailand towards Peers with Specific Learning Disability

Topic Area of Submission: Special Education

Presentation Format: Paper Session

Description:

This qualitative study investigated attitudes of upper primary school students towards peers with specific learning disability. Upper primary schools from 3 schools in Thailand were individually interviewed on what they thought about a hypothetical student who had difficulties with reading and writing. Preliminary analysis found that the majority of the students had positive attitudes towards peers with reading and writing difficulties but their understanding of specific learning disability needed to be further improved.

Investigating Attitudes of Upper Primary School Students in Thailand towards Peers with Specific Learning Disability

Kanokporn Vibulpatanavong, PhD

kanokpornv@g.swu.ac.th

In Thailand, the number of students with specific learning disability in were reported to be approximately 300,000 students (Office of Special Education Administration, 2015). In order to promote social inclusion of students with specific learning disability, it is important to understand the attitudes of regular students towards peers with specific learning disability. Better understanding on the topic will be helpful in developing an effective program for promoting social inclusion of students with specific learning disability.

This qualitative study investigated attitudes of upper primary school students towards peers with specific learning disability. Upper primary school students from 3 schools in Thailand were individually interviewed on what they thought about a hypothetical student who had difficulties with reading and writing. The study employed semi-structured interviews and the interview questions were reviewed by three experts. Approximately half of the male students and female students were interviewed about a hypothetical student with the same gender of the interviewees, while the other half were interviewed about a hypothetical student with a different gender from the interviewees.

Preliminary analysis found little gender differences on the attitudes toward peers with learning disability. The majority of the students had positive attitudes towards peers with reading and writing difficulties but their understanding of specific learning disability needed to be further improved.

ABSTRACT

Leaders are respondent of the obligation of driving individuals in a dynamic and empowering way. One of the imperative parts of Leadership is team leadership and team building. This paper illustrates a blended strategy pilot training of team building and team administration skills created in students when engaged with virtual and traditional group faction in an MBA and DBA class. The results of this pilot study will provide data on salient learning outcomes and skills needed to incorporate in teaching team leadership and building
INTRODUCTION

The current scenario in the business world has placed great responsibility in the hands of the leaders by calling for the formation of teams composed of generations, cultures, and different nationalities. Also, audacious goals and increasingly short deadlines for the completion of the projects become an immensely complex task to integrate and align human capital needs, more than ever, working synergistically.

In this article, let's meet and analyses the main challenges that the Manager must face and overcome to develop a team, and the concepts and techniques that support leadership when exercised in working groups (Fisher, 1999). But is that managers are trained to act in these situations? Training and team leadership of work passes, inevitably, by turbulent periods filled with uncertainties and conflicts. The resulting disarray makes the Manager, often unprepared to deal with individual variables, have great difficulty in integrating people and developing the maturity of the group. To think of leadership is important to set as an example.

The example can take on different facets, but he has to be there. The instance in the context of communication can be considered as the first form of transmitting a message by "unique and shared" or through non-verbal communication. As a rule, always observe more bad examples than good. So it is important to be aware of it. An important way of leading learning to be an example and review all your career and see if you can identify at least two people were fantastic examples of good and bad leadership. Then, you should raise the examples that all these people have come and analysed the effects caused by these examples in the group or team. Some of the key components of the unique and shared team activity include:

**Assignment:** The primary action to go ahead on the road to show the way is a form of leadership by example. Under what conditions you can "lead" in an advanced position in your field?

**Team:** As a builder and maintainer of the team, you should keep or change group standards - the rules that maintain group cohesion. How can you develop patterns of your team through the power of his/her example?

**Individual:** Think of each team member as a leader of law. Each should be a leader in professional or technical function.

Thus we can see how they give priority to the maintenance of the unit, going against external or internal pressures, sometimes demonstrating ingenuity in the process. Many of the group's rules whether written or not, there to promote this unity and to maintain cohesion at all costs.

Those who saw the boat or infringe group standards may rely on reactions that can range from friendly indulgence to absolute fury. Instinctively, there is a common feeling that United we stand, separated miss that friendly relations, desirable in themselves, are also essential means to the goals of the group. This need to create and promote group cohesion may be called the need to maintain individual. Individuals lead to group their needs, or your individual needs, which include not only the physical needs (such as food) but also the psychological, such as recognition, the feeling of doing something useful, status, etc. (Breaker).
TYPES OF TEAM ACTIVITIES IN LEADERSHIP BUILDING

A generalized form, a team activity process supports a person to add better professional or personal life. So there are several contexts and coaching roles, however (Barry, 1991) stresses that occur important distinctions and at the same time an overlap in the various approaches.

