Abstract

This paper presents a conceptual and measurement model underlying the development of the MOOC Virtual Learning Environment Scale (MVLE) assessing student perceptions of virtual course environments and instruction. The scale constructs were adapted from previously validated instruments including the Unified Theory of Acceptance and Use of Technology (UTAUT), E-learning Systems Success Scale (ELSS), and the E-Learning Satisfaction Scale.

The data analysis procedures will include the validation of the scale using Exploratory Factor Analysis (EFA). EFA procedures use factor loading to statistically and theoretically combine items resulting in a final parsimonious scale. Descriptive statistics will also be conducted to describe the shape of the distribution and frequencies of survey item responses.

The specific outcome of this study is the development and validation of a conceptual and measurement model termed the MOOC Virtual Learning Environment Scale (MVLE). This model and scale can be used in the design and development of MOOC courses specific to instructional design and pedagogy. In addition, higher education leaders can use this model to guide strategic planning, transform faculty professional development, and engage in instructional innovation to inspire digital age citizenship.
Title:
Implementing Peer-Led Team Learning in a Community College Computer Science Course: Lessons Learned

Abstract:
Peer-Led Team Learning (PLTL) is an instructional strategy that has the potential to improve the retention and performance of underrepresented minorities students in computer science courses. In this paper, we discuss the lessons learned after implementing PLTL in three courses with different instructors in a community college. Students from one of the three courses had a more positive perception about the PLTL sessions and participated more actively and consistently. We explored some ways to promote a more active participation across all courses.
Introduction

There is a nation-wide concern about the current number of students who choose to major in Computer Science (CS) in the United States (Bureau of Labor Statistics, 2014). This issue is particularly evident with underrepresented minority (URM) students: a College Board report in 2013 showed that among 22,273 high school students who took the Advanced Placement computer science test, 4% were African American, 9% were Hispanic Latino, and 19% were female (College Board, 2014).

According to the findings of a longitudinal study conducted by Chang, Sharkness Hurtado and Newman (2014), that involved 3,670 students at 217 institutions, URM students are significantly less likely to persevere in Science, Technology, Engineering and Math (STEM) majors. The findings also indicated that institutions could potentially improve the persistence of URM students in these majors by increasing the likelihood of students to engage in academic experiences, such as studying frequently with others.

One of the reasons students decide to leave their CS major is the “perception of asocial community with low levels of human interaction including student-faculty and peer-peer” (Biggers, M., Brauer, A., & Yilmaz, T., p. 406). Peer-peer interaction, specifically Peer-Led Team Learning (PLTL), has the potential to improve the retention and performance of URM students in CS courses (Horwitz et al., 2009), increase women’s participation in a CS major (Murphy, Powell, Parton, & Cannon, 2011), and improve the retention attitudes of under achiever students in introductory CS courses (Stewart-Gardiner, 2010).

Hartnell College, a medium-size two-year Community College in California with over 90% of URM students, has exhibited a high attrition rate of students in Computer Science in the past five years: about half of students drop the Introduction to Computer Science course. An optional PLTL program was implemented in Spring 2015 with the goal to improve student retention.
Learning from Peers

Literature in Social Constructivism provides empirical evidence that peer collaboration can foster cognitive growth (Hogan & Tudge, 1999). Having students teaching and guiding their peers is not a new educational approach. Early in the 19th century, Joseph Lancaster created the Monitorial System of Instruction in which advanced students taught novices, educating in this way a very large number of students at a low cost (Rayman, 1981).

Peer-Led Team Learning (PLTL) also involves having advanced students teaching their fellow peers. However, a specific set of characteristics differentiates PLTL from other peer learning models. Gosser et al. (2001) identify the following ones:

PLTL consists of a weekly workshop, which includes a group of six to eight students and a peer leader. The peer leader has successfully completed the course and has been trained in leadership skills and teaching/learning strategies. Peer leaders are facilitators, not lecturers, teaching assistants, or answer givers. Teachers are closely involved with the workshops, holding weekly sessions with the peer leaders and developing challenging materials that are integrated with the course content.

Gosser et al. (2001) also describe the tasks of the peer leaders:

- clarify the purpose and goal of each workshop
- ensure full participation of the students
- build students’ commitment and self-confidence
- strengthen students’ skills and problem solving approaches
- create special opportunities for students
- practice listening skills and questioning techniques
- reflect continuously upon the process they are leading the workshops

PLTL was originally developed in the early 1990s to support students in general chemistry (Gosser et al., 2001); however, it has been successfully implemented in several other areas, such as biology (Batz, 2014), Information and Communications Technology (Sheard et al., 2011), Mathematics (Hockings, DeAngelis, & Frey, 2008), and Computer Science (Horwitz et al., 2009; Huss-Lederman, Chinn, & Skrentny, 2008; Murphy, Powell, Parton, & Cannon, 2011; Stewart-Gardiner, 2010).
PLTL in Computer Science Courses

The results of several studies that implemented PLTL in Computer Science courses are very promising: Murphy, Powell, Parton, and Cannon (2011) report a significant increase of women’s participation in CS majors after six semesters of offering an adapted version of PLTL: their workshops were language agnostic, instead of covering Java, which was the programming language used in the actual course, the workshops focused on algorithmic thinking and problem solving.

Horwitz et al., (2009) implemented a PLTL combined with active recruiting (sending emails to URM and female students, attending orientation sessions, sending announcements in the course, etc). The results indicate an increase of retention rates and grades. Peer leaders benefitted from the PLTL program as well, self-reporting an improvement on their leadership skills.

Stewart-Gardiner (2010) reports that even though not every single student seemed to have benefitted from the PLTL workshops, several groups of students did benefit, especially those enrolled in higher-level undergraduate courses. In a separate study, peer leaders have been found to exhibit cognitive, personal, and instrumental growth from facilitating workshops (Micari, Streitwieser, & Light, 2005).

Our PLTL Implementation

In Spring 2015, PLTL workshops were offered as an optional supporting academic activity to students in the three sections of the Introduction to Computer Science and Programming Fundamentals course (CSS 1). Each section started with an average of 36 students.

Several students applied to be peer leaders but only five were selected by one of the instructors based on their performance in the class. All of them completed the same course the previous year, obtaining high scores. Peer leaders received a stipend for being part of the PLTL program.

The workshops were offered in three days of the week, including Saturdays, being Saturday the most popular day. Each workshop lasted about 2 hours and it was composed of 8 to 10 students. The same content was covered in the three weekly workshops, in this way, students could attend a workshop in the day that it was most
convenient to them. While students were initially assigned to a specific group, they had the flexibility of attending the workshops with other groups to accommodate any unexpected activity in their schedules.

Prior each workshop, all peer leaders were required to attend a one-hour session with the PLTL program coordinator, the second author of this paper. In this session, the program coordinator provided the materials that would be covered in the following workshop. The Coordinator prepared weekly problem sets that aligned with what students learned in the previous week. Emphasis was put on conceptual understanding and misconceptions. Problems were sourced from various curricula.

Peer Leaders worked through each week’s problem set in advance, guided by the PLTL coordinator. Peer Leaders refreshed their own skills, learned computer science- specific teaching techniques like memory diagrams, and discussed concepts where students often struggle. Moreover, peer leaders were trained to use several instructional strategies to facilitate the workshops, including peer problem solving and round robin techniques (Gosser et al., 2001).

Several Peer Leaders attended each of the three weekly sessions and they formed groups as needed based on the number of attendees, keeping up to ten students in a group. The weekly workshops were not required, but students had the opportunity to earn significant course credit (4% of final grade) for consistent attendance. Students were offered extra credit for attending the PLTL workshops.

**PLTL Implementation Results**

An anonymous online survey was conducted to collect students’ perception of their participation in the PLTL program. There were 53 students who submitted the survey across all three sections of the course. Students’ perception towards PLTL varied significantly on each section. The most positive experience was from students in section 1: From the twenty-three students who submitted the survey, 91% attended at least one PLTL session and most of them attended 12 or more sessions. 81% of those who attended at least one PLTL session considered that the sessions were very or extremely helpful and 66.7% of them indicated they were more likely to pursue a major in computer science.
From the 15 students in section 2 who submitted the survey, only 33% attended at least one PLTL session. 80% of them considered that the sessions were very or extremely helpful and also indicated they were more likely to pursue a major in a field related to computer science.

There were 14 students in section 3 who submitted the survey. Only 42.85% of them attended at least one PLTL session. Half of those who attended at least one PLTL session considered that the sessions were very or extremely helpful and also indicated being more likely to pursue a major in computer science.

The following table summarized the survey responses of students in the three sections:

<table>
<thead>
<tr>
<th></th>
<th>Section 1</th>
<th>Section 2</th>
<th>Section 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surveys submitted</td>
<td>23</td>
<td>15</td>
<td>14</td>
</tr>
<tr>
<td>PLTL attendees</td>
<td>21</td>
<td>5</td>
<td>6</td>
</tr>
<tr>
<td>Perceived PLTL very or extremely helpful</td>
<td>17</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>More likely to pursue a major in CS</td>
<td>14</td>
<td>4</td>
<td>3</td>
</tr>
</tbody>
</table>

The course content was the same in the three sections and the peer leaders were also the same for students in all three sections. These are some of the potential reasons that might help explain why students in Section 1 had an overall more positive perception about PLTL and had a bigger number of attendees:

1) Students in section 1 were offered extra credit for attending the PLTL sessions. Specifically, they were offered 4% of the final grade for consistent attendance. Students in the other two sections were not offered any extra credit.

2) The instructor in section 1 is highly charismatic and has several years of experience teaching this course.

3) Based on the survey results, several students in sections 2 and 3 were unable to attend to PLTL sessions due to conflicting schedules.
On average, students who attended at least one PLTL session had a positive perception about the peer leaders: students strongly agreed that the peer leaders were able to adequately answer questions, and they agreed that a) they felt comfortable asking questions to the peer leaders, b) the peer leaders were able to encourage everyone who participated in the sessions, and c) the peer leaders managed group discussion effectively.

One of the survey questions asked students to describe their relationship with the peer leaders. Overall, students in all three sections have a very positive perception of peer leaders. Here are some of their positive answers:

“Although they are a year above my knowledge level, I felt like they were my equal and I didn’t hesitate to ask questions or for help”
“The PLTL leaders made me feel more open to speak up”
“They are such amazing people very helpful and understanding!”
“They were all very helpful”
“All the peer leaders were easy going and friendly to talk to.”
“One of the leaders was particular helpful. It was evident this instructor enjoyed the topics and really tried to help me when I had questions”

Just a handful of responses were not too positive about the peer leaders:

“I felt like some of the leaders were not as invested in the program.”
“some of them were nervous and weren't able to explain their reasoning that strongly.”

Lessons Learned

1) A more active recruiting is needed in order to get students to participate in the PLTL sessions. There was a significant difference in the number attendees from section 1 and the other two sections. Students in section 1 were given the incentive of extra credit. Most students might not be familiar
with PLTL sessions and they need to be encouraged to attend at least one session to realize how helpful they can be.

2) It would be helpful surveying students’ availability to schedule the PLTL sessions. About 14% of the students who responded the survey indicated that they were unable to attend the sessions due to scheduling conflicts.

3) The peer leader training is essential and it seems to be working properly in our implementation. Most students attending the PLTL sessions have a very positive perception of the overall performance of peer leaders.

4) When most students in the course participate in the PLTL sessions, the persistence in the course seems to increase: from all students in Section 1, over 61% of them completed the course, which is higher than the 50% typical completion rate.

Abstract

Virtual Learning Environments (VLEs) are software platforms designed to provide learning spaces for education, economics, cultural, and other human activities. In this paper, the authors conceptualize three major design components related to an efficient VLE. We offer a conceptual model and framework for educators to consider during curricular developmental stages. This framework consists of best practices related to system alignment, pedagogy and instruction, and social dimensions in the formation of the VLE environment.

An Integrative Literature Review is a specific research design and methodology of its own. This type of literature review is a selective scholarly overview that synthesizes prior research to formulate a research question and establish credibility for a study. As part of the process, researchers attempt to provide a compilation of major theories that contribute to the research topic that are bounded by the parameters identified in prior research.

Based on an exhaustive review of prior research evidence, we suggest a VLE model for teaching and learning promoting synchronous and asynchronous learning. Through the dissemination of information, communication, collaboration, and various Web 2.0 tools (i.e. blogs, wikis, discussion forums), educators have the ability to enhance the quality and variety of student engagement activities and academic outcomes. In addition, VLEs promote 21st century constructivist, student-centered learning that fulfills the crucial demand of technology skills in a progressive global setting.
EFFECTS OF CONVERSION FROM O/A LEVEL TO INTERMEDIATE STREAM IN PAKISTAN: A CASE STUDY

Dr Nayer Fardows, Principal Edwardes College, Peshawar Pakistan
Sarah Nayer, Lecturer Edwardes College, Peshawar, Pakistan
Daud Nayer, University of Lahore (Islamabad Campus)
Rakhil Mariam, Research Associate

Abstract

The subsequent research investigates the swift rise in the adaptation from O/A levels which is the British education system to the intermediate system (the national education system) of Pakistan. Seekers consider that intermediate stream upsurges the probabilities of getting admission in medical and engineering colleges as the intermediate system in Pakistan operates according to the fundamentals of science colleges. Moreover, reduction in the overall marks obtained in the British education system at the time of entry test by the Inter Board Committee of Chairman (IBCC) also dispirits the students to pursue in this stream. However, both structures have almost similar years of learning but differ in their learning patterns. O/A levels comprise a motif of conceptual learning. On the contrary, intermediate stream is entirely an annual based system where students are analyzed on the basis of their exam attempting abilities. Furthermore the British education system is even challenging to bear the expenses keeping in mind the economy level of Pakistan. O/A levels are considered to be as a status symbol in Pakistan. This study explores as to how successfully students are profited after conversion from O/A levels to intermediate stream. A sample of 100 students within the vicinity of Edwardes College Peshawar, Pakistan were engaged as the case study that has shifted from O/A levels to intermediate stream within the last five years (2010-2015). A quantitative survey method was used to acquire responses from the respondents. The outcome advocates that 25% students, who convert, significantly reach their target of study. 50% students scuffle and face strain to cope up with the memory based learning. Left over25% students achieve either average grades or fail their exams.

Keyword: O/A stream, Intermediate Stream, Conversion from Conceptual Learning to root memory system

Introduction

Education in Pakistan is overseen by the Federal Ministry of Education and the Provincial governments, whereas the federal government mostly assists in curriculum development, accreditation and in the financing of research and development. Article 25-A of constitution of Pakistan obligates the state to provide free and compulsory quality education to children of the age group 3 to 16 years. "The State shall provide free and compulsory education to all children of the age of five to sixteen years in such a manner as may be determined by law".

The education system in Pakistan is generally divided into six levels: Preschool (for the age from 3 to 5 years), primary (grade one through five), middle (grade six through eight), high (grade nine and ten, leading to the secondary school certificate or SSC), intermediate (grade eleven and twelve, leading to a higher secondary school certificate or HSSC) and university programs leading to undergraduate and graduate degrees.

The communal assessment system of England and Wales is the Advanced or A-Level, which is a regulated test of the high school, taught after the completion of O level, intended for the acquisition of General Certificate of Education (GCE). A-Level encompasses an enhanced
learning and comprehension and serves as a pre-requisite for the students aged 17-18 years desirous of higher education, to be eligible for admission into the university.

The formal A-Level system of England is comparable to the Intermediate or FSc. in Pakistan. Intermediate is the Federal evaluation analysis of students who have completed their two year Matriculation studies. The Intermediate is aimed at providing the High School or Higher Secondary School Certificate (HSSC), based solely on subjective reasoning and questioning. Intermediate is obligatory for Students aged 17-19 years seeking further advanced education.

**Comparative Overview of Both Systems**

**Syllabus Pattern.** A-levels for every subject there is a specific syllabus and guideline to follow. Students study from different reference books in accordance with syllabus and are not stuck with a single course book throughout the course period. Intermediate students have certain prescribed books for every subject which they are bound to learn for exams. They don’t go around consulting different books.

**Grading System.** In A-levels performance of a student in each subject is graded. The grades range from A+ being the best to E being the last considerable grade. Students unable to make through exams are ungraded and are graded with symbol, “U”. Matric system deals with numbers rather than grades. Total marks for Matric and intermediate (secondary and higher school certificate) exams are different for different Boards. They get grades on overall performance instead of per subject. Student who scores more than 80 percent marks is awarded an A grade.

**Examination Pattern.** In O level CIE takes 2 to 3 papers of a single subject aimed at building skills in creative thinking, enquiry and problem solving, practical skills and theoretical knowledge. Matric exam usually have either 2 papers or 2 sections under the name of Objective and Subjective testing there theoretical knowledge. There is a practical exam for science subjects also.

**Examination Fee.** A-levels are far more expensive than its counterpart. The examination fee for A-level is the sum of individual fee for every subject a student takes. It is more or less 65 pounds per subject making the total examination fee more than 500 pounds.

**Examination Timings.** A-levels exams take place biannually. Once in May/June and then in November/December for the second time. This gives students; an opportunity to improve their grade within a span of 6 months. Matric examination takes place once in a year during spring season. Students willing to improve their marks have an opportunity of reappearing in the exams held right after the results.

**Most people perspective.** If pursuing the higher education abroad is the primary concern, than A-levels without a doubt is the accurate preference. But if future resides within the country one should opt for the national educational boards.

**Objectives**

The objective of research is to **explores** as to how successfully students are profited after conversion from O/A levels to intermediate stream.
Hypothesis

H1: Students are successful after conversion from O level to intermediate stream.
H2: Students are partially successful after conversion.
H3: Students are not successful at all after conversion.

Significance of the study

Students will possess the potential to elect the wise and suitable system with secure and acceptable policies and the authority to figure out the pros and cons of both the classification.

Literature Review

Muhammad Saied. (2007), stated that Education system varies from province to province in Pakistan. Literacy rate of Baluchistan is comparatively low than other provinces. Even the selection criteria for admission in universities are different for the residents of tribal areas of Pakistan. The fact that preference of desiring FSC over A-levels, after doing O-levels, can vary from province to province. Literacy and change adaptation rate is high in Punjab and Sindh that means they possess a higher tendency of accepting a sudden change in education system. Even in U.K, educational years for the same degree in England are different as that of Scotland. Bachelors from England comprises of 3 years whereas 4 years in Scotland. Education and training authority, assessment and evaluation and supervision and management vary from area to area within the same country.

Khalid, S. M., & Khan, M. F. (2006), concluded that the condition of education in Pakistan is that students are only inclined towards achieving a degree. They are least bothered in getting practical education. A country performs well because of its highly experienced and learned human resource. The ones who are studying just for the sake of getting admissions and getting a degree are going to be the future HR of this country. Even parents are not realizing this situation. They make their kids pass levels first and then transfer them into intermediate stream because of certain factors such as: levels overall percentage falls at the time of admission in a university, the university tests are according to the intermediate system. They barely bother about personal grooming and learning potential in a child.

Memon, G. R. (2007), found that presently Pakistan higher education is very low and poor. The research rate is very less as compared to other countries. The main reason behind this is that students are just concerned about their results and getting a degree to show off. They do not know what exactly they are interested in for e.g. opting intermediate after O-levels, not having the proper prerequisite which ends upon not getting any proper educational background just because no proper assistance was set about the educational future. In Pakistan parents and students do not have this attribute of having a friendly relation where students can openly tell their parents what they wish to study in future. Students are not given proper facilities either by the government or even in private sector.

Lumsden, Mary Ann, et al. (2005), stated that a tool such as personal qualities assessment is used for medical student admission in order to realize, are they capable enough to perform at a higher level representing the medical situation of their country? It doesn't matter how fast you learn the notes. The personal grooming and growth of a student matters the most. Anybody can be a man but it takes a lot to be a gentleman. The intermediate stream does not play a vital role in the grooming of a student whereas Levels students are the ones that study and excel in a better learning environment. Intermediate focuses on just admission in top universities of sciences.
Rumberger, R. W., & Thomas, S. L. (2000), came up with the findings that when a student transfers from O-levels to intermediate stream the turnover and dropout rate rises. Scott stated that usually the dropout or turnover rate depends on a student's background. If students are studying something that they have never heard about before in their lifetime or are never interested in that, it will lead them towards huge failure or if maybe a student does not have that potential of studying something and is forced by family to study so (which has actually become the culture of Pak now), it will lead him towards nowhere. Another factor that creates an immense impact is the policies of that specific institution. It has happened allot that even a fine performing student, ends up getting out having no degree in his/her hands because of certain practices. School policies influence failure as well.

**Methodology**

Respondents include students of Universities and colleges of private sector. The data was collected from 100 students of private sector universities and colleges within the vicinity of Peshawar and Islamabad. A self-developed questionnaire regarding the study was shaped and distributed. Our method of sampling was convenient sampling. Self administered questionnaires were distributed among the respondents who were students. Total number of 120 questionnaires was distributed out of which 100 were properly responded back. Data analysis was obtained using descriptive statistics in SPSS.

**Results and Discussion**

The result of this analysis is a clear depiction of the fact that the levels system emphasizes the practical learning of the students. It lays importance on the creative thinking of the students, unlike the opposed, intermediate system of education. It develops confidence in the students when working with the opposite gender from the beginning (co-education). The students are well versed owing to the fact that they communicate and work in English. The fraction of intermediate is low as the students are tested based merely on their performance in the exams, as to how well they attempt the questions asked, not on the intellect, knowledge and
understanding of the student. Nonetheless, a reasonable portion exclaims that more than the system of education in which a student is, the primary element of creative learning, gaining knowledge and understanding is the student itself. Neither the Levels can make a student competent nor the intermediate confine their skills and knowledge.

A majority of the people have opted for practical learning over getting good grades as practical learning is the source of gaining better skills and better learning. An institution is the best place to enhance and refine the skills and qualities of a student. The present day Pakistani student is well aware of the importance of practical learning in developing a good career. However, unexpectedly, the other half that has chosen getting good grades, are not false in saying so, as unfortunately, in Pakistan, acquiring good grades is the only way the students can enter a well reputed organization to prove themselves being knowledgeable enough to get a good job and establish a stable future.
The entry tests for universities in Pakistan are based entirely on the education taught in intermediate. Moreover, importantly, the education imparted in universities is also formatted on the intermediate education system because the Federal Ministry Instructs the National system of education for all the Pakistani colleges and universities. In this respect, the Levels students face problems in passing the entry test, also owing to the fact that their percentage marks are also deducted when applying to any university. Yet, a small fraction of people also hold the view that the students can clear the test irrespective of the system if education studied in.

### 3. Which system is more beneficial in passing an entry test of medical and engineering college?

<table>
<thead>
<tr>
<th>Levels</th>
<th>Intermediate</th>
<th>Both</th>
</tr>
</thead>
<tbody>
<tr>
<td>18%</td>
<td>46%</td>
<td>36%</td>
</tr>
</tbody>
</table>

### 4. Which system is a better option for applying in a foreign university?

<table>
<thead>
<tr>
<th>Levels</th>
<th>Intermediate</th>
<th>Both</th>
</tr>
</thead>
<tbody>
<tr>
<td>80%</td>
<td>6%</td>
<td>14%</td>
</tr>
</tbody>
</table>
Evidently, Levels being the education system of Britain, is based entirely on the British education standards. The structure, method of teaching, grading, subjects and exam boards are all the ones, practiced in Great Britain. Despite the difficulty faced in coping up for the difference of education system, the intermediate students still, are eligible to apply for admission in the foreign universities.

5. Which system is easy to afford?

A striking majority of the people have voted for the intermediate as being the cost effective system of education. Pakistan being an emerging state is still ranked in the list of third world countries, where, for a lay man, to spend a major portion of the income on an expensive system of education such as Levels is not viable.
The majority voted for Levels, as the levels system is based on developing in the learner, skills of creative thinking, enquiry and problem solving. It is framed such that the student focuses on the subject content, enhancing their intellect in applying their knowledge to new, unprecedented situations. Also awakening in them, a sense of cultural awareness which is barely seen in the intermediate system of education, presenting the meagre portion of the results. Although, for some 18% of the study population, this variation in the learning pattern holds no significant standing.
The Levels system of education focuses on a more broad and expanded provision of knowledge to its students thereby, increasing the duration of the study period which takes about a year and a half above the intermediate system of education. If the student is unable to pass the examination they will have to wait another six months before reappearing. Where an intermediate student, on the other hand, has the privilege to reappear just after three months, further prolonging the time duration for the Levels student. As shown clearly by the results.
The rate of success in the transition from Levels to the intermediate is more as the learning patterns and policies of the institutions are flexible for such students and the students themselves are apt enough to adapt to the changing environment, they will undoubtedly face difficulties, but will manage to succeed. Though, the less 30% of the respondents disagree and find it will not be possible for them to cope up with an abrupt change in the teaching system, where in their own system the Levels students are much indulged.

9. Will you transfer from levels to intermediate stream if you realize in between that it is not appropriate for you?

The rate of success in the transition from Levels to the intermediate is more as the learning patterns and policies of the institutions are flexible for such students and the students themselves are apt enough to adapt to the changing environment, they will undoubtedly face difficulties, but will manage to succeed. Though, the less 30% of the respondents disagree and find it will not be possible for them to cope up with an abrupt change in the teaching system, where in their own system the Levels students are much indulged.
A present day student (representing majority of the study result) is well aware of choosing the field suitable for them, if however during the course of study they assess that their productivity is not to the maximum owing the inappropriate system of education they are in, they will consider it wise to switch the system in between rather than wasting one whole year and wait for the upcoming session to start. Nevertheless, a lesser amount still considers switching in between the session might prove to be ineffective for them.

### 10. Will you choose the education system that you are forced to, by the society or parents?

<table>
<thead>
<tr>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>40%</td>
<td>60%</td>
</tr>
</tbody>
</table>

A majority of the students are conscious to the significance of choosing a path that they think is appropriate for them, depicted clearly in the study results. 40% students are still forced to opt for the path chosen by their parents, who are forced to get the education preferred by their parents, which is the major cause of student drop out from schools. Parents nowadays consider admitting their children to a medical or engineering college as a status symbol, not realizing their interests and abilities, which ends up as a failure in professional career of their children.

**Conclusion**

Laying significance on the inventive opinion of the students, A. levels is considered to be an enormous platform of practical learning mounting the self-confidence attitude of the students. It is evident that practical learning, being the focus of a student’s mission, is the foundation of gaining healthier skills and enhanced knowledge. The structure of A-levels leaves behind no query when it comes to applying in a foreign university or competing in an international environment. Whereas in Pakistan, intermediate makes it fairly straightforward and feasible for a student to enter a medical or engineering college since the teaching imparted in universities is also designed on the intermediate education system. Intermediate scheme turns out to be the simply affordable quality education system caring regarding the purchasing power parity of an individual in Pakistan, moreover being the single effectual and remarkable
education system that consume not as much of educational time period as compared to the opponent system results in building a vast satisfaction rate over A. levels. More than two third of the entire populace believe transferring from O-levels to intermediate stream rather than continuing A. levels is a sensible come secure decision and one third of the population as collapsed when opting the similar shift of education systems, considering the discussed aspects in view. Specifically when in Pakistan. However, social pressure from parents and society do play a serious function in a student’s educational tenure, thoroughly confused and ending up choosing the mistaken corridor. Further details that need to be carried out in the same field of study include the suggestion from other provinces of Pakistan and responses from public sector.

Movement’s Role in Learning: A Neuroeducational Perspective

Matt Thul
**Introduction**

The purpose of this literature review is to analyze the role that movement plays in the cognitive learning process. This review includes exploration of why movement is important for learning and a deeper exploration of how the cerebellum impacts learning is included as well. Furthermore, movement’s role in learning will be emphasized through analyzezation of learning disabilities and cognitive impairments.

**Neuroeducation Definition**

To bring clarity to this review and topic of neuroeducation a definition would prove useful. Neuroeducation is defined as an “interdisciplinary field that combines neuroscience, psychology, and education to help create improved teaching methods and curricula” (The Dana Foundation, 2009, para. 2).

**Movement’s Role in Learning: A Neuroeducational Perspective**

Movement plays an important role in student academic achievement and learning, especially when attached to some form of novel, goal-directed learning (i.e. a student with an interest in art reads a book on painting techniques believing it will make him or her a better artist) (Tomporowski, Davis, Miller, & Naglieri, 2008). When some type of movement is performed on a regular basis for several weeks, positive cognitive effects occur (Colcombe et al., 2004). Aerobic, when compared to anaerobic exercise, has been shown to be more effective in producing a positive correlation between movement and cognitive abilities (Kramer et al., 1999; Tuckman & Hinkle, 1986). Studies have shown that there is a connection between fitness levels and academic scores for students ranging from elementary age through high school (California Department of Education, 2005; Dwyer, Sallis, Blizzard, Lazarus, & Dean, 2001). Also, connections between cognitive delays and developmental motor skills have been shown
MOVEMENT’S ROLE IN LEARNING: A NEUROEDUCATIONAL PERSPECTIVE

(Westendorp, Hartman, Houwen, Smith, & Visscher, 2011), which further demonstrates the connection between movement and learning.

Movement plays an important role in the maintenance of body weight and the reduction of health risks, especially during a time when childhood obesity is at an all-time high; overweight children now represent over one third of all children in the U.S. (Davis, et al., 2011). Forms of physical activity or movement, such as running, playing on outdoor park equipment, or participating in organized sports, may also provide enriched effects on children’s mental functioning that are associated with cognitive development (Davis, et al., 2011; Leiner, Leiner, & Dow, 1991; Sibley & Etnier, 2003). When exercise is performed on a regular basis for several weeks, alterations to brain functions related to cognitive development occur (Colcombe, et al., 2004). Davis et al. (2011) conducted a study that showed positive effects on overweight 7 to 11-year-old African American and Caucasian children in both higher planning skills as well as mathematics achievement; the 171 children were randomly assigned and participated in either regular aerobic exercises (two separate groups having durations of either 20 minutes/day or 40 minutes/day) or a no exercise control group for three months. The children in the study were given no mathematical instruction, yet they still showed improvement. Similarly, Tomporowski et al. (2008) found that gains in children’s mental functioning due to exercise was most enhanced when exercise was paired with goal-directed actions (i.e. studying for a test to get a better grade) in complex, constantly changing, novel environments.

There is a difference associated with learning outcomes based from the type of exercise performed. Aerobic exercise (i.e. running and cycling) impacts cognitive function more strongly than anaerobic exercise (i.e. weightlifting). A study performed by Kramer and colleagues (1999) assigned 124 participants to either a 6-month aerobic training program or a 6-month non-aerobic
toning program. Participants were given a variety of tasks to accomplish before and after the specific training program. Participants who were in the aerobic training program performed executive-function-based tasks (i.e. task switching, response compatibility, and stopping) more rapidly than did the participants in the non-aerobic program. Another study conducted by Tuckman and Hinkle (1986) demonstrated similar results. The study consisted of 154 fourth, fifth, and sixth grade children who were randomly assigned to either participate in a 12-week aerobic running program or attend regular 30-minute gym classes that met three times per week. Children who participated in the aerobic exercise training program performed better on a test measuring creativity than did the students in the regularly assigned gym class. The test used in this study was the Alternate Uses Test, which measures divergent thinking. Participants were asked to name 10 familiar objects and write as many appropriate uses for each object.

Research indicates there is a relationship between measures of physical fitness levels and academic achievement. Dwyer et al. (2001) conducted a study measuring fitness levels of over 8,000 Australian children ranging in ages seven to 15 years of age in 109 schools and compared the results with the student’s individual academic scores. Although small, there was a significant positive association between a child’s physical fitness level and their academic scores. There was no additional exercise of any form imposed on any of the children in this study, however. The California Department of Education (2005) conducted a similar study, which revealed comparable results between physical fitness levels and test scores among fifth, seventh, and ninth grade boys and girls. This study showed a stronger relationship between girls’ physical fitness levels and tests scores than when compared to the boys’ physical fitness levels and tests scores. Considering students’ physical fitness levels may help give an overall picture of students’ learning abilities.
Movement through play allows students to develop academically as well as emotionally. Because the brain is continually growing, changing, and adapting, it is important to give students room to learn independently (Rushton, 2011). Neuroscientist Rushton uses movement and play in classrooms as a way to allow early childhood students to form self-selected learning which is unique to each child’s emotional, intellectual, and physical domains. Rushton gave an example of a kindergarten student who accidently broke her classmate’s thermos, became embarrassed and was not sure how to handle the situation, so she ran to the canvas in the classroom and started painting until she was calm. When students are allowed to express themselves through play, they move towards mastery of emotions in any given situation (Rushton, 2011). This mastery can look different depending on the child due to our individually and uniquely structured brains. Additional positive effects can be gained when adding, along with movement, real life, hands-on, meaningful learning experiences that require some form of problem-solving, such as learning the meaning of a new word while helping a family member cook a family favorite recipe (Rushton, 2011). Rushton’s classroom demonstration emphasizes that students are unique learners and will display different forms of learning based from emotional, intellectual, and physical abilities.

Learning Disabilities and Movement

Children are different in many ways, and learning abilities are no exception; however, the connection and interaction between motor skills (movement) and academic abilities remain the same because of this shared relationship. Research has shown the connection between well-developed gross motor skills and children’s cognitive functioning abilities, especially academic abilities reading, language, and mathematics (Burns, O’Callaghan, McDonell, & Rogers, 2004; Son & Meisels, 2006). Since there is a connection between gross motor skills and cognitive
functioning abilities, one could predict that children with cognitive delays would demonstrate some lag in typical gross motor development. Westendorp et al. (2011) showed that students with cognitive learning disabilities often displayed under-developed gross motor skills. The strongest connection for students with cognitive delays was between mathematics and object-control skills, such as handling a ball or catching an object.

In a similar manner, research indicates that students with differing learning disabilities show similar signs of struggle in relation to developmental lags in movement and the specific learning or cognitive disability. For instance, Henderson and Sugden (1992) performed a study that discovered a connection between students who have dyslexia and poor scores in the balance test of the Movement Assessment for Children. Furthermore, Best, Miller, and Naglieri (2011) found that the larger the child’s developmental learning lag, the poorer the child’s motor skills. The authors also studied the relation between learning disabilities and poor gross motor skills, which showed students with learning disabilities performed poorly on locomotor skills and ball handling skills.

**Movement and Learning: The Cerebellum’s Role**

The connection between movement and academic abilities may be closely intertwined to an area of the brain called the cerebellum. From a neuropsychological perspective, the connection between the cerebellum and the prefrontal cortex makes sense (Diamond, 2000). The prefrontal cortex is associated with higher-order thinking or executive functioning and the cerebellum is associated with complex, coordinated movements. When one performs a strategic movement, both areas of the brain are activated.

Motor control (i.e. strategic movements) is most associated with the area of the brain called the cerebellum. The cerebellum sits at the back of the brain underneath the occipital lobe
and is connected to the brainstem (Carter, 2014). It only takes up one-tenth of the brain by volume, but it contains nearly half of all its neurons (Ivry & Fiez, 2000). In fact, most of the neural circuits in the cerebellum go outwards, meaning it influences the rest of the brain (Middleton & Strick, 1994). Thusly, the influence of the cerebellum is not wholly limited to movement. The cerebellum can make predictive actions involving gross-motor tasks as well as cognitive tasks (Ivry, 1997).

Movement, as associated with the cerebellum, and learning can further be examined through reflection of human evolution. Humans have evolved, survived, and thrived because of movement (Bloedel & Bracha, 1997; Blumenfeld, 2002; Koziol, Budding, & Chidekel, 2012). The part of the brain that is most concerned with movement is the cerebellum (Carter, 2014). The brain is influenced by the cerebellum due to the assigned outward-going neural circuits (Middleton & Strick, 1994). The effects of the cerebellum have been produced in areas of the prefrontal and parietal cortexes which construct advanced planning, executive functioning skills, and planned movements (Leiner, Leiner, & Dow, 1993). It is movement that drives inspiration of learning and higher-order thought processes in the brain and the cognitive effects are its byproducts (Ivry, 1997).

Cognitive thought is a byproduct of movement (Koziol et al., 2012). Without movement, there is no need for thought because we were born to move (Bloedel & Bracha, 1997). Our survival depended on and still depends on successfully making strategically planned movements (Koziol et al., 2012). Evolution of manual dexterity for use of tools, creation of art, and instruments to be played are all products of movement (Koziol et al., 2012). Compliments of movement also include the ability to gesture, write, or even speak (Gibson, 2002). It is not coincidental that all the parts of the body with the greatest sensory sensitivity generate
movement, including: toes, feet, fingers and hands (Blumenfeld, 2002). The importance the role movement plays in our learning process is highlighted by nature. The enhanced sensitivity to the areas of the human body that generate movement allow us to learn more effectively and are essentially linked with the cerebellum.

The range of the cerebellum’s effects extends to the prefrontal and parietal cortex areas of the brain which are associated with advanced planning, executive functioning skills, as well as planned movements (Leiner et al., 1993). The cerebellum can no longer be viewed as a structure with a sole purpose focused on movement (Bostan, Dum, & Strick, 2013). Bostan and colleagues (2013) explored the cerebellum’s impact by injecting virus trans-neuronal tracers into the cerebellum of primates and recording the outputs. The study found that the virus tracers were observed in both areas of the prefrontal cortex, as well as the parietal cortex, again demonstrating the range of the cerebellum’s influence on other areas of the brain. Furthermore, Koziol et al. (2012) argue that the cerebellum in fact trains the frontal system’s responses to various settings and situations by anticipating outcomes through use of sensory input, thus concluding that the frontal lobe is situated by sensorimotor structure. Since the frontal lobe is most directly associated with executive functions and the cerebellum attributes great influence on its function, the role of movement and learning is again emphasized.

Executive functions are used as a means to help make sense of new learning and behaviors. Miller (2008) defines executive function as the functions an organism uses for its own interest as an act of survival. The cerebellum is attached to the brainstem, which serves many of the automatic functions used for survival, such as breathing and heart rate and in the cerebellum’s case movement and coordination (Carter, 2014). Koziol et al. (2012) emphasis of the cerebellum’s role in the prefrontal regions of the brain, which are associated with executive
functioning, remains grounded in sensorimotor anticipation which means that executive functioning abilities are based from automatic movement-based principles.

**Learning Disabilities and the Cerebellum**

The importance that movement plays in our abilities to learn can equally be shown through observations of people with cognitive learning disabilities and impairments towards motor functions. Piek, Dawson, Smith, and Gasson (2008) led a study that examined 33 infants with gross motor problems in early stages of their lives and followed up with the same children at later ages, six to 11 years of age. The infants were noted as having troubles with the sucking motion during feeding. A predictive relationship between the lack of gross motor skills (sucking motion during feeding) and later-shown inefficiencies involving working memory and processing speed was revealed. Thus, there is a strong relationship between early gross motor problems and troubles in higher-order, executive functioning because feeding habits in early years overlap with neural networks of cortical, subcortical, and brainstem regions of the brain which support executive functioning later in life (Piek et al., 2008).

The cerebellum’s role in movement and its association with learning can be analyzed from the perspective of children who suffered damage to their cerebellar regions. Riva and Giorgi (2000) conducted a study, which analyzed 26 children with a mean age of 10 years old, all of whom had undergone surgery to remove tumors located in their cerebellar regions. The children with tumors on the right side of the cerebellum presented inefficiencies in auditory sequential memory and language processing, while children with tumors on the left side of their cerebellum showed disturbances with spatial and visual sequential memory attributes. Post-surgery, children who underwent surgery on the right side of the cerebellum developed speech disorders, and children who had surgery on the left side developed behavior disorders similar to
those of children with autism. The cerebellum is known for its critical roles in movement. Cross-examination of studies involving disturbances to the cerebellar region and the connection between the cerebellum’s role in movement emphasizes the impact that movement has towards learning.

**Concluding Summary**

This literature review explored connections between movement and the cognitive learning processes. Analyses between different forms of movements including aerobic versus anaerobic exercises, as well as general correlations between physical fitness levels and academic levels were explored. The cerebellum’s role in the cognitive learning process was explained, as well as analyzed from a neuroscientific and medical lens based from learning disabilities.

Research shows there are observable connections between either physical fitness levels or intentionally practiced forms of movement (California Department of Education, 2005; Colcombe et al., 2004; Dwyer et al., 2001). Greater positive results can be made when meaningful and novel learning (i.e. providing a learning experience which is applicable to the student’s life or directly relates to the student’s interests) is attached with the movement or exercise (Tomporowski et al., 2008). The cerebellum’s role is clearly identified through research studies; however, it is commonly disputed within the neuroscientific field due to inconsistencies in overall research and restrictions or limitations due to specificities conducted in the studies. For example, the study conducted by Davis et al. (2011) involved sedentary, overweight, seven to 11-year old African American and Caucasian children. This may generate profound implications but it should not then be generalized to the overall public and thusly more research is needed. However, the importance of findings from studies such as these contribute knowledge into students’ overall learning process and may help bring further insight into the education field.
References

This study examined emotional knowledge as a mediator between inhibitory control and social competence in preschool children. The research was performed three times, at the beginning of the school year (Time 1), in the middle of the school year (Time 2) and at the end of the school year (Time 3). The results suggested that inhibitory control (Time 1) and emotion knowledge (Time 1) showed associations with social skills (Time 3).

Abstract

Background
The recent child abuse cases by preschool teachers caused increase of social mistrust about teachers and preschools in South Korea. Some experts have stressed that school society need to change and make efforts for forming educational community as a key of solution (Chung, 2015; Kim, 2007; Hong, 2012). And competent preschool teachers and parents are needed for building the early childhood educational community but little effort has been made to understand teachers’ and parents’ core competencies.

Purpose
The focus of this study was to compare the factors of Korean early childhood teachers’ and parents’ competence scale for building educational community. And the study intended to present educational implications for developing preschool teachers’ and parents’ competencies.

Method
The sample of the research consisted of 638 preschool teachers and 543 parents with preschoolers,
selected according to cluster sampling method. In light of the scales obtained from the related literatures and focused interview with 12 members included in 2 teachers, 2 parents, 2 directors, and 6 experts. Then, the first form of the scale was presented into the views of 5 field experts for content validity. Final scale consisted of 68 items which had 17 competence elements divided into 15 common and 2 teacher specific or parent specific elements. In order to test the validity of the scale, the exploratory and confirmatory factor analyses were carried out.

Results

The same two factors were extracted like ability of practicing partnerships and ability of practicing shared core values of the scales. The estimates of confirmatory factor analysis provided a good fit to the data. The scales showed high validity, reliability and item quality so that it can be used to measure teachers’ and parents’ competencies for building educational community. By the way, components within the factors were different between the scales. Teachers’ scale showed similar components number but parents’ one consisted of relatively little components in ability of practicing shared core values factor.

Conclusions

An interesting finding in the present study showed differences in ability of practicing shared core values factor between teachers’ and parents’ scale. This means that parental perception about ability of practicing shared core values was different to teachers’. And it shows that parents tend to think about some elements of social competencies for development of institutes and society in relation with individual psychological competence such as ability of practicing partnerships. This study suggests that understanding and educating of parental social competencies is important to develop educational community competence.

Abstract: This research analyzes the usage of Information Communication Technology (ICT) in the university setting, based on enrollment size. The research reports the results of the “Survey on promotion of ICT utilization education in higher education in Japan,” administered in 2015. Two main points were found in the survey. First, the introduction of LMS is progressing, compared to results found on the same survey in 2013. However, it tends to be used primarily in small universities. Second, improvement of the technological "infrastructure" is fairly universal, regardless of the size of the university; however, educational support and school administration factors are just being introduced in most small universities. In addition, smaller universities tend to take a more active approach in ICT implementation.

Introduction
In recent years, with the advancement of globalization and openness of higher education, the use of information communication technology (ICT) is becoming indispensable for providing diverse forms of education in the 21st century university. However, the current state of ICT utilization education in higher education in Japan has not been widely studied. Therefore, based on the survey result of ICT utilization by higher education in Japan conducted by AXIES (Academic Exchange for Information Environment and Strategy) in FY2015, this paper examines the state of the ICT environment in Japanese universities.

Overview of Survey
With the cooperation of the Ministry of Education, Culture, Sports, Science and Technology, the ICT Utilization Research Group of AXIES surveyed 1215 institutions of higher education in Japan during the period from November to December 2015. The purpose of the survey was to grasp the situations and trends of ICT utilization in education, such as e-learning and open education, at Japanese universities. The survey was conducted in a web questionnaire format. The response rate was 64.8% (517/798 institutions responded).
Methods of Analysis
AXIES analyzed the question items from "the state of ICT in the university" survey, and was disaggregated based on university enrollment. Based on the number of undergraduate students, the scale indicators were classified into five groups A to E as shown in Table 1.

Results and Discussion

1) Introduction Rate of LMS
Figure 1 shows the trends in the implementation rate of LMS by university size, together with the results of a survey conducted by the Ministry of Education, Culture, Sports, Science and Technology conducted in FY 2013 (Kyoto University, 2014). In the two years from FY 2013 to FY 2015, the introduction of whole school LMS is increasing for universities of all enrollment sizes; however, introduction has progressed further in smaller universities in comparison to larger universities.

![Figure 1: Implementation rate of LMS by university size](image)

2) Introduction Rates of ICT Environments
We divided the whole ICT environment into "Infrastructure", "Administration,” and "Learning Support” categories. Figure 2 shows the rate by category.
As seen in Fig. 2 (a), the mail system was introduced in over 90% of all surveyed universities. For on-campus wireless LAN, the introduction rate is high overall. However, smaller schools lag behind in the availability of wireless LAN on campuses.
Figure 2 (b) shows the introduction rate of the ICT environment related to teaching management. Web publishing of syllabi is almost universal for all universities. Course management systems are not used as much in large universities as in small universities.
Figure 2 (c) shows the introduction rate of ICT environment related to learning support. Evaluation using a "study portfolio" is listed in the national guidelines of 2012 as an item to be promptly addressed, so the introduction rate of an e portfolio tends to be high among the items of learning support. However, Japan’s rate is behind that of the United States, according to this data (Allen, 2014).
From these graphs, systems that allow students to take actions themselves, such as viewing and registering systems, are being updated at universities of all sizes. However, in the area of support for
learning, the introduction of the ICT environment has not yet taken place. Furthermore, the introduction of the ICT environment is delayed overall in smaller universities.

According to survey items about securing the budget to procure ICT utilization for education, the smaller group, the E group, is not dependent on the type of school (national, public, private), but the rate at which "budget is not secured" is higher than in other groups. We also found that smaller universities are reluctant to utilize ICT at educational sites.

![Graph of ICT environment implementation rate by university size](image)

**Figure2: Implementation rate of ICT environments by university size**

**Conclusions**

Based on the data of the 2015 survey on ICT utilization in higher education, we analyzed the situation of the ICT environment. Regardless of the size of the university, while the infrastructure environment has been improved, it has been found that ICT is not yet utilized in the learning scene. Introduction of the ICT environment was delayed in the larger universities as well as in smaller universities, and more detailed analysis is necessary.

The Effect of Safe Ride Programs on Neighborhood Crime

Amy Siever
University of Wisconsin Milwaukee
Abstract

According to the National Center for Education Statistics (NCES), 34% of public four-year colleges, and 24% of private colleges offer some version of night-time shuttle or van service for their students. Student safety is the primary purpose of these programs. However, given the relationship between institutions of higher education and their communities (often referred to as the “Town and Gown” relationship), might these programs be providing a greater service by reducing the amount of crime in the neighborhoods served? This study analyzed crime rates in the neighborhoods served by one university’s van shuttle program and determined that the program played a significant role in reducing crime in these neighborhoods. The study has relevance for other campus’ currently sponsoring, or considering sponsoring, such services.
Introduction

Private expenditures on crime deterrence and prevention are enormous. Americans spend more on private security than they do on police (U.S. Census Bureau, 2012). Private efforts to reduce crime include block watches, alert systems, security equipment, and personal expenditures on self-defense. Colleges and universities are similarly concerned about the safety of their students, and spend a great deal of time and money on programs related to the safety of their students. These programs include, but are not limited to foot patrols, nighttime escort services, emergency phone systems, better lighting, and self-defense courses. They also include van service or ‘safe ride’ programs for students. All of these programs and services are designed to keep students safe. But is it possible that these programs, in particular the safe ride programs, serve a secondary purpose: reducing the crime rate in the neighborhoods surrounding the campus? This paper looks at the effect that one safe ride program had on the crime rate in the neighborhoods served, and determined that the van service did indeed reduce the crime rate in the area served. The results will be useful for students and administrators who can use the data to make a strong case that safe ride programs have a wide-ranging, positive affect on the college and the community.

Purpose of Safe Ride Programs

According to the National Center for Educational Statistics (NCES), 34% of public four-year universities, and 24% of private four-year universities had some version of a safe ride program for their campus. These programs vary in their hours and breadth of services, but they were all designed for two purposes: 1) prevent the victimization of students and; 2) prevent students from driving drunk (Lewis, 1997). Although there is no one single organization that keeps track of all the campus safe ride programs, two national organizations do exist to help
students develop and maintain safe ride programs. These organizations are Safe Ride Programs United (SRPU) and the BACCHUS Initiative (part of NASPA: The National Association of Student Personnel Administrators). When one scans their respective websites, it is clear to see that the foci of campus safe ride programs are, indeed, safety of the students and prevention of drunk driving. According to Gieck and Slagle (2006), students using safe ride programs do, in fact, use them for these two reasons. Additionally, Gieck and Slagle found in their study that 75% of students using the safe ride program in their study indicated their primary reason for utilizing the safe ride program was to avoid drunken driving. Nineteen percent indicated that a lack of transportation was the reason for their using the service, 16% used it due to inclement weather, and 34% used it because their friends did. Although these two foci (safety of students and preventing drunk driving) do exist, this paper focuses on just one of the issues: safety. More specifically, and certainly related, it focuses on what affect safe ride programs have on the level of crime in the neighborhood they serve.

Colleges and universities have become increasingly concerned about protecting their students since the Jeanne Clery Act took effect in 1991. As a result of this legislation, universities have been required to collect and release crime data for their campuses. These crime data can be instrumental in the enrollment decisions of prospective students and their parents. According to Janosik and Gehring (2003) 60% of students read crime-related reports, news articles, or flyers produced by their institutions. Their concern about campus crime may be warranted, given the fact that 15% of the students in this same study reported that they had been a crime victim while they were a student. Colleges, realizing that high crime rates can handicap efforts to attract students (and faculty), to their respective campuses, often use safe ride programs to show how they are actively working to keep their campuses safe.
Despite widespread prevalence of these safe ride programs, however, little systematic exploration has been done to assess their effectiveness. While Elam, McKaig, Jacobs, Whitlow and Louis (2006) found that a majority of students believe that safe ride programs are effective, there exists no statistical analysis of the actual effectiveness of safe ride programs on campus. Given the substantial investment that colleges continue to make with these programs and the increasing pressure on programs to demonstrate that they are having an impact, such studies could have a substantial impact for these programs in terms of funding and improving town/gown relationships.

History of UWM’s Safe Ride Program

In 1999 the University of Wisconsin – Milwaukee (UWM), started an evening shuttle program, Be On the Safe Side (BOSS), for students to utilize on campus and in the surrounding neighborhood. At its inception the program was defined as being a core component of UWM’s commitment to campus safety. Initially, students were allowed to bring guests on the vans but the program later transitioned to being a service strictly for UWM students. In 2015, however, the guest policy was reinstated. When BOSS started in 1999, neighborhood patrol teams were also part of the program and that practice continues today. During BOSS operation hours, three teams of two continue to walk the neighborhood surrounding the campus. If a student calls BOSS for a ride and needs to travel less than three blocks, the patrol team walks with the student instead of providing a shuttle. In this way the patrol program works to alleviate the burden BOSS faces during its busiest times, while still providing an escort service many students want to ensure their safety.
At other universities, similar shuttle programs are offered to promote campus safety.

Table 1 is a snapshot that compares the service BOSS offers, to similar programs across the country.

The BOSS program has some rules to guide its operation, but many of its policies are intentionally vague thereby neither limiting nor committing to a set number of rides a student can take during the year, nor to limit the location the vans will go. While the geographic territory is defined, places within the territory are generally not restricted. Having said that, the BOSS staff will not pick up students from a location where they suspect inappropriate behavior. This policy will be revisited in the discussion section of this paper.
The shuttle programs help ensure the safety of the students and the community members by providing students a safe method of transportation home during evening hours. According to DeJong (1995) these programs serve as a formal reminder to students that there is no need to drive under the influence. The service discourages drunk driving by providing students an alternative way to get home safely. Gieck and Slagle (2006) claim that this also benefits the surrounding campus neighborhood. They showed that for every $1 spent on van shuttles, the community saved $3. In another study examining a late night bus study, police captains appreciated the service because they felt it kept intoxicated people from driving or walking home, which in turn resulted in fewer alcohol-related arrests (Elam, McKaig, Jacobs, Whitlow, Gros Louis, 2006). Although these programs can sometimes be seen as expensive for the college they serve, there is a clear benefit for the campus community.

Even though there has been support to continue the shuttle programs, there have been some negative responses to these services. The concern with these programs is that it eliminates a student’s reason not to drink by providing a ride home (DeJong, 1995). If a student is guaranteed a free ride home at the end of the night, it enables a student to drink recklessly. There is also a concern that these programs are not getting to the root of the problem. In Kelly and Torres's study of women's perceptions of campus safety, they stated that safety services are crucial to the campus, but "these measures only address the fear of crime" (Kelly & Torres, 2006). Those who oppose these programs, are concerned about sending students the wrong message and only solving a short term problem.

When parents are getting ready to send their son or daughter off to college, questions about campus safety often arise during the school selection process. In Janosik's (2004) study on "Parents' Views on the Clery Act and Campus Safety," he found that parents were asking about
campus safety during campus visits and new student orientation, however, the crime statistics did not factor into the college decision. This could simply mean that parents, while interested in what colleges and universities are doing to keep their students safe, they do not have that as one of their priorities when selecting a school initially. Should something happen to their child during the school year, however, it could have a major impact on retention.

Although different universities implement campus shuttle programs at different capacities, these services are becoming a necessity. The shuttles help keep students from drinking and driving, and keep intoxicated students out of the neighborhoods. Even though this is a short term solution to the problems the student could be facing, it helps keep the campus community safe and gives the student a safety net. Not all students are going to make responsible decisions, but it should be the university's responsibility to help guide them towards being accountable for their actions.

Methodology

In conducting a study related to campus shuttles and safety, one might anticipate that university policy makers would target the program so that it is open during high crime hours and closed in low crime hours, leading to concern with reverse causality. If this influence dominates, positive correlation can be expected between the hours the program is open and the count of the crime. Indeed, national data confirm that relatively little crime occurs between 2am and noon, and the night hours before 2am have more crime than daylight hours (Dudzinski, 2011). Therefore, to select an estimation strategy that controls for this reverse causality, fixed effects in an hour of the week panel is ultimately controlled for. Each hour of the week is presumed to have a unique propensity for crime over the data window, supported by the frequent openings and closings of the program within any hour over the time series. It is shown in later analysis that
failure to control for these fixed effects generates an estimate for the program that conflates the program’s crime reducing influence with the tendency of the program to operate during high-crime hours. By comparing pooled and fixed effect estimates, the size of this confounding effect is isolated.

As suggested, the variation in the provision of the program acts as quasi-natural experiment to identify its impact on crime. Poisson regression is required for an hourly number of crime as a count data. Therefore, the follow regression is created with controls to build a more complete specification:

\[
\text{crime}_{it} = e^{(open_{it} \times \delta_1 + x_{it} \times \beta)} + \epsilon_{it}
\]

Where the independent variables, \(i\) and \(t\), represent the hour of \(i\) from the week \(t\) in the 182 weeks of the time frame. The variable of interest, \(open_{it}\), is given the value of 1 if the Boss van service is available in that particular hour, otherwise 0. The coefficient \(\delta_1\) denotes the relationship between the Boss van program being open and crime. \(x_{it}\) is the pooled content of control vector, varying with specific estimate. Conveniently, the coefficients are interpretable as the approximate response in the percentage of hourly crimes from a unit of increase in the independent variable. Also, to avoid overdispersion from Poisson data, the coefficients are bootstrapped 200 times following the recommendation from Efrom and Tibshirani (1993).

Findings

To generate the \(x_{it}\) containing the best information of controlled condition, so as to uncover the effect of the Boss van program as accurately, multiple specifications were attempted. The result is show in Table 1.

</table>

P<0.1 is *, p<0.05 is **, p<0.01 is ***
Column 1 in Table 1 shows the simple partial correlation involving only the element of whether the Boss van program is open or not. We can see that the opening of the Boss van program is correlated with a weakly significant 9.1% decline in count of crimes ($b=-0.091$, $t=1.84$, $p<0.1$).

Column 2 has both Boss van program and open school in sessions in the model because one may consider when school is in session crime around school as well as the demand for transportation and rides increase. This is supported by the coefficient that effect of school session accounts for 16.6% of the crime increase in school. By adding this element, the effect of Boss van program drop slightly to 8.8% in reducing crime counts, which is still a significant effect ($b=-0.088$, $t=1.74$, $p<0.1$).

Column 3 takes the influence of weather on crime into consideration since weather clearly impact both demand for transportation and crime. The meaningful weather condition on crime may include precipitation, snowfall, snow on the ground and minimum temperature. As shown in the column, one unit of increase in precipitation, snowfall and snow on the ground tends to decrease the crime count by 1.7%, 10.7% and 2.5% respectively; while, if minimum temperature increases by one Celsius degree, crime count will be 5% higher. With the weather condition considered, the effect of school in session increases to 17.3%. The target effect, the effect of the Boss van program, decrease again to even weaker but significant 8.5% ($b=-0.085$, $t=1.68$, $p<0.1$).

Finally in column 4 we add the effect for hour of the week, that is, the interaction of hour and day, based on the consideration that each hour of the week had a different mean amount of total crime. As is shown in the table that, when adding the effect for hour of the week, other elements still affect crime counts in the same direction, only the effect size varies from previous
ones. A noticeable 15.2% of the crime count reduction can be attributed to the Boss van program (b=-0.152, t=3.56, p<.01), which is nearly as twice as when the effect for hour of the week is not considered. This discrepancy in the magnitude of the coefficient suggest that using the effect of fixed hour of the day uncovered a substantial portion of the endogeneity that exist in the Boss van program.

To further investigate the conditions that will possibly affect the Boss van program’s effect on crime, next we take weekdays (Monday-Thursday) or weekends (Friday- Sunday) in to the model. The result is displayed in Table above.

A glance at the table reveals that in general, all the variables affect the crime count in the same direction as before except for precipitation and snow on the ground in the weekdays. They two changed their coefficient signs, meaning one unit of increase in the either precipitation or snow on the ground will encourage, rather than reduce, the crime in weekdays. This may signals that in weekdays the effect of weather, at least of precipitation and snow on the ground, is random. In other words, crime will happen as it should do in weekdays on matter what is the precipitation of the day and how much snow is on the ground. Based on this interpretation, our target effect, the open or close of the Boss van program in a designated hour, attribute to as much as 20.5% of the crime decrease in weekdays (b=-0.205, t=4.53, p<.01), while on weekends, the effect is only 8.1% (b=-0.081, t=1.09, p>.1). This comparison may indicate the less efficiency of Boss van program on weekends.

In the last two columns, effect on different types of crimes is also presented. When the crimes are categorized into violence and nonviolence based on the XYZ classification system, the Boss van program have significant effect on both of them. In addition, we should notice that,
even though both are significant at certain statistical level, the program is more effective on nonviolent crimes ($b=-0.185$, $t=2.13$, $p<.05$) than on violent crimes ($b=-0.146$, $t=3.70$, $p<.01$) – reduce nonviolent crimes by 18% and violent crimes by 15%, which seems not matching to the natural and the goal of the program. However, given that the program is operated during the time periods when violent crimes are more likely to occur, this is also interpretable. The program’s effect to nonviolence is probably due to the fact that nonviolence is not necessarily conducted during the night and early morning, when the Boss van program operates. Its effect coefficient might be inflated. On the other hand, because the rides are available only when the violent crimes are highly possible, the effect coefficient on violence shown above might be conservative.

(From here on talking about next table)

Furthermore, we investigating the number of rides Boss vans give in an hour, several relationships between crime and Boss van program have been uncovered. Within the 35 crime categories that we have examined, all of them receive negative effect implication with only one notable exception of kidnapping. This means, for the 34 crime categories, additional rides lead to lower every single crime category if the impact is significant; if the impact is not significant, additional rides is still feasible to each crimes only that the effect is not statistically significant. The significant effect details of the Boss van program on the 4 categories of crimes are presented in Table 2 below.

P<0.1 is *, p<0.05 is **, p<0.01 is ***
The elements of control listed in Table 2 are selected to be presented here. To study the hourly rides as its relationship to each of the crime categories, the total slate of controls that should have been contained in the table included an indicator for every hour of the day, every day of the week, every month of the year and every year as well as the set of weather variables. However, uninteresting controls are omitted for brevity, keeping only the weather variables, Monday, Friday, 2am, 9am, noon and June as reference. These are selected because of the anecdotal values of Monday and Friday nights as “low crime” and “high crime” respectively. June was chosen to represent summer break. The times of 2am, 9am and noon were chosen to represent bar close, typical work hours and lunch time, respectively. The constant term represent a “normal time”, which the results are centered around, the time of Sunday at 12am in January, 2005.

In spite of the small coefficient value due to the measuring scale of number of rides, we can see that an additional ride from Boss van will be reduce about 7‰ of a burglary \( (b=-0.0069, t=3.04, p<.01) \), 3 ‰ of a motor vehicle theft \( (b=-0.0034, t=1.90, p<.1) \) and 3 ‰ of a robbery \( (b=-0.0034, t=1.81, p<.1) \), but encourage 6% of a kidnapping \( (b=0.070, t=2.19, p<.05) \). A more visible description of the effect can be found in the summary table below.

</tbody>
</table>

Note: BOSS delivers about 124,000 rides yearly. † is categorized as a violent crime.
While the table has coefficient of elements on each crime type with a reasonable sign, indicating it is promoting or reducing the type of crime, there are two additional patterns of notes in the data. Firstly, burglaries begin during the day, and tend to stop in the evening. In general, burglaries are likely to happen when people go to work (represented as 9am in Table 2), and not when they come home. Burglaries are unlikely to occur in the evening. Secondly, agreeing with the discussion above for Weekdays, weather element such as snow, snow on the ground, minimum temperature and precipitation do not dampen violent crimes. Most of these crimes appear to be impulsive, and therefore not particularly responsive to weather. Nonviolent crimes, such as vandalism and larceny, are very likely to be premeditated, and therefore impacted somehow by the weather.

While the program’s impacts on other crime categories are not significant, a list of all the crimes categories that are studied in this research can be found in the appendix to illustrate the statistically insignificant but practically important impact a shuttle program can have potentially. Although these crime categories were not affected in this study, it is entirely reasonable to thing that a similar shuttle service operating somewhere else could have a positive affect in reducing crime in some of these categories.

As the results are clear and confident, it is reasonable to conclude from all the discussion above that Boss van program reduces crime in a measurable and statistically significant amount.

Discussion

The data from this study confirms what many administrators feel, and what some researchers have anecdotally found. Elam, McKaig, Jacobs, Whitlow, and Louis (2006), for
example, stated “While one purported benefit of the Midnight Special (a Safe Ride program at one university in the Midwest) is keeping intoxicated student drivers off the road, available police arrest data are largely inconclusive, if not contradictory, to this claim. However, this perception remains, along with contentions that vandalism, noise, fights, and other alcohol-related disturbances have also been reduced by this service.” They go on to suggest “Efforts should be made by university administrators to work with the police departments to gather outcomes data more formally that can validly establish or refute these claims.”

Similarly Ketterman and Holmes (2009), in their analysis of the Safe Ride program at Frostburg State University, found that while the program was initially established to provide students with safe rides home at night, “Soon after implementation, the campus learned of other benefits of the program. The local law enforcement agency indicated that there was a decrease in nighttime vandalism. The local neighborhood group reported that nighttime noise also had decreased.”

While data from the study by Gieck and Slagle (2006) found that passengers using safe ride programs do so in order to reduce the risk of harm to themselves and others, there is also a monetary reason for colleges and universities to establish Safe Ride programs for their students. According to the National Highway Safety Administration (2002), safe ride programs save their communities $3 for every $1 spent.

Despite their effectiveness, however, Safe Ride programs can still use some good PR. In their study assessing late night bus services, Geick and Stangle found that 60% of students felt that safe ride programs promote drinking. Since safe ride programs do carry students to and from bars, it is entirely possible that community members might feel the same about these
programs. Nineteen percent of the students in Geick and Stangle’s study also said that when they used the Safe Ride program, they did consume more alcohol because the ride was available. In contrast, however, 81% of the students in the study, said that using the service did not influence their drinking behavior.

Increasing Learner Metacognition and Self-Regulatory Behavior In Graduate Distance Education

Benjamin J. Roberts, Walter E. Owen

Naval Postgraduate School (United States)

Abstract

The purpose of this paper is to illustrate strategies taken to increase program completion in a graduate Systems Engineering program delivered primarily by web conferencing. Recent literature (Bezait 2016, Dunn and Rakes 2015) has called attention to the paucity of research on employing metacognitive and self-regulatory strategies in graduate distance education. The referent educational program for this article is a graduate, executive-level systems engineering program that is delivered primarily by web-conferencing. The authors are faculty members who have served as program managers for this program and have gathered lessons learned for over a fifteen-year period of time. The program is characterized by a two-week resident session at the onset, followed by two-years of coursework and a thesis requirement. The impetus for the strategies taken resulted from observations of successful course completion, followed by notable unsuccessful thesis completion rates. This, in turn, resulted in lowered graduation rates. This paper is a qualitative review of a work in progress to address program completion rates. More specifically, strategies are discussed that are complimentary to both the distance learning environment and student characteristics. The strategies taken collectively fall into both Metacognitive and Self-Regulatory practices. Of the many reasons in the literature for graduate program incompletion, the authors recognized a pattern described by Kiely (1984) that observed graduate candidates finding themselves disconnected from the structure of coursework and interaction with faculty. After completion of coursework, and at the onset of thesis work, students may experience isolation and lack of preparedness to conduct thesis work. As reaffirmed by Rakes and Dunn (2010), “Maintaining motivation may be more difficult for the online students as they face problems related to social isolation and technical issues that cause frustration not as frequently experienced by students in face-to-face classes.” Taking these perspectives into account, the authors, as program managers, have instituted a tiered strategy that occurs over the lifecycle of the student’s program. That strategy has included the following elements: A two-week resident orientation; providing students with their learning and perceptual styles; an ongoing seminar emphasizing critical thinking; thesis workshops; two industry trips to enhance learning, motivation and cohort cohesion; introduction of specifications grading. The implementation of these elements are described and discussed in light of program completion.

1. Paper Title: “Indigenous Knowledge Active-STEM”: Promoting Culturally Responsive, Physically Active STEM Learning and Youth Development in Pre-High School Coeur d’Alene Tribal Students

2. Topic Area: STEM Education; Indigenous Education (additional topic area) (Research Abstract)

3. Preferred Presentation Format: Paper session

4. Description (75 words or less): This presentation will describe a multi-year project in partnership with Coeur d’Alene Tribe to provide pre-high school youth with culturally-relevant, physically active STEM education through canoeing and canoe building, snowshoeing and snowshoe lacing, native plant and animal identification, physically active games, and hiking. This presentation will focus on the reciprocal learning opportunities, optimal engagement, and relatedness that developed between youth and project staff. We will discuss various program challenges (and possible solutions?) as well.

HICE Abstract Proposal: Indigenous Knowledge Active-STEM: Promoting Culturally Responsive Physically Active STEM Learning and Youth Development in Pre-High School Coeur d’Alene Tribal Students

Background Significance: Enhancing STEM education and physical activity (PA) opportunities are two key initiatives for youth in our partner Tribal communities. STEM achievement levels are lower in the U.S. than other developed nations (e.g., Tabernik & Williams, 2010) and youth obesity levels continue to climb (Skinner, Perrin, & Skelton, 2016). These issues are particularly significant in Tribal communities, where an environmental-based STEM workforce is key to maintaining the community’s sovereignty (Cajete, 1994). STEM initiatives focused on the importance of cultural relevance and equity are only beginning to be developed, with a dearth of STEM programs for pre-high school Native American youth. Add to this situation, STEM programs tend to stay within well-defined disciplinary boundaries, with little attention to youth development from an Indigenous, holistic mind-body-spirit standpoint (Cajete, 1999). The White House released a press release recently (April 21, 2016) on “Advancing Active STEM Education for Our Youngest Learners.” Of the dozens of STEM projects highlighted, only one focused on Alaska Native STEM education and none mentioned physically active STEM.

Study Purpose and Setting: It is important to provide some information about the project in which this study is a part to provide some context of, and a deeper connection to, the community - as community is of the utmost importance (Weber-Pillwax, 2001). The Families in Four Seasons Project is an ongoing, multi-year project with Coeur d’Alene Tribe in Northern Idaho. The primary purpose of the project was to provide youth with culturally-responsive, physically active opportunities for STEM education through experiential learning of canoe and canoe paddle building, snowshoe lacing on wooden snowshoes, searching for native plants and animals, hiking, canoeing, and snowshoeing. The intent is for these activities to represent the four seasons of spring, summer, fall and winter with the incorporation of both old and new aspects of Coeur d’Alene culture (Stephenson 2008). Please see Project Medicine Wheel attached, which was developed for the Schitsu’umsh (Coeur d’Alene) Calendar. The hope is that youth learning these activities and skills will continue these traditions in their own lives and transfer these concepts and values to their families now and in the future. An additional purpose of this study was to provide project staff, including college student staff members, with knowledge of Coeur d’Alene culture and experience working with youth on physically active STEM projects. In this
way, the researchers hope for a reciprocal learning environment that values community, relationality, and respect for all learners (Weber-Pillwax, 2001; Wilson, 2008).

*Study Design & Methodology:* Youth participated in 17 Culture Days in the Active-STEM program over the course of the 2015-2016 school year. Program activities included physically active games and activities, building wooden canoe models and canoe paddles, building features of a 16-foot sturgeon nose canoe, including lacing to support the ribs and battens and sewing to attach the kevlar skin, snowshoe lacing, learning language terms for animals that could be found on trips, and Elder and visitor guest lectures/demonstrations. To date, seventeen 4th to 8th grade youth and seven project staff, including two undergraduate and three graduate students, have participated in the project. One research objective was to determine to what extent project students and staff felt the project accomplished the goals of providing physically active STEM learning opportunities and increasing cultural awareness for both Coeur d’Alene youth and university students. Another key objective was to determine what ways of learning and knowing university students and staff described as part of their own journeys on the project. This analysis relies on qualitative questionnaire data with four college students over three time periods in addition to 52 pages of field notes provided by staff and college students.

*Results & Discussion:* Results revealed several key youth development themes from the perspective of college students and staff: a) Youth engaged and learned about culturally responsive physical activities and Coeur d’Alene language, b) Youth learned how to use diverse wood working and other tools to make the canoe paddles, canoe models, and sturgeon nose canoe c) Snowshoe lacing may have exceeded the optimal challenge/skill combination, with the task proving difficult for youth and instructors alike, and d) Development of mutual trust and respect amongst youth and project staff, and the involvement of Elders and knowledgeable guests, enhanced youth learning outcomes and engagement (Relationality; Weber-Pillwax, 2001, Wilson, 2008). Staff also learned the importance of: a) lesson planning, and having Plan A and Plan B lesson plans with 2-to-3 hour class sessions, b) encouraging participation through role modeling (Respect, Reciprocity, Wilson, 2008), and c) interspersing STEM lesson plans with culturally- and age-appropriate physically active games. In this presentation, we attempt to relate these findings to Csikszentmihályi’s (1990) Flow Theory and Deci and Ryan’s Self-Determination Theory (Deci & Ryan, 1985; Ryan & Deci, 2000), particularly the concepts of optimal engagement, autonomy, competence, and relatedness in Active-STEM education. Although there seemed to be some applicability of these theories to the findings, it may be that these theories seem to apply because the majority of project staff members have been trained in a Western approach. Further research is needed to determine to what extent, if any, these theories or modifications therein are responsive to Coeur d’Alene culture and education. Additionally, as part of this presentation, we will discuss various program challenges (and possible solutions?) as well.

Strategies & Self-Regulation in ESL Writing:
Using Self-Regulated Strategy Development in an African Seminary

Carol.Butterfield@cwu.edu
Abstract

Self-Regulatory Strategy Development (SRSD) is an interactive instructional method used to teach writing through the use of strategies and self-regulation (Harris, Graham, Friedlander, & Laud, 2013). Using SRSD, the researcher implemented a 6-week essay writing unit in an ESL university classroom in Cameroon, West Africa. The author collected and analyzed data in the form of writing samples, student and teacher assessments, and student self-reflections. The findings demonstrate the effectiveness of SRSD within this setting, from a quantitative perspective (rubric-based assessments) and a qualitative perspective (student self-reflections). A discussion on the findings and implications for future use of SRSD are included.
Academic writing is a valuable and essential tool for all students across all subjects. At the university level, writing demands are significant. Students convey their knowledge and understanding through writing, especially expository writing. The process of writing is quite complex. Skilled writing involves knowledge of writing genres and formats, problem solving skills, and self-regulation (Harris, Graham, Friedlander, & Laud, 2013).

Academic English writing can present difficulties for students with a non-English speaking background. Students must master content knowledge as well as procedural knowledge necessary for writing, all in a language where they might still be struggling with grammar and vocabulary (Wong & Storey, 2006). This is true, not only within the United States, but around the world in areas where people from diverse linguistic and educational backgrounds are attending westernized English-based institutions (Li & Vandermensbrugghe, 2011; Pappamihel, Nishimata, & Mihai, 2008; Pessoa, Miller, & Kaufer, 2014; Wang & Bakken, 2004; Weaver & Jackson, 2011). This project was designed specifically to offer writing intervention, in the form of Self-Regulated Strategy Development, to ESL students in Cameroon struggling to meet university academic writing requirements.

**Purpose of the Project**

This action research project took place in a theological seminary located in the West African nation of Cameroon, boasting over 270 living languages. English, as one of the country’s two official languages, is the academic language of the institution, though it is not the primary or often secondary language of the majority of citizens. Academic writing is required in all content classes at this institution, and each instructor has his or her own requirements and specifications for written assignments. In teaching “English Grammar and Composition” to first year Bachelor of Arts students, my goal is to prepare them to write well in their content classes
and provide students with an effective writing strategy that can be easily reproduced and adjusted for a variety of writing situations and assignments.

Self-Regulatory Strategy Development (SRSD) is an instructional approach designed to teach task-specific writing strategies using self-regulatory procedures. Through teacher modeling, scaffolding, and allowing independent practice, students learn to organize, write and revise their work through memorization and implementation of writing strategies as well as self-regulatory strategies. Using flexible and recursive instructional procedures, teachers help students learn, maintain, and repeat effective writing skills (Graham & Harris, 1999; Harris & Graham, 1993).

In this project, students were introduced to a mnemonic strategy (POWER + TREE) to remember the steps of the writing process and the organization of a persuasive essay, based on POW+TREE, a common SRSD strategy. POW stands for Pick my idea, Organize my notes, and Write and say more. During the organization of notes, the mnemonic TREE is used, representing Topic sentence, Reasons: 3 or more, Explanation for each reason, Ending (Mason, Harris, & Graham, 2011). Within this instructional unit, two additional steps were added, creating POWER (Pick a topic, Organize, Write, Edit, and Revise). Also adjust slightly was the T in TREE. In this unit it stood for Topic, which is a broader concept than Topic sentence, and could therefore include more features of an introduction, such as introduction of the topic, background information, definition of terms, and the topic sentence. Within this unit, TREE stood for Topic, Reasons, Explain, and Ending.

This action research was designed to evaluate the effectiveness of SRSD on the academic writing abilities of students within this class. If academic writing skills increase, as expected, I will have a flexible teaching tool to supplement the curriculum and provide students with
strategies for many writing purposes. The question driving this research was: If Self-Regulated Strategy Development is taught, what will happen to the academic writing abilities of the students?

**Framework of the Project**

Academic writing can be a challenge for all students, and can be especially difficult for students with a Non-English Speaking Background. Many students not only lack grammatical and lexical knowledge, but can also have little experience with English academic texts (Ewert, 2011). Effective ESL university writing programs often include some or all of the following: Academic English and text structure instruction, process writing, self-regulation, and task-specific strategy instruction.

Academic writing has a particular style, rhetorical convention, and structure that is dependent on the arrangement and organization of ideas, use of specific language and vocabulary, understanding of genres, and the ability to use evidence to support main ideas and details. Explicit instruction in style and structure is important as it provides the framework for effective academic writing (Li & Vandermensbrugghe, 2011; Pessoa et al., 2014; Weaver & Jackson, 2011). Students should be exposed to and instructed in various expository text structures, in order to recognize basic components, including introductions, conclusions, and placement of main ideas and details (Bluestein, 2010; Montelongo et al., 2010). Students need practice interacting with various structures, noting interrelationships between ideas, in order to then apply that knowledge to their writing (Reynolds & Perin, 2009).

Students struggling with writing often lack necessary information about the writing process (Harris, Graham, Mason & Saddler, 2002). When students learn to write, it is essential that they learn to plan and organize before writing, and after writing, they should revise and edit.
Reviewing and revising one’s writing and/or having an outside observer help has been found to be helpful for ESL students (Pessoa et al., 2014; Weaver & Jackson, 2011). “Skilled revision involves critically reading one’s writing and comparing it to a representation of intended text, noting discrepancies, and making changes so the existing text becomes more in line with the ideal text” (De La Paz & Sherman, 2013, p. 129). This requires an emphasis on the text as a whole, consideration of rhetorical features, fluency, clarity, and text development and organization, rather than an emphasis on surface features, like spelling, mechanics, and word choice (De La Paz & Sherman, 2013; Ewert, 2011; Moussu, 2013).

Metacognition and self-regulation also contribute positively to writing performance. Using quality teacher feedback and self and peer assessments, students can learn about themselves, increase self-efficacy, and become more motivated (Lam, 2015). Writing lends itself to self-regulation because writing is an intentional activity with many parts and processes. Self-regulation offers routines and “building blocks” for the writing process, and offers the writer opportunities for fine-tuning in the process (Graham & Harris, 2000). It allows students to be autonomous in their writing by assisting students in remembering and maintaining writing strategies and transferring those strategies to various situations (Harris & Graham, 1999; Lam 2015; MacArthur, Philippakos, & Ianetta, 2014).

Skilled writers have a stock of strategies at their disposal for managing the writing process, such as task analysis, organization of content in specific genres, and revising for ideas (Graham & Harris, 2016; MacArthur et al., 2014). These strategies are not visible actions; so teaching them explicitly makes them tangible and understandable (Graham, Harris, & MacArthur, 2006). Task-specific strategies are useful as they can be duplicated in independent
writing, so it is important to teach students not only how to use them, but when to use them (Wong & Storey, 2006).

**Self-Regulated Strategy Development**

Self-Regulated Strategy Development was developed to address affective, behavioral and cognitive needs of students and provide powerful interventions for students tackling writing challenges (Harris & Graham, 1999). It is a teaching method involving explicit, interactive and scaffolded instruction to teach specific planning, writing and revising strategies, including various memorized mnemonics to remember the writing process, and how to apply these strategies across writing genres (Graham et al., 2006; Harris et al, 2013; Mason, Harris, & Graham, 2011).

The key components of Self-Regulated Strategy Development are self-regulation and strategy instruction. SRSD instruction generally flows in the same order starting with developing background knowledge and explicit text structure instruction, interactive discussion of strategies, teacher modeling of self-regulation and writing strategies, memorization of strategies, followed by guided practice, or scaffolding, in order to move the student toward independent practice, and eventually maintenance (De La Paz & Sherman, 2013; Graham et al, 2006; Harris et al, 2013; Guzel-Ozmen, 2009; Lienemann & Reid, 2008; Mason et al., 2009; Santangelo, Harris & Graham, 2008). Taking student needs into account, these steps can be rearranged and repeated as necessary (Harris et al, 2013).

SRSD has been effective in students with LD and ESL, and organizes instruction in such a way as to reduce the demands on working memory, by teaching small steps and utilizing guided practice (De La Paz & Sherman, 2013; Lienemann & Reid, 2008; Sexton, Harris, & Graham, 1998). SRSD has shown effectiveness in writing performance with students of all ages
and various writing levels, from elementary to university (Graham & Harris, 1999; Harris & Graham, 1999; MacArthur et al, 2014; Santangelo et al, 2008). Students successfully moved from teacher modeling to independent practice, and they used self-regulating strategies in their writing process (Guzel-Ozmen, 2009; Lienemann & Reid, 2008; Mason et al., 2011).

Methodology

As practical action research, this project was designed to focus on one specific issue (persuasive academic writing) in one specific classroom (English Grammar and Composition, BA year 1). The objective was to determine if SRSD could be used effectively to improve writing skills. Quantitative and qualitative data were collected in the form of student essays, student and teacher assessments, and student self-reflections.

Setting and Participants

Cameroon is officially a bilingual country divided into two sections linguistically, Anglophone and Francophone. The government school system uses English and French for instructional purposes. However there are over 270 distinct languages in Cameroon, including Cameroonian Pidgin English. These are the primary languages spoken in homes and communities. The seminary is located in the Anglophone area of Cameroon, and English is the language used for all professional purposes. The seminary is a theological institution with Bachelor of Arts and Master of Arts and Divinity programs. Students come from many ethnic and linguistic backgrounds, but almost all are from Cameroon with some students from neighboring Nigeria and Congo. Ages range from 19 to 46, and the vast majority of students are male.

As the researcher, I include my own demographic information only because it differs from the class and school demographics. I am an American white female with eleven years
teaching experience. I have taught expatriate and national students in primary and secondary institutions, as well as worked with mother tongue literacy programs for five years in Cameroon.

The English Grammar and Composition class in which this action research took place consisted of 25 male and 4 female students, totalling 29 students. All students were Cameroonian in nationality, and hailed from the Anglophone region of Cameroon. 9 students (7 male, 2 female) were selected as a sample size of the larger group for data collection, using systematic sampling.

**Procedures**

This action research took place in six weeks over an eight-week period of time during the second semester. The class met three hours per week in two sessions, lasting 1 hour and 2 hours respectively. The unit followed the 6 steps of SRSD, which are development of knowledge, discussion, modeling, memorization, and independent performance, repeating and reordering steps as necessary. Quantitative data, in the form of student essays and rubric-based student and teacher assessments, as well as qualitative data, in the form of student self-reflections, were gathered throughout the unit.

**Prior to the Instructional Unit**

Students were provided folders and asked to keep all their work from this unit in order to review it, evaluate it, and observe their growth in the writing process. Students completed the Initial Self-Reflection (Appendix A) answering questions about how they view themselves as writers, steps they take when writing, and their goals for writing. These were collected and analyzed thematically, and the results are discussed in the Data Analysis section.

Students were asked to write a 5-paragraph persuasive essay on education. The topic could be education in general or a specific aspect of education. There was no time limit, though
all students completed the essay within the scheduled 2-hour class period. This and all essays throughout the unit were scored using a 4-point rubric (Appendix B), assessing five traits of effective writing: ideas, organization, word choice, fluency, and conventions.

These two pre-assessments provided a baseline writing score, an understanding of students’ beliefs and goals, and information for guiding instruction. In the self-reflections, many students viewed themselves as unskilled writers lacking strategies for completing writing assignments, and many considered organization a weakness. In the student essays, many students included the basic structure of a 5-paragraph essay. However, many lacked effective style and necessary elements, including clear topic sentences, sufficient supporting details, and conclusions. All this encouraged me that SRSD, and POWER+TREE specifically, still aligned with goal of this research project, to provide students with strategies to write effectively for academic purposes.

**SRSD Instructional Unit**

Self-Regulatory Strategy Development generally follows 6 stages of instruction: develop and activate background knowledge, discuss the strategy, model the strategy, memorize the strategy, support the strategy, independent performance (Graham et al., 2006; Harris et al., 2002; Harris et al., 2013; Mason et al. 2011). When discussing strategies, this includes both writing strategies, such as TREE, and self-regulatory strategies, such as POWER. The stages do not necessarily go in order, and steps can be repeated as necessary throughout the unit. In this project, memorization of the strategies was encouraged and supported throughout the unit through repetition, but was not an explicit instructional stage.

POWER and TREE were exhibited on posters that hung in the classroom through the entire unit. The POWER poster simply displayed the mnemonic (Pick a topic, organize, write,
Develop and activate background knowledge. The first two sessions were dedicated to looking at good persuasive essays and discussing what made them good. After a brief overview of TREE, students were given three examples of persuasive essays. As a class, we read through each essay finding and marking the key parts, as shown on the poster, including the introduction, conclusion, reasons, and explanations of each reason.

I explained self-regulation, and we discussed its importance, including self-assessment. We discussed the fact that if they learn to assess their own writing, they could assess their future writing, finding what is good and what needs to be adjusted. Students were assigned to assess their initial essay for effectiveness. Using a checklist (Appendix D), students read through their essays looking for each TREE component, and completed the “Student” section of the checklist. Then I completed the “Teacher” portion of the checklist, looking for the same components. I then assessed their essay using a 4-point rubric (Appendix B), which provided a baseline quantitative score.

Discuss it. In the third classroom session, the use of strategies was explained in more depth. First, POWER and TREE were reviewed and then explained in more detail. The class discussed why using strategies such as these could be useful in their writing. Not only would they help in this class, but once learned and mastered, students could apply these strategies to other pieces of writing. We discussed how writing strategies and self-regulation, like the self-regulating they practiced in the previous session, would aid them in future assignments when they lack time to have their writing proofread in the writing lab, and can edit and revise their own work.
**Model it (POW + TREE).** I explained that I would demonstrate the POW, using TREE for organization. Since self-regulation is often an unseen cognitive process, I explained that I would demonstrate self-instructions, monitoring, and reinforcement by saying my thoughts aloud. Enthusiasm is important throughout SRSD, especially in this stage (Harris et al., 2002), so I demonstrated with energy and movement.

Using a subject familiar to all students, the topic was formed, “Why one should attend this seminary”. Applying a pre-writing activity, I wrote every idea I had about the topic. Then, explaining my thoughts, I grouped similar ideas together, and discussed the decision making process of sorting reasons and details to explain those reasons, as well as explaining which reasons were important and supportable. Then, using TREE, I organized the paragraphs, and then wrote the essay. Using self-speak, I explained writing decisions such as word choice, sentence fluency, sentence variety, grammar, and organization.

**Support it (POW + TREE).** Collaboratively, the class worked through each POW step to write on a new topic, the importance of tithing. Students offered input, and all ideas were accepted when writing our initial ideas. When deciding how to group ideas, students again offered ideas and most decisions were agreed upon by everyone. We narrowed down the three most important reasons to tithe: Tithing is a command, tithing brings blessings, the early church tithed. When we were uncertain about the order in which to list our 3 reasons, students voted. We organized the TRE outline together. When writing the essay, everyone offered input, and the class discussed differing ideas. Most of the writing was student generated, but as the instructor, I did offer suggestions and ask guiding questions.

**Independent performance (POW + TREE).** Students then independently wrote a new essay, using the strategies. Choosing from three topics, the importance of prayer, baptism, or
worship (topics familiar to theology students), students had one week to complete the assignment, which included a pre-writing activity, a completed TREE outline, and a complete essay.

**Discuss and model it (POWER + TREE).** The final two steps of POWER were discussed and modeled in the next session. The purpose and importance of revision were explained first, followed by a discussion of particular areas to be revised, specifically, Ideas, Organization, Voice, Word Choice, and Sentence Fluency. For each area, I modeled one or two examples and the thought process behind changing them. When discussing editing, I reviewed common grammatical mistakes and how to fix them. This included comma placement, pronoun clarity, pronoun-antecedent agreement, subject-verb agreement, verb tense, and apostrophe placement. The idea of reading one’s writing out loud was especially stressed, so that one is able to see and to hear their work. Students were introduced to editing and revising checklists (Appendix E) adapted from their textbook, “Writers INC”, by Sebranek, Kemper, & Meyer (2006).

**Support it (POWER + TREE).** After reading together a 5-paragraph persuasive essay in need of proofreading, the class collaboratively practiced editing and revising. We used the editing and revising checklists to assess the work and make changes.

**Independent performance (POWER + TREE).** After students completed their first independent essay (Essay 2) and brought it to class, they then were given the opportunity to independently practice editing and revising their work. Using the checklists previously modeled and supported, students spread out, read their work aloud, and made adjustments to their work. They then rewrote their essay and submitted a final draft.
Students then completed two more persuasive essays independently, using POWER + TREE. I supported students as necessary, and provided short lessons on specific difficulties that presented themselves in student writing, such as subject-verb agreement, verb tense, run-on sentences, and sentence fluency. For their fifth and final assessment (post-assessment), students submitted a complete and independently written persuasive essay from a list of education themed topics.

Self-Regulation

A key component of SRSD is self-regulation, as evidenced in the name itself. POWER + TREE are self-regulatory in nature as they offer a memorized order to the writing process to help students self-monitor. In this project, additional self-regulatory processes were added, including self-assessment and self-reflection.

**Self-assessment.** At two points in this project, students were asked to assess their own work. They reviewed their initial essay, looking for specific organization parts of TREE. After seeing their first and second essay scored on the 4-point rubric, students were asked to use the rubric to evaluate their third essay using the same rubric. Students then compared their assessment to my assessment in the third self-reflection.

**Self-reflection.** Students completed a total of four self-reflections (Appendix A), each evaluating different aspects of the writing and self-regulatory processes. This provided students with opportunities to reflect on their learning and growth and consider how they can improve. It also gave me insight as to how SRSD was working and if adjustments needed to be made. And finally, it provided qualitative data on the effectiveness of SRSD within this setting.
Data Analysis

Twenty-nine students participated in the SRSD unit. Using systematic sampling, 9 students were selected for qualitative and quantitative analysis. Every 3rd student from the alphabetical class list was selected, and for the purposes of this paper have been translated to letters A – I.

Each of the five student essays was assessed using a 4-point rubric (Appendix B). Final essays scores for all essays are compared in Table 1. Pre- and post-assessment rubrics, organized by separate writing traits (ideas, organization, word choice, sentence fluency, and conventions) and total score were compared to determine the effectiveness of SRSD within this classroom (Table 2).

Self-reflections did not correspond with assessments; they were analyzed separately. Self-reflections concerned students’ views of themselves as writers from the beginning of the unit to the end and students’ views on particular aspects of SRSD. These were studied and crosschecked, taking note of recurring words and phrases, and used to identify significant themes.

Findings

After using SRSD as an instructional method, this class demonstrated improvement in writing essays. Table 1 shows the total essay scores for all 5 of the essays independently written in this unit, including the pre-assessment and the post assessment, demonstrating overall improvement for most students. Self-reflections also indicate that students felt they improved in writing through the unit.
Writing Abilities

Writing abilities of students were assessed in the following 5 categories: *Ideas*, *Organization*, *Word Choice*, *Sentence Fluency*, and *Conventions*. Comparing the pre-assessment to the post assessment in Table 2, total scores increased in all but one student. Some students made slight increases, while others recorded large improvements in their writing scores.

Quite notable was Student A, increasing from 26 total points in the pre-assessment to 40 total points in the post-assessment, a perfect score. Also notable was Student G, with the lowest overall score of 23 in the pre-assessment, who increased his score to 36 in the post-assessment. The scores of Student D, which decreased from a total 30 points to a total of 28 points, demonstrate that not all students showed improvement in their writing abilities after the SRSD unit. However, in looking at student D’s performance on the third essay, one can see that this student showed improvement in previous essays (Table 1), but not in the final essay.

**Ideas.** It is not surprising that the trait of *Ideas*, the presentation of a clear topic with strong support, had the largest average combined score increase of all the traits, 1.9 points. Using SRSD, and specifically TREE, the idea of a clear topic is part of the repeated mnemonic, and was emphasized throughout the unit.

The first subsection of *Ideas* on the rubric was “Clear, focused topic & topic sentence.” Pre-assessment scores indicated that students earned an average of 3.1 in this area, which was a high number to begin with. That number increased to an average of 3.8 in the post-assessment, with all but one in the sample receiving 4 points, the highest possible score.

The second subsection, “Each paragraph supports the main ideas with strong, relevant details,” had the lowest overall score in the pre-assessment, with a 1.7 average. This increased to
3 in the post-assessment, which (along with a word choice subsection) was the largest variation in a single subsection, an increase of 1.2 points.

**Organization.** In addition to *Ideas*, another highly emphasized aspect of SRSD is *Organization*. Not only is the process of writing organized through POWER, but also there is a specific structure (TREE) for a 5-paragraph essay that students learn and practice. The combined subsections increased a total of 1.8 points from pre-assessment to post-assessment.

Both subsections of “Clear pattern of organization” and “Effective introduction and conclusion” made significant gains overall. Seven of the nine sample students received a score of 4 in “clear pattern of organization”. The post-assessment average score in this area was higher than “Effective introduction and conclusion,” (3.6 compared to 3.4), but “Effective introduction and conclusion” had a higher overall average increase (1 point compared to .8 points).

**Word Choice.** While not an over-emphasized writing trait within SRSD, significant improvement was made in this *Word Choice*, especially in the subsection “Precise language and carefully chosen words, avoiding repetition and redundancy.” This, along with the previously mentioned *Ideas*, had the highest gain in a single subsection, averaging 2.5 in the pre-assessment and 3.7 in the post-assessment. The subsection “Appropriate level of formality” increased a slight .3 points. However, that was the highest possible gain this category could make, as this was one of two categories in which all sample students received 4 points in the post-assessment.

**Sentence Fluency.** The first subsection of *Sentence Fluency* is “Complete and clear sentences that flow smoothly.” This area showed improvement overall shifting from an average of 3 to an average of 3.6. Also in *Sentence Fluency* was the subsection “Varied sentence
structures and lengths.” This subsection had a perfect average of 4 in pre-assessment and the same in post-assessment.

**Conventions.** This category was divided into “Punctuation and Mechanics (Spelling and capital letters)” and “Grammar”. These topics are not explicitly taught through Self-Regulatory Strategy Development, but were covered during the unit through mini-lessons on specific concerns that arose. The first category had very little gain, .2 points overall; and the second category had moderate gain of .7 points.

**Self-Assessment**

When students were asked to assess their work, it was met with almost universal disapproval. Most students complained that they could not do it, as they were submitting the essay because they thought it was their best work. However, students did complete the assessments (Table 3), and did not simply mark 4 in every category; and their total scores were not far from the teacher assessed total scores. The largest difference between student and teacher assessment was 3 points, and five differed by only 1 point. But in looking at the subsections, not all students recognized the specific strengths and weaknesses of their writing, as seen in the discrepancies between student and teacher assessment.

Students with lower overall scores (C, G, and F) had more room for variation in their scoring. While they recognized that their essay was weak in some areas and strong in others, those areas did not necessarily align with the areas that the teacher evaluated as weak and strong. Student G with the lowest total score differs from the teacher in 6 of the 10 categories. And for student F, the categories of *Ideas* and *Organization* are notable, as they underestimated *ideas* (3 and 1 compared to 4 and 2), and overestimated the subsection on introduction and conclusion with a perfect score of 4, while the teacher gave only a 2.
Students with the highest overall scores (A, E, and H) tended to assess their work with a more similar evaluation as the teacher’s assessment. Student A scored their work with 4 for every category but conventions, which received two 3’s. The teacher gave the same assessment with one exception, a 3 in Sentence Fluency. Student H only differed by 1 point from the teacher in 2 sections, grading their paper more harshly in Sentence Fluency and Conventions.

After comparing their self-assessments to teacher assessments, students reflected on the experience, considering what differed and why. The following statements were made in Self-Reflection 3, in answer to the question, “What can you do in the future to assess your work well?”

Student B: “In the future I should not focus more on marks but on that which is of help to me. I think I will learn from the assessment of the teacher to improve.”

Student C: “Check my punctuations, tenses, grammar, etc.”

Student E: “I need to check it for ideas, organization, word choice, sentence fluency and conventions. These guide pages I think will help me do a better assessment.”

Student F: “I will have to read the essay over to see some weaknesses in grammar, support of each point, effective conclusion and introduction so as to assess it well.”

Student I: “The most important thing is to reread my work after writing before editing the work. Also someone can also read my work before I can make the final copy.”

**Self-Reflections**

Self-reflections provide insight into the unseen aspects of the writing process. Through self-reflection, students consider their learning, management, and writing ability. In studying self-reflections 1, 2, and 4, four significant themes emerged.
Self-efficacy. The theme of self-efficacy understandably developed because students were asked in each of these reflections to consider themselves as writers. They considered their strengths and weaknesses, and without prompting, some considered their attitudes toward writing. The initial self-reflection had a wide variety of answers to the question, “How do you consider yourself as a writer?” They were almost all negative comments, such as “I find difficulties with…,” “I face challenges,” and ,“I know that I am not a good writer.”

By the end of the unit, however, these same students who wrote poorly of themselves had adjusted their answer to positive. One student simply changed his answer from “fair” to “good”, and another wrote in her final reflection, “I feel very good and more confident when I write now more than ever before.” Two students in the initial reflection discussed their willingness to try and desire to improve. By the end, they considered themselves “better” and “improved”. Student C considered his specific writing skills and listed his difficulties in the first reflection, but by the final reflection, he wrote, “I am very sure that I have improved my writing skills as compared to the time I was yet to come here.” Student I had the largest shift in self-efficacy, with his original response of “…not a good writer,” changing to, “I consider myself a good writer because the way I organize my work has greatly improved. The ideas that I have I can really express it out now based on POWER and the TREE method.”

Organization. In self-reflection 2, students considered the positive and negative characteristics of the writing unit, as well as specific aspects in which they had improved. Organization was the most common response. One student said, “I was so disorganized but now I have improved in the area of organization,” and another wrote, “It has improved in my style of presenting my work and organizing it.” Organization was implied in other comments like, “It has helped me in that I now know the importance of outline and how to link up my ideas.” Many
students also listed organization as a helpful part of the POWER and TREE strategy. Student D, whose overall score decreased in the post-assessment, wrote in the final self-reflection that her strength was to, “Organize work or ideas well.”

**Self-evaluation.** Another commonly mentioned helpful quality of POWER + TREE was evaluating one’s own work. “We have learnt in this course to write and self-evaluate the work,” said one student. Though students audibly complained about editing and revising their work prior to doing it, their reflections show that they found it helpful. It appeared that the idea of checking over one’s work was a new concept to some students, like the student who now knows, “I can check my work for coherence, flow, and so on,” and another who said he was able to “do some proper check out which I never did before.” One student remarked, “It has caused me to know that I always need to edit and revise my work after writing,” and yet another appreciated, “critical checking helps me realize errors.”

**Content over conventions.** There is a marked difference in the way students discuss writing in the first reflection and the last. When discussing specific parts of the writing process, most references in the initial reflection relate to surface features of writing, such as grammar, punctuation, spelling, and vocabulary. Much fewer references are made to writing as a whole and as a process. In the final reflection, though, references to conventions decrease, while many comments are made such as, “have good ideas to be developed,” “develop the body of my writing,” “bring good ideas and organize them effectively,” and, “organize the materials and develop them with good facts and examples.” A majority of students now viewed writing as more than words put together following grammar and spelling rules, but a multi-step process involving ideas, organization, fluency, word choice, and conventions.
Discussion

The research question of this action research project was: If Self-Regulated Strategy Development is taught, what will happen to the academic writing abilities of the students? Teacher assessments, student self-assessments, and student self-reflections demonstrate the effectiveness of SRSD within this context, specifically in the increase in writing scores and the positive feedback from students.

In examining the specific areas of growth in writing, there are some interesting trends. While it was noted that Ideas is specifically addressed throughout this unit, it is also worthy to note that the Ideas subsection, “Each paragraph supports the main idea with strong, relevant details” had the lowest overall score of any subsection, so it had the most room for improvement. Yet it still had the lowest overall average score on the final assessment. However, the scores improved, and I believe with more practice, could increase even more.

While the idea of paragraphs supporting the topic through strong details was emphasized repeatedly, Word Choice was not as frequently mentioned. It was therefore surprising that the Word Choice subsection, “Precise language and carefully chosen words, avoiding repetition and redundancy,” had such a large increase. In assessing essays, I wrote many notes that simply said, “Word choice,” indicating notes and assessments might not have only been read, but possibly affected students’ writing.

Within Sentence Fluency, “Varied sentence structures and lengths,” was not really a factor in this unit. Students had no problem with sentence variety at the beginning of the unit, nor did they have a problem at the end. The main issues with sentence fluency were with incomplete sentences and run-on sentences. Therefore, I included mini-lessons on these issues, and it appears to have helped.
The majority of the mini-lessons throughout the unit were on conventions, mostly in commas, quotation marks, verb tense, and subject-verb agreement. However, *Conventions* did not improve as much as other sections. Mechanics specifically had very little growth. Students continued to struggle with comma and quotation mark use, but they especially struggled with spelling. We did not discuss spelling in the lessons, and I simply marked their spelling mistakes in their papers. We discussed and practiced verb usage multiple times in the unit, but it did not appear to have a large impact on scores.

It was clear from the beginning of this unit that self-assessment was unusual and uncomfortable for students. This involved critical analysis, a didactic component possibly lacking in a government school system that values rote memorization. Many reacted negatively to any activity involving the evaluation of their own work, including editing, revising, and self-assessing. However, as we have seen from their self-reflections, the activity was valuable. The largest increase in total scores from one essay to the next occurs between the Pre-assessment and Essay 2, in which they first edit and revise.

In self-assessing Essay 3, students seemed to be aware of how well they scored overall. Students receiving lower marks from the teacher also scored themselves lower, and students receiving higher marks from the teacher scored themselves higher. Struggling writers however, were not able to always pinpoint where their writing was lacking or excelling. If struggling writers could recognize specifically where they need improvement, it might help them improve. This might be an area for further research.

**Implications**

This action research has demonstrated that SRSD is a valuable teaching strategy in this setting. It provides students with strategies, structures, and self-regulatory processes to guide
their writing. It was not difficult to implement, and the lessons were interesting enough to hold students’ attention. The mnemonics made it easy for students to remember and reproduce the strategies.

A large amount of practice is crucial to this teaching strategy. Students need opportunities to try what they’ve learned, evaluate what they’ve learned, and try again. There is still room for improvement, so it would be good, if time provides, to even offer one or maybe two more opportunities to practice these skills. In addition to practice, students received feedback. Each time students submitted an essay, I assessed them and returned them quickly, giving students feedback that could inform their next assignment.

In thinking about their writing, students shifted from focusing on surface features to content as a whole, but that doesn’t mean they forgot about conventions or that they no longer had problems with conventions. They still mentioned their need to improve in the areas of spelling, punctuation, grammar, and vocabulary, and the data affirms that.

The unit has already demonstrated value in many ways. It has provided a self-regulatory writing strategy that can be applied to other writing. When the class continued to the next writing unit, article and book reviews, students were already aware that any writing assignment is a process and we used POWER to guide our work. The unit also demonstrated that self-evaluation is crucial to the writing process. Students have continued to evaluate their work, but with much more ease than at the beginning of the unit. It might be helpful in the future to incorporate peer editing and revision to the unit.

Limitations

This action research took place in 6-weeks within an 8-week period in one “English Grammar and Composition” class at the BA level in a theological seminary in Cameroon. There
was no control group, and SRSD was not compared with other instructional methods. Therefore, it cannot be said SRSD was the only reason scores improved, or that scores improved more with SRSD than another teaching strategy. However, students did demonstrate growth. They wrote significantly better papers at the end of the unit compared to the beginning of the unit.

Within the class, nine students were chosen for data collection and analysis. It is therefore limited in its scope, and findings may not necessarily be applied to a wider context. Qualitative results, such as self-reflections, while informative to the teacher and students, also may not pertain to a larger population.

Other limitations include time, schedule, attendance, and cultural values. The length of the unit was affected by the institutional schedule; administrative demands interrupted the class schedule the second and third weeks of instruction, therefore causing the 6-week unit to be taught in 8 weeks. Also, all classes were scheduled in the afternoon, some of them late in the afternoon. This affected motivation and engagement in class activities and lessons. Attendance and tardiness were also factors, as they affected instruction and completion of assignments.

When reviewing the self-reflection surveys, one must consider the high cultural value of respect for authority within this setting. Respect mandates that those in lower positions, i.e. students, show deference to those in higher positions, i.e. teachers. Criticism of authority is not allowed. Therefore, answers to direct questions about difficulties and struggles with the instructional approach might not be completely forthright.

Culture must also be considered when looking at the teacher-student dynamic. With an American female as the teacher of an almost exclusively male class, there are some considerations. Males tend to be those in positions of authority in Cameroon, although there are other women as teachers at this school. Also, I speak with an accent, so there could be
communication issues. In addition, there are always cultural differences that people are unaware of that can affect how you interpret and evaluate a situation. However, having lived in Cameroon a total of five years, I am familiar with many cultural aspects, and I also adjust my speech to be understood; and having taught this same class the first semester, the students were familiar with me and we had a positive, respectful rapport.

As an action research project, the goal was to find a practical solution to a specific problem. This research, despite the limitations, has accomplished its goal. Teaching SRSD in this specific context has demonstrated value and efficacy in raising essay writing scores.

Table 2: Pre- and Post-Assessment Scores

Students were assessed in 5 categories of effective writing traits, based on a 4-point scale (Appendix D). Each writing category has two subsections, but due to space restrictions, the subsections have not been labeled here, but their labels can be found on the rubric (Appendix D). This table presents the students’ pre- and post-assessment scores, the average scores of each subsection and total scores, and the total difference in average scores from pre- to post-assessment.

Appendix A

Self-Reflection Questions

Initial Self-Reflection:
1. How do you consider yourself as a writer?
2. When writing for school, what are your strengths?
3. What are your weaknesses?
4. What would you like to improve or learn in the area of writing?
5. When given a writing assignment, what steps (if any) do you take to complete the assignment?

Self-Reflection 2:
1. Did you find using POWER & TREE helpful in writing this essay?
2. What has been helpful about using this strategy?
3. Is there anything that has not been helpful? Explain.
4. Do you feel your writing has improved?
5. If yes, how has it improved?
6. In what areas of writing do you still need more improvement?

Self-Reflection 3:
1. When you compare your assessment to the teacher’s assessment, what are some differences?
2. Why do you think that is?
3. What can you do in the future to assess your work well?

Final Self-Reflection:
1. How do you consider yourself as a writer now?
2. What are your strengths?
3. What are your weaknesses?
4. When given a writing assignment in the future, what steps (if any) do you take to complete the assignment?

**TREE POSTER**

**TREE**

**TOPIC**
- Introduce topic
- Define terms (if necessary)
- Give background information
- Topic Sentence (State your position)

**REASON**
- Give at least 3 reasons that support your topic

**EXPLAIN**
- Explain each reason using supporting details/examples/quotes

**ENDING**
- Restate main ideas
- Reaffirm your position
- One last thought

*Edit and Revise Checklist*

**Revision Checklist:**

**Topic**
- Did I introduce the topic in an interesting way?
- Did I define necessary terms?
- Did I give background information?
- Do I have a strong topic sentence?

**Reasons**
- Do I have 3 separate reasons to support my topic sentence?
- Are they strong and supportable reasons?

**Explain**
- Do I have strong explanations for each reason?

**Ending**
- Do I restate main ideas/reasons?
- Do I reaffirm my position?
- Do I offer a new reason? (If so, it does not belong in the ending.)
- Have I used the appropriate level of formality?
- Do I sound interested in, and knowledgeable about my topic?
- Do I avoid unneeded repetition and redundancies?
- Are my sentences complete and clearly written?
- Do my sentences flow smoothly?
- Have I varied my sentence beginnings and lengths?

**Editing Checklist:**

- Do my sentences end with proper punctuation?
- Do I use commas correctly in compound sentences?
- Do I use commas correctly in a series and after long introductory phrases or clauses?
- Do I use apostrophes correctly?
- Do I punctuate quotations correctly?
- Do I start my sentences and proper nouns with capital letters?
- Have I checked for spelling errors?
- Do the subjects and verbs agree in my sentences?
- Do my sentences use correct and consistent verb tenses?
- Do my pronouns agree with their antecedents?
Ensuring Integrity for the Review of the Performance of Faculty

Conference Topic: Higher Education

Research Paper

Paper Session

The review process and procedures that govern the evaluation of full-time Faculty at National University for meritorious achievement (merit) is designed to assure consistent, objective, and equitable review of performance. The evaluation for merit includes a review of the full effort of the individual since the previous academic year deadline for the last completed evaluation for their rank at National University, considering the accomplishments of the rank sought.

Abstract

The review process and procedures that govern the evaluation of full-time Faculty at National University for meritorious achievement has been designed to assure consistent, objective, and equitable review of the performance of Faculty. At this University, excellence in teaching is a central institutional goal. Simultaneously, excellence in scholarship and service are highly valued aspects of the role of full-time Faculty members.

Faculty must be mindful of expectations when negotiating their Faculty Development Plans (FDPs) with their respective Chairs to ensure they are allowed sufficient time to meet the expectations in all three areas. Deviations from these expectations should be clearly noted in the FDP and referred to when the faculty member applies for meritorious achievement. The evaluation of Faculty for reappointment includes a review of the full effort of the individual since the published deadline for the last completed evaluation.

In this paper, the process of evaluative review of faculty for meritorious achievement will be examined at National University, according to the University policies and procedures, by an evaluation calendar set up by the Provost, along with the success rate of faculty members achieving merit. The evaluation of Faculty for merit includes a review of the full effort of the faculty for the current academic year, commensurate with faculty member’s current rank at National University. The success rates of these results will be examined according to records compiled by the University Office of the Provost.
Ensuring Integrity for the Meritorious Review
of Faculty Performance

Background, History and Mission of National University

National University, a private university of 28,000 students with headquarters in San Diego, California is dedicated to making lifelong learning opportunities accessible, challenging, and relevant to a diverse student population in its mission statement. Its aim is to facilitate educational access and academic excellence through exceptional management of University operations and resources, innovative delivery systems and student services, and relevant programs that are learner-centered, success oriented, and responsive to technology. National University’s central purpose is to promote continuous learning by offering a diversity of instructional approaches, by encouraging scholarship, by engaging in collaborative community service, and by empowering its constituents to become responsible citizens in an interdependent, pluralistic, global community (National University General Catalog, 2016, p. 18).

National University was founded in 1971. The 1970s brought dramatic growth and change to colleges and universities across the United States, driven largely by the demands of baby boomers, minorities, and veterans to gain greater access to higher education. There was an overlooked demographic which encompassed all of those populations: the working adult. In 1971, National University was established to serve the needs of business executives, military officers, law enforcement officials, and others with the desire to learn while they earn. Its founder realized that few people could afford to put their life on hold for several years while they pursued a degree, so he tailored a flexible format of one-month long classes that accommodated the academically disenfranchised nine-to-fivers.
Performance of Faculty to Meet Growing Accountability Demands

An important and welcome change has taken place on all college and many university campuses over the last 30 years, except those with strong graduate schools of research: Teaching is being taken more seriously. Higher education institutions throughout the country have transitioned from providing lip service of the importance of teaching to sustained evaluation to decisions to evaluate and reward this concept. As never before, faculty members are being held accountable to provide solid evidence of the quality and effectiveness of their instruction. This solid trend has replaced the traditional role of the professor being hired to teach, and being rewarded for their research.

What has been behind this increased emphasis on the importance of quality teaching and effective instruction? The growing demands from students and parents facing spiraling tuition and college expenses, and the general public for increasing expenses of public colleges and universities. In addition, the rapid development of use of technology for offering online courses replacing on-site courses has dramatically changed the approach to instruction and altering the teaching role of professors. Probably the biggest demands increased teaching accountability have come from elected legislators and boards of public higher education institutions faced with unrelenting budgetary pressures from growing expenses of their operations. Consequently, both public and private higher education institutions are now under closer scrutiny faculty members teaching quality and instructional effectiveness. This has come from higher education administration and more significantly from regional and national accrediting agencies demanding assessment of instructional results on students.

Private for-profit institutions are under a different type of pressure to provide relevant programs for students finding employment and launching successful careers, along with increasing graduation rates as a condition of receiving continued federal funding and Pell Grants.
Some of these institutions have been hit with re-accreditation snags because of low graduate rates, too much emphasis on student recruitment as opposed to servicing already enrolled students.

These increasing demands and implementation have resulted from faculty member associations pushing back by demanding shared governance for fairness and equitable treatment from assessments and accountability, and taxpayer demands for more effective use of tax revenues. As a result, faculty meritorious achievement for merit pay have become increasingly complex in recent years in terms of assuring consistent, objective, and equitable review of their performance. In the face of these increasing complexities for delivering fair and objective review of faculty performance, how can faculty member performance and evaluation be objectively assessed?

**Early Research on Evaluation of Faculty**

Early research on how faculty performance is evaluated were based on reports from academic deans or vice presidents. One of the earliest studies was by Gustad (1961) and included a national sample of colleges and universities. Astin and Lee (1967) repeated the survey about five years later with a similarly extensive sample of all types of postsecondary institutions. Both studies asked administrators to indicate the importance of various sources of information in evaluating, first, faculty performance and, second, teaching performance. The results were analyzed by type of institution. In both surveys, the university deans of arts and sciences ranked department heads as the most important source of information.

In 1974, Seldin (1975) repeated the Gustad and the Astin and Lee surveys in 1974 with Academic deans in liberal arts colleges in order to examine changes that might have taken place in the eight-year period. The deans reported more emphasis on systematic student ratings in
evaluating teaching (an increase from 11 to 29 percent of the colleges) and slightly less emphasis on research in evaluating overall faculty performance. The increased use of student ratings in making decisions on faculty advancement was also reported in studies that included doctoral-level universities (Bejar, 1975; Boyd & Schietinger, 1976). A Southern Regional Education Board study found, in addition, that the major purpose of evaluation in doctoral-level universities was to make decisions on faculty advancement, rather than to improve instruction, and that department heads had greater responsibility than academic deans or vice presidents in making these decisions (Boyd & Schietinger, 1976).

**Three Page Merit Request Letter for Faculty Evaluation of Teaching**

For years of evaluating faculty performance for merit pay, there was ample evidence for research grants, conference presentations, professional journal publications and books and/or chapters, but little factual evidence and objective documentation for fair assessment and evaluation of teaching performance. More recently, a three page digital letter has been submitted by faculty members to honestly reflect on their evaluation of teaching performance through various means that will be explained later, but also reflect and provide validation for faculty scholarship, and service. This letter, submitted without documentation, has been an effective means for merit pay requests because of the high trust level between faculty members evaluating the letter and the university administration.

A Teaching section in the letter is a factual description and reflection of a professor’s accomplishments of teaching, service activities, and scholarship accomplishments, which collectively suggests the scope and quality of the professor’s performance. It allows the professor to briefly describe examples of accomplishments and present them in an organized manner for display to others for their evaluation. Furthermore, it provides an opportunity for a
description of the uniqueness of his/her teaching, service, and scholarship from a separate reflection from each, and providing documentations for support in each of three categories.

Why should faculty members spend time developing and organizing a Teaching Section in the letter of merit, which includes a summary of student ratings on quality of teaching, along with peer and administrative reviews. Because it makes good accountability sense to publicly and professionally document teaching in the same public manner that service and scholarship is presented and documented with artifacts. Merit request letters also elevate the importance of teaching on a par with service and scholarship.

What are the uses of faculty merit letters of request? Some uses may include developing a summary to change jobs to a different teaching position or a higher-level position, future employer requirements for finalist candidates, merit pay consideration, leaving a legacy of accomplishments upon retirement for successors, applications for grants or release time, for institutional use to provide data for their performance to their board of trustees, external organizations, accrediting agencies for re-accreditation, government agencies for grants, etc. However, the two most important reasons for a teaching summary are personal in nature: merit pay, and to enhance accountability of higher education institutions by showing continuous improvement of teaching. Standardization of teaching merit pay letters meaning that certain required components are needed for meritorious achievement and merit pay.

National University Guidelines for Faculty Evaluation

This three-page merit pay letter request model has been in place at National University for review by multiple evaluation channels for the evaluation for faculty member merit pay. This procedure has been approved by the University Faculty-Senate for their policies and bylaws, and adopted by the University Board of Trustees. Faculty achievement in the merit pay letter is
ENSURING INTEGRITY

presented and reviewed in the traditional three areas of higher education faculty evaluation: teaching, scholarship, and service, described in detail below.

Before the commencement of the merit letter preparation and review timeline in February, the Provost’s Office sponsors a merit letter in-service for interested faculty members. This provides faculty members the “know-how” in writing a correct letter outlining teaching achievements, scholarship summary, and activities summary from their Faculty Development Plan, which was previously submitted the prior June of the academic year.

The merit letter request provides a summary of successful teaching, including student, department chair (administrative), and peer reviews of teaching, a self-assessment by the faculty member. The primacy of teaching should mean, among other things, that excellence in teaching carries more weight in deliberations regarding merit than accomplishments in scholarship or service. Such evidence of teaching quality include, but not be limited to these documents:

- self-assessment, including commentary on peer and/or administrative reviews;
- commentary on innovative teaching methods or upon any relevant information regarding courses taught;
- brief reflection on student advising;
- summary of student evaluations and comments on the teaching/learning process

The second major component of the National University merit letter request summarizes Scholarship accomplishments. Teaching and scholarship being closely linked intellectual activities. A summary of scholarship are varied but follows norms and standards legitimized throughout higher education:

- Documented and available for circulation and publication;
- Available for professional peer review;
• Grounded within a body of established learning and in some way extends or changes a component of that knowledge;

• Based upon traditions of presentation of material, persuasion, refutation and both

• Interpretive rigor and interpretive differences;

• Significant and worthy of disciplinary or professional respect.

• Application of knowledge to problems or challenges in a discipline or community; or teaching, which results in acquisition and utilization of knowledge in the teaching/learning process rests first with the individual Faculty.

**Service** is the third major component of the National University merit letter request, which is defined as the work of Faculty, which employs professional expertise to meet the mission of the institution. Faculty carry out service in many ways: to the University and its schools and departments; to communities and organizations; to national or local academic and professional organizations. It establishes evidence regarding service to include a detailed self-assessment and documented activities such as:

• Organizing seminars, panels, or colloquia;

• Participating in and serving on departmental functions and committees that address and foster departmental goals and outcomes

• Developing training programs, continuing education programs, consulting;

• Chairing a department;

• Participating in the recruitment, selection, appointment and mentoring of full-time and part-time Faculty;

• Developing professional growth programs for full-time and part-time Faculty;

• Serving on the Faculty Senate, school and University committees, task forces, or
special projects;

- Leading community organizations in work relevant to one's academic discipline;
- Serving in leadership positions in professional organizations and societies;
- Assuming special administrative responsibilities or assignments;
- Participating in continuing education;
- Developing and implementing new academic programs;
- Leading effective academic program review.

**National University Steps and Timeline for Faculty Evaluation**

Faculty merit letter requests go through several evaluation steps with finite timelines to lend maximum objectivity, quality and fairness and equity for each faculty member seeking promotion and/or re-appointment. At every level, summary evaluation letters are sent to the faculty member who authored the merit letter for evaluation with copies to representatives of each of the five below levels of evaluation. The university requires a strict timeline submission schedule to assure completion of the process.

At each level, the faculty member has right to write an appeal, if she/he disagrees with the written report and recommendations at any one level. The written appeal is limited to correction of any inaccurate information submitted by any of the levels, and must be written to the next higher level in time for dossier consideration at that level.

The first evaluation step begins with a faculty member submitting his/her dossier to his/her **Department Chair**, who reviews and writes an evaluation on teaching, activities, and scholarship based on a rubric: not meeting expectations, meeting expectations, and exceeding expectations.
The second step is at the faculty-elected School Personnel Committee reviews and considers the Faculty review dossier and the Department Chair’s report in the context of reports of other Department Chairs. This Committee prepares a recommendation for each Faculty member seeking promotion. The committee seeks to ensure equity of evaluation across all departments of the school, then forwards its report to the appropriate School Dean for a similar dossier review, review of previously written reports by both the school personnel committee and department chair.

The third evaluation step is the academic school Dean, who reviews the faculty merit letter along with the reports from both the department chair and school personnel committee, based on the rubric found in the university board polices on faculty evaluation. The school Dean writes her/his report based on her/his evaluation of the faculty merit letter, and rates each of the components (teaching, scholarship, and service) along with exceeds standards, meets standards, or does not meet standards in teaching, scholarship, and service, and submits to Provost.

The fourth step of evaluation is at the Provost level, who also follows the same previously mentioned procedures, culminating in a written report for the university president. He evaluates the merit letter in each of the three areas as exceeds, meets, or does not meet standards.

The fifth and final level is the evaluation from the President, who also writes a report based on the recommendations of the previous four levels, and is considered the final decision.

APC Notes for Teaching, Scholarship, Service

1. EEE means exceed standards in teaching, scholarship, and service
   EEM means “exceeds” standards in two categories, and “meets” standards. In one category
   EMM means “exceeds” standards in one category, and “meets” standards in two categories

2. All EEEs were recommended for 1% merit. The Provost raised two faculty from EE to EEE.

3. All EEs were recommended for .67% merit.

4. All Es were recommended for .33% merit.

*Faculty School totals derived from National University 2016 General Catalog; FT faculty only

Findings, Conclusions, and Recommendations

The above data shows a recent past year statistics of faculty merit pay attempts and successes in Spring Cycles during the 2015-2016 academic year when the two authors served on the School of Education Personnel Committee. As readily apparent, the success rate of full time faculty members seeking meritorious achievement is very high for several reasons:

1) Provost’s Office Dossier Development Workshop for faculty prior to each fall and spring cycle, which was well-attended by faculty merit pay candidates,

2) Multiple evaluation review levels of faculty merit pay letters for each level, which allows faculty members to submit additional information not included in original letters,
3) Peer assistance to faculty members developing and organizing their letters of merit, and

4) Dedication and determination of faculty members to submit complete letters for merit pay.

In addition to success of this process, faculty members believe that this process assures a consistent, objective, and equitable review of performance for effective teaching. In past years, merit pay has resulted in up to two percent salary enhancement for teaching, one percent for scholarship, and one percent for service, plus an overall two per cent “cost of living adjustment” for all faculty members.

Recommendations for the future include continued digital submission of merit letters online for quicker review of multiple levels as opposed to the traditional operation of development, and continued assistance of merit pay workshops for faculty candidates to assure their continued success.

National University Office of Provost Statistical Data on School of Education on Merit Letter Awards. June, 2016

Tracking Language Learning Behavior to Enhance Self-Regulated Learning

Many first year university students in Japan have difficulty finding the best way to study effectively as high school requires rote memorization of information in order for them to pass university entrance examinations (Kubota, 1999). Therefore, they do not acquire the skills and strategies needed to cope with university classes. The promotion of self-regulated learning (SRL) may be a key to solving such study related problems.

SRL emphasizes taking control over one’s own learning, and regulating and reflecting on actions towards one’s goals. Self-regulated learners are aware of their strength and weaknesses, motivated to challenge themselves and think of and implement various learning strategies. Tracking language learning activities is one of the components of SRL, on which very little research has been done. It fosters the acquisition of skills required for students' lifelong learning and future career, such as planning, organizing, and reflecting on their work and progress. Furthermore, teachers can monitor and support students' development more effectively. However, most online trackers are connected to a particular course or program; therefore, they do not enable learners (or teachers) to take note of their entire learning. We have developed an online tracker which does not limit its scope to studies related to a single course but attempts to cover the entire spectrum of students' learning, from the classroom to independent study.

This study included six classes of twenty students, from low, intermediate, and advanced levels and implemented daily tracking. The purpose was to define what, how, when and
how often students actually study in terms of homework and independent study. Second, we wanted to discover if and how beneficial the tracker was for them. We conducted pre- and post-study questionnaires based on Pintrich's conceptual framework (2004) and questionnaire “Phases and Areas for Self-Regulated Learning” (2000), and students tracked all English language study for a month. After the tracking period was finished, tracking data was downloaded and given to the students for them to consider and reflect on what they had achieved in their language studies.

The post-tracking data revealed that most students found the tracking useful. Many students wanted to continue tracking, while others reflected that they had often forgotten to track studies as the tracker had been troublesome to use. We as researchers found that online tracking is a powerful tool to check students’ language learning behavior, as it is easy to compile data. However, we also found that it was difficult to review the data with the students due to the limitations of the online survey's available functions. Making the tracker easier to use, designing alternative paper-based trackers and regular one-to-one consultations between the teacher and learners may help increase the number of students using and enjoying the benefits of study tracking.

Using PBL to close the opportunity gap for achievement and engagement with diverse and low-SES populations

Curriculum, Research and Development

Paper Session

Problem-Based Learning (PBL) provides meaningful, developmentally appropriate learning opportunities for all students. When utilized in diverse and low-SES schools, student achievement and engagement data and teachers interviews from the first two years of a five-year study indicate that PBL provides opportunities for students to learn content in new ways and allows teachers to see their students from a fresh perspective.

George Mason University  
nholich@gmu.edu
Objectives
All students must become skilled in advanced reading and communication if they are to achieve expertise in a given field. Although early adolescence seems an ideal time to develop advanced reading and communication skills, it holds unique challenges for high-ability, low-income (HA-LI) students. These challenges include a drop in achievement for HA-LI students as they move through school (Xiang, Dahlin, Cronin, Theaker, & Durant, 2011), less engaging curriculum in low-income schools that fails to ignite the passion of high ability students (Gamoran, 2000) and a lower rate of differentiation and sustained intellectual engagement in low-income classrooms (Callahan, 2005). An additional issue challenging HA-LI students is that the peer culture in low-income populations often militates against achievement (Garcia-Reid, Reid, & Peterson, 2005). Students who are capable of achievement often seek to hide their ability (Bishop & Pflaum, 2005), and there may be little incentive to achieve.

The purpose of this paper is to explore how HA-LI middle school students can be served with developmentally appropriate, meaningful learning experiences that lead to content acquisition and advanced reading and communication skills.

Theoretical Framework

Curriculum for Gifted. Inquiry-based models of instruction are most effective for gifted education (Van Tassel-Baska & Brown, 2007). Central to the inquiry-based approach was engaging students in complexity and challenge by asking questions and pursuing answers that involved problem solving and decision making. Gifted students’ views on their schooling confirm that complexity and challenge is more satisfying (Gallagher, Harradine & Coleman, 1997; Kanevsky & Keighley, 2003; Siegle, Rubenstein & Mitchell, 2014). Needs of gifted students align with the design of Problem-Based
Learning.

**Problem-Based Learning.** Problem-Based Learning (Barrows, 1994; Barrows & Tamblyn, 1980) has gained credibility through hundreds of empirical studies conducted in medical school and P-12 classrooms. Problem-Based Learning capitalizes on students’ natural curiosity by beginning instruction with an ill-structured problem, which is designed intentionally to leave gaps in information for students to resolve through inquiry and investigation. Curiosity is a powerful motivator for students, as it is considered by some a basic instinct (Arnone, Small, Chauncey, & McKenna, 2011) and can benefit academic achievement (Kashdan and Yuen, 2007).

**Cognitive Outcomes**

PBL students retain learned content longer than students who receive more traditional instruction (Diggs, 1997). When PBL is properly designed and delivered, students acquire as much or more content as students who receive more traditional instruction (Horak, 2013; Finkelstein & Hanson, 2011; Feng, Van Tassel-Baska, Quek, Bai, & O’Neill, 2005). Superior learning gains are observed among PBL students on measures of conceptual reasoning (Tarhan & Acar-Sesen, 2013), and students in PBL groups also outperformed students in control groups in problem-solving (Finkelstein & Hanson (2011). The development of data literacy is an additional benefit of engaging students in PBL (Swan, et al., 2013).

**Non-Cognitive Outcomes.** The reported benefits of PBL extend beyond cognitive outcomes. Students in PBL classes develop social skills (Cerezo, 2004; Goodnough & Cashion, 2006), and there is evidence to suggest students’ sense of agency is affected as well. Students in the PBL classes reported increased motivation, self-
efficacy, confidence, enthusiasm, persistence, engagement, higher self-confidence, willingness to problem-solve and share knowledge in PBL settings (Belland, Glazewski, and Ertmer, 2009; Brush & Saye, 2000; Cerezo, 2004; Tarhan, Ayar-Kayali, Urek, & Acar, 2008).

Using PBL to serve HA-LI students. Projects PBLISS and Insights demonstrated the efficacy of PBL both as a platform for in situ identification and as an effective academic intervention with high-ability, low-income adolescents, (Gallagher, 1999; Gallagher & Bray, 2000; Gallagher & Gallagher, 2013). Project ExCEL was funded by Javits Gifted and Talented Program to test the efficacy of replicating and scaling up these first results. Thus, this presentation will focus on the use of PBL as an intervention for HA-LI students from the first year results of a five-year research program addressing multiple questions. The current study, based on Year 1 data, focuses on using PBL as the basis of instruction for high ability low income students in the English language arts classrooms. The operating hypothesis is that shifting curriculum to a PBL model in middle school language arts classrooms will result in the achievement and engagement of students of advanced academic ability.

Methods

Participants. In year one of our project, five 7th grade language arts teachers at one school in a Mid-Atlantic school district implemented PBL with their 385 students. During year two we expanded to an additional two schools in the same district, and also added 8th grade teachers at our original school site. At these three schools in year two there were a total of 1,485 7th grade students and 122 8th grade students. During year
two we also expanded into a second school district, located in the Southeast. The two schools in this district included three 7th grade teachers and their 466 7th grade students.

**Curriculum.** The PBL units used in Project ExCEL are adapted from the model presented by Barrows and Tamblyn (1980) for medical schools and is described in Stepien and Pyke (1997). The model adapted for P-12 described in Stepien and Pyke (1997) includes five phases: (a) Problem Engagement, (b) Inquiry and Investigation, (c) Problem Definition, (d) Problem Resolution, and (e) Problem Debriefing. Additionally, Gallagher (2001) distinguishes three key defining features of PBL instruction: (a) the ill-structured problem; (b) the teacher serves as a meta-cognitive coach; and (c) the student is the primarily stakeholder in the learning process. This model was used for the development of PBL units and the units that were implemented for this study had all been previously been through a rigorous process of piloting, revision and testing again.

The PBL units were selected by a collaborative team of teachers at each school. In years one and two *Black Death* (Gallagher, 2013) was implemented. During year two additional curriculum units were added, to include *Hull House* (Gallagher & Plowden, 2013), *All Work and No Play* (Gallagher, 2013), and *A Final Appeal* (Gallagher & Plowden, 2013).