Executive learning

It is the increase of skills identified as keys to professional development. It is possible to say also, according to (Fisher, 1999) which is a personal improvement, since the Executive learns to do a leadership himself. The company generally is favoured with the coaching; that represent a way of organizational transformation through collective and individual alignment with the focus on the desired future. Within the Executive learning activity, according to (Fisher, 1999), it separate application contexts occurs:

• "Performance": Focus on capacity and current demands, seeking a full expression of professional force.
• Skills and Abilities: Focus in the current project or support for a specific situation.
• Development: Focus on responsibilities of future job or career in the future, strengthening skills now to be ready in time to take on new responsibilities to respond to challenges and new opportunities.

Life coaching

This type of coach plays an individual consulting with his client for the purpose of creating customer satisfaction and a sense of accomplishment in life (Zaccaro, Rittman, & Marks, 2002). Points out that a large proportion of people seek Coaching for life at a stage where we are already well underway, however, still want to invest in themselves to take full advantage of their potential, creating in this way. Nowadays represents a worldwide trend in human development to achieve personal and professional success.

Learning steps

According to (Zaccaro, Rittman, & Marks, 2002) the coaching process consists of six steps and has variation from person to person, from task to task, in form and content:

Definition or negotiation of standards, what is expected of the person

You can't expect people to have clearly what the company expects of them in terms of behavior, values and results. People are different and perceive the world differently. Their behaviors are reflections of the internal realities that are formed according to the meaning that they give to the facts that they write. It is up to the Coach to translate the vision, mission and objectives of the Organization on standards understandable and accepted by the developers. According to (Barry, 1991), the first phase of the team activity is formulated in table-1:
PROJECT BASED LEADERSHIP DYNAMICS (Barry, 1991)

<table>
<thead>
<tr>
<th>Team Activities</th>
<th>Leadership Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Getting acquainted</td>
<td>• Social</td>
</tr>
<tr>
<td>• Resource discovery</td>

</tr>
<tr>
<td>• Develop goals &amp; vision</td>
<td>• Envisioning</td>
</tr>
<tr>
<td>• Assess realism of vision</td>
<td>• Organizing &amp; Spanning</td>
</tr>
</tbody>
</table>

OF THE REASON AND THE IMPACT

Knowing your role within the structure, because it must perform certain tasks, and what impact that attitudes and behaviours have in overall results, the developer feels more fresh, confident, secure and part of the team. When applicable, the Coach must demonstrate how to do the task, once images are worth more than words

Coach:

• Observe, exercising positive control the Coach controls to supervise, but not because it has the commitment to ensure that the standard is being met. The control is necessary; out of control you can't measure progress; so you can't know if the path is correct. The developer can participate in deciding how to control wants to be controlled in this way won't be monitored or "charged".

• Guide with feedback- it is impossible to give consistent feedback without going through the previous step. Without notice and control, such as whether the developer is developing and playing your role? There is no feedback upon "guesses". The feedback should be specific, given in a positive way, without trial. Must be authentic and focus on the future and on the results. Constant recognition is essential to maintain the motivation of employees.

• Be open to suggestions for change-As the conditions change constantly, the developer can create a better way (to himself) to perform the task. The Coach must learn to listen and be open to what the developer guarantees your motivation to perform a task the way you think best. Most of the time, this also leads to better results.

To move forward on this very important subject, let's first understand the distinction between the terms "group" and "team". The group is different. The Group has sometimes divergent objectives, where every one cares about its own target. The team, in contrast, works for a higher cause: a collective project. The team recognizes individual contributions and vibrates with the total result (Melita Prati, 2003)

It is clear, therefore, that lead a team means to promote both the maturity of its members as the power relations between them. In this sense, the leader will need to face and overcome two fundamental challenges that are part of the development process of the working groups:
1. Empower the team members to take on self-management.