**Procedure.** Teachers received 3 days of professional development prior to teaching the unit. Included in the professional development was general training in Problem-Based Learning, specific details about the unit *Black Death* (Gallagher, 2013), and a framework for thinking about indicators of exceptional ability. The latter included information organized around the categories in the Gifted Rating Behavior Scale:
Exceptional Ability to Learn, Exceptional Application of Knowledge, Exceptional Motivation to Succeed, and Exceptional Creative/Productive Thinking (Shaklee, 1993).

All seventh grade language arts teachers taught the PBL unit in the spring. Project staff observed several lessons during unit implementation to ensure fidelity to the PBL model. After completing the unit, teachers were asked to select students who they thought demonstrated exceptional academic potential that was not evident before the PBL experience. Students were separated into three groups: 1) students identified as gifted using traditional district criteria (TI), 2) students identified as having advanced academic Potential based on teachers’ perceptions of their performance during PBL (PBLi), and 3) remaining General Education (GE) students. The PBLi students were then randomly assigned to an 8th grade advanced class with PBL or an 8th grade advanced class.

Data sources

A variety of data sources were gathered in order to assess the effect on achievement and engagement. Quantitative measures were chosen to allow for analysis of student learning in English Language Arts (ELA), student motivation and student learning of PBL-unit content.

The comprehension section of the GATES (MacGinitie, MacGinitie, Maria, Dreyer, Hughes, 2000) was selected during year 1 to show changes in ELA achievement. The project also had access to state standardized test scores in English Language Arts (ELA) and end of course ELA grades.

During year 1 the Motivated Strategies for Learning Questionnaire (MSLQ) (Pintrich, Smith, Garcia, & McKeachie, 1991) was selected as the engagement measure, and specific sub-scales were selected for use in the project. Additionally, items were
modified to align them for use in a middle school PBL-classroom. The modified MSLQ (MSLQ-M) was administered in year 1 with Cohort 1 as a pre- and post-assessment of student engagement. During year 2, analysis of the MSLQ-M commenced, including a factor analysis to validate the scale for the team’s continued use.

Content measures for each of the PBL units were administered. This measure was collected as both a pre-assessment before the PBL unit, and again as a post assessment at the conclusion of the PBL unit.

Qualitative measures gathered for analysis included teacher interviews, a measure of PBL implementation and student embedded measures.

Results

Data Analysis. At the time of this proposal, year one data has been completed and year two data collection is ongoing. Three groups will be included in the analysis; traditionally identified gifted students (TI), Problem-Based Learning identified students (PBLi), and the remaining general education (GE) seventh grade students. Due to the limitations of this proposal length only a portion of our results are presented here. Additional year one results and the year two results (currently being compiled and analyzed) will be presented in the conference paper and presentation.

Quantitative data on Achievement. The content measure (administered before and after PBL) reflected learning overall and for PBL-identified students. For PBL-identified students who completed both the pre- and post- content test (n=38) there was a statistically significant difference in the pre-test (M=9.92, SD=2.84) and post-test (M=12.84, SD=1.82); (t(37)=7.15, p<.001, d=1.237). The effect size (d=1.237) suggests a large practical significance. Additional significant findings related to achievement on the
GATES assessment will be discussed in our final paper.

**Quantitative Data on Engagement.** Exploratory factor analysis of the updated MSLQ led to a 21-item scale loading on four factors. The new scale, (preliminarily labeled MSLQ-M-PBL) has four factor sub-scales, including Value of Content, Self-efficacy for Learning, Meta-cognitive Self-regulation, and Grade Expectations. Preliminary analysis of the pre-test MSLQ-M-PBL year 1 data indicates there are significant differences on some of the MSLQ-M-PBL factor sub-scales for multiple under-represented groups, including our target population.

**Self-efficacy for Learning.** Students classified as free and reduced lunch (FRL) scored significantly lower on the Self-Efficacy for Learning Sub-scale of the MSLQ-M-PBL pre-assessment when compared to non-FRL students. There was a statistically significant difference on the Self-Efficacy for Learning sub-scale of the MSLQ-M-PBL pre-assessment between FRL students (n=90, M=21.9, SD=4.8) and non-FRL students (n=256, M=24.0, SD=3.4); (t (123.424) = 3.870, p<.001). Students classified as English Language Learners (ELL) also scored significantly lower on the Self-Efficacy for Learning sub-scale of the MSLQ-M-PBL pre-assessment when compared to non-ELL students. There was a statistically significant difference on the Self-Efficacy for Learning sub-scale of the MSLQ-M-PBL pre-assessment between ELL students (n=107, M=22.3, SD=4.6); and non-ELL students (n=239, M=23.9, SD=3.5); (t (164.216) = 3.372, p=.001). These differences between ELL and non-ELL students and between FRL and non-FRL students were evident in later measures of MSLQ-M-PBL, suggesting that student beliefs about ability are an important element in understanding student learning.

**Qualitative data.** Teacher interview data for Cohort 1, 2B1, and 2B2 was
collected during year 2. Further data analysis of all interviews is ongoing. Preliminary analysis of interview data indicates that PBL helped teachers view student engagement and student learning from a new perspective.

Additional qualitative sources were collected from both the teachers and the students. These sources and the findings will be discussed in greater detail in the paper for this presentation.

**Significance**

This research explores the use of PBL to identify and serve high ability, low income students. Our ongoing analysis of data will allow further discussion regarding the implications of using PBL to identify and serve HA-LI students in comparison to serving these students in the traditional classroom.

Although PBL is established within the literature as impacting problem-solving, conceptual reasoning and non-cognitive skills, the targeted use of PBL with HA-LI students has been limited to a few prior studies. This research will provide evidence of the impact of PBL-instruction on students at all levels, including HA-LI students and ELL students. This study will contribute to the field of PBL research, as well as to our understanding of gifted identification of under-served populations.

Empowering English Language Learners’ Academic Potential through Problem-based Learning: Leading Teachers with a Capacity-based Lens

ESL/TESL

Paper Session

This study investigates the impact of Problem-based Learning (PBL) on middle school English language learners’ (ELLs) academic potential and classroom engagement when teachers use a capacity-based lens for identification of potential. Findings from a federally funded grant, Project ExCEL, indicate that ELLs (n=121) demonstrated increased content knowledge and engagement in the PBL setting and through inquiry-based learning, teachers recognized their potential for advanced academic performance.

Purpose

The purpose of this paper is to address how Problem-based Learning (PBL) provides a learning platform in which English language learners (ELLs) can thrive and their teachers have a new lens for seeing their academic potential. Culturally and linguistically diverse students enrich gifted programs and yet they continue to be an untapped resource. As deficit thinking still prevails, the identification of gifted students from culturally and linguistically diverse backgrounds remains a challenge (Ford & Whiting, 2008). Representation in gifted programs lags behind traditional populations, including other underserved populations (Ford, 1998; Donovan & Cross, 2002; Matthews, 2014). Adding complexity to the issue is the fact that many culturally and linguistically diverse students are also classified as low-income, another underserved population (Camarota, 2012).

This study builds on a social justice framework that supports how PK-16 teachers can use a capacity-based approach to observe academic potential in underserved populations, particularly students of culturally, linguistically, and socioeconomically diverse populations. ELLs may be typically overlooked in the traditional identification process, which generally relies heavily on verbally laden ability tests, in part because of the difficulty seeing past their language proficiency to their academic capacity. One concern is that dominant culture bias may be a factor contributing to a deficit perspective when using traditional measures and methods, even when incorporating multiple criteria such as checklists and observational scales. A multi-dimensional shift in identification practices that includes exploring practices showing promise to help make visible these students’ strengths, despite language and cultural differences, is an urgent and critical need. A literature review conducted by the National Center for Research on Gifted Education (NCRGE, 2016) found some early trends indicate success with identification using
strategies such as using universal screening and performance tasks. Universal screening procedures alone have shown to significantly increase representation for all underrepresented groups and particularly high-ability, low-income (HA-LI) language learners without a relaxation of criteria standards (Card & Giuliano, 2015).

In concordance with these potentially promising practices is the design of Project ExCEL, which uses Problem-based Learning (PBL) as a universal screening curriculum intervention for in situ identification. Project ExCEL, Experiences Cultivating Exceptional Learning (ExCEL), is a 5-year federally funded scale-up Javits grant that incorporates PBL in the English Language Arts classroom as an instructional method for in situ identification of high-ability, low-income middle-school students. Embedded in the in situ identification process are performance tasks and also the use of teacher judgments. Therefore, for Project ExCEL, the question becomes, how does PBL influence the performance and engagement of ELLs and give teachers a new lens through which to look for high-ability ELL students? When we prepare teachers to use PBL, do they broaden their perspectives of what high performance looks like across culturally, linguistically, and socioeconomically diverse students, and can they can better recognize the academic potential of ELLs?

**Theoretical Framework**

What the research show about effective instruction and curriculum for students generally apply for ELLs too (Goldenberg, 2008). ELLs can succeed and benefit from learning environments that are highly engaging, low stress, culturally appropriate, and conducive to risk taking (Castellano, 2003; Krashen, 1982; Lewis, Rivera, & Roby, 2012; Pereira & Oliviera, 2015). PBL is a form of inquiry-based instruction designed to motivate, engage, and set the stage for improving academic achievement and skills by capitalizing on students’ natural
EMPOWERING ELLS ACADEMIC POTENTIAL

curiosity by beginning instruction with an ill-structured problem. PBL provides ELLs with an opportunity to demonstrate multiple modes of ability in a way they might not otherwise in traditionally instructed classes. By raising the academic rigor of curriculum with the depth and complexity that is needed for understanding big ideas and examining different points of view and by providing a real-word, ill-structured problem to grapple with, PBL creates a learning environment that offers challenge where ELLs may thrive and are motivated to succeed. In turn, this allows for the attributes of giftedness to emerge and teachers to make observations of behavior that might not be typical in traditional classrooms.

In Projects PBLISS and Insights, Gallagher and colleagues demonstrated the efficacy of PBL both as a platform for \textit{in situ} identification and as an effective academic intervention with HA-LI adolescents (Gallagher & Bray, 2000; Gallagher & Gallagher, 2013). The \textit{in situ} identification process begins in the classroom as a universal screening for all students and one component of which involves the use of performance tasks, both of which have been cited as promising practices in addressing this issue (NCRGE, 2016). Project ExCEL builds on this model to give teachers the chance to expand the lens with which they view ELL students. Starting first with PBL instruction for all students as a universal screening procedure, then allowing students’ capacities to emerge throughout the PBL unit, teachers incorporate their professional judgment and use observations of the attributes of giftedness, as defined by Shaklee and Viechnicki’s model of the early assessment for exceptional potential (1995), to identify students with potential for success in advanced classes.

\textbf{Method}

The paper reports on the data analysis from Year 1 PBL implementation with Project ExCEL Cohort 1, which included one site school and six English Language Arts (ELA) teachers.
Participants were 385 consenting 7th grade students, of which 121 were ELLs. Demographic data provided by the school district show the overall school population was comprised of 18% African Americans, 42% Caucasians, 30% Hispanic/Latino, and 6% Asian. ELLs were 18% of the school population.

Project ExCEL uses a mixed methods approach that incorporates experimental design in the second year of participants’ involvement in the study. During the first year of implementation reported in this paper, all 7th grade ELA teachers implemented one PBL unit. Multiple sources of data were collected during the three-week unit. At its conclusion, teachers were interviewed and identified students that demonstrated attributes of giftedness during the PBL unit.

Project ExCEL provided initial professional development to Year 1 teachers about equitably identifying diverse students of underserved populations. Since then, targeted professional development was provided about recognizing potential in culturally and linguistically diverse students as to meet this emerging population. These trainings focus on understanding the gifted attributes of English language learners and how to identify them within the classroom and PBL environment. Through ongoing, site-based professional development, Project ExCEL strives to lead teachers to observe students with new lenses for seeing their potential and becoming critically conscious advocates for their learning and success.

Data Sources

Quantitative measures gathered for analysis included the Motivated Strategies for Learning Questionnaire (MSLQ) (Pintrich, Smith, Garcia, & McKeachie, 1991) and a standardized test of social studies content associated with the PBL units. Teacher interviews were conducted at the conclusion of the PBL unit for qualitative analysis. During the interviews,
teachers identified students they observed as showing high ability and academic potential during the PBL unit.

The MSLQ was used to measure student engagement and specific sub-scales were selected for use in the project. Additionally, items were modified to align them for use in a middle school PBL-classroom. The modified MSLQ (MSLQ-M-PBL) was administered in Year 1 with Cohort 1 as a pre- and post-assessment of student engagement. The content assessments were given to students prior to the PBL unit and at its conclusion. Questions were comprised from a database of released standardized test items and created by project curriculum developers. The teacher interviews were conducted at the conclusion of the PBL unit implementation, audio-recorded, and transcribed. Direct quotes that were representative of the emerging themes across the interviews were pulled to support our findings of teacher observations of ELLs during PBL.

Results

At the time of this proposal, Year 1 data analysis has been completed and Year 2 preliminary data analysis is ongoing. The findings from Year 1 are reported below.

Modified MSLQ-M-PBL

SPSS was used for the statistical analysis. A paired samples t-test was used to compare student MSLQ scores for specific items from before and after PBL implementation. For the ELL population (n = 121), several indicators showed a statistically significant higher response after learning through PBL than before. One example of these indicators is: I often question things I hear or read in this class to decide if I believe them. ELLs in our sample had a statistically significant higher response after learning through PBL on this indicator (M=4.376, SD=1.69) than before (M=3.832, SD=1.77), (t(100)=2.538, p=.013). Cohen’s effect size (d=0.314) suggests a moderate practical significance. This suggests that ELL students’ engagement in PBL
helped them think more strategically about learning.

**Content Assessment**

Gain scores were calculated from the difference in post-test and pre-test scores of the PBL content assessment. An independent samples t-test was used to compare the gain scores for ELL students (n=121) and non-ELL students (n=264) students in the sample. ELL students had statistically significant higher gain scores on the content assessment than non-ELL students, with ELL students (M=3.60, SD=4.19) gaining significantly more points on the post-assessment as compared to the pre-assessment than the non-ELL students (M=1.89, SD = 5.61), t(305) = 3.32, p=.001. Cohen's effect size (d=0.345) suggests a moderate practical significance. These findings indicate that all students gained significant content knowledge through engagement in PBL instruction. However, ELL students gained significantly more content knowledge through PBL, effectively closing the achievement gap on this assessment.

**Teacher Interviews**

At the conclusion of the three-week PBL unit, teachers were interviewed about their observations of student engagement and performance during inquiry-based learning. One teacher from Year 1 said how her ELL students rose to the occasion during PBL, sharing:

It was a really interesting dynamic because if you put them [ELLs] in a situation where there is enough structure, but a challenge, they will rise to it. But then also it was really interesting to see that we have made our classroom a safe place for them to be able to take chances…In one of those classes we have 26 kids and 20 of them speak Spanish at home.

Another teacher, from Year 2, shared her observations of ELLs demonstrating different academic capacities in PBL than in traditional instruction. She stated:
I noticed especially with my ELL students, sometimes in class, they'll ask about what a word means. But even more so now, they were very concerned with asking about what vocabulary meant, who this person was, and making sure that they had enough knowledge where they could get their work done or they could answer the question.

In regard to creating an equitable opportunity to observe students’ potential for gifted attributes, she also remarked, “Just like you have students that excel in different areas of assessment are different learners, this is another way to kind of mine and see who is gifted without necessarily taking the traditional routes. I think there's a sense of fairness and equity in that.”

Student participation in PBL instruction may allow teachers to see different qualities in student ability, particularly in ELLs. Of the 58 students that teachers identified as showing potentially gifted attributes during PBL, 14 (24%) were classified as ELL. The school’s overall ELL population makes up only 18% of the school, so our findings suggest that teachers were better able to identify gifted attributes as a result of student engagement in PBL, which typically does not happen with traditional identification practices.

**Scholarly Significance**

ELLs are among the fastest growing population of learners in the U.S. (NCES, 2013). Many school systems are struggling with an influx of students for whom traditional identification practices have not been effective. Giftedness extends to all cultures and languages and gifted education programs should reflect changing U.S. demographics (Shaklee & Baily, 2012; U.S. Department of Education, 2008). Thus, it is imperative to examine practices that serve to effectively identify and support this diverse population of ELLs in gifted programs for achieving an equal educational opportunity. Given the results from Year 1 of this study, PBL as a universal screening model has the potential to function as a viable social justice framework to
support a capacity-based approach to observe academic potential in underserved populations, particularly students of culturally, linguistically, and socioeconomically diverse populations.

The Instructional Administrators at all 116 CCCCCO Institutions who provided the survey data presented in this report

San Diego Continuing Education Institutional Effectiveness Staff
The California Community College system is the largest in the nation with 2.1 million students attending 113 colleges ("CCCCO Home Page," 2016), 67 percent of the students are of diverse ethnic backgrounds ("California Community Colleges Key Facts," 2016), and in 2014, 9.3 percent were enrolled in noncredit courses (Harris, 2016). Noncredit or adult education programs include various segments of higher education and have used terms such as extension, extended-day, part-time, adult, evening classes, and continuing education to describe these programs ("Noncredit at a glance," 2006). Adult noncredit education as part of the community colleges is included as a secondary mission to its primary mission of academic and vocational instruction, and according to Education Code Section 66010.4 ("California State Legislature Education Code," n.d.), includes:

> The provision of remedial instruction for those in need of it and, in conjunction with the school districts, instruction in English as a second language, adult noncredit instruction, and support services which help students succeed at the postsecondary level are reaffirmed and supported as essential and important functions of the community colleges.

> The provision of adult noncredit education curricula in areas defined as being in the state’s interest is an essential and important function of the community colleges.

> The provision of community services courses and programs is an authorized function of the community colleges so long as their provision is compatible with an institution’s ability to meet its obligations in its primary missions.

Noncredit programs primary purpose is to provide those “18 years or older with precollegiate-level knowledge and skills they need to participate in society and the workforce” ("Restructuring California’s Adult Education System," 2012) and serve the needs of the most underserved and non-traditional students by providing flexibility in course schedules and locations; noncredit enrollment eliminates financial barriers for students due to the zero costs and fees to attend along with the struggles these students may have in navigating the complicated financial aid process ("The Reemergence of Noncredit in the California Community Colleges," 2016), thus noncredit programs provide for the most underserved members of our communities. In addition, programming and services are closely aligned with both Student Equity (SE) and Student Success and
Report Program (SSSP) plan objectives in support of students enrolled in elementary and secondary basic skills, English as a second language, courses for persons with substantial disabilities, citizenship for immigrants, parenting, and short-term vocational classes.

With the equalization of Career Development and College Preparation (CDCP) noncredit program funding with credit FTES funding along with statewide decline in FTES, many colleges have begun intensive noncredit program development and expansion. By the spring of 2016, dozens of institutions had contacted San Diego Continuing Education (SDCE), the noncredit division of the San Diego Community College District, for guidance on how to build out their noncredit offerings.

It has become clear that with new initiatives and funding for noncredit, growth for California community colleges may increasingly center upon the expansion of adult education, and resources for colleges’ programming and operational infrastructure questions were not yet available. Therefore it was concluded that in order to support our colleagues around the state, exploratory research was critical in providing insight into adult education in California. The following key action items constitute the framework and intent of the report:

- Address the need to document the past structure and growth of adult education in California through an in depth historical study.

- Determine the current state of noncredit programming in California and any immediate plans by the community colleges for increase in noncredit offerings through a survey of instructional experts at each of the community colleges and institutions statewide.

- Explore recommendations for moving forward, both in future research and the future of community college noncredit education.

SDCE is creating the context and baseline data for subsequent surveys and reports, along with recommendations for the future of noncredit adult education research and practice to inform state enhancements in support of noncredit program growth. By exploring the history along with the current state of noncredit programs, services and students, we look towards supporting the mission of the community college, the most underserved population, and advocating for its future in California.
We must study our past to chart a positive direction for our future. As a basis for the recommendations for noncredit program development and expansion in this report, this chapter provides an abbreviated history of adult education in California and the United States from 1856 to 2016.

Since the birth of adult education, the federal government has played a role in supporting state-administered adult education programs. However, federal government was minimally involved in state-administered adult education programs until ratification of the Economic Opportunity Act (EOA) of 1964. For the past fifty years, federal and state agencies have worked in concert with professional adult education associations in their advocacy for increased accountability, standardization, and centralization. As a result, adult education practitioners now work collaboratively across districts and institutions to develop thoughtful plans, report outcome data, and meet ambitious objectives.

California adult education traces its beginnings to the early 1850s, and through the years, it has been an important part of the state’s educational system. Evening classes serving the educational needs of immigrants expanded through the decades into diverse educational programs to meet changing populations and the challenges of society. In California, adult education has been offered by a wide range of providers, most notably the adult schools in the public school system and the noncredit programs in the community colleges that in 1967 became a separate entity.

During the Great Recession (2008-2014), California adult education experienced catastrophic setbacks and positive advancements. This chapter explores the landmark legislation, organizational transformation, and curricular developments that assist California educational leaders invested in the
expansion of adult education in response to recent equalization of state funding for Career Development and College Preparation certificate programs.

The Gold Rush and Birth of a State: The Origins of Adult and Vocational Education

In 1848, Mexico and the United States of America signed a treaty to end the Mexican-American War, which gave the United States control over the territory that comprises the present Southwest region of the country, including present day Arizona, California, Colorado, Texas, New Mexico, and Utah (“California Admission Day September 9, 1850,” 2016).

Several days earlier, on January 24, 1848, gold had been discovered on the American River near Sacramento, sparking the start of the Gold Rush and precipitating rapid American westward migration. The national debate over slavery and the ensuing gold rush hastened California’s admittance to the Union. The exponential increase in population, caused by the Gold Rush, created a pressing need for civil government and public education (“California Admission Day September 9, 1850,” 2016).

In 1849, Californians sought statehood and, after heated debate on slavery in Washington, California entered the Union as a free (non-slavery) state by the Compromise of 1850. The 31st state on September 9, 1850 (Starr, 2007). This date is known as California Admission Day. Ever since, the Golden State’s rich history has been shaped by people of every ethnic background who traveled to California seeking economic, social, and educational opportunity (“California Admission Day September 9, 1850,” 2016).

The United States Department of Education’s Adult Education Office report—titled An American Heritage: Federal Adult Education, A Legislative History, 1964-2013—reports the federal government provided federal funding for adult education since the birth of the nation. The earliest federally supported adult education came in the form of math and military skills training for soldiers in the Continental Army, using the “General Welfare” clause in the U.S. Constitution. Albeit modest, this appropriation marked the entry of federal government support of adult education (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). Adult education for military and civilian employees has operated in various forms since the 1700s. Federal funding for nonfederal employee adult education and training began with the ratification of the Ordinance of 1787 and the first Morrill Act, passed in 1862.

The Morrill Act of 1862 was the first major federal effort to expand the federal government’s role in state-administered adult education programs. This legislation designates specific vocational programs authorized to receive land grants, which were awarded to states for the development of the public state colleges. The federal government mandated that colleges to be awarded grants must focus on workforce development for adult learners in two employment sectors: agriculture and mechanical arts (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). The University of California was founded in 1868 in Berkeley, born out of a vision in the State Constitution of a university that would “contribute even more than California’s gold to the glory and happiness of advancing generations” (“About UC Berkeley,” 2016).
California Department of Education’s (CDE’s) adult history project (2005), *Meeting the Challenge—A History of Adult Education in California: From the Beginnings to the Twenty-First Century*, reports that adult education began in California in 1856 during the state’s infancy. The first recorded adult school opened in 1856 under the authority of the San Francisco Board of Education (SFBOE) using state financing (“Beginnings - California Adult Education History,” 2005). Serving a largely immigrant population, the first adult school provided programming in elementary-level academic subjects with a focus on literacy and numeracy skills and vocational pathways in areas such as drafting and bookkeeping. During the mid-1800s, California immigrants came primarily from Italy, Ireland, and China. John Swett, a pioneer adult educator and the first principal of San Francisco’s adult evening school from 1868 to 1871, persuaded the school district’s governing body to offer adult education courses and programs at zero cost to students. Swett can be attributed for implementing tuition-free adult education in California, a tradition that has endured for over 150 years (“Meeting the challenge: A history of adult education in California,” 2005).

Through the remaining decades of the nineteenth century, most major California municipalities developed diverse adult education programs. Sacramento started to offer English as a second language (ESL) to Chinese adult students in 1872. Adult school programs in the present state capital expanded to include a wide array of academic subjects, bookkeeping, and electrical science. During the 1880s, Los Angeles, Oakland, and San Jose began providing adult education programming to their residents with a particular emphasis on immigrant populations. In 1898, the first recorded adult school for female students opened in Los Angeles. By the close of the century, adult evening schools had become institutionalized as elementary, vocational, and Americanization centers (“Meeting the challenge: A history of adult education in California,” 2005).

**The Progressive Era: The Legal Foundations of Adult and Vocational Education**

Reform efforts throughout the early 1900s professionalized secondary, adult, and vocational education in California. In 1902, an amendment to the California Constitution authorized the development of public secondary schools. In 1910, an additional provision to the state constitution mandated state funding for high schools. “The concept of free public education has come of age, and adult education was part of it” (“Meeting the challenge: A history of adult education in California,” 2005: 3). At the national level, similar trends emerged with ratification of the compulsory education acts in all states, with Mississippi becoming the last state to codify mandatory free public education in 1918 (Button & Provenzo, 1983; Cremin, 1961).

In *Board of Education v. Hyatt* (152 Cal. 515), the legitimacy of adult evening schools came before the courts after California Superintendent of Public Instruction Edward Hyatt denied funding for SFBOE’s Humboldt Evening School, established in 1896. California Supreme Court ruled in favor of SFBOE and ordered Hyatt to provide funding to adult education programs, thereby guaranteeing the right of evening adult schools to exist as a separate entity entitled to state financial support. In 1912, a similar case, *San Francisco v. Hyatt* (163 Cal. 346), affirmed the four-hour minimum day required for state funding of evening adult schools (“Meeting the challenge: A history of adult education in California,” 2005).
Also, in 1910, Fresno Junior College (currently named Fresno City College) became the state’s first community college, which ultimately transformed adult noncredit education in California. The college’s history began in 1907, when C. L. McLane, the superintendent of schools for the city of Fresno, identified a need for post-secondary education for the residents of San Joaquin Valley. The first class consisted of 20 students and three faculty (Fresno City College Facts & History, 2016). Public junior colleges initially were designed to teach the first two years of university study. In 1917, training in mechanical arts, agriculture, civic engagement, and commerce were added to their mission (Bruno, Burnett, & Galizio, 2016).

Throughout the Progressive Era (1890-1920), American politicians, journalists, professionals, and volunteers engaged in reform campaigns to address a variety of social problems associated with industrialization and immigration. Women activists, mainly from privileged backgrounds, emphasized advocating for a greater role for women in public life while championing the need to Americanize immigrant women (Cohen, 2016; Evans, 1997). In the tradition of national Progressive women leaders like Jane Adams, leading female California reformists advocated for adult education to facilitate the Americanization of recent immigrant populations. Mary S. Gibson, a member of the California Commission on Immigration and Housing, asserted the need to educate foreign-born women as a critical component of assimilating immigrant families (“Meeting the challenge: A history of adult education in California,” 2005).

Two additional steps taken by the California state legislature supported the expansion of adult education and reaffirmed the mission to serve disadvantaged immigrant student populations: (1) The Home Teacher Act of 1915 permitted

The first recorded adult school in California opened in 1856 under the authority of the San Francisco Board of Education using state financing

local school boards the authority to hire teachers to work with (predominantly female) adult students in their homes to learn about American standards of nutrition, hygiene, sanitation, and housekeeping. These teachers also provided guidance on the American political system and the citizenship process; (2) the Part Time Education Act of 1919 reinforced California’s commitment to adult education by mandating that schools provide continuing education for minors and basic education for adults (“Meeting the challenge: A history of adult education in California,” 2005).

The federal government also became involved in state-administered adult education programs with funding reserved for adult literacy programs. The ratification of the U.S. Immigration Act of 1918 assisted public educational institutions that offered English language, history, government, and citizenship programs for immigrants working toward naturalization. Since the birth of the nation, states frowned upon federal intervention in local education matters, but many states, including California, were willing to support the federal government having a limited role, and accepted funding in exchange for textbooks and other curriculum materials (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013 ; Barkan, 2013).

Passage of the Smith-Lever Act of 1914 established the Cooperative Extension Service and legislated matching federal funds with state, local, and/or institutional monies for the first time. Grants were awarded to adult education programs focused on four basic skills program categories: farming, marketing, family living, and community development (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013 ; “Smith-Lever Act of 1914,” n.d.). The historic roots of basic educational skills programs for adults are more difficult to trace than the roots of workforce development programs, which the federal government first supported with funding under the Morrill Act of 1862. “This is due in part to lack of general agreement about the meaning of the term ‘basic skills’ and in part to inclusion of basic education components in programs initiated for other purposes” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013, p. 8).

The success of the Morrill Act of 1862 prompted progressive reformers to mobilize federal support for vocational programs at the high school level. This pressure culminated in passage of the Smith-Hughes Act in 1917, which provided federal grants to be matched by state funds to support occupational training in vocational program areas, including: agriculture, home economics, trades, and industries. Subsequent amendments expanded program areas to include health careers, fishery trades, national defense, and office job skills (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). The Smith-Lever and Smith-Hughes Acts ushered new funding for adult and vocational education, a federal commitment that would continue to rise throughout the twentieth century.

**America’s Transition to a World Power: The Professionalization of Adult and Vocational Education**

By 1920, E. R. Snyder, the first Commissioner of Industrial and Vocational Education, reported the number of adult evening schools in California had grown to 33. This growth in adult education programs is attributed largely to another Progressive reformer, Ethel Richardson, who served as Assistant Superintendent of Public Instruction in charge of Americanization. Richardson notably penned a practitioner’s guide, titled *Discussion of Methods for Teaching English to Adult Foreigners* and successfully advanced a 1921 law requiring
local school boards to establish Americanization classes when 20 or more adults requested them. This 1921 law remains a part of the California Education Code (Section 52540) (“Meeting the challenge: A history of adult education in California,” 2005).

Leon Richardson, Director of the University of California’s Extension Division, became increasingly involved with adult education reform efforts at the national level and helped spearhead the organization of the American Association of Adult Education in 1926. That same year Richardson authored a State Plan for Adult Education. As part of this state plan, the California Association for Adult Education was launched to advocate for the goals set forth in Richardson’s state plan. This organization existed until 1937 with offices in Los Angeles and Berkeley (“Meeting the challenge: A history of adult education in California,” 2005).

In 1927, the California Department of Education was reorganized to include the Division of Adult Education. Until 1930, Richardson served as the head of this new division, which housed immigrant education, vocational education, and child study/parent education. Richardson’s focus and the purpose of adult education shifted during this transitional period “from policies to remove educational handicaps toward the concept of organizing resources to improve the community” (“Meeting the challenge: A history of adult education in California,” 2005: 5). By the end of the 1930s, adult education transformed Americanization and vocational programs into evening adult schools and enrollment skyrocketed to more than a quarter million students. Many rural communities established local programs with a new emphasis on agricultural training. After World War I, increased interest in adult education for veterans emerged (“Meeting the challenge: A history of adult education in California,” 2005).

As the Great Depression began, adult education suffered in California. Throughout the 1930s, many K-12 districts dismantled their adult education programs, shifting limited fiscal resources to their elementary and secondary day programs. Junior colleges subsequently began to offer more programs under the umbrella of adult education. In 1931, legislation passed providing supplemental funds for adult schools, and until 1945 formed the basis for regulations governing adult education programs. This legislation required the appointment of principals to adult schools, which further professionalized these programs. During the 1920s and 1930s, many universities began offering specialized credentials, conferences, workshops, and publications for adult educators (“Meeting the challenge: A history of adult education in California,” 2005).

During the Great Depression, five federally-sponsored employment-related educational programs were implemented: (1) the Federal Emergency Relief Act, which included components of adult education and vocational rehabilitation; (2) the Works Projects Administration, which supported college-administered literacy and citizenship education; (3) the National Youth Administration, which administered programs for disengaged youth; (4) the Civilian Conservation Corps, which provided job training and employment to young people; and (5) the Bureau of Apprenticeship, which was designed to stimulate training of workers, initially in the building trades and later in other skilled occupations. Of these five federal initiatives, only the Bureau of Apprenticeship continued to operate after the nation’s economy rebounded (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).
A National Agenda: Federal Intervention in Adult and Vocational Education

The National Education Association (NEA) through its affiliated departments advocated for federal support for adult education (Luke, 1992; “An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). From 1933 to 1942, the federal government operated supplemental adult education to help address the impact of the economic crisis. Coordinated by the Works Progress Administration and supervised by the CSDE, federally funded adult education programs included literacy classes, vocational training, parent education, and early childhood education centers. The additional federal programs helped to increase adult education enrollments to over a half million in a state with eight million residents (“Meeting the challenge: A history of adult education in California,” 2005).

From 1940 to 1945, the federal government shifted the focus of federally funded adult education programs to support the training of defense workers. During this period, approximately one million Californians participated in pre-employment training to gain jobs in factories, farms, and offices. Adult education emphasized civilian defense, first-aid, flying, office skills, and truck driving and maintenance (“Meeting the challenge: A history of adult education in California,” 2005). The General Educational Development (GED) tests were first developed in 1942 by the Department of Defense in cooperation with the American Council on Education and the state of New York (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013; Mullane & Stewart, 2001, 3, 10-11). Between 1942 and 1947, only military members were eligible to take the tests. In 1947, New York became the first state to open the test to civilians. California was the last state to recognize and introduce the GED, in 1974. From the first 1942 Series through 2010, the GED program issued 18,251,070 credentials (Mullane & Stewart, 2001: xiii).

While the nation was engaged in World War II, leading adult education reformers and professionals came together to form the California Council for Adult Education. In 1945, the new Superintendent Roy E. Simpson reorganized CSDE, by eliminating the Division of Adult Education and moving adult education under the Division of Instruction. California Education Code (Section 12140) also established and mandated the adult education credential for teachers. Further, adult schools were provided the authority to charge fees. Rising post-war immigration and the return of American veterans led to programming that supported these growing student populations. By 1950, annual adult education enrollments grew to over 800,000 (“Meeting the challenge: A history of adult education in California,” 2005).

During this postwar period, the California State Department of Education (CSDE) housed adult education in the form of unified school districts, high school districts, or junior college districts administered by CSDE’s Bureau of Adult Education (BAE). BAE provided various supports to secondary school districts, which included the coordination of in-service training and the development of handbooks on methods and materials. BAE also offered leadership to assist with the development of standards and program evaluation instruments (“Meeting the challenge: A history of adult education in California,” 2005).

At the national level, NEA’s adult education department was renamed National Association for Public School Adult Education (NAPSAE) in 1952 and California adult educators provided national leadership through the 1980s. (Luke, 1992; “Meeting the challenge: A history of adult education in California,” 2005; “An American heritage—Federal adult education: A legislative
In 1954, California reactivated the State Advisory Committee on Adult Education, which produced a report titled *Guiding Principles for Adult Education in California Publicly Supported Institutions*. This report designated specific responsibilities to adult educational programs: supplemental and cultural classes; short-term vocational and occupational training; homemaking; parent education; civic affairs; citizenship; ESL; gerontology; civil defense; and driver education. High school and unified school districts offered high school diploma programs as well; however, junior college programs could offer only high school diploma pathways if requested by local high school leadership. Conversely, junior colleges offered lower level division courses in liberal arts. The 1950s notably led to increased programs in four primary areas: high school diplomas, older adult education, parent education, and citizenship.

In 1955, growing interest in adult education led to the creation of an Adult Education Section in USDOE (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). While the federal government committed resources to multiple adult education program areas, adult basic education, particularly in the area of literacy, became the primary focus during the fifties. The Library Service Act of 1956 encouraged libraries to take an active role in the administration of adult literacy programs. This legislation brought public library programs to rural communities. The 1964 Library Services and Construction Act (amended in 1970) called for the delivery of library services to economically and socially disadvantaged, handicapped, homebound, and institutionalized adults (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). This legislation led to the expansion of adult literacy and civics programs in public libraries across California (“Meeting the challenge: A history of adult education in California,” 2005).

During the 1950s, funding for adult education came from the federal government for designated vocational and basic skills programs; from the state in the form of apportionment based on average daily attendance, and from local school districts through property taxes. Adult education programs continued to charge reasonable fees for programs, except in three prohibited categories: elementary education, citizenship, and English as a second language.

### California’s “First” Golden Age of Adult and Vocational Education

The civil rights and progressive reform movements of the 1960s ushered in a new era for American education policy and the first golden age of adult education in California. From the birth of the nation through the mid-1900s, the federal government rarely interjected itself into local education politics and governance. “During the sixties the federal role in adult education leadership expanded because a heightened national consciousness had emerged concerning the need to improve the economic conditions of disadvantaged persons” (“Beginnings - California Adult Education History,” 2005: 16). Federal policy initiatives appropriated new types of funding for adult education, resulting in program expansion and a new direction for basic skills. President John F. Kennedy’s and President Lyndon Johnson’s antipoverty program in the 1960s led to authorization of three key pieces of legislation: (1) The Economic Opportunity Act of 1964; (2) the Adult Education Act of 1966; and (3) the Elementary and Secondary Education Act Amendments of 1968. “This first decade of the Adult Education Act was a time when people conducted impactful work. From the White House to Congress to federal officials to adult educators to the state and local learning environments, lives were changed through a common passion for adult education.” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013, p. 15).
The Adult Education Section of the U.S. Department of Education recruited personnel with experience in adult continuing education, civil defense, lifelong learning programs, and adult literacy. Federal adult education initiatives during the 1960s focused primarily on three program areas: (1) the education of civilian and military government employees; (2) workforce development; and (3) basic skills, especially adult literacy. Summations of federal activities to support these three program areas follow (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013):

1. **Education of civilian and military government employees:** During the 1960s, the federal government invested first in adult education for military employees then in programming for civilian employees. During World War I (1914-1918), the military played a formative role in developing programs, curricular materials, and special instructional techniques for education of undereducated adults. During World War II (1939-1945), 300,000 illiterate men enlisted in the United States Army and provided a 90-day education program to address adult basic educational needs. In 1969, a similar program, called Project 100,000, was launched. The elements of this program (methods, materials, assessments, etc.) were disseminated to adult education programs across the United States for replication. The Department of Defense also formed general adult secondary education programs to help service personnel obtain high school credentials (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

2. **Workforce Development:** Federally funded adult education programs focused
on workforce development and job training gained broad support during the 1960s. The economic recession, the worst economic slump since the Great Depression, resulted in high unemployment. The economic downturn coupled with the civil rights movement, which called for social justice and economic equity, set the stage for progressive reform of vocational education. At first, legislative efforts aimed to stimulate economic growth and emphasized job training for unemployed heads of households with prior employment history. The Area Redevelopment Act of 1961 and Manpower Development and Training Act of 1962 (MDTA) were designed to support unemployed individuals who were displaced as a result of geographic shifts in demand for labor and technological innovation. However, these two legislative efforts never intended to meet the needs of the chronically unemployed or adults and opportunity youth who lacked essential basic skills for employment (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013; Kremen, 1974).

3. **Adult Basic Education:** Although federally funded adult basic education programs in California and across the nation served millions of Americans, millions more were excluded from participation. Many adults lacked basic educational preparation necessary for participation. Meanwhile, other adults were excluded from participation because of their age, geographical location, labor market status, or disability. In 1962, the U.S. House of Representatives’ Committee on Education and Labor convened hearings on categorical federal support for adult basic education. In 1964, unemployment rates improved, but African Americans, English language learners, and the undereducated were slow to benefit from the economic upturn (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

While the Civil Rights Act of 1964 effectively prohibited discrimination in employment practices based on race, sex, age, religion or national origin, a disproportionately high percentage of educationally and economically disadvantaged populations remained under and unemployed. Ratification of the Economic Opportunity Act in 1964 resulted in the development of the Adult Basic Education Program. The new federally funded adult education initiative was designed to address inequities of educational disadvantage by offering persons 18 years of age and older, the basic literacy and numeracy skills to increase their employment opportunities. This age was revised to 16 years of age by P.L. 91-230 in 1970; Elementary and Secondary Education Act Amendments, 1970 (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

The Economic Opportunity Act, approved August 20, 1964, implemented a number of reform efforts to address the cyclical poverty in America. This federal legislation included a host of new resources for helping families escape intergenerational poverty, which included several new federal grants for adult basic education. Adult basic and secondary-level education programs were subsequently implemented in all 50 states, the District of Columbia, and the colonies of American Samoa, Guam, Puerto Rico, the Trust Territory of the Pacific Islands, the Virgin Islands, and the Northern Mariana Islands. State and local education agencies could use federal funding to develop instructional programs. Funding was allocated specifically to hire and train professional adult educators, establish best practices, and develop new curriculum and programs (“An American heritage—Federal adult education:
Ratification of the Economic Opportunity Act (EOA) in 1964, and basic skills legislation, each set the stage for the federal government’s initiative in addressing adult illiteracy nationwide. Passage of Title II B of the EOA allocated federal funding for adult literacy programs that emphasized preparation for employment and institutionalized the federal government’s involvement in state-administered adult education. The changing needs of the workforce, the development of new technologies, and the rise of globalization prompted the federal government to allocate funding for state-administered adult education efforts ("An American heritage—Federal adult education: A legislative history 1964-2013," 2013).

Proponents of EOA focused on legal adult residents whose inability to read or write English constituted a substantial impairment to their ability to obtain or retain employment. State education agencies were primarily responsible for program supervision and coordination. Federally funded programs were to be held in public elementary and secondary schools or adult schools operating local instructional classes. The Director of the Office of Economic Opportunity administered Title II grants. To be eligible for a state grant award, the states had to develop thorough adult education plans ("An American heritage—Federal adult education: A legislative history 1964-2013," 2013). In response to Title II B, the CSDE composed the 1964-66 California Plan for Adult Basic Education ("Meeting the challenge: A history of adult education in California," 2005).

The Economic Opportunity Act of 1964 only funded adult education for two years. In 1966, the Adult Education Act was passed as Title III of the 1966 Amendments to the Elementary and Secondary Education Act of 1965 (ESEA). Federal support for adult education was institutionalized by the revised Adult Education Act, which modified the EOA adult education initiative by transferring the program to the supervision of the U.S. Office of Education and broadening the purpose of adult education by deemphasizing the vocational focus of the Act. The new adult education package emphasized special projects, staff development, and demonstration grants. Although the federal government would fund up to 90 percent of the costs for establishing or expanding programs, the states were required to maintain their previous levels of financial support, which meant states could not supplant existing programs with federal dollars. Special focus was placed on the education of American Natives and adults with disabilities ("An American heritage—Federal adult education: A legislative history 1964-2013," 2013). California used most of this new federal funding for basic skills and other innovative programming. New federal emphasis and financial support for basic skills shifted the focus of adult education toward people who were educationally and economically disadvantaged ("Meeting the challenge: A history of adult education in California," 2005).

In California, vocational program enrollments doubled and the number of occupations served by vocational education quadrupled primarily as a result of the Manpower Development and Training Act of 1962 (MDTA) and two other federal initiatives, the Vocational Education Act of 1963 (VEA), often referred to as the Carl D. Perkins Act, and the Work Incentive Program (WIP). These initiatives inextricably linked workforce to education. The MDTA provided extensive funding for job training and literacy programming (including ESL) targeting the unemployed. VEA allowed for federal involvement in vocational education, a role that continued until the 1990s, and resulted in consequential increases in funding to support the maintenance, extension, and improvement of existing and new vocational programs.
The Workforce Incentive Program under WIP provided employability training to adults receiving federal Aid to Families with Dependent Children (AFDC) (“Meeting the challenge: A history of adult education in California,” 2005).

Greater centralization and standardization of education by the federal government precipitated efforts to tighten up the administration of vocational education in California. In 1965, state legislation allowed school districts and counties the authority to establish Regional Occupational Centers (ROCs) and Regional Occupational Programs (ROPs), which provided apportionment for part-time job training certificate programs. ROCs and ROPs served upper level high school students and adults. By 1970, 24 programs had been developed statewide and approximately 28,000 students enrolled annually (“Meeting the challenge: A history of adult education in California,” 2005).

The sixties ushered in substantive changes in the administration of adult and vocational programs in California with ratification of the Donohoe Act, which implemented the California Master Plan (CMP). CMP established a three-tiered public higher education system for the state of California: (1) community college, (2) California State University, and (3) the University of California. Until 1967, CSDE’s Bureau of Adult Education (BAE) supervised adult and vocational educational programs offered in junior and community colleges. BAE approved new and revised course and program curriculum and tracked enrollment and attendance reporting (“Meeting the challenge: A history of adult education in California,” 2005). In 1963, “all statutes that pertained to junior colleges were placed in a separate section of the Education Code [Title 5] and established the Board of Governors of the California Junior Colleges which was subsequently renamed California Community Colleges” (“Noncredit at a glance,” 2006, 5). The sixties led to a post-World War II decline in civil defense courses and witnessed the rise of parent education and special adult education guidance services. While older adult courses were not recognized as a distinct program area, roughly one in five adult schools offered dedicated older adult courses on topics such as estate planning, health, and nutrition. Open-entry, open exit courses also emerged during this period, initially in large, urban districts (“Meeting the challenge: A history of adult education in California,” 2005).

The Evolution of the Adult Education Act

At the federal level, a series of presidents and a bipartisan body of lawmakers continued to elevate the importance of education policy and practice until the end of the 1970s. Between 1968 and 1978, five amendments were made to the Adult Education Act, which have had a lasting impact on basic skills in the United States.

With passage of the 1968 amendments, the federal government reaffirmed its focus on adult literacy. In response to the 1968 amendment, 20 adult education organizations established an advisory board of adult and continuing education experts to organize the Galaxy Conference in the nation’s capital. The conference was held in December 1969, and over 4,000 educators, leaders, and government officials attended; these engaged adult education professionals charted the future of adult education in the United States, resulting in the development of a priority list of “Imperatives for Action.” It was a “concerted effort by the field of adult education to accomplish the important task of providing new direction and emphasis to adult education as a vital segment of American education” (“An American

The 1972 amendments to Elementary and Secondary Education Act added sections authorizing grants for pilot demonstration projects, programs for high school equivalency, and programs to improve employment and educational opportunities for adult Native Americans. Congress also appropriated over $50 million in additional funding for state-administered adult education programs. By 1972, adult secondary education became a federally funded instructional program. The content of adult basic education and adult secondary education (ABE/ASE) was divided into six educational levels with four levels in ABE: beginning literacy, beginning basic, low intermediate, and high intermediate, plus two levels for ASE: low secondary and high secondary (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

Under President Gerald Ford, the 1974 amendments to Elementary and Secondary Education Act extended funding for existing adult education programs and called for expanded educational programming for designated populations of adult learners. These amendments required specialized instruction and services for adults with disabilities, institutionalized adults, citizens residing in select American colonies (including American Samoa, Guam, and the Virgin Islands), and non-English speaking residents. These amendments established the Office of Bilingual Education in United States Office of Education, the National Defense Education Act, and the Emergency School Aid Act. Federal support for adult education continued to increase under President Ford, evidenced by ratification of an omnibus education bill and new authorization for the president to convene a White House Conference on Education. By 1974, ABE/ASE enrollments grew to 965,000 (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

The 1978 amendments to the Elementary and Secondary Education Act under President Jimmy Carter placed a renewed emphasis on basic education, which included an expanded definition of ABE and supplemental grant funding. These amendments also established new state plan requirements and increased accountability. The new accountability mandates focused on data, demonstration activities, and program evaluation. Specialized funding for programs serving Indochinese refugees and adult immigrants were also included. The 1978 amendments mandated states to conduct intensive outreach to those most in need of basic skills instruction and to address the whole student by providing student-centered interventions, such as flexible schedules, transportation, and assistance with child care (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

On October 17, 1979, the Department of Education Organization Act became law as President Carter secured Congressional support for the establishment of the United States Department

The amendments to the Adult Education Act between 1968 and 1978 transformed American adult education systems. Congress, the White House (under both Republican and Democratic administrations), and education professionals shared a common passion for adult education during the first decade of the Adult Education Act. In one decade, adult education basic state grants increased from $31 million to $81 million. From 1977 to 1980, President Carter worked with Congress to increase state grant awards in increments of $10 million annually for three consecutive years. Adult education enrollments during the 1970s reached 11 million in ABE, ASE, and ESL. In 1975, enrollments in federally funded adult education programs grew to one million and by the end of the decade, total enrollment increased to almost two million students (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

During this same period, President Carter signed the Youth Employment and Demonstration Projects Act of 1977, designed to curtail skyrocketing increases in youth unemployment (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). This legislation followed the Comprehensive Employment and Training Act (CETA) of 1973, which provided support for disengaged youth (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). California, like many states, established program cooperative agreements with CETA; a hearing was held in Oakland California in 1977 by the House of Representatives referencing the positive outcomes of CETA in the Bay area to “underscore the need for a rational and comprehensive national full employment policy” (CETA Hearing, 1977: 1). A 1980 Vice Presidential Task Force brought renewed attention to opportunity youth, which resulted in the Youth Act of 1981 “to strengthen and improve efforts of local educational agencies and institutions in helping youth and young adults with special problems prepare for participation in the labor force” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013, p. 8).

The Great Divide: The Role of K-12 and Community College in Adult and Vocational Education

In California, the governance structure of two-year colleges changed with passage of the Stiern Act of 1967, which established a new state coordinating agency to oversee junior colleges: the Board of Governors of the California Junior Colleges. From this point on, CSDE was no longer responsible for the administration of junior colleges. By 1967, 66 two-year college districts had been established. These districts served more than 600,000 students statewide. By 1970, junior colleges became known as community colleges (“Meeting the challenge: A history of adult education in California,” 2005).

Across California, local communities debated the role of the new community college system in the delivery of adult and vocational education. In some regions, school districts handed over responsibility of these programs to the colleges. Community colleges in San Diego, San Francisco, and Santa Barbara subsequently became major hubs of
adult education. These communities asserted that adult-aged students should be served by colleges while other communities insisted that pre-collegiate programs should be housed in the K-12 system. Many communities, such as Oakland and Los Angeles, fought to keep adult education under the authority of the K-12 school districts (“Meeting the challenge: A history of adult education in California,” 2005). California’s unwillingness to mediate this debate allowed local communities to determine the role of colleges and high schools in the management of adult education, which created long-standing division and conflict in many regions.

Federal regulations for state management of federal funds for vocational and adult education necessitated additional negotiations. The federal government expected all states to identify state boards to oversee federally supported vocational education funding and adult education funding. After separating the governance between adult education programs offered in the high schools and those offered by the community colleges, a Joint Committee on Vocational Education was formed, composed of three CSDE designees and three Board of Governor designees. Administration of adult education funds was resolved with the CSDE maintaining jurisdiction over the funds allocated to noncredit programs in the community colleges (“Meeting the challenge: A history of adult education in California,” 2005).

The delineation of functions of adult programs in school districts and community colleges caused on-going tension between local educational agencies in some communities. In the 1970-71 academic year, adult education programs were provided by 183 school districts and 94 community colleges. CSDE reported approximately one million unduplicated enrollments and the California Community College Chancellor’s Office (CCCCO) reported roughly a
half-million students participated in college adult education course offerings (“Meeting the challenge: A history of adult education in California,” 2005).

To address the unclear delineation of functions between CSDE and CCCCCO, Senate Bill 765 directed these two agencies to determine their respective roles in the delivery of adult education. In fall 1972 Senate Bill 94 was signed by the governor and officially took effect in March 1973. This legislation for delineation of functions required community colleges to have a formal agreement with their local K-12 providers to offer noncredit programming, which would otherwise be regarded as the purview of local school districts (“Meeting the challenge: A history of adult education in California,” 2005).

The Crash of 1978: Prop 13 Decimates Adult Education

As federal support for adult education grew exponentially during the late 1970s, California support for adult education experienced drastic cuts that all but dismantled existing state-funded programs. The sixties may have marked the first golden age of adult education in California, but the turbulent 1970s brought a series of dramatic changes in funding formulas, which resulted in a major restructuring of public education finance in the state. Almost yearly, state funding fluctuated causing uneasiness and apprehension amongst faculty and administration. A permissive ten-cent local tax created during the late 1960s was repealed in 1973. During this decade, cost of living adjustments were implemented to adult education programs in an arbitrary, erratic manner and did not match increases allocated to K-12 programs. Meanwhile, adult education enrollments skyrocketed, leading Governor Jerry Brown (who interestingly served on the Los Angeles Community College Board of Trustees from 1969-1971) to place a five percent cap on growth until legislators identified a long-term funding solution. In 1976, the disparate funding of adults under and over 21 was eliminated as adult education funding was equalized for all persons 19 and older and not currently enrolled in high school (“Meeting the challenge: A history of adult education in California,” 2005).

The passage of Proposition 13 in 1978 radically transformed public education finance in California for decades. This general election ballot initiative immediately reduced property taxes by more than 50 percent. The impact of this reduction in funding for public education devastated adult education programs across the state. State-funded adult education instructional programs were reduced to seven areas: elementary basic skills, secondary basic skills, adult substantially handicapped, short-term vocational education, citizenship, apprenticeship programs, and parent education. In 1979, funding for adult education was slashed by more than $350 million, enrollments reduced by a half million students, and 10,000 faculty members lost jobs. (“Meeting the challenge: A history of adult education in California,” 2005). Proposition 13 also established a distinct funding rate per student per district but maintaining the per student rates in effect in each district before Proposition 13 was passed. Thus, while each homeowner now paid one tax rate statewide, the per student apportionment varied considerably from community to community (Carroll, 2016; Turnage & Lay, 2006).

The Pro-Active Committee on Public School Adult Education, which became active under the California Council for Adult Education (CCAE), and the Adult Committee of Association of California School Administrators (ACSA) launched a counterassault in favor of adult education and secured 1979 “cleanup” legislation restoring ESL
and older adults as program areas eligible for funding. While minor gains were made by adult education advocates, enrollments have never again reached 1978 levels and the pernicious consequences of funding reductions in the 1970s were not fully addressed until 1992 (“Meeting the challenge: A history of adult education in California,” 2005).

Re-envisioning Adult and Vocational Education: The Anatomy of a Budding Academic Discipline and Legitimate Career for Professional Educators

The 1970s gave rise nationally to competency-based adult education (CBAE). The CBAE movement spread across the nation with strong support from California reformers. CSDE used federal funding from the Adult Education Act to promote CBAE through field-based staff development and localized curriculum development. While federal funding prompted the expansion of vocational education programs during this period, the passage of Proposition 13 in 1978 caused a significant decline in other adult education offerings in art, music, crafts, drama, foreign languages, and civic education (“Meeting the challenge: A history of adult education in California,” 2005). Academics helped to professionalize adult and vocational education during the post-war period—particularly the sixties through the eighties—as a result of increased research and scholarship on andragogy. While German educator Alexander Kapp first coined the term “andragogy,” Malcolm S. Knowles earned recognition as the modern father of andragogy by developing a theoretical framework for adult education during the 1970s. He is best known for using the terms “adult education” and “andragogy” synonymously and interchangeably. According to Knowles, andragogy is the art and science of adult learning, thus andragogy refers to any form of adult learning. In 1980, Knowles proposed four assumptions about the characteristics of adult learners (andragogy) that are different from the assumptions about child learners (pedagogy). In 1984, Knowles added the fifth assumption. These assumptions are that as a person matures: (1) his/her self-concept moves from one of being a dependent personality toward one of being a self-directed human being; (2) he/she accumulates a growing reservoir of experience that becomes an increasing resource for learning; (3) his/her readiness to learn becomes oriented increasingly to the developmental tasks of his/her social roles; (4) his/her orientation toward learning shifts from one of subject-centeredness to one of problem-centeredness; and (5) his/her motivation to learn is internal. (Knowles, 1984, p. 12).

Based on these assumptions, Knowles’ suggested four Principles of Andragogy as they apply to adult education: (1) adults need to be involved in the planning and evaluation of their instruction; (2) experience (including mistakes) provides the basis for the learning activities; (3) adults are most interested in learning subjects that have immediate relevance and impact to their job or personal life; and (4) adult learning is problem-centered rather than content-oriented (Kearsley, 2010).

The expansion of scholarly research on andragogy led to an affirmation of CBAE. The first statewide CBAE conference took place in San Diego in 1974, sponsored by the federal Region IX ABE Staff Development Project and co-sponsored by CSDE. Throughout the 1970s, CBAE became the focus of a number of CSDE staff development projects, including the California Adult Competency Education (CACE) project, which led to composition CBAE: Process Model, an implementation handbook, and the California Competency (CALCOMP), a competency-based high school diploma completion program. Although more than 90 percent of adult education faculty were adjuncts (part-time), the professionalization of
adult educators led to a doubling in full-time faculty during the 1970s as well as an increased recognition of adult education as a legitimate career pathway for educators (“Meeting the challenge: A history of adult education in California,” 2005).

Changing demographics also informed adult education programming during the 1970s. A dramatic rise in the number of refugees from Southeast Asia after the conclusion of Vietnam War in 1975 led to increased demand for ESL and vocational offerings. With secondary migration, nearly 40 percent of the almost one million Southeast Asian refugees settled in California. Typical refugees arriving in the later years had little education and were often illiterate in their native language. In face of this mounting challenge, California educators acted promptly and provided a leadership role nationally on how to support these new immigrant populations. “A special curriculum was developed by the noncredit division of the San Diego Community College District, and its products were distributed through the county offices of education. San Diego continued to develop curriculum especially targeting the literacy level. Eventually this locally developed curriculum was published in a document entitled English for Adult Competency” (“Meeting the challenge: A history of adult education in California,” 2005: 42; Miller, 1991, p. 60).

These curricular developments prompted the formation of Vocational ESL (VESL) programming to provide limited English speaking refugees with targeted literacy skills to support their success in adult vocational training programs. VESL courses teach the general language for getting and keeping a job and the occupation-specific language required for educational and workplace success (“Meeting the challenge: A history of adult education in California,” 2005; Arnold, 2013).

Ushering in a New Culture of Centralization, Standardization, and Accountability

The period between 1979 and the early 1990s marked more than a decade of continual growth in congressional funding, state budgets, and adult student enrollment across the United States. Adult education enrollment rose by 47 percent between 1979 and 1993. Federally funded grants to states increased from $91 million in 1979 to $255 million in 1993. Congress also authorized $3.9 million for National Programs, $4.9 million for the National Institute for Literacy, $9.6 million for Literacy Training of Homeless Adults, and $19 million for Workplace Literacy Partnerships. State Literacy Resource Centers received $7.9 million in support and the allocation for Literacy Programs for Prisoners totaled $4.9 million. In 1988, National Programs, Training of Homeless Adults, and Workplace Literacy Partnerships were included in the federal appropriation. Over the next three years, federal adult education funding grew by 56 percent, from $134 million in 1988 to $241 million in 1991 (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

The roaring eighties marked a decade of ambitious education reform efforts. The National Commission on Excellence in Education issued a report A Nation at Risk: The Imperative for Educational Reform, which reflected the spirit of the nation. The report’s cover bore the words “An Open Letter to the American People” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013; Gardiner, 1983). Policymakers, the media, and education reformers lobbied for serious solutions to America’s education divide. The Cold War and Space Age precipitated increased funding for and emphasis on math and science. Reforms of the 1970s included education dissemination centers, individualized reading programs, equity, bilingual adult education, and the introduction of computer technology. These decades set the

During the 1980s, education innovation focused on a variety of initiatives including: high school curriculum, whole language, old math vs. new math, a new national assessment of education progress, issues of governance, increased adult education program evaluation, and workforce literacy. Federal legislation during the 1980s expanded state programs for community schools and institutionalized adults, enacted a 20 percent cap on the use of funding for secondary adult education, and supported the expansion of adult ESL and older adult programs. This growth in targeted focused project funding paralleled efforts by President Ronald Reagan to reduce the federal role in education in support of localized state control. The Reagan administration combined 29 education-related categorical programs into block grants, which states could spend with fewer restrictions. In 1983, President Reagan championed the Adult Literacy Initiative, which called for USDOE to conduct a series of national conferences and convene to support increased collaboration amongst adult education providers to reduce adult literacy (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013; Gardiner, 1983).

Between 1983 and 1986, a series of scathing reports criticized American educational systems, providing President Reagan with ammunition for his campaign to strengthen state oversight of public education. The National Commission on Excellence in Education published a report titled: A Nation at Risk: The Imperative for Educational Reform resulting in what became known as “The Year of the Educational Reform Reports” (Flaxman, 1987a: 5). Three years later in The National Governors’ Association’s Center for Policy Research and Analysis, these issues remained with the publication of Time for Results: The Governor’s 1991 Reports on Education (Flaxman, 1987b). In response to these astonishing reports, 40 states established more stringent high school diploma requirements. The decline in American educational outcomes since the 1970s is largely attributed to the exponential increase in non-English speakers and a growing economic and educational divide between native-born citizens. According to a federal research study on literacy, roughly one out of eight Americans lacked basic literacy skills. The report revealed that many illiterate Americans held high school diplomas and the majority were under 50 years of age.

USDOE lobbied for passage of federal legislation to appropriate $421 million in state grant funds for adult basic education from 1985 to 1999. During the late 1980s, a record 11.6 million adults enrolled in federally funded ABE programs. In addition, two long-term Continuing Resolutions (1986 and 1987) enabled the Adult Literacy Act to continue. Before the end of his second term, President Reagan signed the Hawkins/Stafford Elementary and Secondary Education Act Amendments, which provided increased grant funding for workforce and literacy programs as well as increased USDOE program evaluation initiatives and requirements, which included the strengthening of evaluation requirements (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). Professional organizations championed the need for data and research to inform adult education reform.

The national professional organizations advocated for greater research in adult education and California educators provided leadership (“Meeting the challenge: A history of adult education in California,” 2005). NAPSAE was founded in 1952 to represent public school adult education and literacy

During the 1980s, scholarly contributions to the field of adult and vocational education dramatically shaped practice in California. CSDE fully embraced CBAE and used funding incentives to influence curriculum development and classroom instruction. CSDE, charged with oversight of federal funding from the Adult Education Act, mandated that local education agencies (LEA) interested in financial support develop a plan to institutionalize a competency-based approach in their programs. CSDE supported statewide implementation of CBAE by using federal funding for system-wide professional development, program assessment, and curriculum development (“Meeting the challenge: A history of adult education in California,” 2005).

The California Adult Student Assessment System (CASAS) was initiated in 1980 as a consortium of local educational agencies receiving Adult Education Act funding. The San Diego Community College District served as the lead agency. CASAS was developed to establish a comprehensive assessment system for CBAE-based adult education programs. By 1988, over 40 California LEAs local educational agencies and representatives from other states comprised the CASAS workgroup. The new standardized instrument included a pre-enrollment diagnostic and a post-program assessment for students in ESL and ABE basic skills courses. In 1986, CASAS moved out of SDCCD and transitioned into an independent nonprofit organization and has since been validated by the USDOE. CASAS is presently used across the United States to assess youths and adults in diverse settings, including programs in special education, career technical education, high school completion, workplace and family literacy (“Meeting the challenge: A history of adult education in California,” 2005).
Professional development support took the form of a *Handbook on CBAE Staff Development* in 1983 and a classroom observation tool known as the *Teaching Improvement Process* (TIP). Federal funding also supported development of a professional development academy to support ESL faculty known as the ESL Teacher Institute. Across disciplines, adult and vocational education professionals in California bolstered one another through formation of the Dissemination Network for Adult Educators (DNAE), which was established in 1981 and operated until 1988. The Association of California School Administrators (ACSA) functioned as the fiscal agent of DNAE. In addition to strengthening communication amongst adult and vocational education programs, DNAE allowed for participating LEAs local educational agencies to share approved curriculum across institutions. DNAE also championed the formation of the California GED Teacher Academy, which provided professional development for ABE/ASE faculty. When DNAE disbanded, the San Juan Unified School District housed the GED Teacher Academy (“Meeting the challenge: A history of adult education in California,” 2005).

With increased emphasis on employment outcomes, the 1980s fundamentally changed the business of adult education. During the 1980s, opposition to state welfare mounted. Social welfare services, which in the view of welfare historians includes public education, were slashed. In 1984, CCCCO began charging fees for the first time to students enrolling in community college. The new $5 per unit enrollment fee only applied to credit course courses. (Krop, Carroll, & Rivera, 1997). In 1986, California implemented Greater Avenues to Independence (GAIN) program as an educational initiative targeting recipients of state aid (“Working toward jobs: The California Greater Avenues for Independence (GAIN) program,” 1990). The Job Training Partnership Act (JTPA) of 1983 and the Job Opportunities and Basic Skills Training Program (JOBS)—a welfare reform initiative, created as part of the Family Support Act of 1988—made participation in adult education mandatory for the first time in history, targeting welfare recipients. The new culture of centralization, standardization, and accountability caused career counseling and workforce development to become core functions of adult and vocational education programs (“Meeting the challenge: A history of adult education in California,” 2005).

During the 1980s, a number of economic and social developments shaped adult and vocational program development and expansion. First, the workplace modernized rapidly. Low-skill job opportunities consequently declined as jobs requiring technical skills dramatically increased. American companies shipped manufacturing jobs overseas, relegating low skill workers to the service industry. Demographic shifts also formed the changing workplace of the eighties with a significant rise in immigrants arriving from Asia and Mexico. A rise in divorced and teen mothers led to a huge increase in single-parent families. More and more women entered the workforce throughout this period. Proportionately, greater numbers of immigrants, people of color, and females joined the workplace in California, but many of these new workers lacked formal education and basic literacy skills. Meanwhile, advances in healthcare resulted in a growing population of older residents; greater appreciation for the needs of adults with disabilities led to an increase in clients receiving state services; and the number of incarcerated adults tripled. All of these developments created new demands for educational services (“Beginnings - California Adult Education History,” 2005).

In 1982, “due to the passage of Proposition 13 and based on the state’s fiscal crisis and
recommendations from the Behr Commission, new legislation was passed that further restricted adult and noncredit instruction. An acknowledgment of funding disparities between the two systems of adult/noncredit instruction by the Behr Commission and by the Commission for the Review of the Master Plan called for “delineation of function” agreements between adult schools and community colleges. Community college noncredit reimbursements were reduced and categories for state support revised (“Noncredit at a glance,” 2006: 6; “Meeting the challenge: A history of adult education in California,” 2005).

By the mid-1980s, 1095 organizations provided adult literacy services in California, serving approximately 880,000 students. The community college system enrolled 21 percent of these students while adult schools served roughly 75 percent. Library and community-based programs educated less than five percent. Federal legislation created new opportunities for libraries to provide adult education services. In 1983, the Library Services and Construction Act allocated $2.5 million to launch the California Literacy Campaign (CLC). With increased emphasis on workplace literacy and civics education, 1988 amendments to the Adult Education Act increased funding for VESL (“Meeting the challenge: A history of adult education in California,” 2005).

The federal Immigration Reform and Control Act (IRCA) of 1986 granted amnesty to 1.6 million undocumented immigrants. To become eligible for permanent residence, applicants had to speak basic English and demonstrate knowledge of American history and government by passing a test or completing a 40 hour course to obtain a Certificate of Satisfactory Pursuit. More than half of amnesty applicants resided in California. The overwhelming majority of applicants spoke Spanish and came from Mexico. Between 1987 and 1991, more than one million students enrolled in citizenship courses. ESL became the largest adult school program. Insufficient space and qualified faculty created a huge burden for adult education providers. The Migrant and Amnesty Office of CSDE provided support with faculty training; SDCE and Hacienda La Puente Adult Education created curriculum that was disseminated statewide. Once these students obtained citizenship, many returned to school or college for job training and literacy skills (“Meeting the challenge: A history of adult education in California,” 2005).

During the 1980s the number of persons incarcerated in California tripled, and there was increased interest in adult education for offenders. By 1990 18 percent of persons housed in state prisons and county jails were served by adult education programs. California Department of Corrections (CDC) and the Youth Authority students received 11 percent of adult education funding. Typical adult education programs, such as high school equivalency, ESL, and over 50 vocational programs, were offered by school and community college districts statewide. In addition to these traditional adult education programs, specialized offerings were developed on prerelease transition, substance abuse prevention, health education, and victims’ rights. More than 50 percent of these students had not completed high school, and one-third did not speak English (“Meeting the challenge: A history of adult education in California,” 2005). For the first time under the National Literacy Act of 1991, states were required to set aside at least 10 percent of federal grant funding for corrections education. Funds also could be used to provide instruction and training for teacher personnel specializing in correctional education (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

Roughly one decade after the passage of Proposition 13 decimated adult education in California, voters passed Proposition 98,
mandating a percentage of the general fund for education. While Proposition 98 did not reserve a specific amount for adult education, the new law required the allocation of adequate funding for schools and colleges. As with most other legislative developments since 1980, increased emphasis was placed on accountability to ensure program quality ("Meeting the challenge: A history of adult education in California," 2005).

Outline of Recommendations

**IMPROVE ACCESS TO USERS:**

1. Funding to Meet Today’s Needs
2. Funding for Innovation and Performance
3. Community Adult Education Information Services
4. EduCard (Adult Education Access Card)
5. Linkage of Support Services to Increase Access

**IMPROVE ACCOUNTABILITY:**

6. Procedures for Adjusting Instructional Priorities
7. Quality Standards and Performance Measures
8. Integrated Adult Education Data System

**IMPROVE QUALITY AND RESPONSIVENESS:**

9. Program and Staff Development Support
10. Teacher Certification Appropriate to Adult Education
11. Facilities for the Future
12. Special Grants to Test Program Innovations

**IMPROVE PLANNING AND COORDINATION:**

13. Collaborative Planning
14. Adult Education Research and Planning Institute

Adult education programs in California were scheduled “sunset” or to be eliminated from the state budget on June 30, 1989. The legislature agreed to reauthorize adult education for another four years, but review of data compiled by CSDE for the Legislative Analyst’s Office highlighted a number of issues with the adult education system, from insufficient funding to inequitable access across all regions of the state. In response, CSDE
appointed a 26-member Adult Education Advisory Committee, which engaged in a strategic planning process that resulted in fourteen proposals that were then detailed in policy option papers. The proposals are presented in the following table (“Meeting the challenge: A history of adult education in California,” 2005).

In addition to developing the Strategic Plan, the Adult Education Advisory Committee produced the California State Plan for Adult Basic Education, which focused primarily on literacy skills and further emphasized collaboration amongst ESL and ABE providers. Meanwhile, model adult education programs in California earned national recognition. USDOE started to recognize outstanding adult education and literacy programs in 1985. Three California programs received a Secretary’s Award: Sweetwater Union High School District in 1988, Baldwin Park Unified School District in 1990, and Merced Adult School in 1992 (“Meeting the challenge: A history of adult education in California,” 2005). In 1990, “SB 1874 consolidated adult education. The references to 13th and 14th grades were deleted from the Education Code. Noncredit instruction and community services were added to the mission and functions of California Community Colleges” (“Noncredit at a glance,” 2006, p. 6).

The Institutionalization of Adult Education in California in the Nineties

Whereas 1980s education reforms emphasized adult literacy, the reform efforts of the 1990s advocated the pairing of adult literacy programs with postsecondary education and training. Policymakers and education leaders championed postsecondary education, work skill certification, and other industry-recognized credentials for undereducated adults as industry and business demanded specific skills and knowledge for their workers to compete effectively in a technology-based global economy. Applied, integrated basic skills in career technical education (CTE) programs linked workforce development with adult basic education/adult secondary education (ABE/ASE). Combining ABE with CTE provided exciting opportunities for dual enrollment and promising employment prospects for adult education students. New legislation also provided authority to grant-funded programs for dropout prevention and ASE skills improvement; established parent education programs for disadvantaged children, and modernized auditing procedures for the USDOE (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

Ratification of the Adult Education Amendments of 1988 (Title II) established new requirements for USDOE to submit a report on the definition of literacy and then report on the state of adult literacy nationwide. To fulfill these new requirements, USDOE’s Division of Adult Education and Literacy collaborated with the National Center for Education Statistics (NCES) to develop the 1992 National Adult Literacy Survey (NALS), a nationally representative household survey to ascertain adult literacy levels. In 1989, President George H. W. Bush convened an Education Summit with all 50 state governors to set education goals for the United States. In early 1990, President Bush announced the National Goals, which were subsequently adopted by the governors. Goal six of the National Goals set high expectations for adult education, ambitiously asserting: “By the year 2000, every adult in America will be literate and will possess the knowledge and skills necessary
to compete in a global economy and exercise the rights and responsibilities of citizenship” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013: 20). To maintain national focus on America’s literacy crisis, President Bush and the governors formed the National Educational Goals Panel to prepare annual progress reports. The following year, policymakers enacted the National Literacy Act, designed to “to enhance the literacy and basic skills of adults, to ensure that all adults in the United States acquire the basic skills necessary to function effectively and achieve the greatest possible opportunity in their work and in their lives, and to strengthen and coordinate adult literacy programs.” (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013, p. 21).

The National Commission on Excellence in Education’s report *A Nation at Risk: The Imperative for Educational Reform* from the 1980s along with data collected for NALS evidenced the huge English literacy deficits amongst adult Americans and encouraged a strong federal response. The National Literacy Act of 1991 called for the formation of a National Institute for Literacy (NIFL). NIFL was established through an interagency agreement among the Secretaries of Education, Labor, and Health and Human Services and directed to: (1) maintain a federal clearinghouse for literacy; (2) provide technical assistance and training to adult education grant recipients; (3) foster research-based activities that would identify and validate effective instructional practices; and (4) disseminate evidence-based best practices (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

The National Literacy Act of 1991 established stringent accountability mandates, which increased state data reporting on three “indicators for program quality”: recruitment, retention, and improvement of students’ literacy skills. These three indicators required states to develop measurable performance standards. Furthermore, USDOE required states to develop performance standards in five additional areas: program planning, curriculum, instruction, professional staff development, and support services. In response to these new mandates, states started to report adult learner progress using standardized test data, teacher reports, job placement data, and portfolio assessment. States were required to use data from these indicators to evaluate local program effectiveness and identify programs needing assistance to make local funding decisions and, when necessary, to reduce or eliminate funding to under performing programs. In 1996, USDOE provided a framework for a system of program accountability, which led to the formation of National Reporting System project to establish an outcomes-based reporting system for the state-administered federal program in 1997 (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

As high rates of immigration from Asia and Latin America sustained, California waged a concerted attack on illiteracy during the 1990s. The immigrant education initiatives developed in the 1980s in response to amnesty received broad support during the 1990s as educators moved to implement the Strategic Plan. In 1990, the *California Education Summit Report* called for recognition of adult literacy as a national crisis and established ambitious annual goals to reduce the adult literacy rate by 50 percent in one decade. In accordance with the summit report, the USDOE called for a renewed focus on literacy through strategic planning at the state level in a report titled *America 2000: An Education Strategy* published in 1991 (“Meeting the challenge: A history of adult education in California,” 2005).
The federal America 2000 campaign prompted a number of research studies to support the campaign’s objectives. One such report, the Secretary’s Commission on Achieving Necessary Skills (SCANS), called for changes in adult education curriculum to meet the needs of employees in the modern workplace. The SCANS report recommended a three-part foundation for the development of quality adult education programs, which encompassed basic skills, [critical] thinking skills, and personal qualities, such as responsibility, ethics, interpersonal communications, and self-management (“Meeting the challenge: A history of adult education in California,” 2005).

A federally funded project charged with implementing the research infrastructure of California’s Strategic Plan and other state plans for adult education became known as the Adult Education Institute for Research and Planning. Working in consultation with an advisory committee comprised of representatives from adult schools, community colleges, industry, labor, and various community-based organizations, the Institute pursued three of the 14 proposals included in the Strategic Plan. First, Learning Networks were developed to help launch a statewide adult education database. Second, model program standards were developed, which eventually included performance indicators. Third, a renewed emphasis on workforce development prompted the CDE and CCCCCO to collaboratively compose four reports:

1. **Workplace Learning: Background Paper for California’s Workplace Learning Plan**, a review of workplace learning literature, research, and program experiences throughout the United States;

2. **California’s State Plan for Workplace Learning**, which resulted in 13 interrelated recommendations;

---

**In 1990, the California Education Summit Report called for recognition of adult literacy as a national crisis and established ambitious annual goals to reduce the adult literacy rate by 50 percent in one decade.”**

A third federally funded initiative was the Adult Literacy Instructors’ Training Institute (ALIT), which was established to improve the quantity and quality of services for native English-speaking students in basic skills programs. Fourth, the ESL Teacher Institute continued to operate under the contract with the Association of California School Administrators (ACSA). Last, CDE worked closely with the California Council of Adult Education (CCAE) and ACSA to form two professional growth programs for adult education administrators: the Adult Leadership Training Program and the Executive Development Program (EDP).

During the early nineties, CDE’s Adult Education Unit convened a blue-ribbon committee to explore the needs of adult education providers and identify recommendations for the state legislature. For the first time in over three decades, the state budget included significant increases in funding for adult education reforms. Five issues took front stage:

1. Inequitable apportionment for adult education;
2. Elimination of a freeze placed on the development of new adult education programs (with an emphasis on elementary and secondary basic skills, ESL, and citizenship programs);
3. New legislation permitting the creation of innovative, alternative modes of program delivery;
4. New restrictions on high school concurrent enrollment; and
5. Greater protection for adult education funding during an economic downturn.

Three professional associations championed the 1992 adult education reforms, and therefore were instrumental in shaping adult education policy and
practice in California during the 1990s: California Council for Adult Education; the Association of California School Administrators, Adult Education Committee; and a new organization named the California Adult Education Administrators’ Association (CAEAA), which formed in 1990 with support from adult education administrators interested in policy advocacy. The Department of Education, the three aforementioned professional associations and most prominent adult education providers collectively endorsed reform legislation, which resulted in passage of three pieces of legislation in 1992 (AB 1321 [Wright], Ch. 1193, Stats. 1992; AB 1891 [Woodruff], Ch. 1195, Stats. 1992; AB 1943 [Lee], Ch. 1196, Stats. 1992). Most provisions became effective on July 1, 1993 (“Meeting the challenge: A history of adult education in California,” 2005).

Mid-decade, the Adult Education Policy and Planning Unit advocated for the removal of adult education from the status of a categorical program under the provisions of statutory “sunset” laws (“Meeting the challenge: A history of adult education in California,” 2005, p. vi). The state legislature embraced this recommendation in 1996 by ratifying legislation (AB 2255 Cuneen), which effectively eliminated the sunset clause on adult education programs. Despite the elimination of the sunset clause, this bill required CDE to review the effectiveness of the adult education program periodically, beginning in 2002 (“Sunset review report on adult education in California,” 1987).

While advancing the end of the sunset clause, CDE effectively institutionalized and professionalized adult education by using federal dollars to elevate the importance of this work within California’s public educational systems. The eldest of California’s federally financed adult education initiatives, CASAS, expanded operations to provide assessment to new partners such as the Immigration and Naturalization Service’s citizenship testing offices. CASAS also incorporated technology into its services.

Throughout the 1990s, the widespread rise of the Internet connected education professionals to one another and allowed for mass dissemination of best practices and instructional resources. In 1994, CDE relocated OTAN, the largest federally funded adult education initiative to the Sacramento County Office of Education. The mission of OTAN at the county office was to provide electronic collaboration, access to information, and technical assistance for literacy and adult education providers.

Multicultural education became central California education reform efforts. Two federally funded initiatives aimed to provide adult education faculty essential skills to support the academic success of disadvantaged student population. The Center for Applied Cultural Studies and Educational Achievement Adult Education Project published a manual on best practices for teaching adult African American students titled Seizing the Power of Experience: Utilizing Culture in the Achievement of Educational Excellence for African American Adults. The Latino Adult Education Services Project produced and piloted 30 resource modules to meet the educational needs of immigrants and non-immigrant adults with minimal formal education called Tierra de oportunidad (Land of Opportunity) (“Meeting the challenge: A history of adult education in California,” 2005).

Technological advances in the nineties also prompted the launch of the federally funded California Distance Learning Project (CDLP) in 1995 as a statewide adult education initiative to foster development of distance education (“Meeting the challenge: A history of adult education in California,” 2005). CDLP was launched to help
expand learner access to adult basic education services in California. This goal included four major tasks: (1) to build and promote a distance learning knowledge base; (2) to provide technical assistance with implementation of distance education programs; (3) to test new instructional delivery models; and (4) to facilitate the development of distance learning infrastructure statewide (“About CDLP,” 2005).

The National Literacy Act of 1991 marked the first nationwide efforts to increase literacy levels, provide measurable student gains, and implement a National Reporting System (NRS) to document successes. NLA appropriated federal financial support for the development of State Literacy Resource Centers (SLRCs). This SLRC program provided grants to states to improve the capacity of adult education and adult literacy providers to serve adults without secondary education credentials, and were designed to help states improve their ability to coordinate and expand literacy programs (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

With multiple educational systems responsible for the administration adult education programs, California established the State Collaborative Literacy Council, which represented the CDE, CCCC0, the State Library, the California Conservation Corps, the Employment Development Department, the Governor’s Office of Child Development and Education, and California Literacy, Inc. NLA also authorized formation of the National Institute for Literacy (NIL), which would later be reauthorized by the Workforce Investment Act of 1998 (WIA). NIL functioned as an interagency group led by the Secretaries of Education, Labor, and Health and Human Services and a nonpartisan ten-member advisory board. NIL focused on the expansion of national, regional, and state literacy services (“Meeting the challenge: A history of adult education in California,” 2005).

From 1966 until the 1990s, states administered their adult education programs under the requirements of the Elementary and Secondary Education Act. The three objectives set forth by Elementary and Secondary Education Act included: (1) basic literacy and numeracy for family and community success, (2) basic skills for the workplace success, and (3) high school completion. However, the federal agenda for adult education pivoted in 1998 with ratification of Public Law 105-220, the Workforce Investment Act (WIA). Authorization of WIA simultaneously repealed the Adult Education Act and established the Adult Education and Family Literacy Act (AEFLA), also referred to as Title II (“Meeting the challenge: A history of adult education in California,” 2005). WIA was designed to consolidate, coordinate, and improve employment, training, literacy, and vocational programs (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

WIA charted a major new direction for adult education and literacy in the United States as a reformation of the diversified and complex delivery system of ABE commenced. WIA contained five titles:

> **Title I** - Workforce Investment Systems (6 chapters)
> **Title II** - Adult Education and Literacy (4 chapters and 19 sections)
> **Title III** - Workforce Investment-Related Activities
> **Title IV** - Rehabilitation Act Amendments of 1998
> **Title V** - General Provisions
WIA reflected the emerging national belief that the economic needs of the country were inextricably linked to the success of education and employment programs for under served adult learners. This legislation aimed to foster greater cooperation and collaboration among various agencies with common “clients,” which led to this radical change in the delivery of education and workforce training. Title I, the significant component of the legislation called for the formation of a new “One-Stop” delivery system, based upon the needs of each Service Delivery Area (SDA) to be determined by the local Workforce Investment Board (WIB). WIA also identified required partners for provision of instructional services in SDAs. As key required partners, adult education providers became critical partners in the delivery of One-Stop services (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). In addition, in 1996, the California Community College system added to its mission: “Advancing California’s economic growth and global competitiveness through education, training and services that contribute to continuous work force improvement” (Bruno, Burnett & Galizio, 2016).

In response to the business and industry concerns about skill levels of current and future employees, the National Literacy Act of 1991 provided, for the first time, fiscal support for National Workforce Demonstration Programs (NWDP) to support effective partnerships between education organizations, business and industry, labor organizations, and private industry councils. NWDP were designed to address the literacy needs of under and unemployed adults to improve their job performance. Funding was also provided for support services such as transportation, counseling, and childcare (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

With passage of the Workforce Investment Act (WIA) of 1998, adult education, labor, and training organizations forged new alliances at the regional level to address the needs of their mutual clients;

“The new authority for adult education contained in WIA legislation made clear the congressional message: the adult education system needed strengthening to meet the job-training demands under the newly created workforce investment system. While retaining the commitment to the broad purposes of educating adults to function better in the family, in the community, and at work, Congress envisioned that adult education providers—local educational agencies, community colleges, community-based organizations, libraries, churches, and other nonprofit organizations—would be more actively involved in the development of a state job-training system. Ultimately, the goal of WIA is to help remove the barriers of low literacy skills from people who are seeking training and employment” (“Meeting the challenge: A history of adult education in California,” 2005, p. 87).

In addition to calling for integrated adult education programs (embedding literacy and numeracy skill building within vocational training) and interagency collaboration, WIA also mandated rigorous accountability for program outcomes. Through the National Reporting System, annual performance measures helped direct program improvement (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013). Student success data were collected by U.S. Department of Education and reported to the U.S. Congress. The three core performance indicators focused on (1) demonstrated gains in basic foundational skills; (2) post-secondary and workplace placement and success rates; and (3) high school diploma or equivalency completion data. WIA also called for a reduction in funding for statewide projects and proportionally increased funding for local providers (“Meeting the challenge: A history of adult education in California,” 2005).
While providing financial support for adult workforce development, federal policy makers also advocated for a significant reduction in welfare programs. Welfare “reform” was authorized under the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) of 1996. Under President Bill Clinton, Temporary Assistance for Needy Families (TANF) program supplanted Aid to Families with Dependent Children. TANF reduced the length of time adults could receive assistance to two years and required welfare recipients to actively seek work and educational opportunities. TANF also placed restrictions on cash assistance for legal immigrants, causing a noteworthy rise in applications for citizenship during the late 1990s (“Meeting the challenge: A history of adult education in California,” 2005; The Brookings Institution, 2002). Between 1995 and 1999, over two million welfare recipients enrolled in state grant programs and approximately 145,000 homeless adults received adult education services (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013; Adult education and literacy, data fact sheet, five year trends 1995-1999 pp. 3-4,” 2000).

In California, the Regional Workforce Preparation and Economic Development Act, more commonly known as the Welfare-to-Work Act of 1997 (Assembly Bill 1542), similarly replaced GAIN—which had few limits and restrictions—with CalWORKs, California Work Opportunity and Responsibility to Kids, which imposed strict eligibility requirements including engagement in work and education to ensure welfare would only be provided temporarily during times of crisis. Both TANF and GAIN aimed to discourage long-term dependency. Although these two “reform” efforts initially emphasized work over education. CDE granted authority to distribute CalWORKs funding to adult schools with a focus on basic skills, high school completion, ESL, and short-term career training (“Meeting the challenge: A history of adult education in California,” 2005).

During the 1990s, education finance reform efforts allowed for the expansion of adult education into underserved communities as innovative approaches to vocational and family literacy programs were developed across the country. Adult education theory and practice supported mass implementation of contextualized basic skills instruction. Intergenerational family literacy programs increased across the state. These programs were designed to end the cycle of generational poverty by tackling literacy at the family level. Advocates argued that improved parent literacy would lead to improved child literacy. Family literacy programs require coordinated collaboration between adult and early childhood educators. WIA’s authorization of the Adult Education and Family Literacy Act provided funding for family literacy priorities, which became a pillar of the California State Plan 1999–2004 (“Meeting the challenge: A history of adult education in California,” 2005).

The passage of Proposition 227 in 1998 all but dismantled bilingual education in public schools. However, this ballot measure earmarked ten years of funding for Community-Based English Tutoring (CBET) program. LEAs applied for CBET funding to establish literacy programs for hundreds of thousands of adults statewide for a decade (“Meeting the challenge: A history of adult education in California,” 2005). Despite state efforts to dismantle bilingual education, funding from the National Literacy Act expanded family literacy programs through Even Start programs to improve the educational opportunities of children and adults. This federal legislation called for the development of interdisciplinary programs that integrated early childhood education, adult literacy

Adult education enrollments doubled during the 1990s as a result of a number of factors, including: significant growth in immigration, which spurred an increase in need for ESL, citizenship, and vocational training; cuts to state and federal welfare programs, which led to spikes in high school diploma and short-term job training programs; additional federal funding for adult literacy and citizenship; and California’s bold 1992 adult education reform legislation, which fostered program development and expansion. Between academic year 1992-93 and 1998-99, adult education enrollments skyrocketed, increasing from 1,216,698 to 2,395,825. Adult education offerings in the 1990s focused primarily on ESL, high school diploma, and vocational programs ("Meeting the challenge: A history of adult education in California," 2005). In 1999, 44.5 percent of adults 17 years old and older nationwide participated in some form of adult education ("An American heritage—Federal adult education: A legislative history 1964-2013," 2013; “Digest of Education Statistics,” 2001, Table 359).

The delineation of functions of adult education providers in K-12 and community college districts remained contentious since the Donahue Act of 1960 moved the administration of community colleges from CDE to the Board of Governors ("Meeting the challenge: A history of adult education in California," 2005). This legislation change the name of two-year colleges from junior colleges to community colleges and focused the new system’s mission on transfer to university, and vocational and technical training for employment (Bruno, Burnett, & Galizio, 2016). Even though K-12 adult education providers had operated since the 1850s, noncredit adult education programs in community colleges “were similar in program offerings and standards by the late nineties” ("Meeting the challenge: A history of adult education in California," 2005, p. 113). When the U.S. Congress authorized WIA, many states shifted adult education from K-12 systems to their junior/community college systems. In 1997, a state-wide joint commission was formed to address legislative matters on adult and noncredit education in California, comprised of three representatives from CDE and three representatives appointed by the Board of Governors to foster development of a more cost-effective, integrated model. The Joint Board Committee on Noncredit and Adult Education offered 12 policy recommendations in five disciplines: ABE, ASE, ESL, parent education, and older adults:

1. Clarify joint authorization to offer noncredit and adult education.

2. Create a formal structure for joint development and implementation of a policy for noncredit and adult education.

4. Redistribute unused existing resources.

5. Encourage school and community college districts to make fair-share distributions.

6. Determine the cost of implementing endorsed changes.

7. Equalize reimbursement rates within and among segments of the adult education system, the kindergarten-through-grade-twelve system, and the community college credit and noncredit system.
8. Finalize and distribute program standards.

9. Develop a coordinated data system.

10. Clarify the scope of authorized instructional categories.

11. Permit reimbursement for work-based education.

12. Establish reciprocity for instructors in noncredit and adult education.

These recommendations received minimal support due to funding limitations and disagreement between the state legislature and the governor.

“Additionally in 1997, the Orange County Unified School District sued the Rancho Santiago Community College District because the Community College District did not meet their responsibility to develop a “mutual agreement” prior to establishing new courses for adults. The mutual agreement requirement was established in law. The court found that a mutual agreement was not needed between K-12 and community colleges because the mission of the Community Colleges included noncredit instruction. This decision, later affirmed by the Court of Appeals, essentially nullified the state law” (“Noncredit at a Glance,” 2006: 6). In 1998 the governor of California approved AB 1725, including the provision that “adult noncredit education curricula in areas defined as being in the state’s interest is an essential and important function of the community colleges” (FACCC, 1998, p. 18).

In 1999, the state legislature impaneled a Joint Committee to Develop a Master Plan for Education-Kindergarten through University. This committee’s 2002 report focused on accountability, standardization, and centralization and called for increased funding, collapsing ten adult program areas into four categories, adoption of an accountability system which included performance indicators in course standards, and a review of the overall governance structure and distinct faculty credential requirements. The draft California Master Plan for Education, composed in 2002, called for moving all adult education into the community college system. Protest from K-12 adult education providers followed. The final plan required the appointment of a state taskforce to explore the governance of adult education statewide (“Meeting the challenge: A history of adult education in California,” 2005).

The Politics of No Child Left Behind as the Point of No Return: Centralization, Standardization, and Accountability Reign in the New Century

During the 1990s, reformers on both sides of the political spectrum called for increased accountability, standardization, and centralization at all levels of public education. By 2000, adult education programs in California had enacted various mandates. For instance, civics and ESL programs had to provide evidence of student learning to receive federal funding and high school completion requirements became more stringent (“Meeting the challenge: A history of adult education in California,” 2005). Policymakers, the media, parents, and taxpayers demanded evidence of continuous improvement to justify funding for all state-supported educational institutions; K-12 schools, adult education providers, community colleges, and state colleges had to comply with mounting accountability initiatives. Progressives and conservatives found common ground in their support of standards-based education, performance-based accountability, and centralized-data reporting. Bipartisan support led to passage of the most recent update to Elementary and Secondary Education Act, No Child Left Behind in 2002, a federal K-12
education reform initiative that has fundamentally transformed public education practices in the twenty-first century (Peterson, 2013).

In 1997, Senate Bill 394 implemented outcomes-based accountability in California. A state council was convened to determine how to measure adult education, including key data elements, performance standards, internal reporting protocols and timelines, and public disclosure practices. The year after, the federal Workforce Investment Act of 1998 (WIA) reauthorized hundreds of career training and workforce services and expanded evidence-based ESL, civics, and basic skills programs (“Meeting the challenge: A history of adult education in California,” 2005).

California developed a plan to qualify for supplemental WIA funding, titled The Workforce Investment Act, Title II, Adult Education and Family Literacy Act: California State Plan, 1999-2004. This plan requested supplemental funding and established new program measurement indicators for five program areas: ABE, ASE, ESL (including family literacy), civics, and vocational education. Although California had used CASAS to report sample student performance outcomes in ABE, ASE and ESL since implementation of the National Literacy Act, the new WIA plan instituted data reporting for all students who attended a minimum of 12 hours. Despite the onerous task for collecting all student success data, California realized all negotiated WIA performance objectives for Title II-funded programs in ABE, ASE and ESL (which included civics and citizenship) (“Meeting the challenge: A history of adult education in California,” 2005).

Two significant developments in ABE and ASE fundamentally transformed the administration of high school diploma and equivalency programs. First, state and federal funding streams required the development of a more challenging high school equivalency instrument in 2002. The adoption of state academic content standards in English language arts, math, science, and social studies precipitated revisions to a national high school equivalency test, the General Educational Development (GED) exam. The content and activities included in the new GED test required demonstration of greater critical reasoning and older adults. The California State Plan, 1999-2004 appropriated ten percent of WIA funding for ASE. Beginning in the 2000-2001 federal fiscal year, new funding for legal immigrant education became available through WIA Title II. Amendments in 2002 to the California State Plan, 1999-2004 included a provision for English Language Citizenship (EL Civics) education. The revised plan also called for experimentation with non-standardized assessments, such as portfolios, journals, group projects, and oral presentations (“Meeting the challenge: A history of adult education in California,” 2005).

As adult education programs modernized, adult education providers increasingly relied on educational technologies and new media literacies. In 2001, CDE’s AEO, through OTAN, developed the California Adult Education Technology Plan, 2001-2004 (CAETP). Technological advances drastically transformed the operation and delivery of adult education programs and services. From online curriculum approval to distance education pilots, the early 2000s redefined the role of technology in adult education. Despite these innovations, limited student access to technology and faculty professional development created challenges for implementation of the CAETP (“Meeting the challenge: A history of adult education in California,” 2005).

During the early 2000s, state-funded programs were very similar to those authorized during the 1990s and included ABE, ESL, citizenship, civics, high school equivalency/diploma, vocational education, adults with disabilities, health and safety, home economics, parent education, and
authentic skills in the four core academic subject areas. To support a seamless transition of faculty teaching in ASE equivalency programs to new equivalency program outcomes, CDE established the California GED Collaborative that worked through the California Council for Adult Education’s GED Teacher Academy and the California Adult Literacy Professional Development Project (CALPRO) (“Meeting the challenge: A history of adult education in California,” 2005).

The second major development in performance-based high school completion reforms began with the Class of 2006 when—for the first time—California high school students had to pass a standards-based test to receive a high school diploma. K-12 students in California public schools were required to pass the California High School Exit Examination (CAHSEE) to demonstrate competency in grade-level skills in reading, writing, and mathematics to earn a high school diploma (“California High School Exit Examination (CAHSEE),” 2016). The content of the CAHSEE was based on content standards in English-language arts and mathematics that were adopted by the State Board of Education (SBE) in 2003. Adult high school diploma students were also required to pass the CAHSEE to graduate, which now required students to demonstrate competency in Algebra. In 2010, the CDE adopted the Common Core State Standards in English–language arts and mathematics (“California High School Exit Examination (CAHSEE),” 2016). Both K-12 developments have had lasting repercussions on adult and post-secondary institutions. While these new accountability initiatives raised academic expectations of students, they also created structural challenges for educational institutions and had negative consequences on students. (“California High School Exit Examination (CAHSEE),” 2016; “Meeting the challenge: A history of adult education in California,” 2005).

The New Politics of Noncredit Education: Career Development and College Preparation

Leading community college administrators advocated assertively for increased funding for community colleges during the early 2000s. For decades, the community college districts of California had disparate rates of funding. These disparities stemmed from a period of time when local boards of trustees had taxing authority and established different rates for each of their 72 districts. These different rates were made permanent in the community college system in 1978 with the passage of Proposition 13 that, among other changes, eliminated the taxing authority of local boards. In 2003, several California community college chancellors and presidents sought to remedy the disparity in FTES funding rates among the districts. Several prominent leaders in the community colleges led a campaign to equalize FTES funding across districts (Carroll, 2016; Turnage & Lay, 2006).

Under the leadership of San Diego Community College District Chancellor Constance Carroll, Ph.D., and Foothill-De Anza Community College District Chancellor Martha Kanter, 44 districts established the “Underfunded Districts Caucus,” which led ultimately to the passage of Senate Bill 361 in 2006, the new Budget Act, which provided equalized funding rates for 66 of the 72 community college districts. Although a number of districts that were funded at higher FTES rates opposed this effort, equalization was included in the legislation, which was signed by Governor Arnold Schwarzenegger who supported this effort. The new funding system required the Chancellor of the California Community Colleges to compute and finalize the equalization adjustment for credit FTES apportionment, which required an additional $240 million in ongoing funding for underfunded
community colleges. Following this successful effort, focus shifted to enhanced noncredit funding (Carroll, 2016; Turnage & Lay, 2006).

In 2006, the nine noncredit education categories eligible for community college funding established in California’s Education Code were:

- Elementary and secondary basic skills
- English as a second language
- Immigrant education (which includes citizenship and workforce preparation)
- Parenting
- Short-term career technical education
- Older adult programs (designed for residents over 55 years of age)
- Programs for adults with disabilities
- Health and safety
- Home economics

During the early 2000s, various groups of key stakeholders rallied in support of increased funding for noncredit programs. The groups included the Academic Senate for California Community Colleges (ASCCC), the participatory governance division of the faculty, the California Community College Chancellors Office (CCCCO), the state’s system office, and the Community College League of California (CCLC), the primary policy advocacy division of CCCCCO. The groups orchestrated the campaign to legislate enhanced (not equalized) credit-noncredit funding for programs leading to Career Development and College Preparation (CDCP). They argued that the disparity in funding between CDCP enhanced noncredit classes and programs at only 56 percent of the credit rate did not provide sufficient financial support for noncredit programs that were designed to support job readiness and transition to credit (“The Role of Noncredit in the California Community Colleges,” 2006; “Noncredit at a glance,” 2006).

In response to a request of the boards of the California Community College Trustees (CCCT) and Chief Executive Officers of the California Community Colleges (CECCCC), a workgroup of chief business officers (CBOs) from a diverse, representative sample of districts met for several months to issue recommendations on changes to the community college funding formula for noncredit programming. In 2004, the California Community Colleges CBO Workgroup on Community College Funding released the Report of the Workgroup on Community College Finance (2004), which recommended that the apportionment funding should be increased for CDCP courses to the full credit rate when funds were available to increase student success and completion. The workgroup recommended replacing the program-based funding distribution to community college districts with a simpler, more equitable method. The report recommended each district receive a basic allocation based on the number of colleges and noncredit centers along with an equalized rate for all credit and noncredit FTES. This recommendation “provides equitable funding while recognizing the unique circumstances surrounding the creation of our different districts” (“Report of the Workgroup on Community College Finance,” 2004, p. 1).

In 2006, ASCCC formally recognized that credit programs in a report titled “The Role of Noncredit in the California Community Colleges” had long overshadowed noncredit programming within California community colleges. ASCCC’s Educational Policy Committee revealed that even though noncredit generated approximately 10 percent of enrollment in the California community college system, many people outside and even within the system did not fully understand the importance of noncredit programs, nor how they
served California’s educational needs. During the early 2000s, most colleges offered few, if any, noncredit courses, and most that offered noncredit programs failed to recognize the full potential of noncredit (“The Role of Noncredit in the California Community Colleges,” 2006). The 2006 report by ASCCC introduced readers to the world of noncredit instruction, surveyed the status of noncredit instruction statewide, and examined a range of issues related to noncredit instruction (“The Role of Noncredit in the California Community Colleges,” 2006).

Based on the responses to the survey conducted by the Educational Policies Committee and related research, the 2006 ASCCC report issued the following recommendations:

**ON A STATEWIDE LEVEL:**

1. The Academic Senate for California Community Colleges should seek to better integrate the concerns and viewpoints of noncredit faculty and programs into its discussions and work through involvement of noncredit faculty in its committees and appointments.

2. The Academic Senate for California Community Colleges should work with the System Office on a plan to increase the number of full-time noncredit faculty in the system and the employment of full-time noncredit faculty in all noncredit programs.

3. The Academic Senate for California Community Colleges should promote the role that noncredit can play as a pathway to credit instruction and encourage the local articulation and linkages between credit and noncredit that creates these pathways.

4. The Academic Senate for California Community Colleges should continue to advocate for increases in noncredit funding to expand support for instruction in all approved noncredit areas.

5. Given the multitude of issues related to noncredit that need to be addressed, including investigation of the wide variety of issues raised in the noncredit survey conducted for this paper, the Academic Senate should establish an ad hoc committee on noncredit.

**ON A LOCAL LEVEL:**

1. Local senates should seek to better integrate the concerns and viewpoints of noncredit faculty and programs into its discussions and work through involvement of noncredit faculty in the local senate, its committees and appointments.

2. Local senates should work through local planning and budget processes and hiring processes to increase the number of full-time faculty serving noncredit programs and instruction.

3. Local senates should work through local planning and budget processes to ensure that augmentations in noncredit funding are used to expand support for noncredit programs and instruction at their colleges and districts.

4. Local senates should work with their curriculum committees and faculty to establish much needed and beneficial articulation and linkages between their colleges’ noncredit and credit programs to encourage and facilitate the movement of students from noncredit to credit.

5. Local senates should work with their colleges and districts to encourage and support data collection on noncredit programs and
students in order to better ascertain needs and provide documentation of the benefits of noncredit programs and instruction

(“The Role of Noncredit in the California Community Colleges,” 2006, p. 1).

The very structure of the community college system guaranteed that, while noncredit students were often the most in need of individual help and support, they received fewer interactions with faculty and support services than did their credit counterparts (“The Role of Noncredit in the California Community Colleges,” 2006). ASCCC joined forces with CCCCO and CCLC to call for additional funding and support for noncredit programs.

To support their noncredit lobbying efforts, CCLC argued that roughly 75 percent of new community college students arrive unprepared for college-level course work and require remediation. The policy advocacy organization asserted that if reimbursement rates were increased, the financial disincentive to offer primarily pre-collegiate credit instruction would discontinue. This approach would provide community colleges with an alternative option to address remediation and students with a different delivery method for instruction. Noncredit students would not pay fees to enroll in basic skills courses, which would be better designed and more appropriate for this student population. “Short, intensive formats with open-entry enrollment would be the norm rather than the traditional 16-week regular credit course. Instruction could be provided in an acceleration format or some other intensification environment which could be an option for CTE or Basic Skills courses” (“Noncredit Education Policy Brief,” 2014: 1). CCLC claimed that students would not pay fees for noncredit basic skills courses and could therefore delay the start of their financial aid eligibility “clock” and have only legitimate

The very structure of the community college system guaranteed that, while noncredit students were often the most in need of individual help and support, they received fewer interactions with faculty and support services than did their credit counterparts.

—“The Role of Noncredit in the California Community Colleges,” 2006).
Another significant development in the California community college system during the first decade of the millennium was the Basic Skills Initiative (BSI). In response to growing numbers of undereducated adult residents, the BSI was established in 2006. This initiative stemmed from both the development of the System Strategic Plan and the Board of Governors’ adoption of the Academic Senate recommendation to increase student success in English and mathematics. These two developments raised awareness about the very high numbers of students who did not progress successfully in developmental courses and therefore failed to complete their educational objectives (“Noncredit instruction: Opportunity and challenge,” 2009).

BSI led to annual grants to colleges to support innovative reforms in developmental ESL, English, and math programs. The first BSI grant, disseminated in 2006, supported the development of *Basic Skills as a Foundation for Student Success in California Community Colleges*, a review of extant literature that describes data-driven best practices in developmental education. The second grant funded a professional development component that involved Academic Senate and faculty-administrator collaboration in providing peer-to-peer training on the research-based best practices identified with funding from the first grant. The third grant most directly involved noncredit faculty and programs. A key objective of all three BSI grants focused on transitions from noncredit to credit programs (“Noncredit instruction: Opportunity and challenge,” 2009).

Under SB 361, funding was increased but not equalized for CDCP courses. CDCP courses were funded at roughly 75 percent, rather than the prior 56 percent rate, provided for credit courses. The rates for CDCP courses were set at $4,367 per FTES, enhanced non-credit at $3,092, and remaining noncredit at $2,626. This new instructional category “more clearly described the intention that the increased resources should target students whose goals are career development or college preparation” (“Noncredit instruction: Opportunity and challenge,” 2009: 10). SB 361 required that CDCP courses be sequenced and lead to certificates focused on transition to credit or employment. CDCP enhanced funding program categories included: ESL, ABE/ASE, short-term CTE certificates with high employment potential, workforce preparation pathways, and apprenticeships (“Exploring New Possibilities for Student Success through Noncredit,” 2014).

As a direct result of intense lobbying efforts, SB 361 also provided supplemental funding for noncredit instruction. “Although one part in a much larger bill, the legislation promised enhanced funding for certain noncredit “career development and college preparation” (CDCP) courses putting apportionment for those noncredit courses closer to an equitable par with other college transfer and career technical preparation efforts (“Noncredit at a Glance,” 2006: 6). Prior to the passage of SB 361, all noncredit instruction apportionment was funded by the state at the same level (“Noncredit at a Glance,” 2006). Disparate funding has been in place since 1981 upon recommendation of the Behr Commission. This new legislation created a new instructional category, named “CDCP,” and opened the door to the potential of equitable funding for noncredit instruction.

During the first decade of the new century, Governor Arnold Schwarzenegger and State Senator Jack Scott called for bipartisan credit classes count toward degree and certificate completion (“Noncredit Education Policy Brief,” 2014).
support for increased funding for five noncredit instructional program categories: ABE/ASE, ESL, immigrant education, programs for adults with disabilities, and short-term CTE certificates to be funded by a new “Adult Education Partnership” program. These five programs received support because they prepare underserved adult learners for transition to credit college programs, entry or re-entry into the job market, and critical citizenship and workforce skills for new Americans (“Noncredit Education Policy Brief,” 2014). Although courses for adults with disabilities were not designated as CDCP, the other instructional categories received enhanced funding under SB 361.

Advocates for a new Adult Education Partnership cited four arguments for their support of these five noncredit program categories. First, adults who lacked basic skills in reading, writing and computation were rarely successful in college-level coursework. Noncredit courses can provide the essential “bridge” to enable students to become college ready and ultimately increase the numbers of Californians who receive certificates and degrees. Second, advocates argued that immigrants with English language skills would be more productive members of society if they gained employment, became citizens or pursued further academic study. Third, reformers asserted that basic skills or vocational education for students with disabilities would enable them to achieve maximum independence. And fourth, short-term career technical education certificates would provide adults with the skills needed for job entry or re-entry as well as career advancement or change (“Noncredit Education Policy Brief,” 2014).

Passage of SB 361 in 2006 by the California legislature opened the door to the potential of equitable funding for noncredit instruction. Curriculum regulations in Title 5 changed to allow local certificate programs in noncredit. The system-wide Basic Skills Initiative also championed the important role noncredit programs can play in introducing more students to the wide range of programs and certificates available in community colleges. Two years after passage of SB 361, ASCCC convened an ad hoc taskforce on noncredit, which issued a report titled Noncredit Instruction: Opportunity and Challenge in 2009. This report highlighted that the promise of SB 361 and related advances had brought about minimal progress.

The 2009 ASCCC report highlighted three areas of concern: funding, student support services, and faculty working conditions. First, this report asserted that 2009 funding for noncredit programs was inadequate, despite improvement provided by SB 361. Second, ASCCC maintained that student supports were inadequate; noncredit student support services were missing or minimal. And third, noncredit faculty were not treated with the same level of dignity and respect as credit faculty: staffing levels of full-time noncredit faculty had not increased sufficiently; faculty workload expectations discouraged effective class preparation, monitoring of student work, and impromptu interactions; and faculty struggled to participate in program development and local governance because of their disproportionate teaching loads (“Noncredit instruction: Opportunity and challenge,” 2009). Noncredit faculty typically taught 25 hours per week while credit faculty were usually contracted to teach 15 hours per week.

During the height of the Great Recession, in 2008, ASCCC raised two important questions for consideration: First, why are there two systems (namely, the K-12 and community college systems) offering similar adult education programs with inconsistent funding mechanisms and linkages between them, and second, why is it that within the community college system there are two different funding mechanisms (credit vs. noncredit) for offering instructional services with the same outcomes? Later, the Legislative Analyst Office’s (LAO’s) report Restructuring California’s
Adult Education System issued in December 2012 and the Little Hoover Commission’s report Serving Students, Serving California published in February 2012 focused on the same two questions. From the perspective of these three bodies, the state of California provides seemingly similar educational services through two different agencies: adult education through the K-12 system and noncredit and credit instruction through the California Community Colleges (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014).

According to the LAO’s report, 52 percent of adult education in 2014 was offered through credit instruction at community colleges—with 14 percent of community college adult education delivered through noncredit instruction—and 34 percent provided by adult schools when evaluating full-time equivalent students. These educational services are concentrated in three areas: CTE, ESL and ABE/ASE. The LAO defined all programming below college-level English and intermediate algebra as pre-collegiate basic skills. The origins of this conflict between adult education and community college education institutions dates back to 1856 when the SFBOE established its first adult school, the “Center for Americanization,” to address the English language needs of its burgeoning population. Since the early 1900s, school districts in California were given legal authority to offer two distinct educational programs for adults: (1) adult schools focusing on immigrant education, basic skills and job skills; and (2) junior or community colleges covering the first two years of postsecondary education to high school graduates (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014).

Over the past 100 years, two paths to address the learning needs of California’s adult learners emerged. “Over the past century, Californians have regularly revisited these tracks resulting in a history of modifications that led to our current practices: K-12 schools are permitted to offer adult education programs and CCC districts may offer noncredit and credit courses and programs” (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014). No mutual agreement is required between these two systems within the same service area. Subsequently, local control has prevailed as common practice. With the passage of California Assembly Bill 86 in July 2013, community colleges and adult education providers in K-12 systems are again expected to determine how adult education providers (through a K-12 delivery system and noncredit in the community college system) can work cooperatively and collaboratively to address the vital needs of the state’s adult population (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force, 2014”). Presently, there are 113 community colleges plus three noncredit centers in the California community college system serving approximately a half million students registered in noncredit programs. It should be noted here that not all community colleges uniformly offer noncredit instruction. Moreover, there are more than one million students in some form of pre-collegiate adult education (K-12, CCC credit instruction, CCC noncredit instruction) throughout California, represented by 500,000 full-time equivalent students (FTES), according to the LAO in 2012. The alignment and collaboration between the K-12 and community college adult education systems remains a point of contestation (“Restructuring California’s Adult Education System,” 2012).

LAO argued that the legislature should “promote collaboration between adult schools and community colleges by clearly defining the missions of the two systems.” For over a century, this debate has not gone unresolved and the alignment and collaboration between the K-12...
and community college adult education systems remains a point of contestation (“Restructuring California’s Adult Education System,” 2012). The LAO has advocated that the following courses that are offered at community colleges be categorized only as noncredit courses: (1) all English and ESL courses that are below transfer level, and (2) all math courses that are more than one level below transfer. The legislature responded in support of the recommendations of the LAO. (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014; “Restructuring California’s Adult Education System,” 2012). The continued discussion about governance over the two systems serving similar adult learner populations with similar needs led to the introduction and successful passage of the Education Protection Act, Senate Bill 860 and Assembly Bill 86 (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014).

At the federal level, the United States investment in adult education (ABE/ASE, ESL and CTE) has continued. Grants to states increased from $416 million in 2000 to $497 million in 2010, and total adult education funding increased from just over $500 million in 2000 to almost $640 million in 2010. Total student enrollment in adult education fluctuated from 2000 to 2010 but ultimately increased from approximately two million to nearly three million. Latinos comprised the largest group enrolled in adult education at 40 percent of enrollees in FY2010-2011, followed by whites at 26 percent and blacks or African Americans at 22 percent (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

In his 2013 State of the Union address, President Obama supported California’s workforce mission to close the skills gap and to provide technical training that industry needs (“Doing what matters for jobs and the economy — California community colleges,” 2016). In its Strategic Plan for FY2011-2014, the USDOE delineated six performance goals to reach President Obama’s 2020 education target. The first goal of the strategic plan focused on postsecondary education, career technical education, and adult education. Three priorities emerged: increased college access, quality, and completion by improving higher education and lifelong learning opportunities for youth and adults.

“To encourage the lifelong learning of Americans, it is important to focus not only on increasing the number of students earning degrees and credentials through postsecondary education, but also on encouraging every American to complete at least one year of education or workforce training, or its equivalent, beyond high school” (An American heritage—Federal adult education: A legislative history 1964-2013,” 2013, p. 30).

The Rise of the Platinum Age of Adult Education

In response to the effect of the economic crisis of 2008, on California public K-12 and community college systems, Governor Brown lobbied voters to support Proposition 30, The Schools and Local Public Safety Protection Act of 2012, which was approved on November 6, 2012. This proposition temporarily increased the state’s sales tax rate for all taxpayers and the personal income tax rates for upper-income taxpayers. Revenues generated from Proposition 30 are deposited...
into a newly created state account called the Education Protection Account (EPA). EPA funding has provided significant money to support adult education student success and program expansion initiatives for both K-12 adult education providers and community colleges (“Proposition 30 impact to state aid - principal apportionment (CA Dept of education),” 2015), and has ushered in the “Platinum Age” of adult education for California K-12 and community college providers.

ASCCC continued to advocate for equalization of career development and college preparation (CDCP) funding for select noncredit program categories. At a plenary session in 2014, ASCCC urged support for noncredit programs because they (1) focused on skill attainments and life skills, not grades; (2) are repeatable; (3) did not charge fees (meaning they are free to all residents); (4) are accessible to all; and (5) serve as a bridge to educational and career advancement (Lynch-Thompson, May, & Grimes, 2014). To address decimation of CTE, ESL and ABE/ASE programs during the economic downturn in 2008, the legislature and Governor Brown approved Senate Bill 860, the Education Omnibus Trailer Bill, which included equalization of CDP noncredit and credit FTES funding in 2014. The new legislation read,

“Beginning in the 2015-2016 fiscal year, career development and college preparation FTES shall be funded at the same level as the credit rate” [(Lynch-Thompson, May, & Grimes, 2014).; SB 860: Ed Code 84750.5 (d)(4)(A) (ii).] Apportionment dollars are not earmarked for credit or noncredit programming. Instead, local districts determine whether or not they wish to offer noncredit. Community colleges must offer credit course to meet accreditation standards under the Accrediting Commission for Community and Junior Colleges (Lynch-Thompson, May, & Grimes, 2014).

After decades of advocacy, SB 860 finally equalized funding for CDP noncredit and credit courses. For academic year 2016-17, these two groups of courses are funded at $5,004 per FTES. Other (non-CDP) noncredit courses are funded at $3,009 per FTES.

Although SB 860 equalized noncredit and credit funding, this legislation did not establish one set of faculty minimum qualifications or one method of attendance reporting for both noncredit and credit programs. State course approval requirements remain the same for credit and noncredit courses and certificates, but Title 5 maintained specific minimum qualifications for noncredit and credit faculty, reinforcing a tiered hierarchical system for instructional faculty that required credit faculty to possess more advanced educational credentials. Similarly, FTES calculation formulas were not aligned. Whereas noncredit FTES reporting requires counting every minute each student attends class, the FTES reporting formula for credit courses requires tallying total student enrollments on one single day during the semester (Lynch-Thompson, May, & Grimes, 2014).

To foster expansion of job and college readiness noncredit programs, the legislature set aside $25 million to support two years of planning across the state. The five categories championed under Governor Schwarzenegger’s 2007 plan were also the focus of Assembly Bill 86 (AB 86), which was signed by Governor Jerry Brown in 2014. AB 86, on July 1, 2013, called for the creation of Adult Education Consortium Programs and the establishment of regional consortia; to-date, 70 have been formed. Each regional consortium must consist of at least one K-12 school district and at least one community college district, with the goal of developing regional plans that serve community needs for adult education. As a result, the CCCCO and CDE, the agencies historically providing adult education,
education services, created an AB 86 Cabinet and Work Group to develop a Certificate of Eligibility (COE) for all adult education providers to respond with the intent to participate in regional consortia. Consortia may also incorporate other agencies, such as correctional entities or community-based organizations. Adult education program categories included in the AB 86 consortia planning grants were:

- ABE and ASE, including high school diploma or high school equivalency certificates;
- Classes for education of immigrants such as ESL, citizenship, and workforce preparation;
- Educational programs for adults with disabilities;
- Short-term career technical education classes with high employment potential; and
- Programs for apprentices

(“Comprehensive Adult Student Assessment Systems (CASAS) Adult Education Block Grant,” 2016).

The one-time planning funds provided under AB 86 resulted in the Adult Education Block Grant, which currently funds adult and career technical education across the state community college system (Lynch-Thompson, May, & Grimes, 2014).

Consortia are expected to address gaps in services for adult students. Each consortium is also responsible for evaluation of currently offered adult education programs within their geographical boundaries and for planning the integration of existing programs to create seamless transition paths to credit or workforce. This new legislation emphasized better program integration and improved student outcomes. During the establishment of these consortia, ASCCC advised local academic senates to evaluate the best curricular mechanism to support student success and achievement of basic skills outcomes and ensure clear articulation within the community college district from noncredit to credit instruction and clear articulation from the K-12 adult education system to the community college instructional offering. “Smooth bridging from noncredit to credit and from noncredit to workforce is fundamental for the success of many of the students in the community college system. Developing and implementing a successful bridging plan requires much thought, along with quality input and cooperation among many areas working collaboratively” (“AB 86: A Brief History and Current State of Affairs from the Noncredit Task Force,” 2014, p. 1).

As of November 2014, a second ASCCC plenary on SB 860 and AB 86 presented on the state of noncredit in California. This presentation took place shortly before equalized CDCP funding took effect in July 2015. ASCCC reported that 68 of 72 districts offered some form of noncredit, and that 85 percent of all noncredit courses statewide were in ESL. While most districts greatly reduced (and in some cases eliminated) noncredit offerings during the Great Recession, several districts continued to operate robust noncredit programs despite the lower rate of funding. The bulk of noncredit has historically been offered by five community college districts (listed in order of size): (1) San Diego; (2) San Francisco; (3) North Orange; (4) Rancho Santiago; and (5) Mount San Antonio (“Exploring New Possibilities for Student Success through Noncredit,” 2014). For the past two years, San Diego has led in the state noncredit FTES with more than 8000 full-time equivalent student enrollments (San Diego Continuing Education, Office of Institutional Effectiveness, 2016).
In alignment with AB 86, CCCCO, specifically the programs of the Division of Workforce and Economic Development, aimed to bridge the skills and jobs mismatch and prepare California’s workforce for twenty-first century careers. Governor Brown argued that community colleges should become essential catalysts in California’s economic recovery and jobs creation at the local, regional, and state level. In support of Governor Brown’s agenda for workforce development, CCCCO launched the “Doing What Matters for Jobs and the Economy” initiative, which developed a four-pronged framework to respond to the call of our nation, state, and regions to close the skills gap. The four prongs aim to:

> Give priority to jobs and the economy
> Make room for jobs and the economy
> Promote student success
> Innovate for jobs and the economy

The goals of “Doing What Matters for Jobs and the Economy” are to supply in-demand skills for employers, create relevant career pathways and stackable credentials, promote student success and get Californians into open jobs. This initiative called for a focus on priority/emergent sectors and industry clusters, recommended the scaling of effective practices; called to integrate and leverage programming between funding streams; promoted common metrics for student success; and removed structural barriers to execution (“Doing what MATTERS,” 2016).

The top 10 California sector priorities include advanced manufacturing; advanced transportations and renewables; agriculture, water and environmental technologies; energy, construction and utilities, global trade and logistics; health; information and communication technologies (ICT)/digital media; life sciences/biotech; retail/hospitality/tourism ‘learn and earn’; and small business. There are fifteen regional consortia and each have identified regional priority sectors in which to focus. (“Doing what MATTERS,” 2016). This has led to the creation of collaborative regional infrastructures to strategically address regional employment gaps while avoiding oversaturating each region with the applicable programming to support narrowing these skills gaps. In addition, funding streams has supported both local and regional approaches.

The Education Protection Account has given rise to the “Platinum Age” of adult education in the California community college system. In addition to equalized funding for CDCP noncredit and AEBG, the Education Protection Account—in lockstep with recommendations of “Doing What Matters for the Jobs and the Economy”—has financed four innovative initiatives to support noncredit student success and program expansion: (1) Student Success and Support Program; (2) Student Equity; (3) CTE Enhancement Funding; and (4) Strong Workforce.

**STUDENT SUCCESS AND SUPPORT PROGRAM (SSSP)**

SSSP (formerly Matriculation) is a CCCCO initiative that enhances student access to the community colleges and promotes and sustains the efforts of credit students to be successful in their educational endeavors. The goals of SSSP are to ensure that all students complete their college courses, persist to the next academic term, and achieve their educational objectives through the assistance of the student-direct components of the student success and support program process: admissions, orientation, assessment and testing, counseling, and student follow-up. The Student Success and Support Program (SSSP) unit provides coordination and leadership to the community colleges with
respect to credit and noncredit programs and services. SSSP funding was allocated in 2015 to support adult education in the statewide system ("Student Success and Support Program," 2016). SSSP funds have called for more accountability in the delivery of robust student supports to increase student access and foster greater rates of completion.

**STUDENT EQUITY**

Student Equity Planning is administered through the SSSP unit at the CCCCO. SSSP staff is responsible for the implementation of the Board of Governor’s Student Equity Policy and related regulations. College student equity plans focus on increasing access and course completion. ESL and basic skills completion, degrees, certificates and transfer for all students as measured by success indicators linked to the CCCCO Student Success Scorecard, and other measures developed in consultation with local colleges. “Success indicators” are used to identify and measure areas for which disadvantaged populations may be impacted by issues of equal opportunity based on ethnic/racial identity, gender identity, socioeconomic status, or designation as a foster youth, veteran, or student with disabilities. “Each college develops specific goals/outcomes and actions to address disparities that are discovered, disaggregating data for indicators by student demographics, preferably in program review. College plans must describe the implementation of each indicator, as well as policies, activities and procedures as they relate to improving equity and success at the college" ("Student equity," 2016: 1). Student equity funding allows colleges to focus on interventions and supports for some of the most disadvantaged credit and noncredit student populations. In 2015, noncredit programs became eligible to receive student equity funding.

**CTE ENHANCEMENT FUNDING**

In the 2014-15 budget signed by Governor Brown, funding was provided on a one-time basis to create greater incentive for California Community Colleges to develop, enhance, retool, and expand quality career technical education offerings that build upon existing community college regional capacity to respond to regional labor market needs. Noncredit and credit programs received significant funding to modernize career technical education programs.

**STRONG WORKFORCE**

In June 2016, the California legislature approved a budget that includes an additional $200 million for a workforce training program that takes aim at the looming skills gap across the state’s regions. Leaders from the California Economic Summit joined the 2015 Strong Workforce Task Force, a statewide effort led by CCCCO to update California’s workforce training programs. This body recommended more than two dozen improvements in the following areas:

> Student Success
> Career Pathways
> Workforce Data and Outcomes
> Curriculum
> Career Technical Education Faculty
> Regional Coordination
> Funding

Governor Brown and the legislature agreed that California’s community colleges are vital to the economy and that they play an important role in boosting our state’s economy by serving more than 2.6 million students each year. In fact,
one out of four community college students in the country is presently enrolled in a California community college, making it the nation’s largest system of higher education. The 113 community colleges and three noncredit institutions provide students with the knowledge and background necessary in today’s competitive job market. With a wide range of educational offerings, the colleges provide workforce training, basic skills courses in English and math, certificate and degree programs and preparation for transfer to four-year colleges and universities (“Doing what matters for jobs and the economy—California community colleges,” 2016; “Doing what MATTERS,” 2016).

In addition to these initiatives, the California High School Exit Examination (CAHSEE), formerly a graduation requirement for students in California public schools, was suspended effective January 1, 2016. Senate Bill 172 (Liu) was signed by the Governor to suspend the administration of the CAHSEE and the requirement that students pass the CAHSEE to receive a high school diploma for the 2015–16, 2016–17, and 2017–18 school years. Due to the change in academic standards, this new legislation required that schools grant a diploma to any pupil who completed grade twelve in the 2003–04 school year or a subsequent school year and met all applicable graduation requirements other than the passage of the high school exit examination. The law further required the state superintendent of public instruction to convene an advisory panel to offer suggestions to the superintendent on the continuation of the high school exit examination and on alternative pathways to fulfill the high school graduation requirements pursuant to Education Code sections 51224.5 and 51225.3.

In President Obama’s first address to Congress, he challenged America to meet an ambitious goal for education by 2020 to once again have the highest proportion of college graduates in the world. His administration has valued innovation, science, technology, and workforce development. In response to President Obama’s ambitious educational objectives, the Secretary of Education, Dr. Duncan, and USDOE staff developed an audacious Strategic Plan for 2011–2014 (“U.S. Department of education strategic plan - FY 2011-14: Draft for public comment,” 2012). This Strategic Plan outlined National Outcome Goals for Postsecondary Education, Career and Technical Education, and Adult Education to increase:

- Number and percentage of 25 to 34-year-olds who attain an associate’s degree or higher
- Number and percentage of students who complete a bachelor’s degree within six years
- Number and percentage of students who complete an associate’s degree or certificate within three years
- Number and percentage of adult education students who obtain a high school credential
- College access, quality, and completion by improving higher education and lifelong learning opportunities for youth and adults.

President Obama’s second term has focused on providing adult students and individuals with disabilities who are college and career-ready with the knowledge and skills necessary to pursue successful career pathways. Bills to reauthorize the Workforce Investment Act were introduced in 2013. The enactment of the Workforce Innovation and Opportunity Act (WIOA) by bipartisan majorities in Congress revitalized and transformed the public workforce system so that these efforts reflect the realities of the twenty-first century.
In line with this effort, the administration also proposed a competitive CTE Innovation and Transformation Fund, administered by USDOE, to incentivize innovation at the district level and support system reform at the state level.

In January 2015, President Obama announced his campaign for free community college. President Obama proclaimed: “Every American, whether they’re young or just young at heart, should be able to earn the skills and education necessary to compete and win in the 21st century economy.” (“FACT SHEET: White House Launches New $100 Million Competition to Expand Tuition-Free Community College Programs that Connect Americans to In-Demand Jobs,” 2016: 1). This announcement celebrated the 27 new free community college programs that have launched in states, and the additional investment of $100 million for America’s Promise Job-Driven Training grants (America’s Promise Grants) to connect more Americans to education and high demand careers. President Barack Obama’s announcement of the America’s College Promise initiative began a national conversation about college affordability (“Beyond Tuition: Reducing Financial Barrier to College,” 2016).

Federal grants will be awarded to pilot and scale innovative tuition-free partnerships between employers, economic development, workforce development boards, community and technical colleges and systems, training programs, K-12 education systems, and community-based organizations to “strengthen the pipeline of Americans ready for in-demand jobs, bridge students’ educational opportunities and employer needs, attract more jobs from overseas, and create more pathways for Americans to reach the middle class,” effectively marrying workforce to adult education and community colleges (“FACT SHEET: White House Launches New $100 Million...
Competition to Expand Tuition-Free Community College Programs that Connect Americans to In-Demand Jobs,” 2016, p. 1).

The California College Promise has charged local community colleges and districts to help fulfill the California College Promise for college completion by partnering with K-12 and university partners, college foundations and the private sector to increase access to underrepresented community members.

Although adult education is already offered at zero fees to state residents, the new Promise programs will offer additional options to individuals who complete noncredit certificates (“Beyond Tuition: Reducing Financial Barrier to College,” 2016). With renewed attention on the cost of college, one could predict that many districts will soon start to convert credit programs—particularly in ABE/ASE, ESL and CTE—to noncredit.

**Conclusion**

Adult education has been federally funded since the birth of the nation, beginning with basic education and skills training for military personnel during the American Revolution. During America’s first 100 years, federal adult education funding grew to provide training to military and civilian employees. Subsequent federal funding emphasized vocational and agricultural education and training. Significant federal funding for basic noncredit education of American adult citizens did not commence until the early 1960s (“An American heritage—Federal adult education: A legislative history 1964-2013,” 2013).

Federal adult education programs established in the 1960s focused primarily on adult literacy and targeted—and continue to target—through state grants and some national programs, those individuals who lack essential literacy skills required for employment and participation in America’s democratic system. Since the mid-1900s, all presidential administrations provided support for adult education, although their visions for these programs may have differed.

Since the 1960s, more than a dozen major congressional policies have been enacted to support the expansion of adult basic education and literacy programs.

California has offered state-supported adult education since 1856, less than one decade after becoming a state. Until 1967, the California State Department of Education oversaw all of adult education provided by the K-12 school districts and the emerging junior colleges. After the two-year colleges became an independent segment within California’s education system, responsibility for adult education continued to be shared by the public adult schools and the community college noncredit programs. Periodic initiatives have attempted to clearly define the missions of the two systems and to promote equity and collaboration to meet the educational needs of the state’s adult population. The most recent efforts of the Legislature are AB86, which led to the establishment of 70 Adult Education Regional Consortia consisting of multiple providers of adult education and Adult Education Block Grant funding, and SB860, which equalized credit and noncredit funding in the Community Colleges.

Over the past 166 years, the state of California has become the most diverse region in the world and a significant player in the world economy. As the fifth-ranked economy on the planet, the
political, economic, and social health of California has implications across the globe (Starr, 2007). Now, more than ever, California needs to lead in the delivery of relevant, sustainable adult education programming that leads to advanced education and job training in careers that provide livable wages.