2. Ensure that the group evolves from conflict to synergy.

---

**LEARNING OUTCOMES AND SKILLS NEEDED TO INCORPORATE IN TEACHING TEAM LEADERSHIP AND BUILDING**

**Outcome 1: empower the led to take the self-management**

You **never, ever** have a team empowered and directed learning unless the Manager is willing to share the control. (Melita Prati, 2003) Would you have thought to see a coach going into the field to do the work of your team? The mentality – so common among some manager’s profiles – "Let me do it" is thus highly pernicious to the construction of self-managed teams. In fact, the more the leader assumes the responsibilities due to led, less responsible they are. As responsibility and power form an inseparable activity, in requiring the first leader's duty to provide the second. An empowered team is faster without losing its effectiveness. It is an assertive decision in most cases, the opinion and approval of the leader, but how to build a team like that?

![Figure-1: Influence of leader performance functions on team effective processes Source: (Zaccaro, Rittman, & Marks, 2002)](image)

The empowerment and self-management in a team do not occur as a result of an isolated act. They are the consequences of continued efforts of the leader in the lead your group through four stages of development – common to virtually all working groups – as model proposed by (Barry, 1991). Let's see what they are.
The 4 stages of group development

1. **Guidance**: in this stage, the Group has high expectations but is dependent on the leader, needing guidance on goals, methods of work and the role of each Member. In this situation, the leader should use "Board style" because the Group's morale is high and the power is low.

2. **Dissatisfaction**: in this stage, the group feels a discrepancy between the high expectations and the harsh reality. To realize the goals are difficult to be reached, the led they feel unhappy about the authority. In this situation, the leader should use "training style" because the Group's morale is low and the competence is medium-low.

3. **Resolution**: in this stage, the group feels a decreasing dissatisfaction. Reduce the discrepancies between expectations and reality and develop harmony, trust, support and mutual respect. The members practice greater openness and more feedback. Take responsibility and share control. Use a language group ("we" instead of "I"). In this situation, the leader should use the "style" because the Group's morale is medium and the medium-high.

4. **Production**: in this stage, people feel excited by participating in team activities. Demonstrate great confidence to accomplish tasks. Share the leadership. Have a positive feeling about the success in the execution of tasks. Have a high level of performance. In this situation, the leader should use "delegation style" because the Group's morale is high and the competence is high.

As we have seen, it is necessary to adjust the style of leadership to the development of the group because of the two variables, morals and competence vary according to the stage in question. Notice also that the Group presents a growth in power and responsibility as it grows its maturity level.

**OUTCOME 2: ENSURE THE GROUP EVOLVES FROM CONFLICT TO SYNERGY**

According to (Melita Prati, 2003), the conflict arises when there is a disagreement resulting from information and different personal preferences "while synergy is when" the result of the group is better than individual results " . We realize, therefore, that synergy is the real *modus operandi* of a team as it provides results that cannot be achieved individually, but as foster synergy in a team?

From experiments with cooperative games, (Zaccaro, Rittman, & Marks, 2002) lists some factors that facilitate the performance of the working groups. They are clarity of objectives; solidarity; trust and mutual respect; open communication; cooperation; "stop to think"; creativity; leadership of all; patience. From the factors listed and personal experience in leading groups, we captured eight practical concepts that the leader should observe to lead the Group of conflict to synergy.
THE 8 CONCEPTS (8CS) TO PROMOTE SYNERGY IN TEAMS:

- C1. Consciousness
- C2. Communication
- C3. Cooperation
- C4. Coordination
- C5. Convergence
- C6. Conviction
- C7. Companionship
- C8. Creativity

Come on now, get to know each of these concepts and how the leader must act to develop them.

➢ C1. Consciousness

Consciousness is the concept that integrates the perception and identification of the individual with the three most important elements of organizational identity: Mission, vision, and values. What is the importance of consciousness to the synergy of the Group? People work with more enthusiasm when they understand that their individual tasks and the work of his staff contribute to a higher purpose. Without awareness of the mission, vision, and organizational values, all routine work seems disjointed and meaningless, causing distress and dissatisfaction that threaten the integrity of the group.

As the leader must act to develop awareness in the Group? Reinforce constantly the relationship between tasks, and its meaning in the larger context of the Mission of the Organization, its vision and the values that are being communicated to the society. Resolve any conflicts by calling the attention of those involved with the actual purpose of the work.