With the community college system in growth mode, colleges are looking to CDCP noncredit for program development and expansion for enrollment and FTES. Also, with increased focus on equity and workforce, many colleges are piloting academic innovations through noncredit. The following chapter will provide the finding of SDCE’s 2016 survey on California Community College Noncredit Offerings, baseline for subsequent surveys, along with recommendations for the future of noncredit adult education research and practice to inform State enhancements in support of noncredit program growth.
San Diego Continuing Education (SDCE) has commenced this study and survey on California Community College Noncredit Offerings to advocate for current and future noncredit programming in community colleges throughout California. Noncredit programs support the most underserved students by removing barriers to entry and while they have always been funded by the State in some capacity, an intentional and unified approach for growth will benefit our institutions and communities in serving a greater number of our citizens.

Survey Methodology

PURPOSE

The purpose of the survey is to track the development and revision of instructional programming across the California Community Colleges in three key areas: current offerings and programming, current operational processes, and planned offerings and programming; which are reflected in the research questions:

1. What is the current state of noncredit offerings and programming across the California Community College system?

2. How are California community colleges and institutions managing their noncredit programming?

3. What plans for future noncredit programming have the California community colleges and institutions put in place?

The 2016 California Community College Noncredit Offerings Survey results are considered exploratory and are baseline data to inform California about the current state of noncredit programming. The survey will be modified and data collection will be repeated annually or semi-annually to then begin to longitudinally track changes and progress made in noncredit programming across California to address at least one additional future research question: What changes are occurring in noncredit offerings and programming within the California Community College system?

INSTRUMENTATION

In fall 2016, the SDCE Office of Institutional Effectiveness worked in conjunction with the SDCE Office of the President to provide feedback on the design of the survey instrument.
Face validity and content validity of the instrument was established through feedback from the SDCE Office of Institutional Effectiveness, the SDCE Office of the President, and CCCCO’s Educational Services, which included the following content experts: an SDCE administrator, SDCE classified staff member, former SDCE instructional dean and staff from the CCCCO’s Office of Educational Services.

Face validity and content validity were based on the following criteria:

1. Survey questions should be directly related to the purpose of the survey, which is to elicit information about current credit and noncredit instructional programming and future provision of noncredit instructional programs.

2. Survey questions should be factually based instead of perceptually based.

3. Survey questions should avoid addressing complex processes or systems that most survey participants won’t be able to answer, are not applicable to them, or are not representative of their knowledge base.

Readability and field tests on the survey instrument were conducted within the SDCE Office of Institutional Effectiveness.

The online survey instrument contained a total of 31 overarching questions or question sets and comprised: one set of open-ended respondent demographic/institutional background questions, 18 stand-alone forced choice questions, 11 question sets that each elicited yes/no responses to item lists, and one multiple-response question set. Moreover, at multiple points in the survey, 10 open-ended response options were included in support of additional comments. It should be noted that the number of questions respondents were actually directed to answer varied due to respondent prior response and structurally built-in skip patterns.

SURVEY POPULATION

A nonprobability purposive sampling approach was used to gather information from each of the 113 California Community Colleges and three ancillary divisions: Compton Center, North Orange School of Continuing Education, and San Diego Continuing Education. “Nonprobability sampling is a catch-all term referring both to samples of convenience (e.g., accessible, volunteer) as well as to more purposive methods of selection (e.g., judgment sampling, quota sampling)” (Field, Pruchno, Bewley, Lemay, & Levinsky, 2006: 567). Based upon the content of the questions and the specific expertise and level of knowledge required to identify broad instructional features of the institution, a hierarchical position-based approach was used in selecting potential respondents that would elicit accuracy in reporting. An expert panel was recruited with one chief instructional leader (CIO) at each institution invited to participate in the survey or designate another well-informed contact at the institution to complete the survey on their college’s behalf. A total of 116 respondents completed surveys for their college or institution, resulting in a 100% college/institution response rate.

DATA COLLECTION

SDCE’s Office of Institutional Effectiveness conducted an extensive campaign in June and July 2016 to engender survey completion from every institution in the state with the assistance of the Office of the President. A pre-notification was emailed to a compiled list of CIOs several days ahead of the start of data collection at the beginning of June. The pre-notification comprised a letter from SDCE President Carlos O. Turner Cortez...
informing potential respondents about the purpose and content of the survey, and requesting support for the statewide project. Initial email invitations were sent to CIOs containing unique links to the survey followed by several reminder emails during the first half of June. CIOs were asked to either submit their college’s survey themselves or designate another contact at the institution with substantial knowledge of noncredit programming to make the submission for the college. In the last part of June and throughout July a combined telephone and email follow-up campaign was initiated with the instructional offices of non-responding institutions to either encourage survey submission or to assign a new contact at the institution due to leadership time-constraints or change in leadership. All colleges submitted their responses by August 1, 2016.

The actual length of time to complete the survey was expected to vary considerably by college. For those colleges not requiring information collection from more than one source, the survey was expected to take approximately 5-15 minutes depending upon the extent of noncredit programming at the college. For colleges that needed to collect information from multiple contacts, length of time to complete is unknown. Contacts were provided emailed survey invitations to submit surveys online as well as hard copies of the survey instrument to enable question pre-screening and collection of accurate information as needed prior to submission of the survey. Hard copies of the survey instruments were provided as requested in the first weeks of data collection, and to all respondents in the phone/email phase of data collection.

ASSUMPTIONS AND LIMITATIONS

Due to the limited number of all-around instructional experts at each institution and the time it may take other staff to gather information from multiple sources, it was not feasible to conduct a full pilot study prior to data collection in this first year. Direct knowledge and expertise by respondents are assumed based upon data collection protocols to first select chief instructional officers as position-based specialists with broad bases of institutional knowledge, second, in replacing subjects with limited knowledge/experience based on referral, and third, in repeated recommendations to respondents to gather information from multiple sources at the institution if needed prior to survey submission.

For respondents requiring the collection of some information from multiple sources, length of time to gather the information is unknown; therefore, it is also unknown if completing the survey was an undue hardship on the respondent. Additionally, certain question items or subject items may require more consultation than others in order to collect accurate institutional responses.

It would be beneficial in the future if prior to revising the survey instrument, feedback is elicited from past survey respondents about challenges encountered in completing the survey with suggestions for the improvement of future surveys.

ANALYSIS AND REPORTING

Descriptive statistical analyses were conducted and questions were grouped into themes. For reporting purposes, results are not referred to in
question order; rather they are clustered into three sections that reflect the primary research questions stated previously:

1. Current Offerings and Programming
2. Current Operational Processes
3. Planned Offerings and Programming

Respondents are assumed to be agents for their institution that provide factual data about the institution. As such, the summary of the findings generally refers to the institution rather than to the respondent.

The Summary of the Findings generally center on positive/negative question response (yes/no); however, when a large percentage of respondents are unsure or choose not to respond to a question, it is noted. In many cases participants were not asked questions due to a preceding response. When appropriate, these respondents are included as part of the base cohort for that question.

**Highlight of the Findings**

The following is a summary of highlights from the survey findings:

**CURRENT OFFERINGS AND PROGRAMMING**

> Seventy percent of institutions are presently offering free noncredit courses

> ESL/ESOL noncredit programming is offered at just over half of the institutions statewide

> Career Technical Education (CTE) noncredit programming is offered at 28% of the institutions statewide

> The top five Career Technical Education pathways are included as priority sectors for the state of California and include:

  » Health
  » Information communications technologies (ICT) and digital media
  » Energy, construction and utilities
  » Small business
  » Advanced manufacturing and retail/hospitality (tied for 5th)

> Just 26% of the institutions who currently offer distance education offer it for noncredit

> Just 5% of the institutions who offer distance education offer hybrid or blended noncredit CTE programming

**CURRENT OPERATIONAL PROCESSES**

> Fifty-nine percent of the institutions with noncredit programming offer both regular and enhanced-funded courses

> The majority of the institutions with noncredit offerings confirmed that they do not charge fees for labs (85%) or for course materials (69%); however, less than half do not charge for textbooks (43%)

> Only 59% of the institutions with noncredit currently use CCC Apply

> Over half (54%) of the institutions with noncredit use a combination of managed enrollment and open entry/open exit to enroll their noncredit students
PLANNED OFFERINGS AND PROGRAMMING

> Among 31 institutions around the state not currently providing any form of noncredit, almost half (48%; 15 institutions) plan to begin offering noncredit within the next two years, with 14 institutions planning to offer noncredit ESL/ESOL for the first time and 12 institutions planning to offer noncredit CTE for the first time.

> Among the 81 institutions that are currently offering noncredit, the scope of noncredit offerings is expected to increase within the next two years. Thirty-seven institutions are planning to offer Career Technical Education for the first time, 16 are planning to offer ABE/ASE for the first time, 15 are planning to offer Ementus for the first time, and 13 are planning to offer DSPS for the first time.

Survey Results

RESPONDENT PROFILE

A total of 116 respondents completed surveys on behalf of their college or institution.

Among all survey completers, 72% were VPIs or VPAAs; 17% were deans, directors, or managers; 3% were presidents, provosts, or vice chancellors; 3% were curriculum specialists; 3% were supervisors, analysts, or other staff; and 2% did not provide a position title.

CURRENT OFFERINGS AND PROGRAMMING

Noncredit Offerings

Seventy percent (n=81) of all respondents (n=116) indicated that their institution is presently offering free noncredit courses, which excludes community services or not-for-credit.

INSTITUTIONS WITH NONCREDIT OFFERINGS

- 70% Offer noncredit
- 27% Do not offer noncredit
- 3% Unsure/No response
**Noncredit Offerings by Subject Area**

About half (51%; n=59) of all institutions (n=116) offer noncredit ESL/ESOL programming and over one-third (34%; n=40) offer disability student programs and supports (DSPS).

More than one-quarter of all institutions offer noncredit high school diploma or equivalency programs (ABE/ASE) (30%; n=35), noncredit career technical education (CTE) (28%; n=32), and/or noncredit for older adults (Emeritus) (27%; n=31).

Only a few institutions in the state are currently providing noncredit pre-apprenticeship offerings (3%, n=4).

**NONCREDIT OFFERINGS BY SUBJECT AREA**

Among 32 institutions currently offering noncredit CTE, the top five pathways are health (47%; n=15); information communications technologies (ICT) and digital media (38%; n=12); energy, construction & utilities (25%; n=8); small business (25%; n=8); and tied for fifth place are advanced manufacturing and retail/hospitality (16% each; n=5 each).
The top five noncredit DSPS pathways (among 40 institutions offering noncredit DSPS courses) are access technology instruction (55%; n=22), computer instruction (48%; n=19), independent living skills (48%; n=19), basic education (43%; n=17), and acquired brain injury specialized instruction (35%; n=14).

Among 31 institutions with noncredit Emeritus courses, the top five noncredit older adult pathways are music (71%; n=22); arts and crafts (68%; n=21); health and wellness (55%; n=17); body dynamics and the aging process (52%; n=16); and technology (45%; n=14).

Note: Some of the respondents were unsure about the types of DE programming their institution offers for their DSPS offerings. See Appendix C item response for details.
**Distance Education**

Ninety-seven percent of institutions statewide (112 out of 116 institutions) are offering distance education (DE) programming (credit and/or noncredit). Among these 112 institutions offering distance education programming (credit or noncredit), it is notable that only 29 (26%) confirmed that they offer noncredit distance education programming. When compared to the much higher number of institutions presently offering noncredit courses (n=81), it appears that distance education is a potential area of growth for noncredit programs and institutions.

**OFFER NONCREDIT DISTANCE EDUCATION**

- 65% Do not offer noncredit Distance Education
- 26% Offer noncredit Distance Education
- 9% Unsure/no response
Among 112 institutions offering distance education (credit or noncredit), 93% (n=104) offer web-enhanced course modes, 55% (n=61) offer fully online degree or certificate programs, and 42% (n=47) offer synchronous (live face-to-face) programs.

Thirty-four percent (n=38) of 112 distance education-supported institutions offer web-enhanced programming for credit and/or noncredit ESL/ESOL, followed by 9% (n=10) that offer web-enhanced programming for noncredit ABE/ASE, and 6% (n=7) that offer web-enhanced programming for noncredit CTE. Four percent each (n=5 and n=4, respectively) currently offer web-enhanced programming for DSPS and Emeritus.

About one in five (19%; n=21) of 112 distance education-supported institutions presently offer hybrid or blended programming for credit and/or noncredit ESL/ESOL and only 5% (n=6) offer hybrid or blended programming for noncredit CTE. Even fewer institutions currently offer hybrid or blended programming for noncredit ABE/ASE, DSPS, or Emeritus (n=3, n=2, and n=1, respectively).

Only about a handful (5%; n=6) of the 112 distance education-supported institutions offer fully online credit and/or noncredit ESL/ESOL, and fewer offer fully online noncredit DSPS or CTE (n=2 and n=1, respectively). There are no institutions that presently offer fully online courses for noncredit ABE/ASE or Emeritus.

COURSES/PROGRAMS OFFERING DISTANTCE EDUCATION PROGRAMMING

Note: Some of the respondents were unsure about the types of DE programming their institution offers for their DSPS offerings. See Appendix C item response for details.
CURRENT OPERATIONAL PROCESSES

Funding

Among 81 institutions with noncredit offerings, 59% (n=48) offer both regular and enhanced noncredit courses, 32% (n=26) offer only regular noncredit courses, and 9% (n=7) offer only enhanced noncredit courses.

FUNDING FOR NONCREDIT COURSES
Among noncredit programs/institutions (n=81), the majority do not charge fees for labs (85%; n=69) or for course materials (69%; n=56); however, fees for textbooks tends to be split more evenly, with 47% (n=38) charging for textbooks, 43% (n=35) not charging for textbooks, and 10% (n=8) unsure or providing no response.

### NONCREDIT COURSE FEES

<table>
<thead>
<tr>
<th>Fee Type</th>
<th>Pay fees</th>
<th>No fees</th>
<th>Unsure/No response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Textbooks</td>
<td>47%</td>
<td>43%</td>
<td>10%</td>
</tr>
<tr>
<td>Labs</td>
<td>7%</td>
<td>85%</td>
<td>7%</td>
</tr>
<tr>
<td>Course Materials</td>
<td>21%</td>
<td>69%</td>
<td>10%</td>
</tr>
</tbody>
</table>

*Note: Some percentages do not total 100% due to rounding error.*

### Staffing

Among the 81 institutions in the state with noncredit programming, nearly half have the same service area requirements (minimum qualifications) for credit and noncredit faculty (49%; n=40) and the same salary tables for credit and noncredit faculty (48%, n=39).

### MINIMUM QUALIFICATIONS FOR CREDIT AND NONCREDIT

- **49%** Same
- **4%** Unsure/no response
- **47%** Different
Among the 81 institutions with noncredit programming, over one third of respondents (35%; n=28) were unsure what their institution’s noncredit full-time contract teaching load was set at or did not respond to the question. However, a rough estimate of full-time teaching load could be presumed from the 53 respondents who confirmed their institution’s load. Thirty percent (n=24) cited a full-time contract teaching load of 15 or below and 22% (n=18) cited a full-time contract teaching load of 25.

FULL-TIME NONCREDIT TEACHING LOAD

Note: Percentages do not total 100% due to rounding error.
Admissions and Registration

Over half (59%; n=48) of the 81 institutions with noncredit have the same admissions process for their credit and noncredit programs. Likewise, over half (59%; n=48) of the institutions with noncredit use CCC Apply for their noncredit program(s) or institution.

The majority of those using CCC Apply (83%; 40 out of 48 institutions) for noncredit have the same admissions process for credit and noncredit.

CREDIT/NONCREDIT ADMISSION PROCESS

- 59% Same
- 37% Separate
- 4% Unsure

USE OF CCC APPLY IN NONCREDIT

- 59% Use CCC Apply
- 36% Do not use CCC Apply
- 5% Unsure
**Enrollment Management**

Over half (54%; n=44) of the institutions with noncredit (n=81) use a combination of managed enrollment and open entry/open exit to enroll their noncredit students and one-quarter (25%; n=20) use only an open entry/open exit system.

**ENROLLMENT MANAGEMENT**

![Enrollment Management Pie Chart]

Fewer than one third (30%; n=24) of institutions with noncredit (n=81) offer combined sections of parallel credit/noncredit courses with both credit and noncredit students enrolled in the same classroom.

**COMBINED CREDIT/NONCREDIT COURSES**

![Combined Credit/Noncredit Courses Pie Chart]
**Grading**

Approximately three out of five (57%; n=46) institutions with noncredit (n=81) do not award grades in any of their noncredit courses and about one in six (14%; n=11) award grades in all noncredit courses.

Close to one quarter (23%; n=19) of the institutions provided another response, the majority of whom indicated that some courses are graded and others are not, all courses use progress indicators (e.g. Pass, No Pass, Satisfactory Progress) or they use a combination of the standard grading and progress indicators.

**GRADES AWARDED IN NONCREDIT COURSES**

- 57% No courses are graded
- 23% Other
- 6% Unsure
- 14% All courses are graded

**Certificates**

Over one third (37%; n=41) of the 112 institutions with credit and/or noncredit ESL/ESOL programming presently have state-approved stackable certificates in place.

**STACKABLE ESL/ESOL CERTIFICATES**

- 61% Do not offer stackable ESL/ESOL certificates
- 37% Offer stackable ESL/ESOL certificates
- 3% Unsure/don’t know

*Note: Percentages do not total 100% due to rounding error.*
**Partnerships**

Among 35 institutions with ABE/ASE noncredit programs, 68% (n=24) have a partnership in place with local K-12 district(s).

**K-12 ABE/ASE PARTNERSHIPS**

Among 40 institutions with noncredit DSPS offerings, 30% (n=12) have a partnership in place to conduct workplace training or internship opportunities for students. Similarly, among 32 institutions with noncredit CTE, about one in four (28%; n=9) have a partnership in place to conduct workplace training or internship opportunities for students. Fewer workplace training or internship opportunities are in place for older adult students, with only 6% (n=2) of the 31 institutions that offer Emeritus courses, also providing workplace training or internships.

**WORKPLACE TRAINING/INTERNSHIP**

- DSPS: 30%
- CTE: 28%
- Emeritus: 6%

*Note: Some respondents were unsure if their institution offers workplace training/internship opportunities for their DSPS programming. See Appendix C Item Response for details.*
PLANNED OFFERINGS AND PROGRAMMING

Among 31 institutions around the state not currently providing any form of noncredit, close to half (48%; n=15) plan to begin offering noncredit within the next two years.

Forty-five percent (n=14) of those not currently offering any form of noncredit (n=31) plan to offer ESL/ESOL for the first time within two years and 39% (n=12) plan to offer CTE for the first time within two years. DSPS, ABE/ASE, and Emeritus are each included in a limited number of college’s plans for future offerings, with each being mentioned by three or fewer colleges.

PLAN TO PROVIDE NONCREDIT IN NEXT TWO YEARS
Among institutions currently offering noncredit in another subject area

Among the 81 institutions that are currently offering noncredit, the scope of noncredit offerings is expected to increase within the next two years. Thirty-seven institutions are planning to offer noncredit CTE for the first time (76% of those not yet offering CTE; 37 of 49 institutions), 13 institutions are planning to offer noncredit DSPS for the first time (36% of those not yet offering DSPS; 13 of 36 institutions), 16 institutions are planning to offer noncredit ABE/ASE for the first time (36% of those not yet offering ABE/ASE; 16 of 45 institutions), and 15 institutions are planning to offer noncredit Emeritus for the first time (33% of those not yet offering Emeritus; 15 of 46 institutions).

Note: Institutions were not asked about ESL/ESOL future plans.
The majority (79%; n=88) of the 112 institutions with credit and/or noncredit distance education programming have plans to move to Canvas as part of the Online Education Initiative; however, nearly 20% (n=22) of those responding were unsure about their institution’s plans, likely yielding a much higher rate of transition to Canvas.

**PLANS TO MOVE TO CANVAS**

Note: Percentages do not total 100% due to rounding error.

The majority (68%; n=27) of the 40 institutions with DSPS offerings have interest in developing Career Development and College Preparation (CDCP) certificates for students with disabilities, while nearly one quarter (23%; n=9) were unsure about their institution’s interest. Only 10% (n=4) of institutions stated no interest in developing CDCP certificates for students with disabilities.

**INTEREST IN DEVELOPING DSPS CDCP CERTIFICATES**

Note: Percentages do not total 100% due to rounding error.
Less than half (45%; n=14) of the 31 institutions with Emeritus offerings have interest in developing Career Development and College Preparation (CDCP) certificates for older adults, while nearly one quarter (23%; n=7) were unsure about their institution’s interest. Nearly one third (32%; n=10) of institutions stated no interest in developing CDCP certificates for older adults.

**INTEREST IN DEVELOPING EMERITUS CDCP CERTIFICATES**
Based on the enclosed history of noncredit adult education and the findings of the California Community College Noncredit Offerings survey SDCE administered on the current status of adult education in California, SDCE’s Office of Institutional Effectiveness makes the following as recommendations on the future of noncredit adult education in the community college system along with improvements to the research design for SDCE’s future research.

**Recommendations for Future Research on Noncredit Adult Education in Community Colleges**

- Triangulate research methods in future years to further expand the yield and breadth of findings, while validating the data through cross verification of multiple methods of quantitative and qualitative research. Interviews with key CEOs from large noncredit institutions, colleges with large noncredit programs, and colleges or institutions growing their noncredit programs may prove informative, as would focus groups with other stakeholders such as Academic Senate presidents and CTE deans.

- Amend the existing annual survey to collect data on the size of programs at each institution offering noncredit to yield a more precise picture of the non-credit offerings across the state.

- Amend the existing annual survey to collect more robust data on noncredit pre-apprenticeships and apprenticeships.

- Research why only 70 percent of ABE/ASE programs have K-12 ABE/ASE partnerships.

**Recommendations for the Future of Noncredit Adult Education in Community Colleges**

**AN AUTHENTIC COMMITMENT TO EQUITY AND SOCIAL JUSTICE CALLS FOR INCREASED RESOURCES FOR ADULT EDUCATION**

- As colleges rebuild their infrastructure—specifically with respect to facilities, technology, and instructional equipment, ensure that equitable funding is identified for noncredit adult education programs.
> Based on the need for on-demand programming, create an attendance infrastructure for online education that allows for open access enrollment and attendance tracking.

> To provide noncredit programs with a more reliable funding model, implement a census-based formula for managed enrollment classes to determine non-credit FTES.

> Continue to fund CDCP offerings at an equalized rate, and include DSPS and emeritus programs that focus on transition to credit or workforce.

> Eliminate the two-tiered adult education system and fund all adult education program categories at the same rate. These programs serve our most needy residents and provide valuable educational opportunities. We should demonstrate our commitment to equity and social justice by taking these programs off the chopping block and ensure their financial sustainability. Non-CDCP program faculty and staff worry that their programs will be eliminated each year as continued funding becomes more difficult for institutions to manage.

> Allocate 20 percent of Statewide FTES annually for noncredit adult education to incentivize the expansion of these vital programs.

MODERNIZE NONCREDIT CURRICULUM AND INSTRUCTION

> After years of debate, clarify the role of the K-12 and community college systems in the delivery of noncredit adult education to minimize conflict between systems.

> As colleges work to develop and expand noncredit, CCCCO should develop greater infrastructure to support noncredit program development, including the:

  » Localization of the noncredit program approval process to expedite the ability of noncredit program to respond to industry demands;

  » Modification of CurricUNET (or other system) to mainstream noncredit course approval process; and

  » Identification of greater support for instructional program design.

> Shift basic skills instruction to noncredit system-wide to allow students to allocate their financial aid to complete a degree program and transfer-level credit courses.

> Locally, expand articulation agreements to support seamless transition from noncredit to credit programs.

> Appropriate state funding to support the development and dissemination of Open Educational Resources (OER) to enhance resources for noncredit students and reduce the textbook fees required by some certificate programs to improve curriculum portability across colleges.

> Expand noncredit pathways for inmates in jails and prisons to reduce recidivism and foster successful reentry.

> Increase non-credit distance education offerings to support the educational needs of adults in the military, in isolated rural communities, and working adults who need alternative delivery models.
> **STRENGTHEN NONCREDIT STUDENT SERVICES**

> Noncredit students typically come from more diverse and socioeconomically disadvantaged backgrounds. They therefore require more intensive and extensive student services. An equitable distribution at the state level for SSSP and SEP funding would provide supplemental financial support for noncredit.

> Qualify noncredit adult learners for federal Pell Grants as was done recently for high school students enrolled in community college.

> Earmark restricted funding to provide dedicated mental health services to noncredit students.

> Engage in targeted outreach to veterans, adults with disabilities, ex-offenders, the marginally housed, immigrants, refugees, opportunity youth, foster youth, the unemployed, and single parents to ensure noncredit programs serve our most vulnerable residents.

> Reinvent and fund non-credit career counseling and implement workforce services to support students with career exploration, transition, placement, and success.

> **MARRY NONCREDIT ADULT EDUCATION TO WORKFORCE DEVELOPMENT**

> Increase AEBG and Strong Workforce funding specifically to support noncredit program development and expansion.

> Institutionalize bridges between industry and education by creating competence-based certificate programs across the state, aligned with industry side competency-based and employee-recognized certifications.

> Strengthen partnerships with regional WIOA-funded workforce development boards to support long-term job placement.

> Modify Title 5 to allow for noncredit internship opportunities without instructor presence to augment experiential learning opportunities for job seekers. Ideally, these internships would also provide stipends.

> Continue to emphasize CTE program development and expansion in alignment with the Deputy Navigator Sectors (as identified by CCCCCO) the Priority Sectors (as identified by the regional workforce development boards) with a focus on noncredit.

> Provide State support to develop a noncredit infrastructure (e.g. Strong Workforce) to track workforce placement.

> **CHAMPION AND CHERISH NONCREDIT FACULTY**

> As noncredit faculty tend to work with the most needy student populations, strengthen the voice and influence of noncredit faculty, equalize the compensation and teaching load of noncredit and credit faculty. There is no distinction in compensation and load for classified employees and administrators. Similarly, there should be no distinction in contracts for noncredit faculty. Maintaining a tiered system places more value on credit faculty and marginalizes the essential work of noncredit faculty.

> To strengthen noncredit programming, increase faculty leadership by allocating state funding to hire 500 noncredit contract faculty system-wide.

> ASCCC should continue to be a strong advocate for noncredit programs and faculty.
PROVIDE SYSTEM SUPPORT FOR INSTITUTIONAL EFFECTIVENESS

> Create a single system for reporting community college, adult education, and workforce outcomes to minimize overhead, maximize efficiency, and marry these three disconnected systems.

> Based on the need to comply with accountability measures, identify retention and success rate definitions for non-credit to better align and standardize non-credit across the state.

> Improve the quality, accessibility, and utility of student outcome and labor market data to support students, educators, colleges, regions, employers, local workforce development boards, and the state in CTE program development and improvement efforts.

ESTABLISH A CONCERTED STATEWIDE MARKETING AND BRANDING CAMPAIGN

> Based on the challenges of community understanding of non-credit education and funding mechanisms, provide the infrastructure and funding to market provide outreach programs specifically for California non-credit programs. Many, if not most, Californians are unaware of the free educational opportunities community colleges offer that could transform their lives.

> Noncredit adult students are not exclusively from lower income communities. A statewide branding and outreach campaign should be developed to de-stigmatize the image of adult education to encourage employed adults to enroll in certificate programs to advance their careers.

Appendix B
Survey Instrument

California Community College Noncredit Offerings
Survey Instrument

Thank you for your participation. The survey should take no more than 10-15 minutes to complete. The information you provide will help to support program development and student success and will be shared in a summary report to all participating institutions.

1. Please fill in the following contact/institutional information (*contact information will be used to build an accurate contact database and will not be shared with participating institutions*):
   a. Name of Institution:
   b. District:

   e. Please specify any additional ESL/ESOL programming types that your institution presently offers.

7. Does your institution presently have state-approved stackable certificates for ESL/ESOL in place?
   Yes
   No
   Unsure/don’t know
8. Does your college presently offer free noncredit courses (not including community services or not-for-credit)? [If yes, skip to next section; if no/unsure/don’t know, skip to end of survey; if no, but will in next two years, answer next question]

Yes, both regular and enhanced noncredit

Yes, but only regular noncredit

Yes, but only enhanced noncredit

No, but we will provide noncredit in the next two years

No, and we have no immediate plans to provide noncredit

Unsure/don’t know

9. Which of the following noncredit courses and/or programs do you have plans to provide in the next two years? (Select all that apply) [Skip to end of survey]

Career technical education (CTE)

English as a Second Language (ESL) or English to Speakers of Other Languages (ESOL)

High school diploma or equivalency, also referred to as Adult Basic Education/Adult Secondary Education (ABE/ASE)

Older adult education (55+), also referred to as Emeritus

Students with disabilities education, also referred to as disability student programs and supports (DSPS)

Other, please specify:

Unsure/don’t know
11. Does your noncredit institution or program use CCCApply?
   Yes
   No
   Unsure/don’t know

12. How do students enroll in your noncredit courses and programs?
   Managed enrollment
   Open entry, open exit
   Both. It depends upon the specific program.
   Unsure/don’t know
   Other, please specify:

13. Are students awarded grades in your noncredit courses?
   Yes, all courses are graded
   No, none of the courses are graded
   Unsure/don’t know
   Other, please specify:

14. Does your institution charge the following fees for noncredit course offerings?

   a. textbooks
   b. labs
   c. course materials
   d. Please specify any additional noncredit course fees charged.

15. Are the following items the same for your credit and noncredit faculty?

   a. service area requirement (minimum qualifications)
   b. salary table
16. What is the full-time teaching load for noncredit faculty
   - 15 or below
   - 18-20
   - 21-24
   - 25
   - Unsure/don’t know

17. Does your institution/district offer combined sections of parallel credit/noncredit courses? (credit and noncredit students enrolled in the same classroom)
   - Yes
   - No
   - Unsure/don’t know

---

**Adult Basic Education/Adult Secondary Education**

18. Does your institution presently offer noncredit high school diploma or equivalency program(s), also referred to as Adult Basic Education/Adult Secondary Education (ABE/ASE)? [If yes, continue; if no/unsure/don’t know, skip to next section]
   - Yes
   - No, but we will provide noncredit ABE/ASE in the next two years
   - No, and we have no immediate plans to provide noncredit ABE/ASE
   - Unsure/don’t know

19. Does your institution presently offer the following noncredit ABE/ASE programming?

<table>

Appendix D
Verbatim Open-Ended Comments

**Question 3:** Please specify any additional distance education course modes that your institution presently offers.

1. All modes
2. Hybrid
3. Hybrid (campus & online meetings)
4. Hybrid (online/face-to-face)
5. Hybrid courses
6. Hybrid courses (partial online; partial face to face)
7. Hybrid/Blended
8. Mesa College doesn’t offer a DE communication or lab science course so this prevents the college from offering a fully DE degree transfer program.
9. Mostly asynchronous courses within regular terms.
10. Not sure if your web-enhanced is the same as a hybrid. For me web-enhanced is a face to face that uses online resources in the course. We offer hybrid classes which are mainly online with some face-to-face contact but the majority of the course is online.
11. Telepresence
12. TV synchronous with other campuses
13. We are planning to develop online noncredit courses in the future.
14. We do offer some courses via ITV whereby we provide a two-way video conference link between classrooms at two locations, however this does not typically fall under distance education as defined by the ACCJC.
15. We have degree and certificate programs that are attainable 50% or more online.
16. We would like to offer noncredit distance education and are trying to work with the funding formula to see how we can best initiate the program.

**Question 6:** Please specify any additional ESL / ESOL programming types that your institution presently offers.

1. Dual roster ESL
2. ESL lab classes
3. Lap top and iPad lab based courses in noncredit ESL
4. Not-for-credit intensive English program (West Language Academy)

5. We have ESL lab-type classes taught in the Learning Resource Center using computers and software, and we also have laptops available for student checkout while in the Resource Center.

6. We offer both credit and noncredit ESL programs.

7. We work through the West Kern Adult Education Consortium to coordinate their not-for-credit offerings as pipelines to college.

Question 9: Which of the following noncredit courses and / or programs do you have plans to provide in the next two years? (Other specified)

1. concurrent supplemental instruction
2. Planning for basic skills in English and Math
3. The enhanced non-credit courses
4. We are looking into options. We are learning more about noncredit and wish to offer some. We currently have noncredit in our Math Lab to provide tutoring and faculty support and are looking at introducing new curriculum for noncredit for Writing Reading across the Curriculum. We also need to revise our Learning Skills program for students with learning disabilities and update our ESL curriculum. Faculty has been attending meetings with adult school partners as part of AB86/104 to consider student and community needs.

Question 12: How do students enroll in your noncredit courses and programs? (Other specified)

1. CCCApply is available to Noncredit students but most enroll using paper applications
2. Enrolled through regular priority dates through the SIS and classes are open-entry/open-exit.
3. moving to managed enrollment
4. We only offer one non-credit class and that is supervised tutoring

Question 13: Are students awarded grades in your noncredit courses? (Other specified)

1. CDCP courses and some non-CDCP noncredit courses are graded; some non-CDCP courses are ungraded.
2. Courses that meet for over 30 hours receive grades
3. Currently only enhanced noncredit courses award grades.
4. Graded as positive attendance.

5. Just our adult high school classes.

6. Not all non-credit is graded

7. P, NP, or IP

8. Pass/Fail

9. some are graded, and some are pass/no pass

10. some are graded, others are not

11. Some courses are graded, others are not.

12. Some courses are graded, some courses are pass/no pass

13. Some courses generate grades of credit or no credit. Other courses do not generate grades (just positive attendance hours).

14. Some with progress indicator

15. They are P/NP

16. They can receive progress indicators but not grades.

17. We use progress indicators based on Pass, No Pass and Satisfactory Progress.

18. We use progress indicators in all NC courses (P, SP, NP)

19. we were part of the non-credit grader pilot and I thought we were doing transcripted grades—but a problem with our student system means it wasn’t happening

**Question 14:** Please specify any additional noncredit course fees charged.

1. If textbooks are required students would need to purchase them.

2. In a few of our older adult courses there are materials fees.

3. No fees, but students would be responsible to pay for books, labs or materials.

4. Students purchase texts and materials via the bookstore or online ordering, just like credit. We charge the health fee $18, student activity fee $1, and a waiveable $5 student representation fee.

5. Textbook fees are an option to buy if student wants to have the textbook.
6. Textbook rental

7. uniforms

8. We don’t charge a fee for the textbook but students are responsible for getting the text.

9. we will be adding courses that will have textbooks and fees within 2 years

**Question 19:** Please specify any additional noncredit ABE / ASE programming types that your institution presently offers.

1. Face to Face only

2. GED students progress through content in a web-enabled portal in a proctored face-to-face environment.

3. We offer a basic math and English course with a web based lab component imbedded in the course

**Question 23:** Please specify any additional noncredit CTE programming types or student opportunities that your institution presently offers.

1. Non credit fire science

2. specifically work readiness

3. We are working on developing more pathways and internship component through AEBG funding.

**Question 26:** Please specify any additional noncredit DSPS programming types or student opportunities that your institution presently offers.

1. DSPS students are not provided specialized non credit courses, they are able to enroll just like any other student. They are provided noncredit tutoring.

**Question 30:** Please specify any additional noncredit older adult programming types or student opportunities that your institution presently offers.

1. We offer courses in music, communications, nutrition, etc., but not pathways.
1. Are we making a difference? What is the impact of an online postgraduate palliative care course on the professional lives of alumni?

2. Deb Rawlings and Kim Devery

3. Flinders University, Adelaide, South Australia

4. Palliative and Supportive Services, Flinders University, GPO Box 2100, Adelaide, 5001, South Australia, Australia

5. deborah.rawlings@flinders.edu.au; kim.devery@flinders.edu.au

6. Abstract:

Are we making a difference? What is the impact of an online postgraduate palliative care course on the professional lives of alumni?

Introduction

As Higher education educators we aim to advance the knowledge, skills and critical thinking abilities of post graduate students who chose to study with us. Importantly, our graduates then apply this advanced knowledge and skills in their professional lives. Palliative care has been described as “an approach that improves the quality of life of patients and their families facing the problem associated with life-threatening illness” (World Health Organisation, 2015). The discipline of Palliative & Supportive Services in the School of Health Sciences, Flinders University, offers post-graduate courses in Palliative Care and in Palliative Care in Aged Care, both of which have been offered exclusively by distance education (online) since 2002. Students are mostly clinicians from a diverse range of settings, geographical locations and country of origin. Courses are not discipline –specific, rather our students work together virtually and collaboratively as they would in practice.

Research Objectives

1. To explore whether the Flinders University Palliative Care (or Palliative Care in Aged Care) Course has an impact on the professional lives of alumni

2. To explore whether the Flinders University Palliative Care (or Palliative Care in Aged Care) Course has empowered alumni to change work or clinical practice – either the way in which they themselves work, or by influencing organisational changes.

3. To find out if anything is missing from the courses, either content in topics or topics themselves

Methodology

This was a one-time (retrospective) online survey administered to alumni who had the experience of studying postgraduate palliative care within the past 10 years. The survey was
administered to 426 alumni – the only email addresses available. To increase response rates information regarding the survey was provided via e-newsletters relevant to the sector. Ethics approval was received from Flinders University (project: 7154). A total of 76 responses were received.

Expected Outcomes

Early indications from the data are that the courses are having a long term impact on practice, and students’ ability to affect change. Students are reporting that they have developed, influenced, or participated in, decision making, mostly within their team or workplace. This extrapolation of individual responses allows us to see what is happening in the sector and will contribute to broader strategic planning for the future.
1. Online communities of practice in a postgraduate topic and the provision of unique learning experiences with real world applications

2. Deb Rawlings and Kim Devery

6. Abstract:

Online communities of practice in a postgraduate topic and the provision of unique learning experiences with real world applications

Introduction

Palliative care has been described as “an approach that improves the quality of life of patients and their families facing the problem associated with life-threatening illness” (World Health Organisation, 2015). The discipline of Palliative & Supportive Services, Flinders University, offers post-graduate courses in Palliative Care and in Palliative Care in Aged Care, both of which have been offered exclusively by distance education (online) since 2002. In one of our topics we were prompted by student responses to a new online learning activity to further explore how communities of practice work when no face to face interaction is available. The students all work clinically and their interactions have real world applications which can help change care at the end of life. In our teaching we observed impressive student interaction that entailed critical analysis, reflection on and synthesis of complex information, problems, concepts and theories – and we wanted to know more.

Research Objectives

1. To learn more about how students learn from each other's experiences

2. To contribute to existing knowledge on online learning communities

Methodology

This is a 5 year retrospective study of de-identified online forum posts as approved by the ethics committee (Flinders University: Project 6292). Contact with students was made by an administration officer in Palliative & Supportive Services at the end of semester with the
research information. They were asked to return a consent form in a reply-paid envelope. Return of the consent form indicates their willingness to have their information de-identified and used in the research.

Expected Outcomes

Four years of data is currently available with the remaining data to be collected at the end of 2016. This paper will focus on the study methodology and look at the facilitation of online communities of practice.
Developing Small Talk Strategies for EFL Students through Animated Films

Seo Eun-mi
Howon University

I. INTRODUCTION

Communicative competence means to develop four strategies: grammatical competence, linguistic competence, discourse competence and strategic competence. EFL students need to learn how to deal with four competences. Strategic competence means how to speak correct expressions in the various situations. Films can be important authentic materials to learn important expressions. Small talk strategies will be helpful to manage successful conversation with other English speakers. Through various situations, students will learn how to lead conversation with the people around the world. In this paper, several situations will be chosen in the films to teach small talk strategies.

It is important for EFL students to develop communicative competence through animated films. Ultimate goal of this study is to teach small talk strategies in English. Classroom activities using Frozen are suggested for students to develop communicative competence.

Animated feature films can be effective tool to study English. Children enjoy watching animated films and learn authentic English expressions easily. Adult students also can use animated films to develop small talk strategies. Paietta (2007) suggests that “cinema is a powerful medium in the world today. Sometimes it is difficult to judge when a film reflects its society and when a film affects its society. Watching a film can have more of an impact than reading a book, especially in this digital age when people claim they do not have enough time for reading.”(p. 1). Most animated feature films have been produced based on the books. Children’s literary books can be important tool to study English, especially for the EFL students who have limited English proficiency.

There are many excellent animated feature films produced by Hollywood. Children and also adults can learn a lot of useful expressions through animated feature films. In this paper, the researcher is going to use musical film Frozen (2013) to teach small talk strategies. The examples of animated musical films are Beauty and Beast (1991), Aladdin (1992), Frozen (2013) and others. It is a good opportunity to appreciate music and culture through films. In this paper, songs and lyrics will be applied to teach small talk strategies.
II. USING FILMS IN THE EFL CLASSROOM

Speaking English is more than short communication in fragmented patterns. Using fragmented and unnatural recorded conversation, students cannot get carry quality communication. In the current society, students should be able to express their thoughts in English. They need to learn real communication which is used in the English speaking countries. To accomplish these goals, the authentic materials should be used to help students. Students are supposed to be exposed to the authentic and natural environment. When students are exposed to the films with different themes, they can learn expressions of different topics. EFL students need to be knowledgeable in various topics if they want to carry conversation with other educated people in the international occasions. They need to be equipped with solid knowledge which means the importance of background knowledge of the world. The more students have knowledge about the various topics, the better they can carry quality communication with other educated people from the different countries.

Films can be excellent authentic textbooks since movies deal with all aspects of possible human lives. According to Seferoglu (2008), "feature films are contextually rich sources of authentic material which can be exploited in the language classroom" (1). Film based syllabus can be created using similar themes. Costanzo (1992) suggested the following themes: film and literature, leading themes including growing up, the back experience, overcoming handicaps, school days, nature versus the human race, the world looks at war. In English classes, creating thematic based teaching with recent movies can be used so that students can get the most of it through movies. In this paper, the researcher chose films on music or musical films.

III. DEVELOPING SMALL TALK STRATEGIES

Various types of music have been used to please human beings throughout the history. Musical films are produced based on lyrics and tunes which most people enjoy in the daily life. When students are exposed to the music and lyrics, they tend to lower the affective filter and eventually they tend to recite lyrics automatically. This will lead to successful language learning. Musical films are all about music and story. They are composed with songs and story lines. The representative musical films are based on the animated films produced by Walt Disney Pictures. When children watch these kinds of musical films, they become familiar with the lyrics and music. Eventually, they can learn English and useful expressions. Frozen (2013) is an animated musical fantasy comedy film. Frozen is based on Hans Andersen’s fairy tale Snow Queen. Most people enjoyed watching this film and they loved songs such as Let it go and For the first time in forever.
Several situations to use the English effectively will be chosen to teach useful expressions for EFL college students. Even children enjoy using various expressions and they like to use them in the meaningful situations. For example, students can learn the following small talk strategies through Frozen:

a) How to propose
   Hans: Can I say something crazy? Will you marry me?
   Anna: Can I say something crazier? Yes!

b) How to be polite:
   Kristoff: What is the magic word?
   Sven: Please!

c) How to make a joke:
   Kristoff: Hang on. You mean to tell me you got engaged to someone you just met?!

d) How to apologize:
   Anna: I am so sorry about what happened. If I’d known.
   Elsa: No, it’s okay. You don’t have to apologize….

First time in Forever, Reprise
Anna: Please don’t slam the door. You don’t have to keep your distance forever.
   Cause for the first time in forever, I finally understand.
   For the first time in forever, we can fix this hand in hand.
   We can head down this mountain together.

IV. CLASSROOM APPLICATION

Animated musical films can be useful medium to teach small talk strategies. While listening to the music and lyrics, students can learn the useful expressions effectively. The following ways can be applied in the English classroom.

a) Developing listening comprehension using trailer of the films.
b) Developing reading comprehension using short clips of the films
c) Developing speaking comprehension using role plays
d) Developing presentation skill
e) Developing writing: dictation, writing reflective journal
It is important to choose various short clips to teach different situations in the classroom. The more students are exposed to the meaningful situations, the better they can learn useful expressions which they can use in the real life situations.

V. CONCLUSION & IMPLEMENTATION

Developing small talk strategies is important for EFL students to manage successful conversation with other English speakers. Through various situations in the animated feature films, students will learn how to lead meaningful conversation with the people. In this paper, several situations were chosen in Frozen to teach small talk strategies. It is important for EFL students to develop communicative competence to be successful in the global society. Classroom activities using Frozen are suggested for students to teach small talk strategies.

Saudi Arabia is now starting initiatives for inclusion of children with disabilities in public schools and preschools. This study aims to investigate to what extent are preschool teachers ready for inclusive practices in their classes by asking five research questions; one for each area covered by the Organizational Change Recipients' Beliefs Scale: discrepancy, appropriateness, efficacy, principal support, and valence. Preschool teachers in Jeddah, Saudi Arabia will be contacted to fill an online survey. Quantitative data will be used to report teachers’ responses on the five areas targeted in the survey to indicate their readiness for implementing inclusive practices. Qualitative data from the open-ended question will be analyzed using a content-driven, thematic analysis.

Key words: inclusion, inclusive education, preschool teachers, readiness for change
An Empirical Assessment of the Study Process Questionnaire: A Business School Application

An Empirical Assessment of the Study Process Questionnaire: A Business School Application

The purpose of this study was to investigate the learning approaches utilized by students in an undergraduate business program. The first objective was to conduct an empirical analysis of the Study Process Questionnaire (Biggs 1978, 1987) to assess the reliability and validity of the scale and determine support for the two-approach vs the three-approach model of learning. The second objective was to develop a classification schema to determine the degree to which business students adopt a consistent learning approach or a hybrid learning approach in the course of their studies.

Consistent with Biggs’ original model, this study showed support for six learning constructs in the three-approach model. Cronbach’s alpha, factor loadings produced by exploratory factor analysis and model fit statistics produced by confirmatory factor analysis provided evidence that the Study Process Questionnaire is a reliable scale, demonstrating unidimensionality, convergent validity, discriminant validity and measurement model validity.

The classification analysis, however, suggested not all students adhere to a consistent learning approach. While the majority of the students were classified as surface approach (surface motive and surface strategy), deep approach (deep motive and deep strategy) or achieving approach (achieving motive and achieving strategy), 46% of the respondents were classified as favoring a hybrid learning approach. As detailed in this study, a significant number of surface motivated and deep motivated students were likely to pursue an achieving strategy and the achieving motived students were equally split between the adoption of a surface or achieving strategy.
The study concludes with a call for research to help determine if this result validates the two-approach model where the achieving approach is split between the surface and deep factors (e.g., Niles, 1995; Watkins & Dahlin, 1997) or if a student’s learning strategy is influenced by factors other than motivation such as the learning environment and context (e.g., Jackling 2003; Baeten, Dochy and Struyven, 2013).

Service Learning in Pacific Island Contexts: How Tertiary-Level Institutions Address Community and Indigenous Issues

I. Introduction

Service learning is a well-established and remarkably prevalent feature of American secondary and post-secondary education, yet it has received relatively little attention in Japanese educational contexts. While it has been adopted by a handful of schools, service learning remains an unfamiliar concept to many teachers and administrators in Japan. Accordingly, the purpose of this paper is to: a) introduce the principles and practice of service learning to educators in Japan; b) provide examples of successful service learning programs and activities at tertiary-level institutions in the U.S., particularly in the Pacific region; c) describe how these programs address community needs and, in some cases, promote awareness of indigenous issues, traditions, and values; and d) show how participation in service learning activities may be beneficial for Japanese students. Based on this discussion, recommendations for constructing culturally-appropriate service learning programs in Japan will be provided.

II. Introduction to Service Learning

A. What is service learning?

1. Definitions

Definitions and descriptions of service learning are abundant and evolving. Some examples will serve to illustrate this point and the concept itself:

“Service learning is a teaching and learning method that connects meaningful community service experiences with academic learning, personal growth, and civic responsibility. Service learning enhances what is taught in the college by extending student learning beyond the classroom and providing opportunities for students to use newly acquired skills and knowledge in real-life situations in their own communities” (Franco, 2002, p.8).

“Service-learning is a structured learning experience that combines community service with preparation and reflection. Service-learning provides college and university students with a ‘community context’ to their education, allowing them to connect their academic coursework to their roles as citizens” (Seifer and Connors, 2007, p.5).
“Service-learning is an educational method that combines service objectives with learning objectives with the intent that the activity changes both the recipient and the provider of the service. This is accomplished by combining service tasks with structured opportunities that link the task to self-reflection, self-discovery, and the acquisition and comprehension of values, skills, and knowledge content” (National Service-Learning Clearinghouse, n.d.).

“Service learning is a teaching method that combines community service with academic instruction as it focuses on critical, reflective thinking and civic responsibility. Service-learning programs involve students in organized community work that addresses local needs, while developing their academic skills, sense of civic responsibility, and commitment to the community” (Campus Compact, n.d.).

“Service learning is the intersection between classroom work and community work. The work you do in the community [helps] inform your learning in the classroom, and you should take skills and ideas that you learn in the classroom with you as you work in the community. The learning is [made] meaningful and deliberate through reflective thinking” (Hawai‘i Pacific University, n.d.).

“Service learning combines the best of active learning and citizenship by connecting course content with service projects that help the community. It is a powerful way of understanding course material by learning from experience…. Service learning is all about connecting what you’re learning in class to the real world. It helps you find relevance in the material you’re learning and exposes you to real-life situations to enhance your understanding” (University of Hawai‘i at Manoa Service Learning Program, n.d.).

Service learning has further been characterized as a high-impact teaching practice that engenders engaged scholarship and serves as a channel for transformative learning (Souza, 2008). As indicated in the preceding definitions, it is distinguishable from other forms of volunteer service because, rather than simply being a community work experience, it involves a structured educational process that is embedded in school curricula, with the service assignments having strong links to course content. These and other core components of service learning will be described briefly below.

2. Core Components

a. Community involvement

One of the key elements of service learning is community service work. Students are asked to spend a specified number of hours (normally 20) during a semester
working with a community partner. The work students do should be both relevant to their coursework and meaningful to the community, and the community service agencies should be considered as equal partners with the university in the development and formulation of service assignments (Howard, 2001). By collaborating with community partners to design worthwhile service activities, universities build reciprocal helping relationships that benefit all parties: the students, the university, the community agency and, by extension, the community itself (Butin, 2010).

b. Coursework

In most cases, service activities are a required and graded component of a standard academic course. The specifics of the service requirement are typically outlined in the course description and detailed in the course syllabus so that students understand in advance what will be expected of them. Instructors will usually work with student services staff at their institution to coordinate community service placements for their students, though they may also take the initiative to contact and make arrangements with community agencies on their own. Importantly, efforts are made to insure that the types of community service work that students become involved with are directly related to course content. Students’ work experiences are discussed periodically during class time, and assignments are given throughout the course that encourage students to reflect on their service experiences and relate what they have learned in the community to course themes. The instructor determines how to evaluate those assignments, as well as how to assess the students’ overall performance on the service component of the course.

c. Reflection

A crucial and distinguishing feature of service learning is reflection. Students are asked to reflect on their community service experiences, both while their work is on-going and after their service has been completed, and make note of any insights or personal discoveries they may have had. This process creates an opportunity for students to think critically about what they have observed in the community, analyze their own reactions, and find what was most meaningful for them in the service encounter. It also leads students to consider the relevance of what they have studied in class to the real-world issues that they have been dealing with during their community involvement. Reflection exercises often include classroom discussions and sharing of students’ service experiences, group work, presentations, reaction papers and other types of personal essays, and the keeping of a journal to record impressions and insights gained throughout the semester. By participating in these types of reflection activities, students deepen their understanding of themselves and their relationship to
others in the community. Because of the insights it provides, reflection is one of the most valuable aspects of the service learning experience.

3. Benefits of service learning

The benefits of service learning are many, varied, and well-documented. Service learning programs have been shown to be beneficial to all parties involved: students, teachers, schools, partner agencies, and the communities being served. To begin with, service learning has the potential to have a profound effect on an array of student goals, including academic, civic, social, and career development goals (McLaughlin, 2004). Research indicates that exposure to well-designed service learning pedagogies enriches students’ academic learning and performance, critical thinking skills, and moral development (Astin and Sax, 1998; Eyler and Giles, 1999; Prentice and Robinson, 2010; Rhodes and Howard 1998). As a result of participation in service learning courses, students have been shown to make significant gains in writing skills (Wurr, 2002) and have improved performance on examinations (Mpofu, 2007). In addition, students become better able to both understand and analyze complex problems (Batchelder and Root, 1994; Eyler and Giles, 1999), and through reflection activities they often gain mastery of content that they otherwise might not achieve (Eyler and Giles, 1999; Pasek et al., 2006). Service learning pedagogies also serve to increase students’ intrinsic motivation for learning course-based materials (Covitt, 2002; Furco, 2003).

Furthermore, service learning may act as a vehicle for career exploration. Through their experiences with service agencies, students make contacts in the community and gain exposure to real-world working situations. While providing an opportunity to develop skills for future employment, such experiences may also spawn insights that help students to clarify their professional goals and more realistically assess their intended career paths (Lascell, 2014).

Importantly, research has shown that one of the primary benefits of service learning is instilling in students a heightened sense of civic and social responsibility (Kendrick 1996). Service work fosters in students a strong sense of connection to their community as they become active participants in civic affairs. Moreover, working with community leaders provides students with role models who may inspire them to become more involved in community issues while also helping them discover their own leadership qualities (McLaughlin, 2004).

Lastly, and perhaps most crucially, service learning has been shown to be a catalyst for the development of empathy (Astin et al., 2000; Eyler, Giles, and Braxton, 1997; Lundy, 2007; Simons and Cleary, 2006; Wilson, 2011). As a result of participation in service learning courses and activities, students often become
more empathetic and more accepting of diversity in all forms—generational, cultural, racial, etc.—transforming previous stereotypical thinking into respect for others (Langstraat and Bowdon, 2011; Rosenberg, 2000; Torsney, 2012). An enhanced and expanded worldview allows students to feel more comfortable working with and helping others who are different from themselves. This in turn often leads to increased trust in peers and adults, as well as an increased sense of self-esteem (Weiler et al., 2013).

As previously mentioned, the benefits of employing service learning curricula extend beyond those pertaining to students. Faculty members may also find incorporating service learning into their courses to be an advantage in that it provides a platform for creating a more hands-on, experiential approach to teaching and learning (McLaughlin, 2004). Utilizing the service learning approach takes the educational experience beyond the classroom and establishes a more realistic learning environment; in other words, it increases the relevancy of education for students. Teachers frequently find that students are able to apply concepts from the classroom to their service and, conversely, are eager to take what they learn and experience in the field and use it to make contributions that enrich classroom interactions. In these ways, service learning adds a unique and stimulating dimension to the teaching design (Guam Community College, n.d.).

For their part, schools find that offering service learning programs gives them the opportunity to be active, engaged partners in the community. Along with developing community partnerships, schools are better able to invite students to become active community members, thereby promoting civic and social responsibility as well as academic development. Overall, by implementing service learning programs as an educational strategy, schools may cultivate a more cooperative and inclusive school climate and culture (Edina Public Schools, n.d.).

Finally, community groups and agencies may benefit from participation in service learning programs in numerous ways, including: establishing mutually beneficial school-community partnerships; increasing human resources for services and problem-solving; profile-raising through increased public awareness of the issues the agencies deal with and the services they provide; and mentoring and nourishing young people who may in turn show their appreciation by devoting considerable energy to their causes over time (Roehlkepartain, 2007). Needless to say, these positive outcomes reverberate among the community members who are recipients of the services provided by the participating community organizations.
III. Service Learning in Pacific Island Contexts

A. Hawai‘i Pacific Islands Campus Compact

For the purposes of this paper, I will focus attention on educational institutions that are members of the Hawai‘i Pacific Islands Campus Compact (HIPICC). HIPICC is a part of the National Campus Compact, a coalition of over 1,100 colleges and universities across the United States committed to linking schools to their respective local communities through the growth and development of campus-based civic engagement. The National Campus Compact “promotes public and community service that develops students’ citizenship skills, helps campuses forge effective community partnerships, and provides resources and training for faculty seeking to integrate civic and community-based learning into the curriculum,” and its affiliated HIPICC member schools are “dedicated to enhancing students’ sense of personal and social responsibility, citizenship, and awareness of the unique communities and peoples of Hawaii, American Samoa, and the Pacific basin, while reinvigorating higher education’s concern for improving the quality of life in society” (University of Hawai‘i at Manoa Service Learning Program, n.d.).

HIPICC consists of 17 member institutions (see Appendix 1 for a complete listing). 14 institutions are located in Hawai‘i and three elsewhere in the Pacific region, these being American Samoa Community College, Guam Community College, and Northern Marianas College; 14 are public institutions and three are private, namely Brigham Young University Hawai‘i, Chaminade University, and Hawai‘i Pacific University; eight are colleges or universities, eight are community colleges, and one—the East-West Center—is a research institute. HIPICC operations are coordinated by the Office of Undergraduate Education Service Learning Program at the University of Hawai‘i at Manoa. In this paper, I will report on the service learning programs at four HIPICC member institutions: American Samoa Community College, Guam Community College, Northern Marianas College, and the University of Hawai‘i at Manoa, with particular emphasis on the programs organized by the University of Hawai‘i at Manoa.

1. American Samoa Community College

Upon joining HIPICC, American Samoa Community College (ASCC) established a Service Learning Office on its campus and set several goals. The first goal was to introduce administrators and faculty members to the new Service Learning Program and demonstrate the ways in which service learning would enhance ASCC’s academic programs. To this end, 15 faculty members from various departments were provided with support to attend conferences in several states in the U.S. at which they could interact with their counterparts from similar
academic disciplines. In one case, teachers of Samoan language studied about oral history with Hawaiian language teachers. These two Polynesian languages and cultures have many similarities, with oral rather than written communication as their base. The Samoan language teachers found that service learning could be utilized as a pathway for their students to interview the elders in their communities, transcribe their stories, and compile them in a booklet that could be preserved and enjoyed by their respective families.

The second goal set by ASCC was to integrate service learning in college courses, not only as student-centered pedagogy but as a way to authentically serve the community. To meet this goal, departments were empowered to take ownership of the Service Learning Program in their own disciplines and decide for themselves how to best meet community needs. Because the very concept of service is a vital part of Samoan culture, participating departments found that both students and community partners were very receptive to the idea of developing service-based relationships. Taking one example, psychology and sociology students were asked to participate in outreach activities at a Catholic home for the elderly. The students primarily spent time conversing, singing, and playing games with the elderly residents. Most of these students were quite used to taking care of their own grandparents at home, so they felt comfortable in this setting and thoroughly enjoyed their fellowship with the residents. In fact, some students continued to visit the home even after their required hours of service were completed. The residents, for their part, were also greatly appreciative of the students’ visits.

ASCC’s third goal was to build service-based relationships with both the public and private sectors of the community. The Department of Business Management, for example, is now working closely with the tax office in American Samoa to assist low-income families in filing their taxes. As a result of this partnership, students on service learning assignments have been able to gain important professional skills while providing services to a segment of the community greatly in need of their assistance. Moreover, some ASCC students have been hired directly into full-time positions at the tax office after completing their degrees.

Considering another example, as part of its commitment to building community relationships, the English Language Institute at ASCC now offers summer reading programs at public and private elementary schools, libraries, churches, village centers, and private homes. Students enrolled in reading classes in the Institute’s developmental program teach these courses, thereby sharpening their own reading skills and gaining practice in teaching while fulfilling their own service learning requirement.
Overall, ASCC currently has eleven academic departments managing their own service learning programs. In addition to the community partners already mentioned, department initiatives have extended service to hospitals (Health Science department), a prison (Social Science department), and the ASCC campus community (Mathematics department). Furthermore, the Business Management department has arranged service activities in the neighboring island nation of Western Samoa and a global outreach program in New Zealand. Some of the instructors involved in the initial establishment of service learning programs at ASCC now hold administrative posts and serve as deans, directors, and vice-presidents, thus ensuring continued administrative support of service learning endeavors at the school (E. Faalafi, personal communication, October 28, 2016).

2. Guam Community College

Service learning programs at Guam Community College (GCC) are coordinated by the Center for Student Involvement (CSI). CSI helps individual teachers make connections with a wide array of community-based organizations that are willing to participate as host institutions for service learning placements. CSI has links to over 80 such organizations in Guam. Teachers choose organizations that match up best with their course content and design service learning components that are directly linked to curriculum. Teachers are then responsible for monitoring students’ service learning experiences. CSI assists this effort by supplying teachers with a packet of materials that includes a Student Agreement Form, Community Based Organization Letter, Student Time Log Sheet, Student Reflection Paper Outline, and Student Evaluation Survey. As for students, in addition to the work that they do off campus, they are normally asked to share their experiences with others in class via presentations and group discussions. They also write reflection journals and papers and receive feedback on these from their teachers.

Examples of departments and courses at GCC linking curriculum with community-based work include: Accounting, which places students with the Guam Girls Scouts to assist with accounting and inventory of supplies and equipment; American Sign Language, which connects students with the Guam Special Olympics and which also sponsors an annual Deaf Expo on campus; Early Childhood Development, which connects students with Island Girl Power to tutor elementary and middle school girls; Math, which sponsors an on-campus Math Carnival consisting of math-oriented games and activities; and Science and Botany, which place students in agencies where they have the opportunity to do environmentally-oriented fieldwork.
While many courses at GCC feature service learning, there is no general requirement at the school for service learning participation. That is, students have the option of choosing courses in which service learning is a requirement, but they may also choose to forgo such courses. According to CSI, those who choose courses that require service learning do so for a variety of reasons, including a desire to begin networking for job opportunities after graduation, as well as simply having a desire to take part in volunteer work to help others.

CSI reports that, in addition to its prevalence in tertiary-level education, service learning is now a staple feature of public high school education in Guam, with 75 hours of work being required of each student before graduation. Civic engagement and service learning activities have also become popular at many junior high schools, though much of the work takes place within the schools rather than outside. Thus, it may be the case that some students at GCC choose courses that involve service learning because of their previous positive service learning experiences in junior and senior high school (B.L. Guerrero, personal communication, July 17, 2015).

3. Northern Marianas College

Northern Marianas College (NMC), located on the island of Saipan, the largest island in the Commonwealth of the Mariana Islands, has operated service learning programs for the past several years with the goals of promoting the value of service and developing servant leadership among its students. To accomplish these goals, NMC has established close working relationships with a variety of community partners. Focus areas have included marine and coastal resources, environmental awareness and stewardship, and community health services. NMC’s programs initially involved partnerships between four community agencies and three academic departments offering nine college courses. A total of ten faculty and staff members helped provide support to over 100 student participants.

More recently, NMC has utilized an outcome-based approach to its service learning projects. According to materials provided by NMC staff (Northern Marianas College 2015), three specific outcomes have been targeted, as follows:

Outcome #1: Implementing a student-driven project to engage students in promoting awareness of the benefits of alternative energy resources and the investments needed to implement their use in the Commonwealth of Northern Mariana Islands.

Outcome #2: Introducing strategies to reduce energy consumption at three community partner sites.
Outcome #3: Partnering with three to four instructional faculty to design and integrate service learning projects into courses in order to support student interest in environmental, energy, and health issues in the Commonwealth.

To achieve these outcomes, new community partners were developed through initiatives and project plans presented by students enrolled in courses whose faculty were identified as being affiliated with the NMC service learning program. New course/faculty partnerships were developed based on faculty commitment to integrating service projects into the curriculum that addressed either environmental, energy, or health-related issues in the community. Faculty who expressed commitment to integrating service learning projects into courses were invited to participate in a service learning information and orientation session.

Additionally, a week-long event was held on the NMC campus to promote service projects in the college community, and presentations were made by students participating in service learning projects. These students also engaged in round-table discussions to identify strategies for effective community outreach as well as for increasing public awareness of alternative energy resources and methods for reducing energy consumption. As part of their program training, service learning students were divided into base groups and participated in various team-building exercises. By means of discussion and debate, academic and social competition, and other group projects, members of these base groups learned to support one another while acquiring skills useful for their college lives. Lastly, to enhance and bolster their self-understanding, students were required to keep reflection logs in which they reported their observations of and reactions to their service learning experiences.

As can be seen in the above descriptions, students at NMC not only participated in service projects, they were actively involved in each stage of the development of the service learning program itself. In this sense, they were utilized as responsible partners for the advancement of service learning at NMC (L. Pangelinan, personal communication, August 28, 2016).

4. University of Hawai‘i at Manoa

The University of Hawai‘i at Manoa (UHM), the flagship campus in the University of Hawai‘i system with an enrollment of over 20,000, extensively promotes service learning for its undergraduate students. Service learning programs are coordinated by two separate offices: the previously mentioned Office of Undergraduate Education Service Learning Program and the College of Social Sciences Program for Civic Engagement and Service Learning.
a. Office of Undergraduate Education Service Learning Program

The Service Learning Program (SLP) at UHM’s Office of Undergraduate Education began its operations in 1994. It supports professors who wish to include a service learning component in their courses by helping to arrange fieldwork opportunities for their students in relevant community organizations (that is, with those organizations whose missions are aligned with the professor’s course content). SLP currently has links with over 175 community organizations and agencies in Honolulu. Additionally, it provides service learning orientations for classes, and it encourages and helps UHM faculty members involved in service learning to network and share ideas and experiences with one another. In these ways, SLP functions as both a guide for and an active link between professors, students, and community partners.

In addition to the activities described above, SLP also administers the Manoa Service Award, a scholarship program in which selected students receive assistance with tuition plus $1000 per term in exchange for completing 100 hours of service-related work on campus and in the community. This is a rare example of student service work being supplemented by financial incentives (University of Hawai‘i at Manoa Service Learning Program, n.d.).

b. College of Social Sciences Program for Civic Engagement and Service Learning

The Program for Civic Engagement and Service Learning at UHM’s College of Social Sciences (CSS) is modeled on the idea that “giving something back to the community is an important college outcome, and...working with community partners is good preparation for citizenship, work, and life” (Prentice and Robinson, 2010). Civic engagement, a broad term that encompasses service learning and other community-related activities, has been defined as “working to make a difference in the civic life of our communities and developing the combination of knowledge, skills, values, and motivation to make that difference. It means promoting the quality of life in a community through both political and non-political processes” (Ehrlich, 2000). According to CSS materials, civic engagement involves “actions wherein individuals participate in activities of personal and public concern that are both individually life enriching and socially beneficial to the community” (University of Hawai‘i at Manoa College of Social Sciences, n.d.). For students, civic engagement may include community-based research, participation in service-learning classes and projects, or other types of community service activities.

To achieve its aims of promoting civic engagement and addressing vital community issues, the CSS program coordinates a variety of interdisciplinary
service learning programs and projects for CSS students and faculty. Many of these projects are also open to students and faculty from other tertiary institutions on O’ahu. The program allies itself with numerous community groups, organizations, and agencies, working closely with them towards the shared goal of improving living conditions for Native Hawaiians as well as other Pacific Islanders and immigrant groups in Hawai’i. More specific objectives include combatting racism and discrimination while improving health, education, housing, and employment opportunities for the previously mentioned groups.

CSS students who participate in service learning or other community-engaged projects as part of their course requirements receive credit for the hours that they devote to community work. In this way, students’ community service activities, coupled with related class discussions and reflection assignments, constitute a significant and meaningful portion of their coursework.

Faculty development is also a goal of the CSS program. Program-related materials state that CSS “offers professional development through mentoring, workshops, institutes, and conferences, and help with curriculum and community-relations development, student-learning outcomes and assessment, research, and publication” (University of Hawai’i at Manoa College of Social Sciences, n.d.).

It is worth noting that the CSS Program in Civic Engagement and Service Learning is centered in its Ethnic Studies department. The Department of Ethnic Studies at UHM places emphasis on Pacific and Asian peoples and is a leader in the emerging sub-field of Oceanic ethnic studies. It focuses on an array of issues associated with “key words in the field: indigeneity, race, culture, ethnicity, class, labor, migration, property, land, aloha ʻaina (love and reverence for the land), sustainability, community, gender, sexuality, and pedagogy” (University of Hawai’i at Manoa Department of Ethnic Studies, 2015). The department embraces a research and teaching philosophy emphasizing direct civic involvement and the application of academic theories to complex community concerns. In keeping with this approach, the department maintains “a commitment to ongoing interactions with local communities on the basis of mutual respect and a two-way exchange of knowledge” (University of Hawai’i at Manoa Department of Ethnic Studies, n.d.). This attitude of respect for collaborating community partners and their bases of knowledge is reflected in the many service learning projects that the Ethnic Studies department has initiated and oversees. The most prominent of these projects will be described below.
Programs addressing Hawaiian and Pacific Island history, culture, and environmental issues

(a) Malama I Na Ahupua’a

Malama I Na Ahupua’a is an environmental and cultural program focusing on environmental protection and traditional Hawaiian practices of land stewardship. It is open to UHM students and students from all member institutions of the Hawai‘i Pacific Islands Campus Compact. Participants are allowed to bring friends and family members, particularly children, with them to the activities. This is encouraged, in fact, in recognition of the importance of both families and hands-on learning in Pacific Island contexts.

Concerning the name, malama in Hawaiian means to take care of, tend, preserve, or protect. An ahupua’a is a traditional division of land, usually running from the mountains to the sea and extending out to the reef. In ancient Hawai‘i, those residing within an ahupua’a had access to diverse ecological zones (i.e., uplands, plains, and coastal areas). By utilizing the resources of these zones in a sustainable manner, they were able to function as self-sufficient communities. Following in this tradition, Malama I Na Ahupua’a emphasizes environmental preservation and stewardship of particular land and sea areas through sustainable use of resources and practices promoting food sovereignty. The program aims to give students a sense of place and an appreciation of native Hawaiian practices of sustainable living by creating a pool of shared knowledge and a wealth of hands-on experience. Activities include outdoor experiences in the uplands, midlands, and lowlands, and range from difficult manual labor to the collection of oral histories. All are designed to shed light on the relationship of people and the environment in Hawai‘i, and to illustrate the traditional Hawaiian approach to self-sufficient and sustainable living.

(b) Ka Holo Wa’a

Ka Holo Wa’a, meaning ‘the voyaging canoe’, is a canoe-building and intercultural sharing project designed to give college, high school, and middle school students a chance to help construct a three to four-meter canoe in traditional Micronesian style using natural canoe-building materials. In the initial project, students worked under the tutelage of the master carver Plasito Eseluquipi from the Micronesian island of Satawal. Plasito is the son of the master navigator Mau Piailug, also from Satawal, who in the mid-1970s helped Native Hawaiians reestablish their knowledge of traditional open ocean navigation and wayfinding methods by guiding the newly-built Hawaiian voyaging canoe Hokule’a from O’ahu to Tahiti. He was quoted as saying at the time, “I have placed the stick [bridge] between Micronesia and Polynesia. I like
we make one family” (University of Hawai‘i at Manoa College of Social Sciences, n.d.). The Ka Holo Wa‘a project, which is subtitled ‘Creating Oceanic Pathways—Walking the Stick of Our Ancestors,’ is meant to follow in this spirit by continuing to rebuild and strengthen the reciprocal relationship among the peoples of Oceania. By creating a canoe together, young people from Hawai‘i and recent immigrants from Micronesia, who often have a tense and antagonistic relationship in the schools and on the streets of present-day Honolulu, are able to ‘walk the stick’, or cross the bridge, of their ancestors and find a shared, essential point of their traditional backgrounds. The canoe, then, represents both the physical and symbolic or spiritual connection between Native Hawaiian and Micronesian history and culture.

Carving of the canoe takes place at Ho‘olu Aina, a community partner dedicated to cultural education, environmental sustainability, and community transformation, which manages 100 acres of forest land at the back of Kalihi Valley on O‘ahu. At this site, additional field activities are offered to facilitate cultural and environmental learning. These include gathering the natural materials needed to build various parts of the canoe, such as the ‘iako (crossbeams), ama (outrigger), kia (mast), pe‘a (sail), hoe uli (steering blade), and kaholo, kumuhele, lanalana, kumupou, and pau-o-lu‘ukia (various types of cordage for lashing). By gathering these materials students become intimately familiar with the landscape and its foliage and more knowledgeable of the steps in the canoe-building process and the vital role that the natural elements played in Hawaiian and Pacific Island cultural practices.

Some participants in this project are also provided experience in sailing a previously constructed canoe, the Kanehunamoku, which is a replica of an eight-meter double-hulled traditional coastal sailing vessel. These students spend 25 hours during the semester learning about the parts and functions of the canoe, along with traditional sailing and navigational skills. They later take part in a canoe festival that is held annually on Oahu’s east shore, sharing what they’ve learned with local community members.

(c) Kaho‘olawe

Kaho‘olawe, the smallest of the eight major Hawaiian islands, was used during World War II and for decades afterwards as a training ground and bombing range by the United States military. After many years of protest by Native Hawaiians, jurisdiction over the island was returned to the State of Hawai‘i in 1994. The island is now protected by the State and designated, along with its surrounding waters, as the Kaho‘olawe Island Reserve. Access is controlled and is limited to selected individuals and groups involved in conservation and restoration efforts and to those whose visits are related to Native Hawaiian
cultural and spiritual practices. Students participating in this project have the unique opportunity to visit the island for several days and assist the Protect Kaho'olawe 'Ohana and the Kaho'olawe Preservation Commission in their efforts to document Hawaiian archeological sites. Students also assist in cleaning up designated areas, replanting native grasses, shrubs, and trees, and developing plans for the revitalization of the island.

(d) Native Hawaiian Initiative

The Native Hawaiian Initiative seeks to “expand the network of faculty cooperating across disciplines to inspire and support research and teaching strategies grounded in Hawaiian values and knowledge systems...[in order to] strengthen learning, social sciences literacy, critical thinking, and student leadership while building strong programs for community engagement and supporting a meaningful and productive home base for indigenous students at the College of Social Sciences” (University of Hawai’i at Manoa College of Social Sciences, 2015). CSS currently has eight Native Hawaiian faculty members and offers more than 40 courses with a Hawai’i or Pacific focus, many of which include a service learning component. In addition to their regular duties on campus, CSS faculty also participate in special programs focused on Native Hawaiian issues such as the following:

--Kupopolo Heiau Field School: A three-year archaeological field school and oral history project on Oahu’s North Shore that trains undergraduates, graduates, and community members in archaeological and ethnographic methods as well as cultural and social protocols. The school responds directly to the needs of the Hawaiian community in the areas of cultural resources management, historic preservation, and burial sites protection.

--University of Victoria Indigenous Governance Graduate Exchange: A University of Hawai’i-University of Victoria graduate exchange program in which students study local, indigenous ways of theorizing and practicing land use, both in the past and at present, and explore how these concepts might be applied in different contexts. Two key concepts that are investigated are kuleana (rights, responsibilities, obligations, and authority) and sustainable self-determination.

(2) Programs addressing other community issues and concerns

(a) Pacific Connections

This project involves a network of community groups, organizations, and agencies that are working to improve the living conditions of Native Hawaiians
and Pacific Island immigrant groups residing in Hawai‘i, particularly immigrants from the Micronesian islands. Students provide community service work that targets the improvement of health conditions, education, housing, and employment opportunities for these groups.

(b) Palolo Pipeline

The Palolo Pipeline is an umbrella program consisting of numerous community partners in and around Honolulu’s Palolo Valley. The program’s goal is to improve education and the overall quality of life for residents of the housing projects located in the valley. While emphasizing early childhood education, it aims to “create and sustain a pipeline of educational support that will provide lifelong learning...and help students move through the educational system from pre-school to higher education” (University of Hawai‘i at Manoa College of Social Sciences, n.d.).

Three neighboring institutions of higher education—Chaminade University, Kapi‘olani Community College, and the University of Hawai‘i at Manoa—work together with community partners to support valley residents and their children. Key resource groups for the program are service learning students and faculty members from these three schools. Service learning students may find themselves working at the Palolo Ohana Learning Center, a community center with extensive after-school support programs, or at one of Palolo’s public elementary or secondary schools, with their activities centered around tutoring and mentoring the students of these schools. The Palolo Pipeline has proven to be so successful that it now serves as a model for work in similar low-income areas nationwide.

(c) Project SHINE

SHINE is an acronym meaning ‘Students Helping in the Naturalization of Elders.’ Project SHINE is a national service learning initiative that entails students tutoring elderly immigrants in civics education and English in preparation for the United States Citizenship and Immigration Services Naturalization Test. Funding for the program has been provided over the years by the Corporation for National Service, the U.S. Department of Education, and Learn and Serve America.

In Hawai‘i, Project SHINE functions as a partnership between Chaminade University, Kapi‘olani Community College, and the University of Hawai‘i at Manoa (the same three schools coordinating the Palolo Pipeline) and, aside from the coordinator’s position, is almost entirely student-run. Students participating in Project SHINE normally engage in weekly tutoring sessions of two hours per
week for a total of ten weeks and may receive credit for their work through classes offering SHINE as a service-learning option. Through this experience, students gain exposure to immigration and immigration law, legal and ethical issues related to culture and ethnicity in Hawai‘i and the U.S., and various aspects of poverty in local communities. While developing their teaching skills, students are also able to facilitate and promote the empowerment of an often marginalized set of immigrants in Hawai‘i.

(d) No Mo’ Haus

No Mo’ Haus’ is a project dedicated to helping the homeless in Hawai‘i, with a special focus on children. Student participants often serve as mentors and tutors for children from homeless families at the Next Step Homeless Shelter in the Kaka’ako area of Honolulu. This shelter houses up to 200 people, about one-third of whom are children. A large portion of the people using the shelter are recent immigrants, mostly from Micronesian countries.

Students are asked to put in 25 hours of work during a semester, usually in weekly two-hour sessions. Activities normally include helping children with their homework assignments as well as simply spending time playing with them. Students may also be asked to help with serving food or assisting in other useful ways at the shelter. After they have become familiar with the shelter and comfortable with their work there, students with time and enthusiasm are given the chance to create a special program for the residents. These programs might be educational in nature or set up just for fun. Examples of previous programs include a Valentine’s Day breakfast event; Surf to Serve, a weekend surfing activity; and an English as a second language class offered for older shelter residents. In some cases, students may be granted permission to conduct research at the shelter, though this requires first showing commitment to, and building trust with, shelter residents and staff.

(e) Local 5

Local 5 is part of an ongoing collaboration between the Department of Ethnic Studies at UHM and Local 5, a labor union representing over 11,000 hotel, health care, and other service industry workers throughout Hawai‘i. The purpose of the program is to “expose students to the issues affecting working families and to…raise awareness and encourage students to become agents of social justice and social change beyond the university” (University of Hawai‘i at Manoa College of Social Sciences, n.d.). The program provides opportunities for students to learn about grassroots and union organizing by working with Local 5’s community and political organizers and participating in Local 5’s Hotel
Workers Rising Campaign. Students may also conduct community-based research as part of their participation in this program.

(f) Other programs

Other programs coordinated by the Department of Ethnic Studies at UHM as part of the College of Social Sciences Program for Civic Engagement and Service Learning include:

--Hawai‘i Plantation Village: Students work at the Hawai‘i Plantation Village, an outdoor museum of Hawaii’s multicultural plantation history, assisting in docent training, website development, systematization of historic photos, oral histories, and other documents, and organization of special events.

--Bridging the Digital Divide at Kuhio Park Terrace: Students assist children and adults at the Kuhio Park Terrace housing project in acquiring and/or improving computer literacy skills.

--BIN-I Program: Students assist the Office of Multicultural Student Services at UHM with its tutorial program for immigrant students enrolled in public schools in Honolulu.

As the many examples given above illustrate, member schools of the Hawai‘i Pacific Islands Campus Compact have a clear dedication to civic engagement and the service learning process. Each institution has worked to develop an extensive set of community partnerships and to establish a broad assortment of service learning programs that deepen and enhance the educational experience of their students while addressing local community concerns and historical, cultural, and environmental issues pertinent to the indigenous populations of Native Hawaiians and Pacific Islanders.

Turning now to the appropriateness of service learning for Japanese students, the following section will utilize a series of case studies to consider the impact of participation in service learning programs at UHM on study-abroad students from Japan.

IV. Service Learning and Study-Abroad Students from Japan

A. Case Studies
In order to obtain first-hand accounts of the effect of participation in service learning programs on Japanese students studying abroad, interviews were conducted with three such students enrolled at the University of Hawai‘i at Manoa. Although their backgrounds and circumstances varied, all three took courses in the Department of Ethnic Studies that contained service learning components, and as a result they participated in programs run through the College of Social Sciences Program for Civic Engagement and Service Learning, such as the previously described Malama I Na Ahupua‘a, Ka Holo Wa‘a, and SHINE. The interviews with these three students are summarized below.

1. Momoko

Momoko, age 20, is from Okayama Prefecture in southwestern Japan. During her high school days, she saw a Japanese movie (‘Paradise’) that depicted the experience of Japanese Americans in Hawai‘i during World War II. The movie also provided Momoko with her first views of Hawaiian hula. This inspired her to want to live and study in Hawai‘i someday, as well as to begin taking hula lessons in Okayama. When the time came for her to enter college, she deliberately chose a school, Ryukoku University in Kyoto, that had an exchange agreement with the University of Hawai‘i. Momoko majored in Intercultural Communication and continued her hula lessons in Kyoto. As she approached her junior year of studies, she applied for a one-year study abroad program at the University of Hawai‘i at Manoa and was accepted.

Because of her interest in issues pertaining to minority groups, Momoko chose to study in the Ethnic Studies department at UHM. As part of her studies, Momoko took courses on Hawaiian and other Pacific Island cultures. She was not aware, however, that service learning would be an essential component of many of her classes and, in fact, before beginning her studies at UHM she had no idea what service learning was. She eventually participated in several service learning projects, including Malama I Na Ahupua‘a and Ka Holo Wa‘a. Excerpts from her service learning journal, in which she comments on her experiences, are shown in Appendix 2.

Before coming to Hawai‘i, Momoko saw it as a place with nice beaches and good shopping. Her first impression after arriving was of an “urbanized and Westernized” place. Through service learning, however, she says she was able to discover and explore Hawaiian culture in a unique way, and this changed her view of and relationship with Hawai‘i entirely. Momoko describes her participation in service learning activities as a “very special opportunity” that she is thankful for having had. She says that through these activities she developed an interest in self-sufficiency, sustainability, and the preservation of traditional culture. Concerning this last point, she says she was especially
impressed to see Hawaiian *kupuna* (elders) passing down their cultural knowledge to future generations. Finally, experiencing Hawaiian culture in a deep and personal way made her want to learn more about her own Japanese culture, something she hopes to do after returning to Japan.

After graduating from her university back in Japan, Momoko now plans to become involved in international development work. She also hopes to find a way to help promote traditional Japanese culture. She plans to return to Hawai‘i often to continue the relationships she developed through her studies at UHM and, particularly, through her participation in service learning projects.

2. Saki

Saki, age 24, is from Fukuoka Prefecture in southwestern Japan. She began her university studies by attending Seinan University in Fukuoka. While there she studied about Asian Americans in her American history seminar class, and she developed an interest in Japanese Americans in Hawai‘i through independent reading. Saki was generally uninspired by her university courses and longed to do something different. She accompanied her family on a trip to Hawai‘i, and something resonated with her there. She decided to move to Hawai‘i and begin a new phase of her life there.

Saki left her university, came to Hawai‘i, and initially joined a language school to improve her English. Though she had no previous volunteer experience in Japan, she began volunteering at the Japanese Cultural Center in Honolulu. Later she enrolled at Kapi‘olani Community College and became involved with a program for foreign students called the International Café. She worked closely with one of her teachers who introduced her to various service learning activities available through the school.

After completing her studies at the community college, Saki transferred to the University of Hawai‘i at Manoa, majoring at first in Asia-Pacific history and then transferring to Ethnic Studies. Through her involvement in Ethnic Studies courses, she participated in several service learning programs. She was less than satisfied with her experience in SHINE due to what she perceived as a lack of structure in the program and a lack of guidance by the program supervisors. She was especially disappointed by the lack of interaction with other SHINE student participants. Her comments here serve to underscore the importance of proper supervision and guidance in a service learning program, and the necessity of creating ample opportunities for interaction among student participants.

In contrast to her experience with SHINE, Saki was very impressed by the Malama I Na Ahupua‘a program, which she described as being “very fulfilling.”
She noted that the program was “full of surprises” and opened her mind to a different side of Hawai‘i that she didn’t know existed. She was able to discover different places and people that she felt she previously did not have access to as a foreign student.

Saki was greatly impressed at the talks given by the leaders at some of the program sites. She particularly recalled a talk at Ulupo Heiau in which a *kupuna* explained the Hawaiian cosmology, including the story of how humans came to be in the islands. These ideas were different from other belief systems she was familiar with because Hawaiians gave great value to plants as part of the evolutionary process and in fact believed that humans evolved from the taro plant, not from another animal, and not as the creation of a god or gods. This spurred her interest in the Hawaiian understanding of and relationship with nature. It also caused her to reflect on the traditional Japanese understanding of nature, which she felt had many similarities with Hawaiian views. For Saki, the concepts of *aloha aina* (love for the land) and *malama aina* (protecting and caring for the land) encapsulated the Hawaiian viewpoint.

Saki made multiple visits to some program sites, deepening her relationship with the people and places on each visit. With her broadened perspective on Hawaiian people, culture, and traditions, she said she began to feel sorry for the Japanese tourists who had “no clue” about the side of Hawai‘i she was experiencing. Later her feeling changed to one of gratitude for having had the chance to encounter Hawaii’s natural environment and its culture and traditions in a unique way through service learning activities and work on the land. Simultaneously, she furthered her understanding of Hawaiian perspectives through her study of the Hawaiian language, which she said helped her to more readily comprehend the concepts discussed at each of her service learning sites.

After graduating from the University of Hawai‘i, Saki plans to return to Japan to attend graduate school, where she intends to focus on minority issues. She hopes to eventually become a teacher, or perhaps work at a university. When she begins her own teaching career, her hope is to organize service learning and other experiential learning activities for her students. She believes that Japanese students would benefit immeasurably from out-of-classroom, “real life” learning experiences, such as the ones she gained so much from in Hawai‘i.

3. Makiko

Makiko, age 55, is from Kanagawa Prefecture in the Kanto region of Japan. She holds a BA degree in English literature from Tamagawa University in Tokyo. She began studying hula in Japan at age 47. Her Japanese instructor had studied under a well-known *kumu hula* (master hula teacher) from the island of Maui.
named Ku‘ualohanui Kaulia. She gradually became interested in Hawaiian culture, and especially the language, because of the many Hawaiian language oli (chants) and terms used in hula.

With her husband’s encouragement, Makiko came to Hawai‘i to learn more about the culture and language. She enrolled at Kapi‘olani Community College for two years and then transferred to UHM to become a Hawaiian language major. She will earn her BA in Hawaiian language in the near future.

Makiko’s initial exposure to service learning took place at the community college. As a requirement for her botany class, students had the choice of doing research and making a presentation at the end of the term or participating in service learning projects. She chose service learning and, she said, was eventually quite glad that she did. Makiko found the Malama I Na Ahupua’a program to be particularly rewarding. Though she was only required to do 25 hours of work during the term, she ended up putting in well over 30 because she simply enjoyed the experience. One activity in the program that she found stimulating was working at He‘eia Fish Pond. On her first visit she went on a one-hour walking tour of the pond during which she heard about the traditional Hawaiian approach to aquaculture, which she understood to be exceptionally clever. Afterwards, she worked alongside 40 students from various colleges and universities around O‘ahu, clearing brush and helping to maintain and rebuild parts of the pond. When the work was finished, she enjoyed sharing lunch and talking with her fellow students. She said that this was an excellent way to begin new relationships and expand her social network in Hawai‘i.

Makiko believes that though she learned much about Hawai‘i through the study of Hawaiian language and hula, participation in service learning activities significantly strengthened and deepened her knowledge of Hawaiian culture. She said she learned through direct experience how Hawaiians valued and took care of the land and sea, the kalo (taro) and the fish. In other words, service learning provided her with an immersion experience in Hawaiian culture which served to expand and fortify her understanding of not only the language, but of the people and their culture. Furthermore, since most of the communication that took place during her service learning activities was in English, she was also able to hone her English language skills in the process.

Makiko explained that she discovered there is an enormous difference between learning about a language, culture, and place through classroom lectures and the understanding gained by experiencing these things directly as she did through service learning. She believes that in order to fully comprehend a language, one must be very familiar with the culture and customs of the people, the natural environment in which they live, and most importantly the people themselves.
She felt fortunate to have been able to learn about all of this through her involvement in service learning projects.

Makiko believes that there are many similarities between Hawaiian and Japanese culture, including the ancient relationship between the people and their many gods, the naming of different types of winds and rains (as she found in hula chants and songs), and the many ways that nature and peoples' relationship with it is interwoven in the traditional way of life. At the same time she realizes that, though she is Japanese, she really does not know her own culture deeply. As such, her service learning experiences have motivated her to make an effort to learn more about Japanese culture, history, and environment upon her return to her country.

V. Discussion

The preceding sections of this paper have illustrated the pervasiveness of the service learning approach in the educational systems of schools in the Pacific region, as well as the diversity and richness of the programs offered at specific tertiary institutions. The examples given show that successful programs create a strong collaborative bond between faculty, students, and community partners in which all parties become fully engaged in a reciprocally beneficial relationship.

All of the programs described above seek to address the needs of their local communities, while some also promote awareness of indigenous issues, traditions, and values. Of the four schools included in this study, the University of Hawai‘i at Manoa placed the most emphasis on raising awareness of indigenous culture and issues of importance to native people in the community. Programs such as Malama I Na Ahupua‘a, Kaho‘olawe, and the Native Hawaiian Initiative expressly aim to shine a light on traditional Hawaiian culture and values as well as on the pressing contemporary social concerns of the Hawaiian people. Ka Holo Wa’a brings together traditional Native Hawaiian and Micronesian cultural practices in one project, and by doing so builds and enhances the respect that the two communities have for one another.

American Samoa Community College, at least in one of its past programs, also focused on indigenous culture with its oral history project involving elders in the Samoan community. On the other hand, Guam Community College and Northern Marianas College, both in Micronesia, have not designed programs with Native Chamorro culture at their core. This may reflect the differing statuses of the native peoples and cultures in different parts of the Pacific. The Hawaiian people are now a minority in their own homeland, and their language and culture were repressed for decades after the overthrow of their kingdom.
until a ‘cultural renaissance’ began in the 1970s. The Micronesian peoples have had a different history, and perhaps feel less need to reclaim cultural identity. This question lies beyond the scope of this study, but it presents fertile ground for future research.

Regarding the effect of service learning on Japanese students, the interviews with the three study abroad students at the University of Hawai‘i at Manoa indicated that numerous benefits resulted from their participation in service learning programs. First, their fieldwork activities provided an opportunity for an immersion experience in another culture, in this case Hawaiian culture. Students were able to obtain direct experience of traditional customs and practices and greater awareness of cultural concepts and spiritual symbolism. As a result, they were able to understand Hawaiian culture in a deeply personal way and access a side of Hawai‘i that those visiting as tourists rarely encounter.

These students also began to see similarities between Hawaiian and Japanese culture. This seems to have created in them a desire to learn much more about their own culture and spurred an interest in protecting and preserving their Japanese cultural traditions. One commonality they perceived between Hawaiian and Japanese thought was an appreciation of nature, and they observed the ways in which a close relationship with nature was interwoven in the traditions of both cultures. This, along with their participation in certain land-based service learning activities, increased their environmental awareness and interest in issues such as food self-sufficiency, organic agriculture, use of non-GMO crops, and environmental sustainability.

Service learning seems to have both reinforced and promoted an interest in minority group issues for the three students, especially with regard to Japanese Americans. While two of the students came to Hawai‘i with prior exposure to basic facts concerning Japanese Americans, all became more knowledgeable of and empathetic towards Japanese Americans and other minority groups in Hawai‘i after working with them in the context of service learning activities. These experiences have motivated at least one of the students to learn more about minority groups in her own country. Thus service learning seems to have the potential for helping ethnic Japanese become more cognizant of the non-mainstream groups in Japanese society and the range of issues that these groups face.

Lastly, the students remarked that service learning helped them to see the merits of building strong personal relationships with people of other cultures. Given the normally monocultural nature of interactions in Japanese society, the intercultural experiences provided by service learning were truly a unique opportunity for them and left a lasting impression. These students not only
served but worked side by side with people from disparate cultures and walks of life, sometimes developing close relationships with them. This helped them to bolster their English (and, in one case, Hawaiian) language skills, but just as importantly they came to personally recognize the worth of person-to-person intercultural cooperation and understanding. By extension, they also realized the value of community service, as well as international development work. They became proponents of volunteerism as a way of not only helping others but also removing barriers and building bridges between peoples of diverse origins and backgrounds. It seems very likely that they will seek out further volunteer experiences and continue to cultivate positive intercultural relationships, after their return to Japan.

VI. Recommendations

Based on the findings of this study and the discussion presented above, some recommendations can be made for constructing service learning programs appropriate to the Japanese context. Beginning with domestic programs, as shown previously a key point is to identify the needs of the community being served and to work closely with community partners in establishing truly useful programs that will thrive by harnessing student support. The needs of specific local communities no doubt differ, but in Japan’s aging society programs centered around services for the elderly might prove particularly welcome. Like their Samoan counterparts, many Japanese students have experienced living with a grandparent and would likely feel comfortable working with, and learning from, this population. Programs geared towards work with children would also fall within students’ ‘comfort zone’ and address prevalent community needs.

By contrast, many college-age students have had little chance to interact with members of Japan’s diverse minority groups. Service learning programs focused on ethnic Koreans, Chinese, Brazilians, or Filipinos would introduce students to groups within their country with backgrounds and worldviews strikingly different from their own, thus heightening the learning experience involved while increasing the prospect of the formation of new intercultural friendships. Similarly, programs centered on Japan’s own indigenous peoples, the Ainu and the Okinawans, would expose students to traditional cultures which, much like that of the Hawaiians, share some traits and values with Japanese culture but are remarkably different, deep, and vibrant in their own ways. In all of these cases, students would learn not only about the cultures of the people they would work with, but also about the issues that these groups face as non-mainstream members of Japanese society.
Colleges and universities in Japan may also wish to design international service learning programs. Such programs often involve environmentally-based work in rural settings in developing countries, giving students experience in a world quite removed from their normally urban, modernized lifestyles. However, some international programs, particularly those run in conjunction with partner universities overseas, involve the types of community-based projects that students might participate in domestically, albeit in significantly different surroundings. In either case, the impact of participating in service projects in a foreign setting often produces a kind of learning experience that is profound and lasting, and that is impossible to replicate in any classroom. The value of such programs for Japanese students cannot be overstated.

VII. Conclusion

The present study has shown service learning to be a compelling experience for college-level students, including those from Japan. It has the capacity to transform mundane coursework into a captivating educational experience, bringing a sense of authenticity to academic lessons. Through service learning, students have a chance to apply what they have learned in the classroom to real-world settings. By participating in community service projects, they are able to bolster their understanding of local and global issues while contributing to the well-being of community members. In the process, they become more informed, engaged, and socially responsible individuals.

Ty Kawika Tengan, a Native Hawaiian, in writing about the political, cultural, and ecological issues now facing Hawai‘i and the Pacific, states “With ancestral knowledge as our guide, we will navigate anew the large and small currents of Oceania” (University of Hawai‘i at Manoa Department of Ethnic Studies, 2015). In the same vein, the practice of service learning may reconnect Japanese students with their cultural traditions and, by also shedding light on contemporary issues and concerns, help prepare them to navigate the currents of the Asia-Pacific region in which they reside.

Acknowledgments

I would like to thank Dr. Ulla Hasager, the Director of Civic Engagement for the College of Social Sciences at the University of Hawai‘i at Manoa, for her invaluable advice and assistance, as well as her unending patience and kindness. Mahalo palena ‘ole.
Thanks are also due to the following people who generously provided input or support for this study: Dr. Ty Kawika Tengan, Department of Ethnic Studies, University of Hawai‘i at Manoa; Bobbie Leon Guerrero, Program Specialist, Center for Student Involvement, Guam Community College; Leo Pangelinan, Dean of Student Services, Northern Marianas College; Elisapeta Faalafi Jones, Instructor, English Language Institute, American Samoa Community College; and Makiko, Saki, and Momoko—mahalo nui to one and all.

Mālama I Nā Ahupua ‘a

I joined the Mālama I Nā Ahupua ‘a (MINA) project, I visited Ho’oulu ‘Alīhāpndi ‘aina. At Ho’oulu ‘Alīhāpndi ‘aina, I learned about organic agriculture and helped promote it through participation in community work. Before we started our work, we made a big ‘aloha circle’ with all the participants, introduced ourselves, and prayed to the land. We worked in a vegetable garden and harvested crops that would be sold at the market. Through working at the organic farm, I met the people who contribute to promoting organic food products and increasing the food self-sufficiency rate in Hawaii.

I learned that one of the big issues in Hawaii is the extremely low food self-sufficiency rate. If more people were to work in the fields growing local products
on small farms it would increase the food self-sufficiency rate. Another serious issue I learned about is the large-scale experiment with GMO (genetically modified organism) products that is currently taking place. It is important to have an interest in what we eat in our daily lives in order to promote healthy agricultural practices in Hawaii. We have a responsibility to choose safe products for our bodies and need to be more concerned about food safety as we try to develop local agriculture.

In addition to working at Ho’oulu Aina, I joined the service learning project at Ulupō Heiau. Before we began work at the heiau (Hawaiian shrine), we made a kukui (candlenut) lei with the other participants and dedicate it to the heiau. We used only fallen yellow leaves which we found on the ground, but it was still a very beautiful lei. Using only fallen leaves means that we do not kill any living creatures. After that, we worked on the heiau and cleared away the weeds. The Hawaiian woman who instructed us told us that the heiau is a very sacred place, so we need to leave all of our negative thoughts behind before we enter there, and we should not think about something bad once we enter, but only positive things such as thankfulness to the land.

The most interesting thing that I learned on that day is the meaning of the name Ulupō. Ulu means “inspire” or “grow,” and pō means “beginning” or “darkness”. Therefore, Ulupō means “beginning in darkness,” and implies that a human baby grows inside the darkness of the mother’s womb, just like a seed grows up in the dark ground and sprouts on the earth. It is really interesting for me because it means that both humans and plants come to the earth in a similar way. In my opinion, it also shows us a strong relationship between nature and people. The reason I think that way is that we are what we have from nature. After people die, they are going to return to the soil, and people have food and water from the land on which their ancestors also existed. Therefore, people and nature have a strong relationship, and it teaches us the importance of keeping a good balance with the earth.

Ka Holo Wa ‘a

I also worked on the Ka Holo Wa ‘a service learning project. Through this project, I learned much about the culture and knowledge related to the Hawaiian voyaging wa’a (canoe). One of the most impressive experiences I had was when I participated in ‘Imi Na’auao, the ‘ohana wa’a (canoe family) crew training on Kauai.

In this program, we worked on building a canoe named Nāmāhoe, which is going to be launched in June, 2015. I learned to tie some sailor’s knots and built one part of the wa’a. Even though it was heavy work, we cooperated and helped
each other to build it. It was such a joy to see the part we finished building by ourselves. One of the leaders told us that Nāmāhoe means “twin,” and this wa’a is made up of two parts: the left side is wāhine (female), and the right is kāne (male). This shows the importance of the balance between kāne and wahine, and that we need to support and respect each other when we voyage. It was a really meaningful experience for me to learn the traditional skills related to the wa’a and to take part in building the Nāmāhoe. I also felt the significance of learning these techniques from people who have had experience in building traditional canoes and sailing them on the open ocean.

On the third day of the program, we went to a place called Hule’ia to help the local NPO organization that is working on removing mangroves there. In this location there used to be a large Hawaiian-style fishpond for aquaculture and a big lo’i (taro patch); however, these traditional features have not been maintained because invasive mangroves have overgrown the area.

In order to do our work there and clean up the area, we cut back the mangroves and formed a long human line to pass and remove the wood. As a result of others before us taking care of this land, there are some native plants now growing tall. I was so impressed by that because I could see the result of people’s effort of mālama ʻāina (protecting and caring for the land). It may be little by little, but the land is surely getting back to the way it used to be. It was a hot day and hard work, but I personally experienced and felt for the first time what mālama ʻāina means.

We worked on building Namahoe again on the last day, and I varnished the underside of the wa’a. Before we left, I humbly gave her leis made of ti leaves, which I made with other members. We all gave offerings in front of her to show our thanks and pray for her. It was a sacred moment, and many of us were even crying. At that moment, I really felt as if she is living and I recognized that she is really one of the ʻohana (family members) who will voyage with the crew members.

On the morning of the day we left, we made our last offerings outside. Before leaving, we made a circle with all the participants and sang a song. While we were singing, tears ran down from my eyes naturally. I was so thankful to everyone who had shared such a special time with me; therefore, I was really sad to say goodbye to them. It was only four days, but people were very welcoming, and I could make a very strong relationship with them within such a short time. I think that is a real canoe family, and I learned how great the spirit of welcoming and accepting other people is, which is necessary as a crew member. I appreciated that people shared so much of the Hawaiian culture with me. It was
really a meaningful and significant experience to learn Pacific culture and skills related to the voyaging and wa’a from many great persons.

Through my service learning projects, I met many people who are protecting their own culture, and there are many things to learn from them. These experiences made me want to know more about not only Hawaiian culture, but also my own culture back in Japan, and to begin learning these things from our own kūpuna (elders). I believe that engaging in community service to meet our needs will create a stronger connection among all the people in the community and will help us to more deeply appreciate and understand our own culture and our relationship with nature.
SCHOOL SAFETY : SELF HARM AND THE DUTY OF CARE.
Working together to make a difference

**Topic Area:** Counsellor Education/ Teacher Education/ Health Education

**Presentation format:** Paper Session

**Description:** One of the greatest challenges in contemporary education is how to manage young people with serious mental health issues in mainstream schools. In 2009 legislation was introduced in NSW, Australia, which increased a school's legal obligation to actively manage student violent behaviour, which includes self-harm. This paper introduces a practical guide for school leaders on how to support students who self-harm and minimise the risk posed to themselves and others, within the context of a school setting.

**Paper Author:** Jennifer Coen (M.A.Ed. BSW)  
Education Officer - Complex Social & Emotional Needs  
(formerly Head of Counselling)  
Sydney Catholic Schools. Australia.  
jennifer.coen@syd.catholic.edu.au

Jennifer is an Accredited Mental Health Social Worker with a Master of Education. She has 25 years of experience working in the areas of child and adolescent mental health, trauma and education. Formerly a Counsellor with the NSW State Coroner's Office, Jennifer now works as a Senior Counsellor/Consultant with Sydney Catholic Schools. Jennifer is the author of “School Safety - & the Duty of Care - Self Harm.” (2016 May publication)
ABSTRACT

In Australia, in 2009, the New South Wales Government introduced legislation that increased the obligation for schools to “**assess, manage and eliminate**” any risks posed by a student’s violent behaviour, to the health and safety of all members of the school community. Most school staff thought this meant dealing with acts of physical violence however it has become increasingly clear that the duty of care extends beyond this, to include psychological injury.

With 1 in 10 young Australians, between the ages of 4 -17 years, engaging in deliberate self harming behaviour, (1) there has been a need for schools to develop better practices to support and manage these students in mainstream educational facilities.

The purpose of this presentation is to help educators gain an understanding of why some students self harm and to introduce guidelines for school staff on how to intervene and support these students, while at the same time, execute their duty of care to provide a safe & supportive environment to all members of the school community.

Participants will be presented with the guidelines recently developed and introduced into Sydney Catholic Schools. The guidelines are informed by best practice standards in mental health care.

The importance of collaboration between school staff, parents and mental health professionals is emphasised.

Linking it All Together: What Concept Maps Show about Students' Implicit Beliefs about Exceptionalities after Instruction

Background

According to the World Health Organization and World Bank (2011), about 15% live with a disability in the world today. The 2010 Census (Newsroom Archive United States Census Bureau, 2012), indicated that about 19% or one in five individuals in the United States has a disability. While many countries, including the United States, have enacted laws to ensure that individuals with disabilities can obtain an education, proper medical care, and a job, there is the ongoing issue of negative attitudes towards these people (Wilson & Scior, 2014), which can limit their potential and opportunities. These attitudes can be implicit, or unconsciously triggered, often without awareness or intent (Prestwich, Kenworthy, Wilson, & Kwan-tat, 2008) and as a result, can be difficult to alter. As noted in a study by Wilson and Scior (2015), “…negative attitudes, in the form of implicit attitudes, appear to prevail” (p. 14/19).

Previous research (e.g., Wilson & Scior, 2015) has studied implicit attitudes towards individuals with disabilities, comparing them with their explicit views. The researchers found that participants had slightly negative implicit attitudes towards people with disabilities in contrast to positive explicit views towards the same group of individuals. Wilson and Scior (2015) noted, “…explicit evaluations may be subject to consciously accessible knowledge being appraised and thus influencing reactions…” (p. 14/19). Therefore, if tenacious implicit beliefs and stereotypes are to be revealed and subsequently addressed, novel assessment approaches are needed.

One non-traditional assessment is a concept map, or the hierarchical arrangement of concepts connected by lines and words to show the relationships among them (Novak & Cañas, 2008; Stuart, 1985). Upon visual inspection, they resemble a flow chart lacking arrows (Wandersee, 1990). Concept maps are basically qualitative assessment tools that are not, in principle, designed to lead to a score however, as graphical representations of knowledge (Novak & Cañas, 2008), they have been used to successfully illustrate conceptual understanding. As noted by Edmondson (2000), “Concept maps may also prove to be useful for portraying learning that traditional methods of assessment have not captured effectively, such as experiential settings…” (p. 25).

Higher education is one place where implicit attitudes could be altered, especially in introductory courses such as Educational Psychology where a chapter on exceptionalities is routinely part of the content. While the traditional structure of introductory courses may preclude in-depth exploration about people with disabilities, these courses have the potential to alter students’ implicit attitudes if they can be identified. Unfortunately, students concerned about behaving in ‘socially acceptable ways’ may mask their opinions in class discussions. Test-
savvy students may conceal their real feelings when taking a multiple-choice exam. It is only with more novel, less content explicit assessments that these attitudes may be revealed.

Concept maps could provide a unique perspective on students’ knowledge of various topics where social desirability might cloud their perceptions. They could also be a useful means of assessing learning relative to concepts that may be more difficult to internalize for a variety of personal, social and developmental reasons. By contextualizing students’ understanding about exceptionalities, implicit views may better be revealed. Once they are discovered, these courses can conceivably alter those views when more innovative pedagogies are utilized (Grauerholz, 2001).

Purpose of the Study

Research is sparse on individuals’ attitudes towards persons with disabilities in a variety of settings (Bruder & Mogro-Wilson, 2016). Therefore, the purpose of this exploratory study was to use concept maps to reveal undergraduates’ conceptual understanding of exceptionalities after instruction in an introductory educational psychology course. While content of the entire course was incorporated into students’ concept maps, this study explored only students’ perceptions of individuals with disabilities. As a control, the less socially contentious topics of Behavioral Learning Theory and classroom management were used for comparison of content complexity, accuracy, and importance on the resulting concept maps.

Methodology

Participants and Materials

Students who were enrolled in an introductory level Educational Psychology course at one liberal arts institution in the northeastern United States participated in the study. An entry-level educational psychology text (Slavin, 2009) guided instruction in the course. A total of twelve chapters’ were covered each semester, roughly a chapter per week of instruction. In this text, the twelfth chapter involved exceptionalities intertwined with the broader topic of diversity. This was the final chapter covered in the course.

The concept maps were a final course project. Prior to making the concept maps, students read about the theory and practice of using them. During class, students completed a series of exercises that introduced the procedures for constructing concept maps. Both the readings and activities were adapted from instructional materials found on the website, (http://istudy.psu.edu/tutorials/conceptmaps/), (accessed on April 2, 2016). Once these introductory activities were completed, instruction was provided to the students on open-source software (Novak & Cañas, 2008). It was this software, found at (http://www.ihmce.us/cmaptools.php), that was used to construct and present students’ maps. Participants were then divided into teams of three to four for their construction of a concept map illustrating major course concepts.
Three groups’ maps were selected to illustrate the diversity of presentation in this study. These maps were selected because they demonstrated different areas (and degrees) of strength, confusion, and avoidance of the content, and each had different implications for assessing (and addressing) students’ implicit attitudes.

Analysis of Concept Maps

Previous researchers (e.g., Kinchin, Hay, & Adams, 2000) have used a qualitative approach to analyze concept maps. Kinchin et al. (2000) argued that solely using a quantitative analysis examining “valid links,” “…seems to contradict the constructivist philosophy underlying the use of concept maps by failing to recognize the significance of students’ perspectives” (p. 46). In the current study, seven main guidelines, a synthesis of ideas presented in Jonassen (2000) and a proposed set of criteria for evaluation on the website, (http://istudy.psu.edu/tutorials/conceptmaps/), accessed on April 2, 2016, that provided a framework for classification. The first four of these guidelines relate to the portrayal of the concepts themselves: accuracy, breadth, depth and importance. In the current study, accuracy was defined as the correct identification of the main or central idea(s). Breadth involved identifying causal relationships between concepts. As the number of concepts increases, breadth increases. Depth was demonstrated by including details and examples. As the amount of levels of concepts increase, depth increases. Importance was defined as the correct prioritization of a set of concepts, according to their relevance. This meant that concepts needed to be represented accurately in terms of their varying weight by the amount of space they encompassed on the map. Color could also be used to effectively differentiate superordinate from subordinate concepts.

The final three guidelines relate to the relationships, or links, between and among concepts: validity, precision, and specificity. Validity was defined as the accurate portrayal of directionality; students must show order in sequentially organized information. For example, if there is a cyclical relationship between concepts, it would need to be visually portrayed as such. Precision related to the ability to identify assumptions that underlie positions on the map, demonstrated by whether labels are accurate or not. Specificity correlated to the degree to which students were able to classify based upon common attributes, and therefore whether the linking words give enough information or not. This qualitative approach allowed for an examination of “invalid links” (Kinchin et al., 2000, p. 46), which could potentially reveal implicit beliefs about individuals with disabilities.

Results

Initial analysis of the concept maps showed either avoidance of the topic of exceptionalities or its connection to race/culture and socioeconomic status. The latter can be seen in the following concept map:
The developers of this map noted that Socioeconomic Status (SES) has a part in Culture and Identity. It was then indicated that Culture and Identity “affects” Students with Exceptionalities.” Interestingly, the developers noted that Socioeconomic Status “can lead to” Interventions. These interventions involved both Classroom Management and Early Childhood Programs, to which Early Intervention was connected. Early Intervention, in turn, was connected to Students with Exceptionalities.

Discussion and Implications

The conflation of exceptionalities with the broader topics of diversity and socioeconomic status (SES) was in sharp contrast to instruction, in which exceptionalities, race, and socioeconomic status (SES) were discussed repeatedly as separate concepts. Their collective association could be seen as part of an implicit theory (Bruning, Schraw, and Norby, 2011), about the relationship of intelligence, race, and wealth. This conflation of exceptionalities with race and culture, as well as socioeconomic status is disconcerting, especially given that previous research has found that implicit attitudes could predict individuals’ behaviors (Greenwald, Poehlman, Uhlmann, & Banaji (2009).

Future research should examine implicit beliefs further using concept maps and other novel assessments. A pre-post model may reveal whether attitudes are altered after instruction.

6. Abstract listed below:

**Abstract**

The purpose of this study was to examine the attitudes and perceptions of nine doctoral students’ and two instructors’ beliefs about their use of academic notebooks as a tool for improving academic writing. Academic notebooks may be a beneficial instructional tool if graduate students are gathering text models, are cognizant of instructors’ feedback, and are systematically applying the gathered information in his or her own writing. Typically, higher education students struggle with academic writing. By understanding doctoral students’ and professor’s attitudes and perceptions about the use of the academic notebook, educators may be able to better support graduate students with learning the nuances of academic language.

Six overarching themes emerged among both teachers and students, and the first letter of each theme formed the acronym ASPIRE: (a) academic club; (b) synthesis; (c) purpose; (d) intentionality; (e) reflection; and (f) efficacy/capacity. The researchers involved in this collective case study suggest that the use of academic notebooks may facilitate growth in academic writing and research skills by providing a tool for metacognitive reflection, scaffolded learning, and instructor and peer feedback.
After School Just Got Healthier

BACKGROUND

The dramatic increase in the prevalence of childhood obesity has become a major national health priority. There is now a mounting body of evidence that multiple factors contribute in the development of childhood obesity. However, four primary behaviors seem to play a leading role: (1) lack of physical activity, (2) lack of fruit and vegetable consumption, (3) high sugar intake (primarily through sugar-sweetened beverages), and (4) television and video game usage. It is estimated that in the United States, more than 60 % of elementary aged children do not participate in after-school organized physical activity, and 47% do not frequently engage in free-time physical activity. The data for healthful eating is equally discouraging, with only 20% of children eating the daily recommended five servings of fruit and vegetables. Even more alarming are the statics for children in underserved communities. Many children, especially minority and economically disadvantaged children, lack environments that promote fitness and healthy eating, making it difficult for them to learn how to select healthy food choices and be physically active.
Students’ attitudes and beliefs about health issues are greatly influenced by the school setting. For this reason, it is imperative that childhood obesity prevention programs target the myriad of needs for students in underserved communities. Few studies to date have looked at efforts to promote positive attitudes, beliefs and behaviors about fitness and good nutrition in an after-school academic tutoring program.

The purpose of this research project was to investigate the effects of a coordinated effort to improve the attitudes, beliefs, and behaviors related to fruit and vegetable consumption and physical fitness on children in an already successful after-school literacy tutoring program. This project engaged elementary age students in a skills-based literacy intervention program, using children’s literature focused on the benefits of healthy eating and physical fitness. Hands-on learning activities and healthy snacks were provided during each literacy tutoring session. Additionally, these children—who report not owning books of their own—kept the book they read that day, thereby creating a home library of books to read over and over again, reinforcing the fitness and good nutrition content with family members.

Three conceptual and research-related principles guided the development of our project design. The first was related to the type of program offered to these children. Many of these children lack environments that promote fitness and healthy eating. As a result, a high percentage of them suffer from childhood obesity and other chronic diseases related to poor nutrition and lack of physical activity. The second perspective involved the children themselves. Because of their nomadic lifestyle and language barriers, they may not have had ample opportunity to become skillful readers, and therefore would benefit from a skills-based literacy tutoring program. The final area of
consideration was related to evidence that suggests that many children from low-income families have limited access to books, which results in lower reading achievement.

With this in mind, we purchased children’s literature recommended in the Healthy Reading for Kids: Food & Fitness Program. The books integrated well with our already successful afterschool literacy tutoring program. After each story, children had the opportunity to display and expand their understanding of the wellness learning through age appropriate activities in a small group setting.

METHODS:

Sixty-eight students in grades K-5, participating in an after-school literacy tutoring program that served a predominantly low SES minority student population, participated in the data collection. The students were surveyed at two points. A pre-survey was administered early each semester to measure student their attitudes, beliefs, and behaviors related to fruit and vegetable consumption and physical fitness, and the post-survey was administered late each semester to the same students. The pre-survey and post-survey scores for each student were analyzed. A paired two-sample t-test was conducted to determine if there was a significant increase in scores from the pre-survey to the post-survey for the fall 2015 and spring 2016 semesters.

RESULTS:

Our research documented a significant increase in: (1) positive attitudes and beliefs toward fruit consumption and vegetable consumption, and (2) positive attitudes and beliefs toward physical fitness. Although we did not find an increase in reported consumption of healthy foods or in the amount of time engaged in physical fitness
activities, we are optimistic that changes in attitudes will result in changes in behavior by the end of this project.

Dr. Beth Walizer, Department of Teacher Education, College of Education, Fort Hays State University, Hays, Kansas, 67601  bwalizer@fhsu.edu

FOCUS OF THE PROJECT

The Read4Respect Bullying Prevention Project was an after-school service-learning project in a low SES elementary school. Fifty-seven students who were identified as struggling readers participated in a skills-based literacy tutoring program over the course of a school year. A paired two-sample t-test was used to determine if there was a significant increase in reading attitude scores from the pre-survey to the post-survey. Attitude scores increased for 13 of the 20 survey questions with increases found to be significant for three of the questions.

CONTEXT OF THE WORK

Given that sufficient print resources are available, the frequency in which a child reads is explained by two factors: success in acquiring reading skills and motivation to read. A child who enjoys reading will read more often and improve at it. Sight word
recognition, ability to decode unfamiliar words, reading fluency, vocabulary development, comprehension, and general knowledge improve with frequent reading. Unfortunately, poor readers often lack motivation to read. Furthermore, motivation is a significant predictor for the amount of reading practice which is the “preeminent predictor” of reading achievement.

Studies show that children from low-income families have restricted access to books at home and in their communities, and therefore, they do not read as often as children from families with access to books. Providing books for children from low-income families may produce reading gains comparable to those by children from middle-income families.

**PRACTICAL APPLICATION OF THE WORK/FINDINGS**

The design of the study was guided by three conceptual and research-related principles. The first was related to the nomadic lifestyle and language barriers of the children that may have limited their opportunities to become skillful readers. The second principle involved the dynamics of the school situation. Common threads throughout literature concerning children in similar situations include poverty, social isolation, rejection, school indifference, and peer victimization. The third principle was related to evidence that suggests that the limited access to books by children from low-income families may significantly contribute to low achievement in reading.

With these principles in mind, we implemented the Read4Respect Program developed by the Anti-Defamation League (ADL). This program engages students in lessons that promote empathy, respect, and appreciation of differences.
IMPLICATIONS FOR PRACTITIONERS, RESEARCHERS, AND COMMUNITY MEMBERS

An increase between pre-survey and post-survey scores was found for 13 of 20 questions related to reading attitude with a significant increase found for three of the questions. Students responded positively toward receiving a book as a present, starting a new book, and learning from a book.

The Read4Respect Bullying Prevention Project is the foundation for a continued collaboration between Fort Hays State University and the Hays Public School District in the development of a student culture of positive and peaceful conflict resolution.
Title: The Practical Physical Education Environment: Shifts in Knowledge Perspectives for Teacher Candidates through Innovative Learning Practices.

Author:

brenda.kalyn@usask.ca

Abstract

As a professor in teacher education, I wondered how teacher candidates (TCs) connected personal learning experiences and knowledge acquisition when involved in a practical learning environment. These environments produce little note taking and a great deal of practical experience. TCs are immersed in the “doing” and consider it “fun” within these practical environments. These classes are different because the theory/course content is embedded in the practical. At the end of the class the TCs would say the class was ‘great’ and I wondered what that really meant. (The TCs vary in knowledge with some students having a major or minor in PE; to those who have no experience teaching PE).

Sound pedagogy and instructional strategies have been researched within the field of physical education. There are many resources that outline these important pieces of practice that are paramount within any methods course in PE for TCs (Graham (2007); NASPE (2007); Seidentop (1991); Pangrazi & Gibbons (2009). For this innovation, important thematic criteria were selected from these resources to create a rubric that represented researched pedagogies that would align with our course work and these pedagogies became the framework for assessment.

The values that TCs place on their learning experiences at the university are clear from my discussions with them. They value practical experiences; however, often share that they experience little of the practical while learning to teach through their methods courses. Except for the realities of their internship, they struggle with professors expecting them to ‘imagine’ what reality looks and feels like. Hopper and Bell (2016) agree that teaching strategies are learned best through field experiences or in other practical environments related to PE pedagogy. Providing practical, learner-centered opportunities assists TCs in understanding practice more authentically and that was the focus of this course.

This innovation in teaching sheds light on their practical learning perspectives and furthers understanding of TC’s experiences relating to physical education specifically. The goal of this research was to gain an understanding of how TCs connect theoretical course content through the practical and build knowledge towards sound pedagogy.

WHO IS MORE FREE?

Abstract

**Purpose:** While an abundance of school choice literature focuses on student achievement outcomes, little has been done to determine the mechanisms involved in producing such outcomes. We present a comparative analysis of private and public school principals using data from the School and Staffing Survey (SASS) 2011-2012. We add to the literature by examining the differences in private and public school principals’ abilities to influence important decisions at their schools.

**Research Design:** We use ordinal logistic regressions to study differences in self-reported decision-making ability of public and private school principals. We report marginal effects for two models: one that controls for principal background characteristics and one that does not.

**Findings:** We find that in comparison to principals in public schools, principals in private schools are more likely to report to have a major influence on six out of seven school-level activities. We conclude that private schooling may have a systematic advantage over public schooling since private school leadership exhibits more autonomy in influencing relevant decisions.

*Keywords:* school choice; school leadership; school management; School and Staffing Survey
WHO IS MORE FREE?

Introduction

“While the public school principal is bound most by red tape, the private school principal is bound most by his or her conscience.”

—John E. Chubb and Terry M. Moe, 1988, p. 1076

School choice has emerged as a key intervention in school reform globally. In fact, the United States President-Elect, Donald Trump, promised massive expansion of private school choice through a reallocation of $20 billion in federal funding in 2017. Evidence suggests that private schools slightly outperform public schools on improving student achievement within the US as well as internationally (Betts & Tang, 2011; Forster, 2016; Greene, 2005; Shakeel, Anderson, & Wolf, 2016; Tooley, 2005; Tooley, Bao, Dixon, & Merrifield, 2011). Most of the school choice studies focus on student achievement (West & Woessmann, 2010; Witte, 2001; Witte et al., 2014; Wolf et al., 2013). Out of the nineteen experimental studies of private school choice in the United States, the only negative findings for test scores were from the two studies of the Louisiana Scholarship Program (Abdulkadiroglu, Pathak, & Walters, 2015; Mills & Wolf, 2016).

Other studies have examined impacts on the long-term outcomes of students such as attainment (Booker et al., 2008; Zimmer, 2009; Cowen et al., 2013; Wolf et al., 2013) and criminal activity (Deming, 2011; Dobbie & Fryer, 2015; DeAngelis & Wolf, 2016). While this evidence is limited, the existing studies have found that access to school choice reduces criminal activity and teen pregnancy while increasing the likelihood of graduating from high school. Additionally, access to private school choice may increase performance in public schools through competitive effects (Egalite, 2013; Egalite, 2016; Figlio & Hart, 2014; Greene & Winters, 2003; Sandström & Bergström, 2005) and increase civic skills such as voter activity,
volunteering, charitable activity, and tolerance of others (Campbell, 2002; Bettinger & Slonim, 2006; Fleming, 2014; Fleming, Mitchell, & McNally, 2014).

Though many studies have examined whether private schools outperform public schools, few have looked at why there are differences in short and long-term student outcomes. Wolf and Hoople (2006) attempted to peer into the black box of the school choice reform through examination of the DC Opportunity Scholarship Program and found that the successful private schools allocated fewer resources to facilities and programs. Our study fits into the literature by examining a potential explanation for why school choice could have an advantage in producing slightly positive outcomes for students.

We examine the differences in the autonomy of school leaders, which may increase the likelihood that leaders can adapt to the changing needs of students and staff within their schools. Effective leadership, and an environment to support the ability to make effective decisions within a school, may be important for creating a high-quality educational experience for children (Rousmaniere, 2013). For example, Grissom, Loeb and Master (2013) find that principals that can spend time on things such as the school’s education curriculum can positively influence student achievement. Conversely, they find that principals that spend more time on activities such as simple classroom walkthroughs may have a negative impact on student growth. Additionally, Ouchi (2009) and Hess (2013) point out that student learning cannot be improved unless school leaders have control over important school-level activities such as curriculum and the budget.

In schooling, leaders that are free to influence important decisions may be better able to change their approach to curriculum, instruction, or professional development practices if their leaders notice inefficiencies (Tekleselassie & Villarreal III, 2011). However, schools with
WHO IS MORE FREE?

constrained leadership will be less likely to capitalize on the benefits associated with needed reform strategies. Branch, Hanushek and Rivkin (2013) point out that highly effective principals increase student learning by two to seven months within a single school year. Chubb and Moe (1988, p. 1065) found that the public and private schools were “distinctively different in environment and organization” and that private school principals had more teaching experience than public school principals. They also theorized that greater autonomy would exist in private schools with respect to their structure, goals and school operations. However, Chubb and Moe did not empirically test this specific theory.

We provide the first study to empirically test the hypothesis that the private schooling sector allows for more leadership autonomy by using nationally representative survey data of principals in the United States for the 2011-12 school year from the School and Staffing Survey. We compare the reported differences between public and private school principals’ influence on decision-making activities within their schools. Since we simply want to make overall comparisons between the two types of institutions, we do not examine subcategories of private schools and public schools.

Theory

In private schools, families have lower transaction costs associated with opting to leave the school, making the school operators more prone to the threat of a shutdown condition (Friedman, 1955; West, 1981). However, loss for a private school is not only monetary in the short-run; it can also cause several chain reactions such as damaged brand name, threat to teachers’ jobs, and threat of change in the perception of future clients. Since families are more able to leave the private school if they are dissatisfied, it is more necessary for the school leader to be able to make changes to influence customer satisfaction levels (Smith, 1776; West, 1997).
WHOM IS MORE FREE?

If a private school principal is able to make the decisions necessary to adapt to the signals transmitted by his or her clients, the quality of their schooling should increase. Since the public school often has a monopoly on public funding, and their customers are assigned residentially, their leaders do not need to adapt to dissatisfaction as quickly (Hoxby, 2007; Peterson, 1998; Peterson & Hassel, 1998). In other words, the transaction costs for a customer leaving a public school are much higher, especially since it would require Tiebout choice (Tiebout, 1956) or paying for a private school out of pocket (Friedman & Friedman, 1990; Merrifield, 2008).

In fact, since the transaction costs are typically much higher in order to exit a public school, large amounts of principal autonomy may not be desirable in that sector (Neal, 2002). If a malicious, or simply ineffective, principal becomes the leader of the school, we may not want them making school-level decisions that could negatively affect students (Hayek, 2011). If the ineffective principal is free to make bad decisions, many students may be harmed without much of an exit option, especially if they come from a disadvantaged family (Gaventa, 1982; Lerner, 1995). Since this scenario is potentially more likely and costly in public institutions, the public sector may be more likely to be set up in a way to limit the possibility of this negative event occurring. As a result, an official from the central office may be more likely to control the important school-level decisions.

The private school principal is likely to have more influence in decision-making since the private schools have fewer political constraints and enjoy more autonomy in selection of students and daily administration than public schools (Firestone & Shipps, 2005; Shipps & White, 2009; White, 2006). Since private school principal are at least less likely to feel the pressures of political constraints, they may feel more confident and able to influence school-level activities. Private school leaders may be more likely to establish an environment of similar students
working towards a uniform mission through selective-admissions and an improved match between school goals and student interests.

Additionally, private school principals may face a stronger dismissal threat than their public school counterparts. If school leaders have fewer costs associated with dismissing their principals, they will be more likely to be able to hold them accountable for their actions. If a private school principal can be dismissed easily, they will have a stronger incentive to make effective decisions. On the other hand, if a school principal is protected through unionization or otherwise, they will be more likely to make ineffective decisions without the same level of accountability (Chubb & Moe, 1986; Painter, 2000; Tucker, 1997; Weisburg et al., 2009). Since it is more difficult to fire a principal in the public sector, we expect that a centralized official will reduce their autonomy in order to limit negative outcomes for students. Furthermore, since school principals in the public sector are more likely to have an incentive to maximize budgets, we expect that central offices will not grant them much autonomy over finance decisions (Niskanen, 1971).

Data

The data for the public and private school principals comes from the School and Staffing Survey (SASS) 2011-2012 questionnaire. SASS was developed by the National Center for Education Statistics (NCES) and it has been administered seven times since 1987-88 to 2011-2012. Table 1 lists the question categories and what they measure\(^1\). The public school principal data file contained 7,510 records while the private school principal data file contained 1,720 records. There were some additional questions for public school principals, but in this paper, we compare only the common questions related to decision making.

\(^1\) For more information, see http://nces.ed.gov/surveys/sass/pdf/1112/SASS2A.pdf (for public school principals) and http://nces.ed.gov/surveys/sass/pdf/1112/SASS2B.pdf (for private school principals).
WHO IS MORE FREE?

Our dependent variables come from questions 16-A through 16-G on decision-making in SASS 2011-2012. This section asks the principals to rate their ability to influence seven school related activities on a four-item Likert scale (no influence, minor influence, moderate influence and major influence) and it includes a *not applicable* option for each activity (Table 1).

[Table 1 about here]

We utilize questions from the survey that relate to principal’s demographics, academic and professional background for summary statistics. Tables 2A and 2B show the population weighted summary statistics expressed as percentages for the principals in public and private schools. Overall, private school principals report more years of principal experience but lower education levels in comparison to the public school principals. This is consistent with the findings of Hill et al. (2016). The proportion of private school principals reporting greater than 10 years of experience as a principal or school head is almost double that of public school principals. The proportion of private school principals involved in teaching in addition to their task as a principal or school head is also about twice that for public school principals.

A higher proportion of public school principals report having previous experience as a department head, assistant principal or program director and participation in a school training or development program in comparison to their private counterparts. The proportion of public school principals holding a school administration license is about twice as large as private school principals. Almost all public school principals earned a MA or higher degree while only 76% of the private school principals report so. The racial composition of principals is largely white in both the sectors (86% in public schools and 90% in private schools; this excludes mixed race, so it is a lower bound). Lastly, private schools have a larger share of females in their leadership in comparison to the public schools.
WHO IS MORE FREE?

[Table 2A about here]

[Table 2B about here]

Methods

Since the survey responses related to decision-making are ordinal and have four categories (from “No Influence” to “Major Influence”), the analytic technique we employ is an ordered logistic regression (Borooah, 2002; Cohen, Cohen, West, & Aiken, 2003) of the form:

\[ DM_i = \alpha_0 + \alpha_1 Private_i + \mu_i \]

The dependent variable of interest, \( DM \), is the reported decision-making ability of a given principal \( i \), for the following school-level activities: setting student performance standards, establishing curriculum, determining teacher professional development content, evaluating teachers, hiring new full-time teachers, setting discipline policy and deciding how the budget will be spent. This variable takes the value 1 for the least influence and value 4 for the highest influence\(^2\). \textit{Private} is a dummy variable of value 1 if the principal is in a private school, and 0 if the principal is in a public school. The coefficient of interest, \( \alpha_1 \), measures the mean difference of the decision-making influence reported by private school principals relative to public school principals. The constant, \( \alpha_0 \), measures the average principal decision-making influence reported by public school principals.