➢ C2. Communication

Communication is the concept that expresses the ability of the team to deal with the information relevant to the implementation of the methods and goals. What is the importance of communication for the synergy of the Group? It is through communication that occurs in the dialogue which means "stream of meaning". To facilitate communication, we are giving way to the organizational identity (mission, vision, and values) and its significance reinforced and relevant information about the working methods to be shared.

As the leader must act to develop the communication within the Group? Be an example of efficiency in communication, both when talking about the hearing. Be effective upon receiving and giving feedback to subordinates. Encourage transparency and open communication among the group.

➢ C3. Cooperation

Cooperation is the concept that expresses the power to "operate together" (co-operate). What is the importance of cooperation to the synergy of the Group? The following phrase can express the sense of cooperation: If your operation makes it easy to me and facilitates its operation, so we're cooperating. A team that cooperates, works faster generates fewer costs and gets better results. Its opposite, the competition, discourages the search for alternatives of type win/win.
When this occurs, in the long term we will have unproductive behaviors generating unnecessary costs for all involved.

As the leader must act to develop cooperation in the Group? Practicing meritocracy valuing individual competence but, especially when this is placed at the service of the integrity of the team. Apply the aphorism "the more evolved the initiative of conciliation." educating their subordinates to seek, as soon as possible, alternatives of type win/win.

- **C4. Coordination**

  Coordination is the concept that expresses the shared use of power and responsibility. It is the right and duty of all team members for the order set (coordinating). What is the importance of Coordination to the synergy of the Group? When the power and responsibility are centred on the leader or even a member of the group, the other members tend to take an immature and dependent behavior. The concept of Coordination fosters the maturity and takes the group to self-management by promoting discipline necessary for the efficient execution of tasks.

As the leader must act to develop the coordination group? Through education and training and to stimulate the maturity of the led to performing their duties better. Allow active participation in decision making to the led that demonstrate competence. Maybe among the eight concepts, it is the most difficult to apply because they require the leader to control and decentralization of power.

- **C5. Convergence**

  Convergence is the concept that expresses the interdependence among the goals in the various cells and levels of the organization.

  What is the importance of the convergence of the synergy of the Group? Since the achievement of individual goals contribute to the achievement of the goals of the team, and the achievement of the goals of the team contribute to the achievement of organizational goals, all members must have science on particular objectives and act aimed at the success of the group. Conflicts and disagreements, when to arise, must be quickly administered by own staff so that both individual results as not compromised collectives.

  As the leader must act to develop convergence on the Group? Clarify, preferably in writing, the individual and collective goals. Clarify the interdependence between the objectives of each. According to the maturity of the Group and the context, individual goals may be negotiated in such a way that, in the end, the collective goal is doable and challenging.

- **C6. Conviction**

  Conviction is the concept that expresses the subjective value credit deposited between team members.

  What is the importance of confidence to the synergy of the Group? Is the confidence that gives support to the flow of meaning (dialogue) that is essential to the proper functioning of the group? Without it, the communication becomes shallow, concealed and, consequently, the "spirit of teamwork" is weakened.

  As the leader must act to develop confidence in the Group, it must externalize the organizational values by example and stimulate this same behavior in your team.
Ø C7. Companionship

The Companionship is the concept that expresses the behavior and zeal among team members.

What is the importance of companionship to the synergy of the team? Unlike the friendship that is based on mutual affection, companionship is a behavior that is independent of personal preferences. It is aimed at the well-being of all to achieving the goals of the team. The lack of companionship with a group creates a psychological environment inhospitable, leading participants to experience feelings of insecurity that reduce productivity, creativity and commitment to cohesion.

As the leader must act to develop fellowship within the team? Be an example and zeal for the led. Not practice nepotism. Never criticize a member of the team in his absence or "behind his back".

Ø C8. Creativity

Creativity is the concept that expresses the manifestation of the power transformer and evolutionary renewal of a team. What is the importance of creativity for the synergy of the team? When it is given to all the right to contribute ideas, creates an exciting atmosphere that increases the motivation for participation. The evolution becomes accelerated because nobody stands up to own ideas. The lack of creativity in a group denotes oppression, omission, and indifference.

As the leader must act to develop creativity in the team? Talk less and listen more. Give you the tools and not impose solutions. Learn how to deal with dissenting ideas, mainly.