Since we want to examine the differences between principals based solely on the type of institution they are in, this initial model does not control for any principal-level differences. Controlling for the differences in types of principals hired by the different institutions would control away the institution itself and therefore bias our effect estimates downward. In order to construct a conservative estimate of the association between institution-type and decision-

\(^2\) Since the dependent variable is ordinal, we report average marginal effects from the ordered logistic regression. We do not report the result for the fifth category of the dependent variable, not applicable, since it is not systematically related to the decision-making ability of the principal.
WHO IS MORE FREE?

making freedom, we construct the following model that also includes principal characteristics as controls:

\[ DM_i = \alpha_0 + \alpha_1 Private_i + \alpha_2 PC_i + \mu_i \]

The variable \( PC \) is a vector of controls for the following principal characteristics: race, gender, education level, years of experience as a principal or school head, years of experience as a teacher in elementary or secondary school, any experience as a department head, any experience as an assistant principal, participation in professional development or training programs, management experience outside of education, and whether the principle holds a license in school administration. This second model includes principal-level controls in order to examine if the effects are significant after accounting for differences in the types of principals hired across the two institutions. We choose not to include school-level controls since they are an essential result of our independent variable of interest. The school-level characteristics are inherent sectoral differences. For example, private schools are typically smaller for market niches while public schools are typically larger in order to take advantage of alleged economies of scale.

The restricted use data provided by the NCES are imputed and adjusted for non-response. Based on the stratified probability proportionate to size (PPS) sampling strategy used by NCES in the SASS, we use the balance repeated replication (BRR) bootstrap methodology\(^3\) so that the results reflect the true population values and not just the sampled units. This methodology does not change our final estimates, but rather corrects the formula for the calculation of the standard errors.

Results

\(^3\) Details can be found in the User’s Manual for the 2011–12 Schools and Staffing Survey.
WHO IS MORE FREE?

We now present the results for our models with and without controls below. The dependent variables (Tables 3 A-G) refer to the variables on decision-making (A-G) as in Table 1. The change of sign in the coefficient from column 1 through 4 and column 5 through 8 is indicative of the ordered logistic regression model working in the expected way. Columns 1 through 4 report the results for the model without controls and columns 5 through 8 do so for the model with controls. We focus on columns 4 and 8 where the principal chose the option of ‘Major Influence’ on that activity. Results from column 4 shows that private school principals have a higher likelihood of reporting to have a major influence in setting student performance standards, establishing curriculum at the school and determining teacher professional development program content.

These results indicate that private school principals perceive to have more autonomy in the decision-making activities at their schools. However, private school principals have a 6.4 percentage point lower likelihood of reporting to have a major influence on the evaluation of the teachers in their school. It could be that private school principals are less likely to have mandatory evaluations of their teachers. The results are not statistically significant for the last three outcome measures, though they are all positive. This model simply examines overall differences of leadership autonomy across the two types of institutions. Though data indicate that private school principals have more leadership autonomy, it could be that private institutions choose to hire principals that are more experienced and therefore more in control. It could be that the institutions foster the same environment for their leaders, but that the leaders are just different. To minimize selection bias, we examine results with many principal-level controls as well.
When controlling for principal differences across sectors, we find robust evidence that private school principals exercise significantly more influence over decision-making activities. In addition to the previous model, results in column 8 show that the private school principals also have a higher likelihood of reporting to have a major influence on hiring teachers and setting discipline policies. The coefficients in this model all increase in magnitude except for the evaluation of teachers. This coefficient drops to about half the size, indicating that private schools principals have a 3.4 percentage point lower likelihood of having a major influence on the evaluation of teachers. Since private school principals have a 5-percentage point higher likelihood of having a major influence over the hiring of teachers, they may not need to provide as much direct feedback. In addition, since private school principals have a 14-percentage point higher likelihood of having a major influence on the content of their teacher professional development programs, they may provide feedback through that channel instead. Notably, private school principals have a 26-percentage point higher likelihood of reporting that they have a major influence on establishing their school’s curriculum and a 15-percentage point higher likelihood of reporting that they have a major influence on their students’ performance standards. This is especially important for the ability of the principal to positively impact student achievement.

[Tables 3 A-G about here]

Our results imply that either principals with better decision-making characteristics self-select into private schools or that private-school leadership does a better job in identifying and hiring principals with better leadership characteristics. It could also be that the smaller regulatory burden found in private schools grants the principals the ability to exercise more influence related to school activities in comparison to the public school principals. To explore this further,
we examine the coefficients on the control variables for the case of reporting major influence as a principal or school head on decisions concerning school activities in Table 4.

[Table 4 about here]

The coefficient on the principal’s previous experience as a department head is significant and positive in all cases except for the case of teacher evaluation, where it is not statistically different from zero. Hence, previous leadership experience has a systematic positive relationship with the principal’s ability to have actual influence on school related activities. However, the presence of negative coefficients for previous principal experience, relative to no previous experience, is surprising. Since the negative estimates are smaller in magnitude as experience level increases, it may be that the principals that stay in the field for longer periods of time are the ones that have not become discouraged enough to leave the field. This appears to be an area for future research.

Having a master’s or higher degree seems to be a positive principal characteristic. It could be that education itself improves decision-making ability or that people that choose to pursue more education are also more motivated and confident. The coefficient on gender (being male) is negative throughout and statistically significant for four of the seven activities. Females seem to have systematic advantages over males in their influence over school-related activities. Since about three-fourths of all elementary and secondary-level teachers are female, female principals may be more able to have a strong connection with their employees (Goldring et al., 2013). Minority principals have a lower likelihood of reporting that they have an influence over hiring teachers and setting discipline policy, but a higher likelihood of reporting that they have an influence over student performance standards and curriculum.

Conclusion and Policy Implications
The principals in both sectors seem to significantly differ in decision-making abilities when it comes to their influence on school-level activities. The private school principals may have an advantage over their public school counterparts by having significantly more influence on almost all the school related activities. Principal characteristics, like previous experience as a department head and having a MA or higher degree, play a positive role in their ability to exercise higher influence on school activities. Nevertheless, the private school sector may be able to learn from the public school sector in evaluating teachers. Female principals seem to have a systematic advantage over their male counterparts in reporting more decision-making influence related to school activities and the relation is statistically significant for most of the categories.

Our findings mainly accord with Chubb and Moe (1988). They reasoned that control variables are endogenous in the institutional perspective on the organization of schools. However, we differentiate between controls related to principal characteristics and controls related to the school-level. We add controls for principal characteristics to our model that show that previous academic leadership experience as a department head and educational attainment contribute positively to the principal’s ability to have a major influence related to school activities.

In terms of policy implications, it seems that private school principals seem to outperform the public school principals on every aspect of decision-making ability except the evaluation of teachers. These findings may point towards the need of training in evaluation activities for the private sector. However, it could mean that the private school sector has a lower need for direct teacher feedback since they have more autonomy in hiring decisions and more involvement in the schools, as Chubb and Moe (1988) find. This may also reflect the emphasis that recent Race to the Top related policy changes have imposed on traditional public schools (Maranto et al.,
2016). Ouchi (2009) has emphasized the importance of principal autonomy and argued that principals know what happens at the school-level while central office employees do not. Perhaps, the relatively short tenure but greater credentialing of public school principals, as well as larger school size may suggest that they are climbers; that is, they see the principal position as a stepping-stone to the superintendence and focus on pleasing superiors rather than serving kids (Downs, 1967; Maranto et al., 2016). Cheng (2015) finds that schools where principals have more autonomy over personnel have greater mission coherence, though his sample only includes public schools.

Since we have relied on self-reported measures in school surveys, the results are prone to social desirability bias as well as reference group bias (Dobbie & Fryer, 2015; West et al., 2015). Although SASS is a nationally representative sample and stable results over time can have good external validity, future studies should utilize other measures like value-added measures related to school’s graduation rates and teacher turnover to study principal’s leadership qualities.

Abstract
This paper attempts to identify factors in student cultural and learning experiences through questionnaire analysis conducted on 16 university students who participated in a month-long Study Abroad (hereafter, SA) program in New Zealand after completing their first year of study. As participants in such programs are usually exposed to all-English environments both in and out of the classroom, they are expected to have opportunities for cross-cultural experiences and to improve their English communication skills as well as to enhance their English proficiency. However, such an ideal environment alone does not automatically ensure positive effects. The results of the questionnaire analysis indicate the effectiveness of this SA program on the enhancement of cultural awareness and the improvement in their English communication skills. Nevertheless, regarding the English proficiency such as reading academic papers and authentic materials, the results show the statistically significant differences between two groups. The group which expressed more positive effects on the improvement in the above mentioned English proficiency has a higher pre-SA TOEFL ITP© score compared to the other group. Especially, the listening score is significantly different between the groups. These suggest that the factors for a successful SA program lie not only in a program itself but also in a preparation stage before the SA program. Therefore, this paper scrutinizes the factors leading to success in a SA program and reports on both positive and negative aspects as basic data for constructing effective SA programs in the future.

Keywords: study abroad program, questionnaire survey, non-parametric test
Introduction

In recent years, and in the present, Japan has been facing urgent need to develop global human resources. As an attempt to meet the challenge, many universities in Japan have modified their curriculums and/or established new departments/faculties which have required SA programs. Although such SA programs; all the students in the faculty are required to study abroad, are claimed as advantages of the newly established curriculums or departments, it is hard to deny that those required SA programs are still in their pilot stages.

In this paper, we provide our findings based on a questionnaire survey on participants of a month-long elective SA program, which was conducted prior to the required SA program. The survey sheds light on what participants actually learned, experienced, and felt specifically. This attempt is to offer basic data for effective and successful SA programs in the future.

Literature review

Trends in Japanese citizens studying abroad and international students in Japan

The Ministry of Education, Culture, Sports, Science and Technology in Japan released the 2012 statistics on Japanese citizens studying abroad. The countries with the largest number of citizens studying abroad were the People’s Republic of China (21,126; up by 3,165 on the previous year), the United States of America (19,568; down 398 from the previous year), and the United Kingdom (3,633; down 72 from the previous year). This indicates the trends in declining popularity of English speaking countries as study abroad destinations. However, with regard to Japanese university and college students studying abroad, the results are different.

As Table 1 shows, according to the Japan Student Services Organization (JASSO), the top four countries with the largest number of Japanese university and college students studying abroad were the United States of America (16,794; up 1,372 from the previous year), Canada (6,614; up 281 from the previous year), the United Kingdom (6,516; up 878 from the previous year), and Australia (5,641; up 624 from the previous year). The number of students studying abroad in the Republic of Korea, the People’s Republic of China, and Germany (shaded in Table
1) has decreased compared to the results of the previous year. Therefore, among university and college students, English speaking countries are still popular SA destination and its popularity is rather increasing.

*Increase or decrease of number was calculated by the authors

In addition, an annual survey conducted by JASSO reports that the number of international students in Japan is showing an increasing trend as of May 1, 2014. In total, there were 184,155 international students in Japan, and the countries/regions accounting for the largest number of international students were the People's Republic of China (94,399), Vietnam (26,439), the Republic of Korea (15,777), Nepal (10,448), and Taiwan (6,231). Considering the goal of the action plan, “Aim to accept 100,000 international students” (Kadokura, 1994, p. 7), advocated by the former Prime Minister Nakasone in 1983, the number of international students acceptance in
2014 (184,155) surpassed the goal in 1983. This indicates that Japan’s internal globalization has indeed made great progress.

The increasing trends mentioned above have accelerated the demands for globalization of Japanese citizens, and for cross-cultural understanding. As one of the roles of tertiary education, universities are expected to provide students with real inter-cultural experiences through SA programs. As a result, more universities are incorporating SA programs into some departments/faculties as a core curriculum.

**Examples of required SA programs at university**

Table 2 shows the summary of required SA programs held at four of the universities in the Kansai region. All of the students belong to certain departments or courses at those universities are required to study abroad. The summary is based on the information posted on the Web-pages of each university, and states major destinations of their required SA programs and the average number of students studying abroad at each destination.

The universities mentioned in Table 2 are only examples and there are many other universities that incorporate required SA programs into their curriculums. For instance, Osaka International University established the faculty of International Liberal Arts in April, 2015 and offers curriculums which require all the students to study abroad for more than four months in the third year of their study. Hitotsubashi University proposed a policy, which requires all the new students go on short term SA programs, by academic year 2018. Rikkyo University and Waseda University also set forth a plan to require their students to study abroad. The period and the timing of the introduction of SA programs vary depending on universities. Some universities have arranged SA programs with schools in Chinese and Korean speaking countries in order to meet current social demands. As shown in these examples, SA programs are increasing in importance because these programs can provide university students with opportunities to learn foreign languages and improve intercultural understanding while they are in university and as a final preparation phase before they leave school and go out into the world.

Difficulties of L2 acquisition and intercultural understanding while studying abroad

Despite the increasing costs for studying abroad and the financial situation, many families
in Japan manage to have their sons and daughters study abroad. However, there are many
Japanese university students whose SA experience, L2 acquisition, and intercultural interaction
end in failure, due to the introversive way of thinking peculiar to the Japanese as well as the
hesitation to integrate into the foreign society because they are so accustomed to the
circumstances in Japan (cf. Kobayashi, 1999). Although once they study abroad, they gain some
kinds of learning (Bateson, 1994), it does not mean that they can achieve their original goals such
as improvement of L2 proficiency and intercultural interaction (cf. Kinginger, 2009).
Summarizing difficulties of L2 acquisition and intercultural understanding, there are three factors
that students have to face (Ayano, 2006; Jackson, 2006; Pearson-Evans, 2006; Ming-Hung Lam,
2006; Gao, 2010)

Table 3

*Three factors and the variations of barriers while studying abroad*

</tr>
</tbody>
</table>

We assume that each of the factors mentioned in Table 1 is entangled complicatedly and
hinders learners’ L2 acquisition and intercultural socialization. Among those factors, “socializing
with other Japanese people” would be what schools that dispatch or accept students studying
abroad can deal with. Dispatching schools can investigate the circumstances and the situations of
accepting schools and choose the schools with less Japanese studying there. Schools accepting international students can consider the balance and ratio of the same nationality in a class, and make their students use English all the time even outside the class.

Regarding the other factors mentioned in Table 2, it is highly difficult to eliminate them. Nevertheless, from the different point of view, these factors can be the best part of intercultural understanding. Therefore, this questionnaire survey investigates if the factors mentioned above can really be the learning obstacles while studying abroad.

**Research Design**

**Research questions**

A summary of the literature review indicates that many factors make it quite difficult to effectively acquire L2 proficiency and experience intercultural socialization through SA programs. Therefore, this paper researches into positive and negative experiences students have actually gone through while studying abroad based on the following six research questions: “1. What kind of intercultural experience did you have?”, “2. What kind of English skills did you feel you gained?”, “3. What kind of communication skills did you feel you gained?”, “4. What are your general impressions of living and studying abroad?”, “5. What did you gain through living with your host family?”, and “6. Now that you have completed SA programs, what English skills would you like to improve?”

**Participants of the survey**

The participants of this survey are 16 first-year students (18 to 19 years old) who belong to a private university located in the Kansai region in Japan. They joined the short term SA program held at the University of Waikato in Hamilton, New Zealand, from February 20, 2016 to March 14, 2016. The average score of their TOEFL ITP® is 418 (the highest: 490, the lowest: 360). There were 23 applicants for this SA program and the 16 participants were selected based on their GPA, the number of credits they earned, and the results of the interview in English. This questionnaire survey was conducted after they completed their SA programs.
Questionnaire survey

The participants who joined the SA program mentioned above responded to the survey on the research questions. Following Dörnyei (2003), four point Likert scale (strongly agree, agree, disagree, strongly disagree) was employed in order to avoid the answer “neither agree nor disagree”. The survey was conducted from March 15, 2016 to March 31, 2016. There were sixteen valid responses (male: four, female: twelve) and ratio of valid responses was 100%.

Data analysis

Analysis of questionnaire: $\chi^2$ test

We converted the survey results on the four point Likert scale (strongly agree, agree, disagree, strongly disagree) into a two point Likert scale (agree, disagree) in order to clarify the participants’ view, and then conducted a chi-square test. The following describes the results shown in Table 4 to Table 10. Q# in each table is the item number of the questionnaire, and the shaded results indicate negative significant differences.

All the items on intercultural experience indicate positive results. It is interesting that the participants realized the advantages of their own culture through the experience of living outside
Japan for a certain period of time (Q2) as well as coming to like foreign culture through studying abroad. The participants felt culture differences during their stay, which is vividly reflected in their positive comments regarding intercultural experience. The following are examples of such comments; (student 3) “The way people always express their thanks when getting off the bus and shop clerks greeted saying ‘have a nice day’ and so on left a big impression on me”, (student 6) “I was impressed that the manner of ladies-first was thoroughly penetrated and everyone greets and shows gratitude to others in a polite way”, (student 8) “Even an elementary school boy was doing ladies-first!”, (student 9) “When we get on a bus in Japan, we go into the bus in order of arrival. However, in New Zealand, I saw high school boys, even though they came to the bus stop earlier; let girls go into the bus before them. I was quite impressed with the culture that is different from Japan, and thought New Zealand is such a wonderful country!”, and (student 15) “I needed to be careful not to take a long shower. Every day, I had cereal for breakfast, and sandwiches, an apple, and crisps for lunch, which was a simple meal compared to the meals I had in Japan. Dinner was a one-plate dish, which had a lot of vegetables, so it was very healthy”.

*p < .05. **p<.01

The items on basic English skills indicate both positive and negative results. Most participants felt that their communication skills in English had improved. As we can see from the comment quoted from student 2, “Unlike the classes I had in Japan, the classes abroad were very active, so it was great. I studied through exchanging ideas, talking, and playing games. I think I can improve my English in these classes as far as I have the attitude of learning English”, the classes of the SA program offered the students opportunities to communicate elaborately. On the other hand, $\chi^2$ test results suggest that the participants felt less improvement on skills typically taught in a lecture style such as English writing skills (Q8), English reading skills (Q9), and English grammar skills (Q10). As these skills can be difficult to improve through SA programs and can also be taught in Japan before SA programs, it is essential to include the improvement of
the above mentioned skills into the curriculums of university courses in Japan and support students to enhance the skills while they are at university in Japan.

In addition, the results on applied English skills (see table 6) were divided into the items on which the participants felt the positive effects and did not realize the positive effects through the SA program. The former includes the items such as expressing their own ideas (Q11), being more aware of their pronunciation (Q13), getting used to translating English into Japanese (Q17), and being more aware of grammar (Q18). It may be a necessary consequence because the participants have overwhelmingly more opportunities to communicate and express their ideas and opinions in English while studying abroad. On the other hand, regarding the latter items: vocabulary skills (Q12), practical and advanced input skills (Q14; Q15; Q19; Q20), and practical writing skills (Q16), the participants did not realize the actual improvement through the SA program.

*p < .05. **p<.01

The results of Table 7 as well as the ones shown in Table 4, 5, and 6, indicate that the participants of the SA program generally perceive the improvement on their English
communication skills. They acquire skills to communicate in English without having any hindrance in daily life (Q22), and their personality traits are changing from introverted ones typically found in Japanese culture to westernized extroverted ones (Q23). However, negative results are also indicated as following; the opportunities to interact with local people were differentiated depending on the participants (Q24), there were many opportunities to speak with Asians (especially with Japanese) (Q25; Q26). One of the participants mentioned in a personal communication with us that it was difficult to interact with local people unless the participants themselves tried to communicate with them proactively, and the quantity of communication at home was different depending on the host family they stayed with. These negative results correspond to three factors of barriers while studying abroad which are shown in Table 3.

*p < .05. **p<.01

In regards to the SA program in general (see Table 8), most of the participants gave a favorable review on the English only circumstances (Q28). In addition, all the participants strongly desire to study abroad again, despite each student having found somewhat negative aspects regarding the SA program (Q29). Table 8 also shows that they have changed their characters and personalities through the SA program in a positive way (Q30).

Regarding the host family system, most of the participants perceived its effectiveness on intercultural experiences (Q31) and acquisition of English proficiency (Q32). Here are some of
the comments from the participants; (student 10) “The intercultural experience that left the biggest impression on me is to spend time with a host family member and family’s friend who are in the same generation as me. I was very happy to hang out with them and experience the local youth culture”, (student 16) “The most memorable experience was my host father’s birthday party. I was told that it wasn’t a typical birthday party in New Zealand, but it was a birthday party I have never experienced in Japan. Commonly, we invite friends to our home to celebrate birthdays in Japan, but for my host father’s birthday, all the host family’s relatives got together and celebrated with him. It was a feast with a whole roasted pig as a main dish.” These comments indicate that living with their host family provided a golden opportunity to have intercultural experience and use English. The participants of this SA program are generally satisfied with the host family system. However, they have never lived in a dormitory abroad; therefore they cannot compare which accommodation style, dormitory or homestay, is more effective in terms of intercultural experience and learning English.

Analysis of questionnaire: cluster analysis

We grouped the participants using 32 variables obtained from the questionnaire (excluding the final question: what subject would they like to register?) in order to see the similarity and difference of the participants on the short term SA program. We conducted the cluster analysis using Ward’s method by Squared Euclidean distance. As a result of automatic discrimination on
Entropy, the participants were classified into four cluster groups (see Figure 1). However, the result of student 14 (‘S’ indicates ‘student” in Figure 1) is far apart from the results of the others; therefore, it was judged as an outlier and the second cluster analysis was conducted excluding the data of student 14. The results indicate two cluster groups: group 1 with four students (S4, S6, S1, and S8) and group 2 with eleven students (S2, S5, S15, S10, S12, S3, S11, S9, S7, S13, and S16).

Next, we conducted a Mann-Whitney U test following the procedure of Carreira (2015) in order to examine the characteristic of each cluster. We employed Mann-Whitney U test using nonparametric method because most items of the questionnaire did not show the normal distribution according to the results of the Shapiro-Wilk normality test. Table 10 is the list of variables which have significant differences between the groups with the results of Mann-Whitney U test (significance level of 5%). Please refer to the results of all the items to Appendix 2.

The items that indicate significant differences between the clusters are the followings: (Q9) “I realize the improvement on reading skills”, (Q14) “I became able to understand movies, TV and radio programs, and songs in English”, (Q15) “I became able to read books, newspapers, and magazines in English”, and (Q20) “I became able to read technical books and research papers in

![Dendrogram](image_url)
English faster and more effectively”. According to the results of this Mann-Whitney U test, the participants in the first cluster earned higher and more practical English skills than the ones in the second cluster. Hence, the first cluster is categorized as the higher English proficiency group and the second cluster as the intermediate English proficiency group.

*p < .05. **p < .01

Why, then, did the participants in the first cluster realize that they had acquired higher English proficiency? Table 11 is the result of TOEFL ITP© between the clusters. Their scores show the normal distribution according to the results of the Shapiro-Wilk normality test; therefore, the results of t-test are also presented in Table 11.

All the sections including the total score indicate that the mean score of the first cluster is higher than that of the second cluster. In addition, we conducted two-tailed t-test (significance level of 5%), and the results are as follows: the listening score: \( t(12)=2.62, p=.02 \), the grammar score: \( t(12)=0.60, p=.56 \), the reading score: \( t(12)=2.62, p=.02 \), and the total score: \( t(12)=1.37, p=.20 \). Only the listening score indicates significant differences between the clusters. In short, the above suggests that the differences of the participants’ English proficiency level before the SA program are closely linked to the questionnaire items that the participants felt their improvement through the SA program. Items Q9, Q14, Q15, and Q20, which show significant differences between the clusters, all require higher proficiency level of English to achieve; therefore, the
participants in the first cluster felt they had acquired more advanced English skills thanks to the solid foundation skills in English they originally had. During the SA program, all the instructions are conducted in English, which suggests that the group with higher significant differences on the listening score had a greater advantage in their study, including the other skills such as reading skills, through the SA program.

*p < .05  **p<.01

The results above also indicate the importance of giving sufficient language learning training to the participants before they go on a SA program. One of the participants (student 6) classified in the first cluster commented as “I was able to train my communication skills because the course offered a lot of opportunities to think about and express my own ideas and opinions. Even in an academic English class, discussion was a part of it. I sometimes got frustrated since I couldn’t express what I wanted to say in English. Still, I think I got the skills to somehow communicate with others and make myself understood.” This comment tells us that the academic English classes required the participants to have communication skills including listening skills.

Discussion

Answer to the research questions

The following are the answers for the research questions. First, regarding RQ1: “what kind
of intercultural experience did you have?”, the participants experienced cultural differences from Japan based on a wide-range of life related matters such as greetings, gender (for example, ladies-first), dietary life, history of the race, life style, and pleasure. Although the literature review indicates the difficulty for international students to interact with local people using the target language, this survey reveals that the participants were able to have social interaction opportunities with the local people using English through the life and communication with their host family. Next, regarding RQ2: “What kind of English skills did you feel you gained?” the participants felt the improvement on speaking and listening skills that are necessary skills for communication. In terms of reading comprehension skills and practical English skills, the participants felt their improvement on those skills differently depending on their level of English proficiency. Those who had a higher English proficiency level, especially in English listening skills, before joining the SA program felt the improvement on a higher level of English skills including academic English. (See Table 10 for the results of the cluster analysis and Mann-Whitney U test.)

With regard to RQ3: “What kind of communication skills did you feel you gained?”, the participants became able to speak positively to people they first met, and express their thoughts and opinions with less hesitation. Therefore, we can conclude that the participants’ personality traits have transformed from introverted ones typically found in Japanese culture to more extroverted ones. As for RQ4: “What are your general impressions of living and studying abroad?”, the participants realized the virtue of Japanese culture once again as well as the one of foreign culture through the intercultural interaction and communication. Regarding RQ5: “What did you gain through living with your host family?”, many participants had intercultural experience through living with their host family, and as a result, we obtained the answers for RQ1 and RQ4.

**Upon completion of the SA program**

Lastly, regarding RQ6: “Now that you have completed SA programs, what English skills would you like to improve?” we would like to refer to the following tabulation results of the final
questionnaire item “what kinds of classes and/or programs would you like to enroll after completion of the SA program? (Multiple answers allowed)”. The results of their answers are; study abroad (16), test taken courses such as TOEFL® and TOEIC® (14), speaking class (14), class with international students (13), English conversation lounge with foreigners (Extracurricular Lessons) (13), listening class (7), class using movies, TV programs, and songs (7), grammar class (6), reading comprehension class (3), self-study programs using computers (2), others (0). Hence, the results above suggest that the participants of this short term SA program generally desire classes to improve communication skills. They realized the improvement of their communication skills through the SA program, and all of them wish to study abroad again. In addition, the results indicate the high demand for test taken classes such as TOEFL®. However, regarding skills on grammar, reading comprehension, practical English using movies, TV programs, and songs, less participants show their interests in improving these skills after the SA program. In theory, acquiring them would coincide with improvement of comprehensive English proficiency, but many of the participants did not realize it through the SA program. This indicates the importance to train these skills intensively in the university programs before sending students to study abroad, and the survey results revealed the the improvement of these skills was the secret of success in studying abroad.

**Conclusion**

**Concluding remarks**

This paper visualized the experience the participants of a short term SA program in an English speaking country in detail, based on the questionnaire survey of participants. The results indicate the positive effects on many criteria such as their communication skills, their next goal to improve English, intercultural experience, love for their country, and so on. Furthermore, regarding three barriers while studying abroad, we, as the conductors of this program, think that the factor of “living in a foreign country (stress from the language barriers, feeling alienated as a foreigner, socializing with other Japanese people” influenced the participants’ intercultural socialization and L2 language learning. It is assumed primarily because the SA program this time
is a short term program. Therefore, as they experience longer term SA programs and interact with many local people and non-Japanese international students, it is highly possible that the other two factors, “the way of communication (differences in communication styles, preference of conversation topics, differences in sense of humor)” and “social and ethnic differences (differences in the values, view of the world, and of the life, differences in social and economic levels, differences in academic levels), become their barriers while studying abroad. We conclude that it is imperative to offer classes to prevent these forecasted barriers and to prepare for the intercultural life before students go on a study abroad program. We will continue to conduct the similar research overtime and study for the changes in experiences and awareness of studying broad depending on the age and the time.

**Limitations**

The following limitations of this study should be considered for future research. This study is based on the data obtained from 16 first year students belonging to a middle-level private university in the Kansai region in Japan. Thus, it is difficult to generalize the results of this study. According to Long (2006), needs analysis have to be conducted from the multiple angles, and sampling of survey participants need to be considered. Without doubt, it is essential to obtain and analyze data from students belonging to different universities in a variety of regions. Moreover, we need to conduct similar studies on different school grades (e.g. first year students, second year students, third year students, forth year students), different generations (e.g. in their teens’, in their twenties’, in their thirties), different occupations (e.g. university students vs. business people), different universities (e.g. national university vs. private university), different regions (e.g. urban area vs. rural area), different accommodations (e.g. dormitory vs. homestay) and so on. Analyzing the data from multiple elements and aggregating the results obtained from the surveys above will make it possible to specify the effects of SA programs on Japanese English learners in detail, and to aim for a more refined generalization.
Notes

3 Hatsuse (1988) rephrases internal phases of globalization as (1) situation of “globalization in a daily life””, (2) “globalization of their mind” regarding how to deal with the situation, (3) action of “globalization of citizens” to shape their future. Kadokura (1994, p. 3) rephrases as “domestic”, “internal”, and “intrinsic” globalization. Internal globalization is mentioned as “under the development of borderless economy, in order to live with the world, we need to globalize our mentality and moral such as culture and customs in addition to the globalization of materials and finances. Internal globalization means opening the minds and practices of Japanese citizens to the world by mutual understanding of culture and customs through interaction of people. One of the effective measures is to accept foreign workers and international students.” (http://www.city.shunan.lg.jp/ho/gappei/sg0708.htm)

6 The total number of students in the University of Waikato is 13,000. Among those, 2,800 students are international students from 70 countries.
Appendix 1

The items of the questionnaire are as follows;

(1. strongly disagree, 2. disagree, 3. agree, 4. strongly agree)

1. I had intercultural experience. 2. I become to like foreign culture. 3. I became to like Japanese culture more than before. 4. Please describe the impressive intercultural experience abroad. (Free descriptive answer) 5. (I think) my English has somewhat improved. 6. (I think) my speaking skills have improved. 7. (I think) my listening skills have improved. 8. (I think) my writing skills have improved. 9. (I think) my reading skills have improved. 10. (I think) my grammatical skills have improved. 11. I became able to express my thoughts, feelings, and what I want to say. 12. I was able to learn many English vocabulary, idioms and expressions. 13. I was able to acquire correct English pronunciation. 14. I became able to understand movies, TV and radio programs, and songs in English. 15. I became able to read books, newspapers, and magazines in English. 16. I became able to read and write emails and/or letters in English. 17. I became able to translate English into Japanese smoothly. 18. I became more aware of English grammar. 19. I became able to understand academic and technical lectures in English. 20. I became able to read technical books and research papers in English faster and more effectively. 21. (I think) my communication skills have somewhat improved. 22. I became able to deal with varieties of daily situations. 23. I became able to speak to people I first met without hesitation. 24. There were many opportunities to speak with local people. 25. There were many opportunities to speak with non-Asian people. 26. There were many opportunities to speak with Asian people. 27. There were many opportunities to speak with Japanese people. 28. The English only circumstances were good. 29. I would like to study abroad again. (Both selection description and free description) 30. I think I have changed my characters through the SA program in a positive way. (Both selection description and free description) 31. I was able to learn cultural differences through living with host family. 32. I was able to study English through living with host family. 33. Please describe the impressive experience living with host family. (Free descriptive answer)

[What kinds of classes and/or programs would you like to enroll after completion of the SA]
program?](Multiple answers allowed)

1. Test taken courses such as TOEFL<sup>®</sup> and TOEIC<sup>®</sup>
2. Exclusive grammar class
3. Exclusive reading class
4. Exclusive listening class
5. Exclusive speaking class
6. Class with a native English teacher
7. Class with international students
8. Class using movies, TV program, and songs
9. Self-study programs using computers
10. English conversation lounge with foreigners (Extracurricular Lessons)
11. Short/long term study abroad program at university
12. Others

ed CHOICE
ABOUT EDCHOICE

EdChoice is a nonprofit, nonpartisan organization dedicated to advancing full and unencumbered educational choice as the best pathway to successful lives and a stronger society. EdChoice believes that families, not bureaucrats, are best equipped to make K–12 schooling decisions for their children. The organization works at the state level to educate diverse audiences, train advocates and engage policymakers on the benefits of high-quality school choice programs. EdChoice is the intellectual legacy of Milton and Rose D. Friedman, who founded the organization in 1996 as the Friedman Foundation for Educational Choice.

We are grateful for the generous financial support of the Walton Family Foundation, which made this project possible.

EXECUTIVE SUMMARY

In this research, we examined longitudinal trends in private school enrollment, grade offerings, and student demographics over a 22-year period to determine the nature of the relationship between school choice program adoption and private school student populations.

We drew our data from the U.S. Department of Education’s Private School Universe Survey (PSS), which has been gathering data biennially on private schools in the United States since the 1989–90 school year. The PSS database collects information from private schools spanning prekindergarten through 12th grade, including ungraded and some post-secondary, but our focus was on the schools serving only K–12 students.

- **Is there a significant difference in private school enrollment after the introduction of private school choice programs?**

Across all analyses, the enrollment trends of private schools in states with private school choice programs either did not differ significantly or differed only trivially from schools operating without the presence of choice. This was the case whether choice was measured broadly or for each different type of school choice program—vouchers, individual tax credits, individual tax deductions, or tax-credit scholarships.

- **Is there a significant difference in the percentage of racial/ethnic minority students in private schools after the introduction of private school choice programs?**

Private schools in choice states did not grow “whiter,” contrary to charges by critics that private schools would grow less diverse as a result of choice. Results show the average percentage of non-white students in private schools grew over time in choice states similar to schools in non-choice states. Moreover, the percentage of minority students enrolled in private schools as compared to the surrounding school-aged populations did not appear to change as a function of choice programs. As with the other analyses, this suggests private schools under circumstances of choice did not grow whiter, and the student body composition appeared consistent with the populations surrounding their schools.

- **Is there a significant difference in the number of grades offered (i.e., capacity) in private schools after the introduction of private school choice programs?**

Results indicate the number of grade levels offered by private schools in choice and non-choice states changed very little over time. And the trends showed little or no divergence based on the introduction of choice. Thus, school capacity trends in private schools under conditions of choice look substantively the same as conditions without choice, both broadly measured and disaggregated by different types of school choice programs.

Although the impulse among some may be to ascribe such results to a failure of school choice to increase enrollment in or the capacity of private schools, other reasons—working in concert—are more likely.

First, private school leaders appear cautious to respond to changes in their environments. New private school choice programs have often been limited in their scope, meaning the number of new students any given private school may see after policy adoption may be small, so small, in fact, as to limit the ability of schools to significantly increase their capacity. Adding a grade, for example, requires hiring at least a new teacher plus

---

1 Note that this differs from the number of classrooms in a given school. Instead, it measures whether a school adds new grade levels to those already existing, such as when a K–5 school adds middle school grades.
curricular material and other related resources, all of which demand enough student growth to cover the increased costs. The prudent school leader would naturally be reluctant to take on the additional costs absent clear and present demand. Such reluctance would be even more pronounced among private school entrepreneurs, who would need to see sufficient demand before committing to opening and operating a new school.

From a broad perspective, the competition driven by school choice, particularly at scale, depends on a critical mass of families exiting their neighborhood schools, but without viable alternatives—i.e., private school capacity—the critical mass is unlikely. Of course, private schools or private school entrepreneurs are unlikely to blindly subscribe to a “build it and they will come” fantasy. Like anyone else, private school leaders see the regulatory limitations imposed on choice programs, such as participation caps, tuition caps, or student eligibility restrictions, and recognize the resulting demand likely will not justify significant expansion. Moreover, for leaders of religious schools, the very real possibility of regulations forcing them to significantly alter the content of their teaching and even their facilities (i.e., removing religious iconography) provides a serious disincentive to participate in choice programs. Indeed, making such changes undermines the very missions that motivate such schools.

Caution to participate may also stem from a fear that even constitutionally “safe” private school choice programs can disappear if funding is eliminated in the state budget. Some programs often depend on annual appropriations in state budgets, and a change in the legislature’s makeup could result in insufficient funding. Anticipating this possibility, private school leaders might hesitate to expand the number of seats made available to school choice program students out of fear their schools would be vulnerable in the event that program funding were taken away.

Second, limitations in choice programs themselves may depress demand and growth in enrollment and capacity. Historically, most choice programs have been targeted in nature, designed to serve only low-income students or those with special needs. Until recently, many programs operated on a small scale, some as trial programs with firm caps on participation, limits on a private school’s choice-using student population, income limitations on the parents to qualify for the program, geographic limitations, grade limitations, and limitations based on where the student last attended school.

If legislators are sincere in their intent to see school choice work at scale to improve K–12 education, the issue of capacity can no longer be ignored. More than 25 years ago, John Chubb and Terry Moe predicted the capacity problem when they warned against policies that focused exclusively on creating demand and ignored mechanisms to encourage and promote the emergence of new and different types of schools. Their warning was prescient. As Foundation for Excellence in Education’s Matthew Ladner observed of current programs,

> “Existing school voucher and tax-credit programs have been designed, in essence, to allow students to transfer from public schools into a preexisting stock of nonprofit private schools...Few state lawmakers have created choice programs robust enough to spur the creation of new private schools.”

Consequently, others have recently begun referring to capacity as one of the most significant limitations on the choice movement. Results from this report confirm such observations.

Increasing private school supply will likely mean:

---

• adopting programs with more universal student eligibility to produce enough demand for private school leaders to expand and/or replicate their schools;

• finding a balance between light regulatory restrictions/burdens and accountability to avoid disincentivizing high-quality providers who value autonomy;

• establishing reliable program funding streams to assure private school leaders choice programs are more than a flash in the pan; and

• securing strong per-pupil funding for school choice programs, whether in the form of vouchers, tax-credit scholarships or education savings accounts, to incentivize greater private school involvement and put a greater number of schools within reach of more children.

We recognize such recommendations are rather general, but because this issue has seen surprisingly little attention, we position these results and recommendations as an initial catalyst to begin creative and productive discussion and undoubtedly debate about the role of capacity in school choice and recommendations for its expansion.
INTRODUCTION

Since the advent of large-scale private school choice programs in recent decades, policymakers, researchers, school choice opponents and proponents, and media members have paid great attention to, among others, the outcomes of these programs,\(^1\) the effects of private choice on public school performance,\(^2\) and issues of equity in program participation.\(^3\) By private school choice, we mean programs that enable students to leave their neighborhood public schools and attend, instead, private schools. Such programmatic mechanisms include vouchers, tax-credit scholarships, and education savings accounts.\(^4\)

Policymakers, researchers, and others have paid comparably less attention, however, to potentially important and revealing trends within the private school population since the adoption of private school choice programs. This report tackles those trends: private school enrollment, the infrastructure growth of the private school sector, and changes in the demographics of private school populations over time—all of which we measure with a nationally representative sample.

An examination of such trends is particularly revealing because it provides insight into the mechanics of choice. As school choice researcher Huriya Jabbar noted, “Although existing research has considered whether competition improves student achievement, it is also important to study how that might occur and what the consequences of such policies are.”\(^5\) More specifically, examination of such trends sheds light on one of the most important issues in the efficacy of choice that has only recently begun to receive the attention it deserves: the capacity or supply of private schools.\(^6\) As described later in this report, for choice to be an efficacious reform policy, certain changes must occur at scale. Without an increase in the capacity or supply of private schools, the reform potential for school choice, in particular, will largely remain unrealized.\(^7\) Indeed, as Gregory Elacqua, Matias Martinez, and Humberto Santos wrote, “This issue is critical to understanding if and how educational markets work. How private schools actually respond to the competitive marketplace created by school choice will greatly affect the future success of [choice] reforms.”\(^8\)

The first of the trends studied herein is private school enrollments, which signals the degree of competition actually experienced by a given public school. One of the central tenets of school choice is that competition can lead to educational reform by spurring public schools to become more effective.\(^9\) The mechanics of such competition are manifest in families that use a voucher, for example, to “exit”\(^10\) their catchment schools in favor of private schools, thereby applying pressure on public schools to improve their offerings in order to keep and/or regain constituents.\(^11\) Setting aside mixed findings about competitive effects from the threats of vouchers,\(^12\) it stands to reason that for competition through exit to work, there has to be a credible threat of exit or actual exit, or at least enough exit to compel change.\(^13\)

To date, these mechanics have gone unexamined.\(^14\) Many of the studies on the competitive effects driven by school choice programs largely assume or acknowledge only descriptively that as a result of the introduction of a school choice program,\(^15\) significant numbers of students are exiting public schools in favor of private institutions.\(^16\) When predicting estimates of the effects of school choice programs, others explicitly assume growth in the private school sector is a result of choice programs.\(^17\)

Given the centrality of the assumed progression from choice to competition to systemic impact, empirically evaluating the first linkage in that chain is particularly important.\(^18\) Accordingly, this study tests this by asking: Is there a significant difference in private school enrollment following the introduction of school choice programs?

The second trend studied here is infrastructure growth in the private school sector. The exit option is real only to the extent that families have private
schools to enter after exiting their catchment schools. In part, this is an issue of capacity. We ask: Is there increased capacity in the private sector to accommodate the students who wish to avail themselves of school choice programs? Does choice, in fact, create new options for students? 19

The capacity question is the infrastructure companion to the prior question on enrollment. Similar to enrollment, economists Thomas Downes and Shane Greenstein succinctly describe the assumption in their study on the locations of private schools,

“[T]he argument in favor of school choice implicitly assumes that once school choice programs go into effect, private schools will enter and locate near low-quality public schools, resulting in a more competitive environment and widespread improvement in public schools.” 20

Indeed, others posit that if choice programs are to succeed in compelling change in public schools, an expansion of private school capacity is required in order to accommodate the critical mass of students that would need to exit their neighborhood schools. 21

Significant data limitations are likely to blame for the scarce attention researchers, pundits, and others have paid to this important issue thus far. 22 Constructing a longitudinal census of private schools in the United States has proven exceptionally difficult, and as discussed in greater detail later in this report, even the data source used for this study—the Private School Universe Survey (PSS)—does not allow for a reliable analysis of changes in the number of schools over time. However, one alternative measure available in the PSS provides at least some approximation, specifically grade levels private schools offer. The logic applied to grade levels mirrors that of schools. As demand for private schooling increases throughout the K–12 span, the assumption is that private schools—many of which may not serve all grades—will increase the number of grades they offer to meet demand. 23 Thus, to examine this trend we ask: Is there a significant difference in the number of grades offered in private schools before and after the adoption of school choice programs?

The third trend considers a persistent issue that follows the adoption of school choice programs: the racial/ethnic composition of private schools. 24 Critics’ assertion is, by now, well-known. They claim school choice programs will result in greater segregation as white students use vouchers and other choice mechanisms at disproportionate rates to leave public schools in favor of private schools. 25 This is not necessarily an implication of the enrollment practices of private schools but of (a) inequitable access on the part of some parents to resources and information necessary to navigate a complicated landscape created by choice programs 26 and/or (b) the desire of parents to send their children to schools populated with other children “like them.” 27 Significant opportunity and monetary costs must be borne by parents in the process of visiting different schools, learning and completing different application procedures, and monitoring the various options if assigned to a waiting list. Such circumstances typically favor parents with strong social networks and resources to understand and navigate the many different enrollment processes. The fact that some parents lack the resources necessary to undergo this process may lead to inequitable access to schools and enrollment patterns segregated by race/ethnicity, socio-economic status, and other indicators. Similarly, inequitable access to information may be as basic as not understanding a choice even exists, let alone possessing the information necessary to utilize the choice provided.

As for choosing based on school demographics, studies are mixed in their findings. Studies such as those reviewed in EdChoice’s reports A Win-Win Solution and The Integration Anomaly find private schools are more racially/ethnically integrated than public schools. 28 Other research, however, suggests parents seek schools with student
populations that reflect their own racial backgrounds, particularly white parents. Such findings have been generated by surveys, analysis of datasets such as the National Education Longitudinal Study, or through tracking Internet search patterns of parents in their school choice decision-making processes.

Yet, such findings are far from definitive, and few examine longitudinal trends at a particularly robust scale. We do so here by postulating that if, through inequitable access or the choices made by parents, the mechanics of choice produce schools with less diverse populations, we should expect to see the percentage of white students increasing in private schools following the adoption of school choice programs.

WHAT PRIOR RESEARCH SAYS

Enrollment

Two recent reports have examined general trends in private school enrollment over time. Using PSS data, Chief of the U.S. Census Bureau’s Foreign-Born Population Branch Stephanie Ewert tracked private school enrollments from 1990 to 2010 and found that the number of students enrolled in private school grew steadily from 1990 to about 2001. After 2002, the number of students enrolled in private school declined. Ewert’s analysis was confirmed by a National Center for Education Statistics (NCES) report that showed enrollments in the 2011–12 school year represented a low point in private school enrollment during the past few decades. During the high point in 2001–02, 6.3 million students attended private schools in the United States. By 2011–12, the number decreased to 4.5 million students.

Both reports provided important descriptive information about general enrollment trends, but neither examined how enrollment trends may have changed based on the adoption of school choice programs. Three others have, but they focus specifically on tax credit programs.

In the first report, researchers studied enrollment trends before and after tax credit program adoption, then compared those trends to neighboring states that had not adopted such programs. None of the tax credit program states saw enrollment increases after program adoption, and some saw decreases. Comparisons to other states showed no significant differences in trends based on program adoption.

The second report analyzed the relationship between the use of tax credits in Iowa and private school enrollment. Results indicated that as the number and amount of tax credit claims increased over time, private school enrollment declined. In fact, private school enrollment declined in every single year in the study, save for one. During the same years studied, public school enrollment increased for a six-year period, then also declined. The authors opined that the tax credit did not appear to increase private school enrollment and the decreasing trend was likely a consequence of a general decrease in the school-aged population in the state.

The third study reported findings similar to those in Iowa using data from Minnesota. It compared tax adjustment increases allowed as part of the state’s tax credit program during 1976, 1984, and 1997 to enrollment figures in private schools under the logic that greater tax adjustments would allow for more families to opt for private schools. Results indicated between 1975 and 1978, there was a 1 percent decrease in private school enrollment following a $300 increase in the adjustment, and between 1983 and 1987, there was a 2 percent decrease in private school enrollment in Minnesota. Only after the adjustment amount was nearly tripled, did private school enrollment increase, albeit modestly, in 1997.

In contrast, World Bank Economist Maria Marta Ferreyra assessed the relationship between private school enrollment and two different types of school
vouchers—universal vouchers and those that could be used only at nonsectarian schools. Her simulation results suggested that both programs increased private school enrollment, but under nonsectarian vouchers, private school enrollment expanded less than under universal vouchers, and religious school enrollment declined for large nonsectarian vouchers. In general, fewer households benefit from nonsectarian vouchers.

**Capacity**

Infrastructure growth in the private school sector indicates an increase in its capacity to take on more students. Some have studied the location patterns of private schools, but few authors have examined the number of new private schools entering the marketplace over time, let alone in the context of school choice policies.

One study examined school creation in Milwaukee and found that the vast majority of Catholic and Lutheran schools existed prior to the city’s school voucher program, but two thirds of “other religious” schools and all of the non-religious schools formed after the program started. Moreover, 46 percent of the new schools’ principals said the Milwaukee voucher program was a major factor in decisions to open the schools.

Another study focused specifically on Florida and its tax-credit scholarship program. It used an interrupted time series analysis to examine whether the number of private schools increased following program adoption. Results provided little evidence that the policy introduction was causally responsible for an expansion of private school supply in the state. Compared to other states, the formation of private schools in Florida increased at a greater rate after the tax-credit scholarship program’s implementation, but the state’s growth rate appeared to have been part of a trend that preceded the adoption of the tax-credit scholarship program.

**Composition**

Though a series of studies have examined the demographics of private school populations as a function of school choice programs, most use a cross-sectional design. In fact, only a few have used any form of longitudinal design.

The first analyzed racial/ethnic enrollments in Milwaukee’s private schools by comparing enrollment figures from 1994–95 to 1998–99. The authors found a noticeable increase in racial and ethnic balance in private schools—a finding in sharp contrast to school choice critics’ often hyperbolic predictions that more choice would worsen racial and ethnic segregation. The report’s authors concluded that the results were reflective of the fact that most low-income students using school vouchers in Milwaukee’s means-tested voucher program belonged to racial or ethnic minority groups. By using the school choice program, Milwaukee voucher students moved from racially isolated public schools, with low percentages of white students, to private schools with larger enrollments of white students.

Another analysis of two years of data from the Louisiana Scholarship Program found voucher students moved from schools in which their racial group was overrepresented relative to the surrounding communities, thereby improving integration in Louisiana public schools. At the same time, student transfers had, in general, no net negative impact on racial integration in their new private schools. The authors reported,

> “Based on this evidence, we conclude that the LSP is unlikely to have harmed desegregation efforts in Louisiana. To the contrary, the statewide school voucher program appears to have brought greater integration to Louisiana’s public schools.”

A third study used two years of data from the Milwaukee Parental Choice Program (MPCP) to study how voucher student transfers affected the demographics of sending and receiving schools and how the public and private schools compared to the demographic profiles of surrounding
communities. Results indicated students who switched schools in Milwaukee tended to (a) improve racial integration at their originating school and (b) worsen integration at their receiving school, whether that receiving school was within Milwaukee Public Schools (MPS) or part of the voucher program. Furthermore, the differences between MPS-to-MPS and MPS-to-MPCP switches were negligible. They also found that MPCP and MPS schools were about equally representative of the racial composition of the broader community in which they were located; however, both sectors had racial compositions that deviate significantly from the Milwaukee metro area. The authors concluded, “Overall, our results show that the Milwaukee voucher program is currently neutral in its effect on racial integration.”

**METHODS**

In this section, we discuss the methods that are generally applied to all of our research questions. We provide additional details about the analyses of each question in the Results section, and findings for each question are discussed and in even greater detail in the Appendix.

**Research Questions**

One overarching question guides this analysis: Have the following three metrics experienced significant change after the introduction of modern private school choice programs?

1. Private school enrollment
2. The percentage of racial/ethnic minority students in private schools
3. The number of grades private schools offer/serve (i.e., student capacity)

**Data and Sample**

To study the question guiding this research, we examined longitudinal trends in enrollment, grades offered, and student demographics among private schools during a 22-year period. We drew our data from the PSS, which has been gathering data biennially on private schools in the United States since the 1989–90 school year. The PSS database collects information from private schools spanning prekindergarten through 12th grade, including ungraded and some post-secondary, but our focus was on the schools serving only K–12 students. For the purposes of this study, we excluded kindergarten-terminal, post-secondary, and ungraded schools, an approach consistent with other studies, but we retained schools that served only primary grades, since those were the types of schools that might be particularly inclined to expand their grade offerings in response to school choice programs.

**Variables**

The outcome (i.e., dependent) variables include total school enrollment, number of grades private schools offer/serve, and the percentage of the student body that are racial/ethnic minorities. Ideally, we would have used the number of schools in operation each year as a measure of capacity, but insight provided by the NCES prohibited us from doing so. The list of schools in the PSS changes each year, but the PSS does not track—and the NCES does not know—whether the appearance and disappearance of schools from one year to the next is a result of entering and exiting the market or simple non-response to the survey. The number of grades schools offer/serve, however, acts as a viable substitute. Indeed, based on her cross sectional study of private school market entry, Federal Reserve Bank Economist Lisa Barrow recommends the number of grades schools offer/serve as a worthy measure.
“In particular, there are other dimensions of private school supply, namely increasing enrollment and offering more grade levels, which are not captured by measures of entry. These are likely to be dimensions on which schools may respond more easily to changes in private school demand. Thus, future work might be helped by capturing several dimensions of increasing private school supply.”

The primary predictor (i.e., independent) variables of interest are private school choice program variables. These include vouchers, tax-credit scholarships, individual tax deductions, and individual tax credits. Notably, education savings accounts are another form of educational choice, but Arizona adopted the first program of its kind just before the final year of data used in this study, precluding its inclusion.

More detailed information about each of these types of choice programs is available on EdChoice’s website, but we review the essential elements below.

**Individual Tax Deductions**

Through individual tax deductions, parents can receive state income tax relief for approved educational expenses, which can include private school tuition, books, supplies, computers, tutors, and transportation. A tax deduction reduces a person’s total taxable income.

**Individual Tax Credits**

Through individual tax credits, parents can receive state income tax relief for approved educational expenses, which can include private school tuition, books, supplies, computers, tutors, and transportation. Tax credits lower the total taxes a person owes.

Table 1 on the next page lists the programs in effect during the study period. Between 1989–90 and 2011–12, 15 voucher programs operated in 10 states and Washington, D.C.

Figure 1 on page 13 illustrates the number of private school choice programs in effect by year and aggregates the number of programs and states by year. During the early years of the data included in this study, the number of programs and states remained basically static. Beginning in 1999–00, the rate of growth increased, with the sharpest increases evident starting in 2005–06. By 2011–12, 17 states offered a combined 31 programs of various types, the greatest number being school voucher programs.

**RESULTS**

Is there a significant difference in enrollment after the introduction of private school choice programs?

</table>
We begin by examining general trends in enrollment disaggregated by states that offer school choice (choice states) sometime during the 22-year period and those that do not (non-choice states). Figures 2A and 2B illustrate the total number of private school students by year in choice and non-choice states. Figure 2A shows the sums by year. Figure 2B shows the percentage change in total enrollment over time.

During the early years of the data, we should expect to see the trend lines for the two groups of states move in essentially parallel fashion. If choice programs are compelling changes in enrollment, trend lines should diverge in later years when choice programs begin to proliferate. As evident in both figures, whether measured as the overall sums or percentage changes compared to 1990, both trends move in very similar trajectories. Thus, these general trends do not suggest choice states saw differential enrollment patterns compared to non-choice states.

Similar trends are evident when looking at average

**Choice Measured Broadly**

$N = 13,809$ Non-Choice; 9,009 Choice

school enrollments over time. Figures 3A and 3B on page 15 show average school size in choice and non-choice states, first with average trends over time and then with the percentage change. In both figures, average school enrollments moved in similar trajectories in choice and non-choice states, although the decrease in choice states appeared to be greater than in non-choice states (Figure 3B).

These are, of course, only descriptive trends. Though they are helpful for understanding general private school enrollment patterns and suggest enrollment trends in choice states differed little from non-choice states, we cannot draw statistical inferences about the relationship between enrollment and the adoption of school choice programs.

To help isolate the relationship between choice and average school enrollment (the outcome variable of interest in this question), we used a time series analysis with linear and curvilinear trends interacted with school choice program indicator variables and school and year fixed effects. The former—where time is measured as years (i.e., linear) and years squared (i.e., curvilinear)—allowed us to detect differences in enrollment trends between schools in choice states and those operating in non-choice states, which we describe in more detail later. The latter—school and year fixed effects—enabled us to control for factors within schools or within years that might confound the relationship between choice and enrollment.

A longitudinal approach to trends in private schools is particularly important because the effects of large-scale interventions often take time to manifest. As one study of vouchers and racial segregation noted,

“[I]t may take several years or possibly decades before a new long-run equilibrium is reached. Evaluations conducted only a few years after implementation may reveal very little about the long-run effects of [choice] because they will not fully account for, along with many other factors, the long-run supply responses of existing private schools, entry by new private schools, competitive responses by public schools, and long-run demand responses.”

The analyses began with choice measured broadly as simply whether a state had any type of choice, as defined above. We also controlled for whether a state had a charter school law. The inclusion of a charter variable controlled for the possible effects of charter schools on the outcome measures. We say “possible” because prior research is mixed on the relationship between charter schools and private school enrollment, but because the greater consensus of prior research findings seems to indicate a negative relationship between charter schools and private school enrollment, we included a measure in our analyses.

Setting aside all of the control variables, the primary variables of interest are average school enrollment—the outcome variable—years, years squared, and the interaction of the choice indicator variable with both time variables—the predictor variables. We included years squared given earlier research findings of a curvilinear trend in private school enrollment and the trend lines displayed previously, which clearly show non-linear trends in enrollment over time in both choice and non-choice states. The interaction of the choice indicator variable with years and years squared captured possible differential trends in enrollment between those operating in choice environments and those that were not. To reiterate, if choice produces growth in average enrollment in private schools that differs from trends in non-choice states, we should expect to see the interaction variable in the tables below as statistically significant and with positive regression coefficients, indicating schools in choice states growing at rates different than schools in non-choice states.

As Table 2 indicates, there appears to be no meaningful difference in enrollment trends between those operating under choice and those that are not, thereby confirming the trends evident

\( R^2 \text{adj} = 0.90; \text{N} = 273,746; \text{dependent variable} = \text{average school enrollment} \)

in Figures 3A and 3B. The interaction between choice and year is significant, and indicates a slight decrease in enrollment compared to non-choice states, but the magnitude of the difference is small (i.e., 1.6 fewer students per year). Moreover, the non-significant coefficient for the interaction of choice and year squared indicates the subsequent trend in choice states did not deviate from non-choice states.

Together, these results indicate no meaningful difference in enrollment trends between private schools operating under conditions of school choice and those that do not.

**Choice Measured by Specific Programs**

Of course, the prior analysis measures choice broadly by combining all types of choice programs into a single group. It could be that enrollment is sensitive to specific types of choice. To measure this possibility, we disaggregated choice into the different types of choice programs—voucher, tax-credit scholarship, individual tax credit, and individual tax deduction programs. Figures 4A through 4D illustrate trends over time—specifically the percentage of change—for states based on the different types of programs offered. Similar to Figures 2 and 3, the trends in Figures 4A through 4D show average school enrollment trends move in similar trajectories in states with various types of choice programs as compared to states without such programs. Although the trend lines are not perfectly correlated, they nonetheless fail to show strongly divergent trends that would be consistent with the aforementioned school choice theories.

Subjecting these trends to similar statistical analyses described above confirms the descriptive trends in Figures 4A through 4D. As Table 3 indicates, only two of the interactions involving time and school choice programs were significant. This means the enrollment patterns of choice schools did not consistently diverge from the pattern of non-choice schools. Of the two significant interactions, schools in states with individual tax credits saw a small decrease in enrollment compared to states without such programs, and no change in enrollment in later years. Conversely, schools in individual tax deduction states saw a greater increase in enrollment as compared to non-individual tax deduction states; however, the effect was, again, small with no change in enrollment in later years.

Enrollment Trends Compared to Population Trends

It is important to note that trends in enrollment or demographics may be influenced by changes in the communities in which schools operate. In light of this, we compare private school enrollment trends to those in the larger population. To do so, we used geographic information system (GIS) or geocoding in comparing private schools to their surrounding communities and schools. To date, few school choice studies have used this growing technology, which is an unfortunate omission given the importance of the social, cultural, and economic landscapes that shape school choice. Using contemporary technology, GIS allows researchers to “layer” data with spatial characteristics on computer-generated maps in order to better understand contextual issues and spatial patterns and relationships. It can also be used with traditional statistical analyses to improve estimates such as those derived herein. Of those who have used spatial analysis in school choice research, prior authors have examined how geography affects domains, such as parental choices, differences in achievement, housing markets, school efficiency, and racial segregation. Thus, while our use of GIS is not entirely unique, it is one among a very small collection of studies in the school choice oeuvre.

We compared the enrollment trends of each private school to those of public schools operating within five miles of the respective private school. This approach examines whether the enrollment trends in private schools mirror those of surrounding public schools—a measure of population changes—or whether conditions of choice alter the enrollment trends of private schools in relation to public schools.

We drew the public school data from the Elementary and Secondary Information System (ElSi). ElSi data were available for all years that corresponded to the PSS data, and we matched public schools to private schools based on the grade levels they offer.

We created the specific outcome measure in the analyses by dividing each private school's enrollment by the total enrollment in the surrounding public schools. This ratio enabled us to track changes in the enrollment of private schools as compared to surrounding public schools. If the enrollment of private schools increased relative to the surrounding public school enrollment, for example, the ratio should increase. Conversely, if enrollment increased in public schools but remained constant or decreased in the private schools, then the ratio should decrease.

The analysis for this question was similar to that used in the previous analyses, where we examined the enrollment ratio trend in both a linear and a curvilinear pattern, paying particular attention to differences in the trend lines based on the presence of choice programs. Time-varying control variables included the presence of a charter school law and the percentage of free and reduced-price lunch (FRL) students in the public schools used in the comparisons. Finally, as in the previous section, one analysis measured differences using a broad measure of choice, and a second analysis disaggregated by different choice programs.

As Table 4 indicates, the only significant effect when using a broad measure of choice was the interaction between status as a choice state and year. The positive coefficient indicates choice states saw a greater increase in relative enrollment over time, but the effect was very small, too small to be practically significant. Specifically, the outcome variable is a ratio (private school enrollment/average public school enrollment). Thus, in practical terms the coefficient of 0.004 means that from one year to the next, private schools in choice states saw an average increase in enrollment of 0.004 percentage points above the average growth evident in schools in non-choice states vis-à-vis surrounding public schools.

Similarly, when choice was disaggregated into the respective programs, only one program saw significant effects—tax-credit scholarship—and the effects were quite small as seen in Table 5. Schools in tax-credit scholarships states saw a slight relative increase in enrollment but then saw a slight decrease. For practical purposes, however, the differences were not meaningful.

Taken together, the results across the different analyses of enrollment tell a consistent story. The enrollment patterns in private schools in choice states did not differ meaningfully or in most cases statistically from schools in non-choice states. This was the case whether choice was measured broadly or when disaggregated into specific programs or when enrollment trends are compared to general population trends.

Is there a significant difference in the percentage of racial/ethnic minority students after the introduction of private school choice programs?

Choice Measured Broadly

We examined trends in the percentages of racial/ethnic minority students served in private schools. As Figure 5A on page 23 illustrates, in general, the average percentages of minority students enrolled in private schools increased from 1994 through 2012. (The racial composition of private schools was not captured in the PSS in 1990 or 1992.) This was the case in states offering choice (measured broadly as any type of choice program) and those not offering choice. Although both types of states saw an increase, Figure 5B on page 23 suggests that the rate of growth compared to the first year of data was greater in choice states than non-choice states. Based on these descriptive results, it appears

FIGURE 5B  Biannual Percentage Change in Racial/Ethnic Minority Students Over Year 1 in Choice and Non-Choice States

N = 14,003 Non-Choice; 9,132 Choice
private schools operating in choice states have not grown “whiter,” on average, as compared to those in non-choice states and perhaps may have grown more diverse.

Those are, of course, descriptive trends only, but when subjected to the same type of statistical testing described previously, the results told a similar story. Table 6 indicates the interaction of choice and the time variables are not statistically significant, indicating the percentages of minority students in choice schools did not diverge from the pattern of non-choice schools. Specific to the hypothesis guiding this analysis, these results mean the student body demographics of private schools operating under choice mirror those of non-choice schools. Put simply, the demographics of private schools have not grown “whiter” while operating under conditions of choice, broadly measured.

### Choice Measured by Specific Programs

When choice was disaggregated into different programs, results were similar to when choice is measured broadly. As Figures 6A through 6D starting on page 25 illustrate, the percentages of minority students increased over time in states with no type of choice and states that offered the specific school choice programs. Moreover, the growth in choice states appeared to be greater in later years studied herein.

When subjected to statistical analysis, however, the results—found in Table 7 on page 27—were essentially the same as Table 6 suggests. For all programs save one, the interactions between program indicator variables and the time variables were not significant, again meaning the percentages of minority students in choice schools did not diverge from the pattern of non-choice schools once choice was introduced into the environment. The one exception is the interaction of voucher states and year squared. In later years, the coefficient indicates a small increase in schools operating in voucher states. Though, again, the difference is small. Consistent with the broader measure of choice, private school demographics have not grown “whiter” while operating under specific measures of choice, including vouchers and different types of tax-credit programs.

### Percentage Minority Trends Compared to Population Trends

On average, the student populations of private schools in choice states have grown more diverse over time and similarly so compared to non-choice states, but how does the diversity of the schools

compare to the geographical areas surrounding the schools? To answer this, we compared the percentage of racial/ethnic minority students in each school to the matched school-aged population within a one mile area around the respective schools.\textsuperscript{69} In so doing, the analysis “benchmarked” each school’s composition to the surrounding community.

We drew the population data from the decennial census for 2000 and 2010. Although 1990 census data were available, the percentage of minority students were not available for the PSS, so this analysis is limited only to 2000 and 2010. The census data indicate the number of people in geographic areas disaggregated by age groups and race/ethnicity. We matched these age groups to the private schools whereby ages 5–9 in the population were matched to elementary schools, ages 10–14 to middle schools, ages 15–19 to high schools, and various combinations.

To create the specific outcome measure in the analyses, we divided each private school’s minority student percentage by the percentage of minority students within the surrounding school-aged population. This ratio enabled us to track changes in the composition of private schools as compared to the surrounding population. If the racial/ethnic composition of private schools increased relative to the surrounding population, for example, the aforementioned ratio would increase. Conversely, if the percentage of minority children increased in the population but stayed constant or decreased in the private schools, then the ratio would decrease.

The variable measuring changes over time is named “number of years.” This variable indicates the number of years respective choice programs were in effect in 2000 and 2010. For example, if a state’s voucher program went into effect in 1997, then “number of years” would show a value of four in 2000 and a value of 14 in 2010. For states with no programs in operation, “number of years” would

take a value of zero in both 2000 and 2010. This type of coding reflects the fact that states that may offer the same type of choice program often did not begin offering the programs in the same years. By the year 2000, for instance, one state might have offered a program for two years, while another might have offered a program for eight years. Thus, the programs’ effects on student composition may not be the same in 2000.