CONCLUSION

As we have seen, the leadership of a team requires knowledge, skills and attitudes for dealing mainly with the subjective. Visions, beliefs, values and individual feelings create a bond that is both important and critical to the functioning of the group. In this situation, the leader must develop the maturity of the led so that, together, take their self-management and, at the same time, manage conflicts taking the group to the synergic operation.

Identify the stage of development of the team and apply leadership style consistent is the technique that aims to induce a behavioral response toward maturity. The application of the eight proposed concepts, through the leader’s behavior, is tactics that are aimed at the administration of conflict in search of the synergy of the team.

Presentation Abstract

“A Partnership Program Between Institutions of Higher Education and County Offices of Education for Successful School Administrator Preparation”

This presentation describes a unique “partnership” between National University and the Sacramento County Office of Education (SCOE) Leadership Institute. SCOE is approved by the CCTC (Commission on California Teacher Credentialing) to grant the Preliminary Administrative Services Credential to successful program candidates. Many of the credential program candidates also desire to acquire the MS degree in Educational Administration. However, SCOE is not WASC (Western Association of Schools and Colleges) accredited for granting the MS degree in Educational Administration. This is where National University partners with SCOE in order to provide candidates an effective school administrator training program, including the administrative services credential and the MS degree in Educational Administration. The goal of the program is to effectively prepare future successful school leaders with the leadership skills and knowledge for meeting the needs of the local school districts where they serve.

Another advantage of the partnership is all SCOE program instructors, for both the credential and MS degree programs, are approved National University adjunct instructors. Therefore, all program courses, (credential and MS degree) can be taught by current and/or retired local Sacramento COE administrators who meet the National University adjunct instructor standards. The value in this part of the partnership is that these NU approved adjunct instructors know the needs of the local school districts and can properly and effectively prepare the program candidates to be successful future school leaders.
Abstract

After attending this presentation the attendees will have a better understanding of academic freedom and academic responsibility that will help them protect their rights. Faculty members academic freedom is of fundamental importance to their institutions. Academic freedom is the particular freedom for scholars, teachers, and students within the universities and colleges to pursue knowledge, speak, write and conduct scientific activities without unreasonable restriction.

As a result of the increase in ideological conflicts, especially regarding to religious, political economic issues, it is essential for the members of the academic community to be familiar with Declaration of Principles on Academic Freedom and Academic Tenure issued by American Association of University Professors (AAUP) in 1915 and its updated version in 1940. The Declaration stated that academic freedom of the teacher “comprises three elements: freedom of inquiry and research; freedom of teaching within the university or college; and freedom of extramural utterance and action”.

Academic freedom and academic responsibility are the core values of higher education as they affect the academic profession in all aspects of teaching and research. The student also has academic freedom. Academic freedom and responsibility have long been topics for public concern and debate. However, many professionals still do not understand exactly what it means.

The purpose of this presentation is to promote understanding and support of academic freedom amongst the academic community which applies to teaching and research and ensures that faculty rights are protected.
Mobile Apps to Disseminate Information for Instruction and Extension

Kent D. Kobayashi

Honolulu, HI 96822 USA
E-mail: kentko@hawaii.edu

Abstract

Collaboration and cooperation within our college and between our college and the horticultural industry and public is important. This, in part, involves disseminating up-to-date information. The use of mobile devices and apps (applications), specifically RSS feed and news aggregator apps, can help achieve this. The objective was to develop an approach to help our college's research, instruction, and extension personnel find and make known current information to end users. RSS (Rich Site Summary or Really Simple Syndication) is a format for delivering changing web content to a user. RSS feeds help you easily stay updated by retrieving the latest content from sites that you are interested in. New aggregators search the web to bring you news stories and information that is significant to you. Based on reviews of apps and my personal evaluation, I selected the iPad apps Feedly, Read by QxMD, Fox News, and those of local television news stations. These apps were used to retrieve pertinent articles, websites, news stories, and videos on topics, keywords, and scientific journal titles that I had specified. Looking at the titles and briefly evaluating the content helped me determine if these resources would be relevant to specific individuals. For faculty and staff within our department, college, and university, this was done by familiarizing myself with their research and extension projects, and what courses they teach. I e-mailed appropriate articles, websites, news stories, and videos to colleagues in our department, our college, graduate students, undergraduate students, student organizations such as the undergraduate Horticulture Society and the TPSS Graduate Student Organization; and the Coordinating Group on Alien Pest Species, Pacific Cooperative Studies Unit, University of Hawaii. I sent information to colleagues at the University of Hawaii at Hilo College of Agriculture, Forestry and Natural Resource Management, Windward Community College, and Leeward Community College. I further disseminated information to industry organizations such as the Hawaii Tropical Fruit Growers, Hawaii Export Nursery Association, Hawaii Department of Agriculture, Noelani Elementary School teachers, and private companies such as Mari's Gardens, Hawaiian Turfgrass, and Island Fungi. Lastly, I shared information with colleagues in departments of horticulture at U.S. mainland universities. In conclusion, RSS Feed and News Aggregator apps have enabled me to disseminate relevant information to others and to demonstrate this approach for their possible adoption.

Additional index words: applications, RSS feed, news aggregator
**Introduction**

Collaboration and cooperation within our college (College of Tropical Agriculture and Human Resources, University of Hawaii at Manoa) and between our college and the horticultural industry and public is essential. This involves disseminating up-to-date relevant information to colleagues, students, and stakeholders (Wray, 2016).

Extension (Cooperative Extension Service) provides education and learning activities to people including agricultural producers and the general public. It takes the knowledge gained through research and education and brings it directly to the people. Land-grant colleges and universities have the extension mission of conveying practical information to farmers, small business owners, consumers, and the general public.

Up to date information has been disseminated to students online and in the classroom. Extension personnel have provided information to the public through newsletters, extension publications, workshops, field days, and trade publications. With the Internet, electronic means can be used to find and distribute relevant information (Kobayashi, 2014). With the advent of mobile devices and applications (apps), specific apps have been used to find information (Capdarest-Arest and Glassman, 2015; Kobayashi, 2013). These apps included specific apps such as Popular Science, Popular Mechanics, and Science. A disadvantage has been that they require the user to use each app to find information.

A RSS (Rich Site Summary or Really Simple Syndication) reader enables the user to stay informed by retrieving the latest content from news-related sites. Time is saved by not having to visit each site individually. Rather, a RSS reader aggregates or gathers news and web content from online resources such as websites, newspapers, and videos for easy viewing. News aggregator apps search the web to bring news stories and information that are important to the user. The objective of this paper was to develop an approach to help our college's instruction and extension personnel find and disseminate current information to end-users.

**Methodology**

Based on reviews of apps and my personal evaluation, I selected the iPad/iPhone apps Feedly, Read by QxMD, Fox News, NHK World TV, and those of local television news stations. These apps were used to retrieve pertinent articles, websites, news stories, and videos based on topics, keywords, and scientific journal titles that were specified. Looking at the titles and briefly evaluating the content helped to determine if these resources would be relevant to specific individuals. The usefulness of the resources found were based on my familiarity with the subject areas and what would be relevant and useful for someone's work. The information about the resources found was e-mailed to selected people.
Results

Instruction. I e-mailed relevant articles, websites, news stories, and videos to the students in my courses as assigned readings or supplemental readings. With the use of the flipped classroom approach and Bring Your Own Device (BYOD) in my courses, students reviewed these assigned readings and videos outside of class. Then, in class students formed small discussion groups of typically two to four students and discussed the assigned readings, videos, and news stories. Their laptops and mobile devices enabled them to search and retrieve additional information on the Internet to aid in class discussions. Each group of students reported their answers and discussions to the class with each student having the opportunity to speak.

Extension. For faculty and staff within my department, college, and university, I familiarized myself with their research and extension projects, and what courses they teach. Appropriate articles, websites, news stories, and videos were e-mailed to colleagues and graduate students, undergraduate students, student organizations, and various units within our college and the university. For example, information was sent to colleagues at the University of Hawaii at Hilo College of Agriculture, Forestry and Natural Resource Management, Windward Community College, and Leeward Community College. Further, information was disseminated to industry organizations such as the Hawaii Tropical Fruit Growers, Hawaii Export Nursery Association, Hawaii Department of Agriculture, Noelani Elementary School teachers, and private companies such as Mari’s Gardens and Hawaiian Turfgrass. Lastly, information was shared with colleagues in departments of horticulture at U.S. mainland universities.

Conclusions

In conclusion, RSS feed and news aggregator apps have enabled me to disseminate relevant information to others and to demonstrate this approach for their possible adoption.