If choice has the effect predicted by critics, the “number of years” variable would be statistically significant. It would also have a negative sign, showing the ratio of average percentages of
minority students in private schools to surrounding areas decreasing as the number of years of choice increased.

In the analysis, we also controlled for the median income within the geographic areas surrounding the private schools, included a year variable for 2000 and 2010 to control for any effects that would be idiosyncratic to those years, and included a variable interacting the year and “number of years” variables to measure a differential effect between “number of years” and the two different points in the decade. As with results above, we first examined a broader measure of choice and then disaggregated by type of choice program.

None of the variables were significant, using both a broad measure of choice (Table 8; number of years of any kind of choice) and number of years of specific types of choice (Table 9). That means the average percentage of minority students enrolled in private schools compared with the surrounding school-aged populations did not appear to change as a function of choice. Although the ratio did not increase, neither did it decrease, suggesting private schools under circumstances of choice do not grow “whiter.”

The results tell a consistent story across all the analyses specific to the percentage of minority students present in private schools. Contrary to charges by critics that private schools would grow less diverse as a result of choice, results show the average percentage of minority students in private schools grew over time in choice states similar to schools in non-choice states. Moreover, the percentage of minority students enrolled in private schools compared with the surrounding school-aged populations did not appear to change as a function of choice programs. As with the other analyses, this suggests private schools under circumstances of choice did not grow “whiter,” and the student body composition appeared consistent with the populations surrounding their schools.

Is there a significant difference in the number of grade levels schools offer after the introduction of private school choice programs?

Choice Measured Broadly

For the final research question, we examined the extent to which the infrastructures of schools changed over time after the introduction of choice. Infrastructure was measured by the number of grade levels each school offers. Figure 7A shows the average number of grades private schools offer over time in choice and non-choice states, while Figure 7B shows the percentage change over time. In both figures, the trend lines show similar patterns for choice and non-choice states, with schools in choice states offering slightly fewer grades. It is important to note, however, that the scales on the Y-axes show small increments, thereby exaggerating differences. In Figure 7A, for example, the trend lines are moving within the space of two-tenths of a grade. Thus, the differences between states over time are tiny.

When subjected to statistical testing, the results confirm that differences in numbers of grades private schools offer over time did not differ meaningfully between choice and non-choice states as demonstrated in Table 10 on page 33. Interactions between choice and the time variables showed significance on the year term but not year squared. That means choice schools saw a slightly sharper decrease in the number of grades offered in early years (i.e., an average of two-hundredths of a grade per year), but a subsequent increase was not significantly different from non-choice schools. To reiterate, the differences were not meaningfully large. In fact, all of the changes relevant to the number of grades schools offer were exceptionally small.

Choice Measured by Specific Programs

When we measured choice by specific programs, we found similar results to our broad measure of choice. As Figures 8A through 8D on pages 31 and 32 show, the trend lines for each of the specific choice programs follow similar patterns, and any divergences are quite small and magnified only by the very small increments present on the Y axes.

When subjected to statistical testing, results indicate non-significant differences for almost all of the school choice program types, again indicating choice schools did not appear to expand the number of grades they offered at a rate different from non-choice schools. Vouchers were the one program type that showed significant interactions with time squared. As Table 11 indicates, schools in states with voucher programs saw a slightly sharper increase (after an initial nonsignificant decrease) in the number of grades schools offered compared to non-voucher schools. We hasten to add, however, that the effect here was extraordinarily small. Schools in voucher states saw growth in the number of grade levels schools offered at a rate of about two-thousandths of a grade per year above the growth evident in non-voucher states. In other words, the practical significance associated with voucher policies was essentially zero.

Together, these results indicate the number of grade levels private schools offered in choice and non-choice states changed very little over time. And the trends showed little or no divergence based on the introduction of choice. Thus, school capacity trends in private schools under conditions of choice look substantively the same as conditions without choice, both broadly measured and disaggregated by different types of choice programs.

DISCUSSION AND CONCLUSION

This study began with a simple but important premise: The introduction of school choice programs should result in an increase in private school enrollments and capacity over time. Choice and economic theories suggest that choice increases the ability of a broader range of families to exit their neighborhood public schools in favor of private schools. In light of increased demand, private schools should expand their capacity and enroll a greater number of students. This study also tested whether school choice results in private schools serving smaller percentages of racial/ethnic minority students, a common concern among choice critics.

The results were not, however, consistent with such expectations. Across all analyses, the enrollment trends of private schools in states with private school choice programs either did not differ significantly or differed only trivially from schools operating without the presence of choice. This was the case whether school choice was measured broadly or in disaggregated form based on different types of choice programs. Similarly, the trends in racial/ethnic composition of private schools in choice states differed little from those in non-choice states, no matter how choice was defined.

Considering these findings in reverse order, the fact that private schools in choice schools did not grow “whiter” seems contrary to the persistent assertion that choice programs will result in segregation. For several reasons, however, this is not entirely surprising. First, private school choice programs have historically been targeted toward specific student populations, such as low-income families, students with special needs, or those trapped in under-performing or “failing” schools. Because of the strong correlation between income and race/ethnicity, the disproportionate representation of minority students in special education, and the greater likelihood of “failing” schools to be located in urban areas populated by minority families, it is entirely logical that the greatest proportion of students taking advantage of choice programs would be racial/ethnic minorities.

The trend evident in these results may also stem
from school choice enabling religious schools to fulfill one of their historic missions to an even greater degree—providing children who are financially challenged, including racial and ethnic minorities, the opportunity to attend rigorous academic and faith-based programs.74 Seeing such efforts as a form of social welfare, many religious school leaders have set as one of their goals to help break the cycle of poverty by providing disadvantaged students a rigorous education.75 Then, there is the simple explanation that, even in circumstances of universal choice, white parents may not see a need to leave public schools they perceive as high-quality.76 Higher-quality schools continue to be populated disproportionately by white students.77 If parents think their children are receiving the education they need or want from such schools—except for religious instruction that can be provided at their houses of worship—then paying twice for a private school might seem irrational. In that case, this report’s results appear contrary to predictions of racial sorting. Though the impulse among some may be to ascribe this study’s enrollment and capacity results to a failure of school choice to live up to theoretical expectations, other reasons—working in concert—are more likely.

First, as other authors have found, private school leaders appear slow to respond to changes in their environments. In the context of choice interventions, this is logical.78 New school choice programs have often been limited in their scope, meaning the number of new students any given private school may see after policy adoption may be small, so small, in fact, as to limit the ability of schools to significantly increase their capacity. Adding a grade, for example, requires hiring at least a new teacher plus curricular material and other related resources, all of which demand enough student growth to cover the increased costs. The prudent school leader would naturally be reluctant to take on the additional costs absent clear and present demand.79 Such reluctance would be even more pronounced among private school entrepreneurs, who would need to see sufficient demand before committing to opening and operating a new school.

Second, the significant decline in size of the Catholic school system, which largely pre-dated the adoption of many of today’s choice programs, likely has contributed to small or non-significant differences in capacity and enrollment present in this study. The closure of private schools occurs with some regularity,80 but it has been particularly acute among Catholic schools.81 In 1930, Catholic schooling comprised 60 percent of private school enrollment,82 but since 1990, a little more than 20 percent of Catholic schools closed, displacing about 300,000 students.83 Thus, by the time many of the contemporary school choice programs saw adoption, many Catholic schools were gone, with little to no likelihood of reopening. The effect was to further limit capacity of the private school market to show growth under conditions of choice.

Third, limitations in school choice policies themselves may depress demand and growth in enrollment and capacity. Historically, most choice programs have been targeted in nature, designed to serve only low-income students or those with special needs.84 Moreover, until recently, many programs operated on a small scale, some as trials, with firm caps on participation,85 limits on the percentage of students in a school who may be school-choice students, income limitations on the parents to qualify for the program, geographic limitations, grade limitations, and limitations based on where the student last attended school.86

Then there are the financial limitations associated with subsidies. As several authors note, subsidies, such as vouchers, must be large enough to cover or nearly cover private tuition to enable many families to enroll in private schools.87 On the school side, if the voucher is set significantly below the average per-pupil cost, then many private schools may choose not to participate by taking voucher students.88 As David Fleming noted, “Minimal voucher amounts may motivate some private schools to use vouchers to fill empty seats, but they will not encourage educational entrepreneurs to open schools.”89
Program limitations are not purely financial, however. Religious schools may be cautious about participating in programs that could be accompanied by intrusive government regulation and oversight, thereby depressing increased enrollment and capacity. Almost 20 years ago, survey evidence indicated more than half of private schools were likely to refuse to accept voucher students because of over-regulation. One analysis of Milwaukee private schools found that the accreditation requirement imposed upon schools that sought to participate in the voucher program caused many schools to stop participating in the program or close altogether, and the issue was manifest again in 2016 in Louisiana’s newly created voucher program. Under one of the most highly regulated school choice programs in the nation, Louisiana’s private schools that accept voucher students may not use their own admissions criteria, may not charge more than the amount of the voucher, and must administer the state test. The result was that two-thirds of Louisiana private schools refused to accept voucher students. Indeed, Louisiana private school leaders expressly identified intrusive regulations that would affect their schools’ independence, character, or identity as a reason for non-participation.

Caution to participate may also stem from a fear that even constitutionally “safe” private school choice programs can disappear if funding is eliminated in the state budget. Some programs often depend on annual appropriations in state budgets, and a change in the legislature’s makeup could result in insufficient funding. Anticipating this possibility, private school leaders might hesitate to expand the number of seats made available to choice program students out of fear their school would be vulnerable in the event that funding were taken away.

If legislators are sincere in their intent to see choice work at scale, the issue of capacity can no longer be ignored. More than 25 years ago, John Chubb and Terry Moe predicted the capacity problem when they warned against policies that focused exclusively on creating demand and ignored mechanisms to encourage and promote the emergence of new and different types of schools. Their warning was prescient. As Foundation for Excellence in Education’s Matthew Ladner observed of current programs,

“Existing school voucher and tax-credit programs have been designed, in essence, to allow students to transfer from public schools into a preexisting stock of nonprofit private schools....Few state lawmakers have created choice programs robust enough to spur the creation of new private schools.”
Consequently, others have recently begun referring to capacity as one of the most significant limitations on the choice movement. Results from this report confirm such observations.

Increasing capacity will likely mean, among other things, finding a balance between light regulatory restrictions or burdens and accountability; adopting programs that are more universal rather than targeted, thereby producing enough demand to reduce risk for private school leaders to expand; and structuring financial subsidies, whether in the form of tax programs or vouchers, to incentivize greater private school involvement and to put a greater number of schools within reach of more families. We recognize such recommendations are rather general, but because this issue has seen surprisingly little attention among researchers, pundits, policymakers, and others, we position these results and recommendations as an initial catalyst to begin creative and productive discussion and, undoubtedly, debate about the role of capacity in school choice and recommendations for its expansion.

**FUTURE RESEARCH**

Further debates and discussions would also benefit from additional studies that build on the methods and results reported here. Methodologically, future research should apply different statistical models to these research questions. These can include difference-in-difference analyses or fixed effects models that include year as discrete variables rather than modeling time as linear and non-linear trends. Further analyses could also include additional control variables. For example, we do not control for changing patterns of religiosity over time, which could play a significant role given that most private schools in the United States are affiliated with a faith-based organization. Specific to the analyses in which we compared enrollment and school demographic characteristics to surrounding communities, future research could adjust the buffers we imposed around the schools. Particularly in dense urban areas, differences in the sizes of the buffers may produce different comparison groups, thereby yielding different results than what we report.

Perhaps one of the more significant additions to this work would be differentiating states’ school choice programs based on how “strong” or “weak” such programs are. In our analyses, all programs are treated equally, even though the features of voucher programs differ non-trivially, for example. Moreover, temporal changes in these programs are not captured in our analyses and may play an important role in the outcomes we measured.

New data are always being reported, of course, so future research would benefit from adding more years of data from the PSS and EISi. The analysis of school demographics compared to surrounding communities could also take advantage of annual census data now made available through the American Community Survey. These annual data did not become available in a comprehensive form until the mid-2000s, so the addition of more recent years of data in the PSS will allow for more robust analyses than were possible at the time we started this study.

Finally, we took a national approach to our study, which necessarily means localized effects, differences, and nuances are lost. The analyses we report here could be applied at state, county, and even district levels to understand better local effects and contexts.
APPENDIX
Methods

This appendix provides a more detailed description of the analyses used in this report.

As a reminder, the study was guided by this question: Is there a significant difference in the following three factors after the introduction of private school choice programs?

1. Private school enrollment
2. The percentage of racial/ethnic minority students in private schools
3. The number of grades private schools offered (i.e., capacity)

Of the only other two studies to use PSS data for a longitudinal analysis similar to ours, one used t-tests and ANOVA$^{103}$ and the other used interrupted time series,$^{104}$ with both studies comparing trends across states. We used a time series analysis with linear and quadratic trends interacted with program indicator variables and school and year fixed effects. This enabled us to detect differences in trends between schools in choice states and those operating in non-choice states. As noted in the Future Research section above, several types of analyses could have been employed in this study. We elected to use models with linear and quadratic trends because we were interested in studying trends rather average differences over time, such as what would be produced in a difference-in-differences analysis, and the descriptive statistics clearly indicated non-linear trends. Ultimately, a number of different models and variations on models could have been applied here. For the sake of report length, we could not apply all of the possibilities and hope other researchers will exploit the recommendations for future research above.

For all three research questions, the analyses began with a parsimonious model in which the primary independent variables of interest were whether a state offered any type of choice program, year, year squared, and the interaction of choice and the two year variables. Standard errors were clustered on school. The first model took the form:

$$Y_{it} = \alpha + \beta_1(\text{charter}_{it}) + \beta_2(\text{year}_{it}) + \beta_3(\text{year}^2_{it}) + \beta_4(\text{choice } \times \text{year}_{it}) + \beta_5(\text{choice } \times \text{year}^2_{it}) + \epsilon_{it}$$

where

- $Y = $ each school’s enrollment, percentage minority students, or total grade levels offered per year
- $\text{choice} = 0$ for states with choice programs and 1 for non-choice states
- $\text{charter} = 0$ for when a school’s state did not have a charter law and 1 when it did
- $\text{year} = $ integers, with the first year of data as zero and integers increasing by one each subsequent year
- $\alpha = $ intercept
- $\epsilon = $ error term

To examine the possible effects of specific program types, a second model disaggregated the choice variable into the different choice programs and took the form:

$$Y_{it} = \alpha + \beta_1(\text{charter}_{it}) + \beta_2(\text{year}_{it}) + \beta_3(\text{year}^2_{it}) + \beta_4(\text{individual tax credits } \times \text{year}_{it}) + \beta_5(\text{individual tax credits } \times \text{year}^2_{it}) + \beta_6(\text{individual tax deductions } \times \text{year}_{it}) + \beta_7(\text{individual tax deductions } \times \text{year}^2_{it}) + \beta_8(\text{tax-credit scholarships } \times \text{year}_{it}) + \beta_9(\text{tax-credit scholarships } \times \text{year}^2_{it}) + \beta_{10}(\text{vouchers } \times \text{year}_{it}) + \beta_{11}(\text{vouchers } \times \text{year}^2_{it}) + \epsilon_{it}$$

where terms are as defined above, except the individual choice programs = 0 for states with the respective choice programs and 1 for non-choice program states.

For analyses in which we compared the dependent measures of enrollment and percentage minority to surrounding populations, we used two different models, one for enrollment and one for percentage minority. The analysis for enrollment looked similar to models (1) and (2), but with a different...
dependent measure and an additional control variable. The dependent measure is an enrollment ratio, where each private school’s enrollment is divided by the average enrollment of matched public schools each year within five miles. The additional control variable is the average percentage of free and reduced-price lunch (FRL) students per year in the public schools used in the comparisons.

The analyses for percentage minority took different forms. With only two years of decennial census and PSS data available to match, only two years of data—2000 and 2010—were present in the models. The first analysis took the form:

$$3. \ Y_{it} = \alpha_i + \beta_1(\text{year}_{it}) + \beta_2(\text{number of years of choice}_{it}) + \beta_3(\text{year} \times \text{number of years of choice}_{it}) + \beta_4(\text{median income}_{it}) + \epsilon_{it}$$

where

- $Y$ = ratio score of each private school’s percentage minority to surrounding school-aged population percentage minority within one mile
- $\text{year} = 0$ for 2000 and 1 for 2010
- $\text{number of years of choice} = \text{integers, 0 to 11}$
- $\text{median income} = \text{median income of geographic area surrounding each private school}$

The variable measuring changes over time is named “number of years of choice.” This variable indicates the number of years respective choice programs were in effect in 2000 and 2010. For example, if a state’s voucher program went into effect in 1997, then “number of years” would show a value of four in 2000 and a value of 14 in 2010. For states with no programs in operation, “number of years” takes a value of zero in both 2000 and 2010. This type of coding reflects the fact that states that may offer the same type of choice program often did not begin offering the programs in the same years.

The use of the year variable controlled for any effects that would be idiosyncratic to those years, and a variable interacting the year and “number of years” variables to measure a differential effect between “number of years” and the two different points in the decade. As with the analyses above, we first examined a broader measure of choice and then disaggregated by type of choice program. Thus, in model (3) “number of years of choice” measures the number of years a state had any kind of choice. In model (4), this is adjusted to be the number of years of a specific type of choice program.

For the disaggregated measures of choice, the model took the form:

$$4. \ Y_{it} = \alpha_i + \beta_1(\text{year}_{it}) + \beta_2(\text{number of years of individual tax deductions}_{it}) + \beta_3(\text{number of years of tax-credit scholarships}_{it}) + \beta_4(\text{number of years of vouchers}_{it}) + \beta_5(\text{number of years of individual tax credits}_{it}) + \beta_6(\text{number of years of individual tax deductions} \times \text{year}_{it}) + \beta_7(\text{number of years of tax-credit scholarships} \times \text{year}_{it}) + \beta_8(\text{number of years of vouchers} \times \text{year}_{it}) + \beta_9(\text{median income}_{it}) + \epsilon_{it}$$

Finally, it is important to note that in all models, the unit of analysis is the school. The results reported above indicate average effects at the school level, not at higher levels of aggregation.

**LIMITATIONS**

All studies have limitations, of course, and this one is no different. First, time series and fixed effects analyses are strong quasi-experimental methods of isolating the effects of the independent variables of interest, but they cannot answer questions of causality with the same robustness as randomized control trial studies. Thus, the results reported herein should be understood to be strongly correlational. Second is the inclusion of two potentially important covariates—public school quality and religiosity. Specific to the former, the theory of markets suggests private schools will enter markets or expand their capacity in areas...
where competitors (i.e., public schools) offer a sub-standard product, thus spurring demand for a superior product.\textsuperscript{105} Of course, the lack of a consistent, standard measure of public school quality makes this rather difficult. Prior studies have attempted to use proxies for quality (e.g., class size or student to teacher ratio), but results have been mixed and indeterminate.\textsuperscript{106} If or when other research identifies a reliable and consistent proxy for public school quality that can be applied in longitudinal research spanning many years, the use of that proxy in future like that above has the potential to be a useful improvement.

As to the second potential covariate, prior cross-sectional research suggests the religiosity of geographical areas may explain, in part, differential patterns in new private school entrants into a market or other forms of increased capacity.\textsuperscript{107} Like measures of public school quality, however, limitations on consistent, reliable, longitudinal data on religiosity disaggregated to the level of analysis used herein were prohibitive. Given the improved measures of religiosity now available, future research could benefit from the inclusion of this construct.

Third, in addition to covariate limitations, this study is also constrained by its analytical approach. As a report rather than a book, this study necessarily took a focused analytical approach. Future research could expand upon our study as described above.
NOTES

4. To be clear, education saving accounts can be used to fund expenses associated with public, private, and home schools.

5. Emphasis added; Huriya Jabbar, “‘Every Kid Is Money’: Market-Associated with public, private, and home schools.

23. Anna J. Egalite, “Choice Program Design and School Supply,” in *New and Better Schools: The Supply Side of School Choice*, ed. Michael Q. McShane (Lanham, MD: Rowman and Littlefield, 2015), pp. 163-84; see note 8 above. If private schools add grades, an alternative explanation could be that a contracting market leads to an increase in grades offered. For example, if a school offering three grades requiring 100 students per grade to operate finds itself in a contracting market and drops to 75 students per grade, it might add an additional grade to compensate for the lost per grade enrollment. We acknowledge this may reduce the definitiveness of our findings on this measure, but given the limitations in the data, this is the best possible measure. Results should be seen as suggestive rather than conclusive.

the Relationship to Private School Enrollment” (PhD diss., Iowa State Univ., 2011), http://lib.dr.iastate.edu/cgi/viewcontent.cgi?article=1493&context=etd.

43. See note 14 above.

45. Although longitudinal, they compared two cross sections in the respective years. Howard L. Fuller and George A. Mitchell, The Impact of School Choice on Racial and Ethnic Enrollment in Milwaukee Private Schools, Current Education Issues 99-5 (Milwaukee, WI: Marquette Univ., 1999), http://files.eric.ed.gov/fulltext/ED441903.pdf. There are, of course, studies on the demographics of private schools (see Sean F. Reardon and John T. Yun, Private School Racial Enrollments and Segregation (Cambridge, MA: Harvard Univ., Civil Rights Project, 2002), http://files.eric.ed.gov/fulltext/ED467108.pdf), but their connection to choice is tenuous at best. Suits, for example, descriptively studies the over-representation of white students in private schools by, among other things, comparing—as at the state level—the percentages of white students in private schools in 1998 to the percentages in 2012. Overrepresentation is determined by comparing the percentage of white students in private schools to the percentage of white children in the school-aged population, where the former typically exceeds the latter. The author finds the percentage of white students in private schools did not change substantively from 1998 to 2012. Although Suits discusses implications of his findings for school choice, the analysis does not actually empirically test any relationship between choice and the demographics of private schools. Steve Suits, Race and Ethnicity in a New Era of Public Funding of Private Schools: Private School Enrollment in the South and the Nation (Atlanta, GA: Southern Education Foundation, 2016), http://www.southerneducation.org/getattachment/be785c57-6ee7-4682-b80d-04d89994a06b/Race-and-Ethnicity-in-a-New-Era-of-Public-Funding.aspx.

48. Note that this differs from the number of classrooms in a given school. Instead, it measures whether a school adds new grade levels to those already existing, such as when a K-5 school adds middle school grades.

49. As noted on the NCES’ PSS website, the purposes of the PSS are: “a) to generate biennial data on the total number of private schools, teachers, and students; and b) to build an accurate and complete list of private schools to serve as a sampling frame for NCES surveys of private schools. The PSS began with the 1989-90 school year and has been conducted every two years since. The target population for the survey consists of all private schools in the U.S. that meet the NCES definition (i.e., a private school is not supported primarily by public funds, provides classroom instruction for one or more of grades K-12 or comparable ungraded levels, and has one or more teachers. Organizations or institutions that provide support for home schooling without offering classroom instruction for students are not included.). The survey universe is composed of schools from several sources. The main source is a list frame, initially developed for the 1989-90 survey. The list is updated periodically by matching it with lists provided by nationwide private school associations, state departments of education, and other national private school guides and sources...The PSS consists of a single survey that is completed by administrative personnel in private schools. Information collected includes: religious orientation; level of school; size of school; length of school year; length of school day; total enrollment (K-12); number of high school graduates, whether a school is single-sexed or coeducational and enrollment by sex; number of teachers employed; program emphasis; existence and type of kindergarten program. The Private School Universe Survey produces data similar to that of the NCES’ Common Core of Data (CCD) for the public schools. The data are useful for a variety of policy- and research-relevant issues, such as the growth of religiously-affiliated schools, the length of the school year, the number of private high school graduates, and the number of private school students and teachers.” See “Private School Universe Survey (PSS),” National Center for Education Statistics, accessed Oct. 10, 2016, http://nces.ed.gov/surveys/pss.

50. Ungraded schools are those that do not assign students to traditional grade levels, such as 1st grade, 2nd grade, and so forth. Without such grade designations, it was impossible to measure differences in the number of grades offered. Thus, they were dropped from the sample.

51. See notes 14 and 21 above.

52. Stephen P. Broughman (statistician, National Center for Education Statistics), e-mail message to authors, Nov. 17, 2015.

54. Not all choice programs are created equally. Some have greater restrictions on who may benefit from the programs, How much money participants can claim or receive, what kind of schools can participate,
and so forth. For analytical purposes, however, we made no distinction between programs other than the broad categories identified above (individual tax credits, vouchers, etc.).

56. Number of observations for these and all figures represent averages, as the number of schools changes per year.

59. See note 35 above.

60. Downes and Greenstein, “Understanding The Supply Decisions of Nonprofits”; see note 38 above.

61. Ibid.

62. Ibid.

66. Charter schools were excluded from the comparison public schools.

67. Because of the relative scarcity of school choice literature that uses GIS, there was little definitive direction on how large the buffers needed to be for this comparison. We chose five miles for two reasons. First, we wanted to ensure that the buffer would be large enough to include multiple comparison schools, as more data points would mean greater representation and more stable averages. In high density areas, we could have achieved this with smaller buffers, but this would not be so in areas with smaller population density. We also sought to avoid buffers that would be too large and thereby include comparison schools that were unrepresentative of populations surrounding the private schools. Thus, we chose a buffer size that balanced between larger and smaller population density. Second, it is increasingly common that students commute to school, both public and private. Thus, the relevant populations in schools may not be those who live directly in adjacent neighborhoods but also may include those who travel some distance. Recent research suggests average commuting distances are approximately 2.7 miles, with non-trivial percentages of students traveling up to four, five, or six miles or more. Thus, the use of a five-mile buffer enabled us to capture comparison populations taking into account student commutes. Julia Burdick-Will, “Neighbors, But Not Classmates: Neighborhood Disadvantage and Educational Heterogeneity,” (paper presented at the Annual Meeting of the American Educational Research Association, Chicago, IL, Apr. 17, 2015); Glazerman, “School Quality and Social Stratification”; Elizabeth J. Wilson, Julian Marshall, Ryan Wilson, and Kevin Krizek, “By Foot, Bus or Car: Children’s School Travel and School Choice Policy,” Environment and Planning A 42, no. 9 (Sept. 2010), pp. 2168-85, doi:10.1068/a435.

68. These models included school and year fixed effects.

69. Note that this buffer is smaller than what we used with the comparison to public schools. This is because for the census data, we needed to limit the number of tracts intersecting within a buffer. For some schools in rural areas there would only be one census tract; for dense areas there were multiple numbers of tracts. Using a five-mile buffer to examine population would have negated the usefulness of understanding surrounding neighborhoods because a large buffer would capture areas outside of neighborhoods.

ABOUT THE AUTHORS

**Dick M. Carpenter, Ph.D.**

Dick Carpenter is a professor of leadership, research, and foundations at the University of Colorado Colorado Springs and a director of Strategic Research at the Institute for Justice. He previously authored the report *School Choice Signals* for EdChoice in 2014.

**Rebecca S. Keith**

Rebecca S. Keith is a Ph.D candidate and graduate research assistant in the department of leadership, research, and foundations at the University of Colorado Colorado Springs.

**Andrew D. Catt**

Andrew D. Catt is the director of state research and policy analysis for EdChoice. In that role, Drew conducts analyses on private school choice programs, conducts surveys of private school leaders, and supports quality control as EdChoice’s research and data verifier.

Prior to joining EdChoice—formerly the Friedman Foundation—in May 2013, Drew served as the program associate for The Clowes Fund, a private family foundation located in Indianapolis that awards grants to nonprofits in Seattle, Greater Indianapolis, and Northern New England.

Drew graduated from Vanderbilt University in 2008 with a bachelor’s degree in Human and Organizational Development, specializing in Leadership and Organizational Effectiveness. While at Vanderbilt, Drew served as research assistant for North Star Destination Strategies, a community branding organization. During that time, Drew also researched the effects of homeschooling on socialization.

Drew received his Master of Public Affairs in Nonprofit Management at Indiana University’s School of Public and Environmental Affairs in Indianapolis. He also received his Master of Arts in Philanthropic Studies through the Lilly Family School of Philanthropy. While in graduate school, Drew’s research focused on teacher performance incentives and cross-sector collaboration. Drew is currently pursuing a graduate certificate in Geographic Information Science (GIS) at IUPUI.

Drew is a native of central Indiana and currently resides in downtown Indianapolis with his wife Elizabeth.
ACKNOWLEDGMENTS

Dr. Rebecca Theobald provided invaluable assistance with the GIS work that played a central role in several of the analyses herein. We thank her for her critical contribution. We would also like to thank Paul DiPerna, Anna Egalite, Nathan Gray, Marty Lueken, Vijay Lulla, and Lynn Woodworth for their thoughtful comments to the first draft of this report. Finally, we appreciate the efforts of Justin Wilson and Dr. Brandon Vogt for their technical assistance with the data.

The views expressed in this report are the authors’ and do not necessarily represent the views of EdChoice.
EdChoice is committed to research that adheres to high scientific standards, and matters of methodology and transparency are taken seriously at all levels of our organization. We are dedicated to providing high-quality information in a transparent and efficient manner.

The American Association for Public Opinion Research (AAPOR) welcomed EdChoice to its AAPOR Transparency Initiative (TI) in September of 2015. The TI is designed to acknowledge those organizations that pledge to practice transparency in their reporting of survey-based research findings and abide by AAPOR’s disclosure standards as stated in the Code of Professional Ethics and Practices.

All individuals have opinions, and many organizations (like our own) have specific missions or philosophical orientations. Scientific methods, if used correctly and followed closely in well-designed studies, should neutralize these opinions and orientations. Research rules and methods minimize bias. We believe rigorous procedural rules of science prevent a researcher’s motives, and an organization’s particular orientation, from pre-determining results.

If research adheres to proper scientific and methodological standards, its findings can be relied upon no matter who has conducted it. If rules and methods are neither specified nor followed, then the biases of the researcher or an organization may become relevant, because a lack of rigor opens the door for those biases to affect the results.

The authors welcome any and all questions related to methods and findings.

Background

California Baptist University (CBU) is a comprehensive, liberal arts university located in Riverside, California. Founded in 1950 by the Southern Baptist Convention, the one-time college (university status gained in 1998) has grown to 11 colleges, schools, or divisions offering 72 bachelor degree programs with 150 major concentrations and 47 minors, 25 master degree programs with 45 concentrations, and 3 doctoral programs, with a total enrollment of 9,157 students (as of Fall 2016). While the specific verbiage of CBU’s mission statement may have changed since the original 1950 version, the actual mission remains largely the same. California Baptist University believes each person has been created for a purpose. CBU helps students understand and engage this purpose by providing a Christ-centered educational experience that integrates academics with spiritual and social development opportunities. Graduates are challenged to become individuals whose skills, integrity and sense of purpose glorify God and distinguish them in the workplace and in the world. The University seeks to provide academic programs that prepare students for professional careers, as well as co-curricular programs that foster an environment supporting the intellectual, physical, social and spiritual development of each student. Upon completion of a degree program, each student at California Baptist University should be able to:

- Demonstrate spiritual literacy, including Biblical Christian faith and practice, Baptist perspectives, and the Christian's role in fulfilling the Great Commission.
- Respect diverse religious, cultural, philosophical, and aesthetic experiences and perspectives.
- Use critical thinking skills to demonstrate literacy: listening, speaking, writing, reading, viewing, and visual representing.
• Demonstrate competence in mathematical, scientific, and technological skills.
• Transfer academic studies to a profession and the workplace.
• Implement a personal and social ethic that results in informed participation in multiple levels of community.

(These are condensed to a Core Four; Academically Prepared, Biblically Rooted, Globally Minded, Equipped to Serve)

**Division of Online and Professional Studies**

The Division of Online and Professional Studies (OPS) was conceived in 2010 to better serve non-traditional students primarily seeking a distance learning environment (hybrid or online). Additionally, OPS provides traditional students the benefit of taking up to two online courses per semester, at a reduced rate, in order to expedite their time to degree completion. The separate division has complete oversight of faculty and curriculum, and operates largely independent from its traditional, main campus counterparts, while it remains under the control of CBU’s President and Board of Trustees. The OPS division launched with 12 undergraduate degrees in 2010, and as of Fall 2016 offered 18 undergraduate degrees, 10 graduate degrees, and 2 doctorates. Within many of the previously listed degrees are multiple concentrations and specializations. The Online and Professional studies division of California Baptist University undergraduate program maintains a 70% first year retention rate and the graduate programs maintain an 87% retention rate.

**Distance Learning at CBU**

A major report from the U.S. Department of Education concluded that, in terms of student learning, the most successful delivery models are, in order of effectiveness, (1) the hybrid or “blended” model, (2) fully-online coursework, and (3) traditional face-to-face on-
Three primary factors account for the higher effectiveness of online and hybrid models: First, they tend to be “competency-based” or designed to achieve clearly-defined learning objectives. Second, they promote “interactive learning” or personal engagement with the course materials at deeper levels and over a longer period of time. Third, they support the formation of learning communities, which facilitate individual student progress (U.S. Department of Education Office of Planning, Evaluation, and Policy Development, 2009).

The Course Development Paradigm

The authors, as educators, have been heavily influenced by concepts such as Bloom’s cognitive taxonomy, Wiggins’ backward design, and Fink’s integrated course design. OPS has attempted to create support for course design in order to better create significant learning experiences for all students. The course design standard is required to adhere to the cognitive taxonomy (Bloom, 1956) and provide course objectives and testing for student learning for each of the six kinds of learning in the hierarchical sequence (evaluation, synthesis, analysis, application, comprehension, and knowledge). Additionally, Fink (2003) suggests that any taxonomy of significant learning must include a human dimension, the idea of caring to provide energy for learning more, and learning how to learn. While many educators have discovered that dealing with assessment first may greatly enhance teaching and learning, the idea is not intuitive. Wiggins (1998) implies that backwards design, planning with the end in mind, assists in a more effective identification of basic learning goals, learning activities, and assessment activities. Fink’s integrated course design model (2003) helps to identify how connected these three components may or may not be. In other words, learning goals must match up with teaching and learning activities. Teaching and learning activities must be connected with feedback and assessment events. Feedback and assessment events need to align with learning goals.
Associations between each of the three major components of integrated course design must be connected in order to support learning.

While the Division of Online and Professional Studies relies heavily on fully online and hybrid modalities, it typically asks course writers to develop their courses for 100 percent asynchronous delivery. OPS uses the online version to serve students anywhere in the world, who may not be able to come to the University campus. It uses the hybrid version to serve students from the same geographical region which desire occasional face-to-face interactions. Hybrid courses are usually identical to the fully online version, with the exception that some of the learning activities are moved to the on-ground sessions.

OPS’ standard practice is to ask the course writer him/herself to teach the course the first time it is offered. Afterwards, the writer usually repeats the course on multiple occasions. However, since the University often offers too many sections of a course for one instructor to handle, the administrative team actively recruits additional faculty members to share the workload. For this reason, OPS requires course writers to develop all the materials a second instructor would need in order to teach that course.

OPS delivers online course elements via Blackboard, the nation’s leading learning management system (LMS). Each course has its own website through which students interact with their professor and classmates, access course materials, explore digital library resources, engage in a variety of learning activities, submit assignments, and receive grades. The latest technology enables participants to do virtually everything online that they could do in a traditional classroom setting. The Blackboard site includes minimum system requirements and orientation tutorials designed to equip class members for online study. A 24/7 Help Desk supports both faculty and students.
A hybrid course typically includes one 2-hour face-to-face session per week at a CBU education center, along with online follow-up activities. Since fully online courses are primarily designed for “asynchronous” learning, this enables students to log-in and complete their studies at whatever time of the day or night they wish. Occasionally, online courses include “synchronous” sessions where students may interact with one another in real time.

**The Course Development Process**

Philosophically, OPS uses a behaviorist approach to course development. This approach allows OPS to deliver relevant programs and courses, while simultaneously collecting needed data to maintain accreditation. As course developers, faculty are asked to utilize a backward planning strategy for course development. This means beginning with the end in mind, identifying the assessment evidence necessary for students to complete to demonstrate mastery, and then framing learning experiences around that evidence.

The basic components of the OPS model of integrated course design are the same as those found in other models of instructional design: analyze the situational factors, formulate the learning goals and objectives, design the feedback and assessment procedures, and select the teaching/learning activities. What is distinctive about this model is that these components have been put together in a way that emphasizes their interrelatedness. Course designers are gathering information and making decisions about how the course will be taught. Engaging in both of these activities ensures the high likelihood that the students will have a significant learning experience. In order to do this, faculty work through the course design process in a systematic way. This means completing each step before going on to the next one. This is important because all of the later steps build on the earlier ones.
Infancy Stages of Assessment

The Division of Online and Professional Studies model of course design begins with the end in mind in that each course has an identified critical assignment designed to assess student learning outcomes, university learning outcomes, and accrediting body core competencies using a standardized rubric. The result is that each time a course is completed; data indicating the level of student achievement is aggregated based on the outcomes of what students should be learning in the identified course. At the end of each semester, assessment data is aggregated by course and program and then annually serves to determine any immediate necessary improvements as well as information that is vital to the redevelopment stage of a course. The collected assessment data and subsequent analysis provide a basis for evaluation, decision making, planning, and budgeting. In addition, annual assessment aggregation serves an important element in the program/major's formal program review that takes place every five years, analyzing multiple data points to determine the level of student achievement for each set of outcomes identified with the program.

Prior to using automated assessment, each program assessment coordinator was required to create an excel spreadsheet indicating the collected data points from each course critical assignment rubric which was pulled from the Blackboard site. The program assessment coordinator created columns with formulas to add the results of each outcome measurement and then divided by the number of times the course was taught over a given period in order to obtain an average indicator of student achievement for each identified outcome being measured.

Literature Review

Assessment is a basic element of academic life and has been consistently shown to be beneficial to higher education (Suskie, 2003). The primary concern of assessment in the field of
higher education is deciding what students should be learning and making sure they are learning and achieving to those levels (Suskie, 2003). Assessment specifically involves the systematic collection of data, review of this information, and the following use of the data to improve student development and learning (Kezar, 2013). This process has often been described as a loop, as it comprises a never-ending system of assessment, changes, and growth as long as the loop is being completed successfully (Banta & Blaich, 2010). However, as there are many differing approaches to assessment, it has become important to establish the best practices in higher education assessment.

**Current View of Assessment**

Over time, schools have grown to accept assessment, moving from a “why do we have to do assessment?” approach to a “how can we utilize assessment more effectively” approach as more and more schools have begun to utilize assessment approaches in their institutions (Banta, Suskie, & Walvoord, 2015). More recently, accreditation has been a driving factor in assessment, as it is seen as an internal process of evaluation and something all institutions would like to achieve and/or maintain (Kezar, 2013). However, although assessment has become more greatly used, it has had a very modest impact, due to the preoccupation with the process of assessment, instead of utilizing the results of the assessments (Kuh et al., 2015). Assessment results are difficult to implement for many, because while assessments are inherently based on causing change, most institutions would prefer to assume they are doing everything correctly (Banta & Blaich, 2010). Nonetheless, due to many current cultural trends such as the harsher economic environment, technology enhanced platforms, and the emergence of more transparent and comprehensive credentialing frameworks, a measure of student achievement has become more important than ever (Kuh et al., 2015).
Focus on Student Learning

The purpose of assessment should be to help students learn (Banta & Blaich, 2010). As assessments are primarily based on determining the gap between actual student achievement and the student achievement goals, a focus on student’s achievement and how to increase it is the only way to successfully achieve goals (Nichols, Meyers & Burling, 2009). The most successful assessment campuses have a focus on learning and achievement and embed these values in their ongoing assessment processes, in order to make the most difference in the lives of a student and as an institution (Kezar, 2013; Kuh et al., 2015).

Engaging Faculty

In order for assessment programs to be effective, the instructional faculty must be engaged, share ownership in the goals and objectives, and tie into their ability to find individual significance in the overall process (Driscoll & Wood, 2004; Kinzie, Jankowski, & Provezis, 2014). Unfortunately, assessment is often viewed as the job of someone else and can become overburdening if not done well (Driscoll & Wood, 2004; Sum & Light, 2010). In order to overcome the burden of assessment, faculty members must also be trained in the assessment methods, as well as being aware of the goal, or have the opportunity to collaborate with others on determining the objectives to assess (Driscoll & Wood, 2004; Sum & Light, 2010). In one instance, the instructors of each course in the institution were able to work together to determine their own learning objectives for each course, and in doing so, came away from the experience with a personal investment in the assessment process (Driscoll & Wood, 2004).

Transparency

Although there is a tendency to want to keep the presence of assessments and the results hidden from both the students and other faculty, if data is hidden or controversial, the assessment
cannot be effective (Banta & Blaich, 2010). Assessment programs rely on the ability to freely use and grow from the knowledge gained in assessments, and without that ability, there is no point in completing assessments. (Banta & Blaich, 2010). In addition, a pressure to hold institutions accountable and a desire for transparency has increased dramatically, and is unlikely to go away (Banta et al., 2015). Institutions now have to be able to prove achievement of student learning outcomes and share assessment information transparently with both internal and external audiences (Henning et al., 2008; Kinzie et al., 2014).

**Flexibility**

Assessment programs should be constantly reassessed themselves and given the opportunity to learn and grow from the past (Banta & Blaich, 2010). An assessment program cannot thrive if it lingers on old policies that have never been adjusted with the growth and change of both the institution and culture (Suskie, 2003). In addition, an assessment program that allows no room for flexibility is much more likely to become burdensome and later neglected than one that is able to adjust to affecting factors when needed (Suskie, 2003). The need for standardization must be balanced with the individualized needs of both the institution and the faculty responsible for completing the assessments (Banta et al., 2015).

**Alignment with Course Objectives**

In order to have an effective assessment program, a plan must be developed regarding what outcomes should be measured (Henning et al., 2008). As completing assessments is not the goal, but a process to achieve multiple other goals, the specific goals and objectives to be measured are important to determine (Sum & Light, 2010). Many institutions now choose to align the student learning objectives with objectives for individual courses, in an attempt to develop a straightforward unit of measurement (Driscoll & Wood, 2004; Kezar, 2013). Some
schools have begun to include capstone classes as well as a measurement of what students should have learned throughout their educational journey and to pinpoint the holes in their current program that should be filled with more specific instructions or classes (Henning et al., 2008; Sum & Light, 2010). These class-based learning objectives provide a straightforward method of assessment and allow for more definitive reporting of whether the institution’s students are meeting learning objectives.

**Utilizing Results**

As great as assessment programs are, they are irrelevant if their results are not creating change and improvements in the institutions utilizing them. In a study conducted by Banta and Blaich, only 6% of good practice profiles contained evidence of student learning improvements, with very few instances of actual change being specifically reported (2010). Very few institutions are “closing the assessment loop” and utilizing the results to make improvements (Banta & Blaich, 2010). Assessments need to both indicate the gap in achievements, as well as suggest valid actions to close the gap, so the information on current achievement can be used to impact future achievement (Nichols, et al., 2009). Assessment information therefore needs to be actionable, focused on the needs and application of end users, understandable, and specific in order for it to be effectively utilized (Kuh et al., 2015). Without the utilization of results, there is no point running assessments and there is unlikely to be much growth and improvement in student learning.

**Managing Change**

According to Wilson (2014), leaders must develop a change strategy, execute the related communications and implementation, acknowledge change agents and encourage those slow to adopt, and continually access progress in order to successfully managing effective change in an
organization. Developing a change strategy and accompanying communications may be the most important of these elements. Leaders first need to determine what change is expected and be able to document the specifics of what new behaviors are required, what steps should be taken, and what is not expected to change. Also, being able to articulate internally and externally why the change is occurring, the factors driving the change, and the benefits the change will produce is essential. Rogers (1995) suggests that people are more likely to change when five factors are present. The first factor is when there is a belief that an advantage or personal benefit is likely to occur based upon the change. Second, when similarities are identified with the change to the current state people are more likely to change based upon their familiarity. Third, people are more likely to accept change when it is understood, despite any complexities. Fourth, whenever possible, testing the change in some sort of pilot or test group allows a smaller group to embrace the change prior to seeking wide spread approval. Finally, learning how others have successfully implemented a similar change can provide a powerful assurance. Wilson (2014) also suggests that leaders must decide, and communicate effectively, which individuals and groups will be affected by the change and in what ways. All stakeholders should be considered here, along with responsibilities for leading all aspects of the change. Finally, leaders of change must consider not only when and how the change is to occur, but also how each of those aspects will be communicated, and to whom. Once this change strategy and communication plan has been developed, the key to successful implementation is execution during each phase.

Kotter and Lewin Models

Kotter (2014) with an eight-step model, and Lewin (n.d.) with a three-step model, have developed models for change that seem prescriptive and fairly unambiguous. Lewin’s process change model consists of three stages; unfreeze, change, and refreeze. The first stage, unfreeze,
includes determining what needs to change, ensuring strong support from management, creating the need for change, and managing and understanding stakeholders’ doubts and concerns. The second stage, change, begins with communicating often, and moves to dispelling rumors, empowering action, and involving multiple stakeholders in the process. The final stage, refreeze, involves anchoring the changes into the culture, developing ways to sustain the change, providing support and training, and ends with celebrating success. This model appears to be a straightforward framework for managing change. Kotter’s change model begins with developing a sense of urgency around the need for change. This first step includes identifying potential threats, examining opportunities, beginning frank discussions and requesting support from stakeholders. The second step, forming a powerful coalition, involves identifying leaders and stakeholders, seeking commitment, working on team building, and ensuring a good team mix. Next, the third step, deals with creating a vision for change. A clear vision can be accomplished by determining central values, developing a concise version of a vision, creating a strategy to fulfill the vision, and ensuring that all members of the team are able to effectively articulate the vision in simple, concise terms. After creating the vision, the fourth step is communicating the newly formed vision. This can be accomplished by talking often about the change, addressing stakeholders concerns, tying everything back to the vision, and leading by example. As the change initiative begins to emerge, the fifth step becomes necessary which is removing obstacles. Tasks include identifying leaders to assist in change delivery, ensuring that the organizational structure is congruent with the vision, rewarding stakeholders involved with making the change, identifying change resistors, and removing barriers. As this action step naturally unfolds, the sixth step, creating short-term wins, becomes crucial. These shorter-term targets are best created by choosing targets absent of change critics, justifying investments in
each project, analyzing potential pros and cons of targets, and again, rewarding those individuals responsible for meeting targets. Immediately following these short-term or quick wins, step seven is building on the change. Analyzing the projects for improvements, setting goals for continued momentum, seeking continuous improvement, and bringing in new change agents will help to ensure that change continues to be built. The final step, step eight, is anchoring the changes in the culture. In this step, leaders should be talking about progress at every opportunity, hiring new staff that matches the vision, recognizing key change initiators, and planning for the replacement of key change personnel. While these two models (Kotter and Lewin) are similar in the early stages in that each focus on determining the specific change initiative, creating a vision and forming the necessary coalition, Kotter seems to place more emphasis on developing a sense of urgency in the message. In the middle stages, both models focus on communication, dispelling anxieties in an open fashion, removing obstacles, and creating short-term wins, Lewin seems to focus a bit more on stakeholder support. Both models focus on anchoring the changes into the existing culture and sustaining change in the final stages, although Kotter may focus a bit more on the hiring and training of new staff, and succession planning for possible outgoing change agents.

**Vendor Search Process**

The search for a suitable vendor to assist with automating the assessment process was a year-long process. Initially, multiple vendors suggested that meeting the objectives of automating assessment was possible, but when it came to unpacking the process down to the specifics of assessing every course, every time it was taught, and connecting the assessment to multiple outcomes, only Taskstream could provide a comprehensive package. The assessment functionality outcomes that were nonnegotiable were the following: assessing a critical
assignment in every course, every time it was taught; connecting/assessing course level objectives to program level outcomes; connecting/assessing course level objectives to university student outcomes; connecting/assessing course level objectives to WASC core competencies (including general education); connecting/assessing course level objectives to professional accreditation outcomes; aggregating/disaggregating data among all variables of course level objectives; aggregating/disaggregating data among all variables of student and instructor biographic and demographic information. As with any initiative of this magnitude, multiple unforeseen challenges arose such as students having to select the program to be assessed and instructors having access to courses where they were not the instructor of record. To date, all challenges have been handled satisfactorily.

Implementing the Change Process

The following narrative describes the planning of the addition of an automated assessment initiative using Kotter’s 8-step change model as a framework. To create a sense of urgency (step 1) the administrative team shared with the academic leadership (chairs and deans) some of the major challenges with the current, manual assessment process. Generally speaking, the manual process was not sustainable due to validity and reliability factors. In an era of assessment, valid and reliable data must be accessible in order to inform program growth. For step 2, forming a coalition, stakeholders were identified which included deans, chairs, discipline leads, and key faculty in a potential pilot group. The group seemed to be a diverse, but complementary group of stakeholders. The administrative team shared their vision of change (step 3) that was, “assessment for learning,” which was meant to convey the importance of students, faculty, and programs growing through assessment. In step 4, communicating the vision, all team members were encouraged to communicate the change vision at every
opportunity, and to address stakeholders’ concerns. The academic dean led by example in communicating the vision with much help from the program change agent, the dean of assessment. As the change initiative progresses, removing obstacles (step 5) became paramount. During this phase, the leadership team identified those whose main roles were to assist in delivering the change (new assessment program with new procedures for assessing student work), ensuring that the organizational structure was in line with the vision of “assessment for learning,” rewarding those people who are affecting change, helping those resistors align with the shared vision, and removing any barriers impeding the change process. In step 6, creating short term wins, the leadership team identified those mini-projects that were inexpensive, relatively easy to address, and were guaranteed to be successful. These targets were analyzed to ensure success and positively enhance momentum building. The seventh step, building on the change, was a total team effort consisting of goal setting designed to continue momentum, seeking continuous improvement by analyzing best practices and listening to constituents, and bringing in new change agents when necessary. The final step, step eight, was anchoring the changes in the culture. To ensure anchoring the changes in the culture the change leaders communicated progress at every opportunity, hired and realigned staff to better matched the vision, recognized key change initiators, and planned for the replacement of key change personnel. The combination of Kotter’s 8-steps may allow the best chance at initiating a successful automated assessment program that truly does create value for students, faculty, and the university and its programs.

Automated Assessment

Two full semesters before the automated assessment was set to launch for all courses taught through the Division of Online and Professional Studies, a dedicated behind the scenes
preparation was required to personalize the cloud-based software program. First, it was necessary to create a program template for all 18 undergraduate degrees, 10 graduate degrees, six specializations and concentrations within the graduate degrees, and two doctorate degrees. Next, following the creation of 34 program templates, every course offered in each of the degree programs were added to the program template along with the specific critical assignment name for each course. Finally, 389 rubrics were uploaded, one for each course attached to a degree program. The uploaded rubric indicated the four levels of student achievement used by OPS: exemplary; accomplished; developing; and beginning, along with the dimensions of the assignment to be graded using the rubric. For each dimension of the rubric, learning outcomes were attached one-by-one until the rubric fully indicated which student learning outcomes, university learning outcomes and accreditation core competencies were to be measured from the critical assignment submitted by the students. The above-described process required both the dean of assessment along with the academic support coordinator to dedicate full working days of uploading and personalizing rubrics over a period of four months.

**Pilot Group**

The uploading process for the cloud-based software program began and was completed between the end of the spring session and before the fall session opened in 2016. A pilot program launched in the late spring and summer sessions of 2016 for one of the doctoral degree programs while the uploading process was being completed for the remainder of the OPS degree programs. The doctoral program involved two cohorts, one with 15 students, and the other with 17 students, and two professors of record. The intent of the pilot run was to identify questions from both faculty grading and students uploading the critical assignment in a venue outside of the
Blackboard learning management system, and then to prepare the training for the remainder to the faculty to begin to use the new system based on the feedback.

Faculty Training

Multiple faculty meetings were held to train the 53 full time faculty how to use the cloud-based software program to grade the critical assignment and how to support the students enrolled in their courses who would be uploading their critical assignment for the first time in a manner outside of the Blackboard site. The training session included power point slides with screen shots of what the faculty members would see when they entered the cloud-based software program via a link in every Blackboard course. Short videos were produced by volunteer faculty members and sent to the faculty for the purpose of additional assistance with the steps necessary for the professor to grade and how to send the final score back to the Blackboard course to be tallied with the prior scores earned by the student during the course.

In addition to face-to-face training of the full time faculty with offices located on the campus, it was necessary to train the 250 adjuncts who are located throughout the United States. A system of e-mails were generated which included narratives, screen shots, attached videos, and training manuals created by the dean of assessment and the academic support coordinator. The phone number and email address for the cloud-based software programs’ information and technology services provided additional support in learning to the faculty during the training.

Lessons Learned

The Division of Online and Professional Studies has sought from its inception to establish best practices for higher education assessment and to earn buy-in from faculty members who understand that using assessment ultimately allows for improvement of student development and learning. Recognizing the four assessment misconceptions or myths identified
by Suskie (2003) that may drive university faculty away from keeping assessment alive, current, and thriving, OPS seeks to address each of these proactively. The first of these myths that faculty may believe is that student coursework cannot be used to assess a program’s learning outcomes. In OPS, multiple measures for assessing the key learning outcomes are embedded in the critical assignment for each course that will be assessed annually and in the five-year review. Faculty clearly understand by contributing to the creation of the critical assignment rubric how it effectively measures student, program, and university learning outcomes. The second misconception is that quantitative assessments are more valuable than qualitative assessment. The critical assignments developed by OPS faculty range from traditional multiple choice tests, to research papers, multi-media presentations, oral presentations, case studies, and capstone projects created to demonstrate competency in the outcomes for each discipline as well as university and program learning outcomes. The third myth is that using a single assignment was not sufficient for assessing multiple measures. For OPS faculty, each of the types of assignments named above and submitted as the critical assignment use multiple dimensions to measure diverse learning outcomes. For example, an American Sign Language course that has the signing of a song as the critical assignment is designed to measure ability to effectively communicate and demonstrate presentation skills. The ASL signed song presentation also measures the university learning outcome of academic preparedness and a program outcome of assimilating grammatical sentences using ASL. The fourth misconception is the belief by faculty that assessment measures are etched in stone and cannot ever be changed even though they became outdated. OPS faculty undergo training and are encouraged to use the results of assessment data to determine the effectiveness of the critical assignment for appropriately measuring the key learning outcomes for the course. A systematic process for the use of collection of data, review
of the results, and use of the data for changing an outdated critical assignment is in place for
course leads to implement appropriate changes so that key learning outcomes effectively
measure improvement of student development and learning (Kezar, 2013). This process
emphasizes and supports that the most important outcome of higher education assessment is to
use the findings to provide academic programs that prepare students for professional careers, as
well as co-curricular programs that foster an environment supporting the intellectual, physical,
social and spiritual development of each student.

Introduction

California Baptist University (CBU) is a comprehensive, liberal arts university located in Riverside, California. Founded in 1950 by the Southern Baptist Convention, the one-time college (university status gained in 1998) has grown to 11 colleges, schools, or divisions offering 72 bachelor degree programs with 150 major concentrations and 47 minors, 25 master degree programs with 45 concentrations, and 3 doctoral programs, with a total enrollment of 9,157 students (as of Fall 2016). While the specific verbiage of CBU’s mission statement may have changed since the original 1950 version, the actual mission remains largely the same. California Baptist University believes each person has been created for a purpose. CBU helps students understand and engage this purpose by providing a Christ-centered educational experience that integrates academics with spiritual and social development opportunities. Graduates are challenged to become individuals whose skills, integrity and sense of purpose glorify God and distinguish them in the workplace and in the world. The University seeks to provide academic programs that prepare students for professional careers, as well as co-curricular programs that foster an environment supporting the intellectual, physical, social and spiritual development of each student. Upon completion of a degree program, each student at California Baptist University should be able to:

- Demonstrate spiritual literacy, including Biblical Christian faith and practice, Baptist perspectives, and the Christian's role in fulfilling the Great Commission.
- Respect diverse religious, cultural, philosophical, and aesthetic experiences and perspectives.
- Use critical thinking skills to demonstrate literacy: listening, speaking, writing, reading, viewing, and visual representing.
• Demonstrate competence in mathematical, scientific, and technological skills.
• Transfer academic studies to a profession and the workplace.
• Implement a personal and social ethic that results in informed participation in multiple levels of community

The Division of Online and Professional Studies (OPS) was conceived in 2010 to better serve non-traditional students primarily seeking a distance learning environment (hybrid or online). Additionally, OPS provides traditional students the benefit of taking up to two online courses per semester, at a reduced rate, in order to expedite their time to degree completion. The separate division has complete oversight of faculty and curriculum, and operates largely independent from its traditional, main campus counterparts, while it remains under the control of CBU’s President and Board of Trustees. The OPS division launched with 12 undergraduate degrees in 2010, and as of Fall 2016 offered 18 undergraduate degrees, 10 graduate degrees, and 2 doctorates. Within many of the previously listed degrees are multiple concentrations and specializations.

The Online and Professional studies division of California Baptist University undergraduate program maintains a 70% first year retention rate and the graduate programs maintain an 87% retention rate. The evidence indicated the majority percentage of our non-retained students was due to academic suspension. Students were experiencing challenges which caused below standard academic achievement resulting in Academic Suspension. Though students were given the opportunity to appeal their Academic Suspension, there were no systems in place to address the challenges that resulted in the student’s initial suspension, resulting in being academically disqualified from taking any future courses.
Mentorship

Mentorship has been defined as a developmentally oriented relationship between a younger or less experienced individual and an older or more experienced individual (Eby et al., 2013). Other definitions have expanded upon this to clarify the relationship’s goals of providing ongoing guidance, instruction, and encouragement to develop the competence and character of the protégé (Randolph & Johnson, 2008). Research has indicated positive outcomes from mentoring between college faculty and various student populations in regard to students’ persistence and academic achievement, as well as positive outcomes from mentoring in general (Eby et al., 2013; Gotian, 2016; Hodges, Payne, Dietz, & Hajovsky, 2014). This academic mentoring can lead to improvements in academic achievement, scholarly productivity, professional development, identity development, academic persistence, and psychological health, and because of this, is of great help to the students (Eby et al., 2013).

Support Types

Three types of mentoring support exist, instrumental/career support, psychosocial support, and relational support (Allen & Eby, 2004; Eby et al., 2013). Each of these three types of support are linked to mentoring success, and are therefore important in a mentoring relationship (Eby, et al, 2013).

Instrumental/Career Support

Instrumental Support is often considered career support. Depending on the circumstances instrumental support would include all explicitly academic mentoring or any career guidance in an academic setting and include work-related and career-related guidance in a professional setting. Allen and Eby (2004) defined career support as those aspects of the mentoring relationship that prepare the protégé for career advancement, such as sponsorship, exposure,
visibility, coaching, protection, and challenging assignments. Similarly, Eby et al., (2013) defined instrumental support as mentor behaviors that are geared toward facilitating protégé’ goal attainment. These include the specific mentor behaviors of providing task-related assistance, sponsorship, exposure and visibility, and coaching (Eby et al., 2013). Two more tasks, assistance in studying and scheduling strategies, and providing advice regarding classes and work, have been found to be significant forms of instrumental support as well (Hodges et al., 2014).

**Psychosocial Support**

Psychosocial support refers to the aspects of the mentoring relationship that enhance the protégé’s sense of competence and self-image such as role modeling, friendship, counseling, acceptance, and confirmation (Allen & Eby, 2004). Mentor behaviors that enhance a protégé’s perception of competence and facilitate both personal and emotional development, including offering counseling, unconditional acceptance, encouragement, and role modeling (Eby et al., 2013) are also parts of psychosocial support. A qualitative study has been completed to examine the specific behaviors of advocacy, teaching self-advocacy, and goal-setting that have been found to be perceived as helpful contributions from the mentors to the mentees (Hodges, et al., 2014). The psychosocial supports attempt to address the protégés personal well-being and confidence in their academic abilities and in personal identity (Freis-Britt & Snider, 2015).

**Relational Support**

Relational support relates to and implies a high relationship quality. Positive relationships between faculty and students based on trust, integrity, opportunity, and understanding have a critical impact on student persistence (Freis-Britt & Snider, 2015). Three of the principles for mentoring defined by Fries-Britt and Snider involve relational support: building authentic relationships, having transparency and trust, and being vulnerable with each other (2015).
Mentoring relationships that seek authenticity will strengthen and not diminish over time (Freis-Britt & Snider, 2015) because both parties understand the importance of building a meaningful relationship based on accountability and appreciation that will remain in good times and bad. Just as important to maintaining a mentor/mentee relationship is transparency and trust. When transparency and trust are in place, the relationship can deepen and gain strength that fortifies the relationship for decades (Freis-Britt & Snider, 2015). Vulnerability is also a major factor of relational support, as it moves the relationship to a new level, according to Britt and Snider (2015). Every mentor and mentee has to be vulnerable to the other and trust the other person to be non-judgmental, to create an ideal foundation for mentoring (Fletcher, 2007; Mullen, 2000). There also must be sufficient mutual trust for the mentee to feel safe defining and redefining him or herself with the help of the mentor (Fletcher, 2007).

**Contributing Factors**

**Racial Differences**

As established by Eby et al. (2013), deep level similarity and experiential similarity between mentor and mentee are tied to greater instrumental support, psychosocial support, and relationship quality, as well as to higher situational satisfaction. This may be because race and culture have been found to play a large role in mentoring relationships (Figueroa & Rodrigues, 2015). As our perspectives regarding higher education are shaped by our experiences, a difference in experience can provide a major difference in perspective (Figueroa & Rodriguez, 2015). In addition, role-modeling is important for minorities, as mentors reflect the positive characteristics of their mentors, and can therefore pass along more culturally relevant characteristics and provide a roadmap for the mentee (Freis-Britt & Snider, 2015). Interactions of race and gender can be unique to each population and faculty sharing common ground with
students tend to better humanize the educational experience, are more proactive in serving them, provide holistic support, and positively influence success (Freis-Britt & Snider, 2015).

**Gender Differences**

Although not confirmed in every study, gender appears to make a difference between both the mentors and mentees in the mentoring relationships (Allen & Eby, 2004). Females mentors provide more psychosocial mentoring, while male mentors provide more career/instrumental mentoring (Allen & Eby, 2004). According to Allen & Eby, (2004) as women tend to have greater comfort with intimacy and men are perceived to hold greater power within organizations. To that end, the greatest amount of psychosocial mentoring occurred between female mentors and female protégés and the least amount between female mentors and male protégés (Allen & Eby, 2004). Allen and Eby (2004) additionally describe several possible reasons for this including that female mentors recognize and prepare young females for organizational barriers that may exist, females place higher emphasis on interpersonal support, or that males may not ask for this type help for fear of feeling weak.

**Interaction Frequency**

Within studies of mentorship, a common theme is the importance of frequent interaction (Eby et al., 2013; Fletcher, 2012; Hodges et al., 2014; Randolph & Johnson, 2008). Interaction frequency has been shown to increase instrumental support, psychosocial support, and relationship quality, as well as provides an increase in the perceived helpfulness of the mentor (Eby et al., 2013; Hodges et al., 2014). A key to success is soliciting weekly reports from the mentors although some institutions require daily contact with the mentor to maintain frequent mentor-mentee interactions (Fletcher, 2012). Also of note is the significant increase in helpfulness of face-to-face interaction. Although, students like the multiple forms of instant
communication that are available (email, text, phone, or social media), they still find more in-depth help from face to face interactions (Hodges et al., 2014). The results of Hodges et al. (2014) study lends to the idea that a persistent and systematic mentoring program tends to improve satisfaction while helping students develop a sense of belonging.

Training Mentors

Although mentors aren’t usually trained in mentorship, training mentors in mentorship skills has been shown to be effective in increasing mentorship success (Gotian, 2016; Randolph & Johnson, 2008). Success has also been found in co-mentoring, where colleagues help each other to develop as unique equals to better learn from each other’s strengths (Mullen, 2000). Co-mentoring values diversity in areas such as ethnicity, gender, status, and learning style to name a few, which are all crucial aspects in mentor protégé relationships as well (Mullen, 2000). Good mentors should be able to bounce ideas off of each other and ask open ended questions to refrain from simply telling the mentee how to solve his or her problem (Gotian, 2016). According to Gotian, skilled mentors should also train their junior mentors in an effort to pass along gained knowledge to an ever improving process of developing.

Mentorship for Student Success

Just as the little boy in the Starfish story (Eiseley, 1979) makes a difference for every starfish he picks up from the dry shoreline and tosses back into the ocean to save, educators have always sought to find ways to make a difference in the lives of each and every student. Research indicates that everyone learns at different ways and at different rates (Gagne, 1985; Vygotsky, 1978). Mentoring between a faculty member and an online non-traditional student is an innovative solution to promote student success and increase student retention. This is the story of how one online university seeks to make a difference in the lives of non-traditional students.
Evidence of the need for Mentorship for Student Success

The OPS division of CBU undergraduate program maintains a 70% first year retention rate and the graduate programs maintain an 87% retention rate. The Mentorship for Student Success program was designed to support students experiencing challenges which caused below standard academic achievement leading to academic suspension resulting in a student being academically disqualified from taking additional courses. The evidence indicated that a percentage of our non-retained students were due to academic suspension.

Prior to the mentorship program, students who were academically suspended were given the opportunity to appeal suspension. This resulted in arduous meetings of the Admissions and Retention committee, which would receive upwards of 100 appeals, each to be carefully researched and considered. The committee would meet for 2-3 hours at a time over 2-3 days. If the student was approved to continue, he/she was placed on Academic Probation which limited him/her to 12 units per semester. Since students in the OPS program only take 12 units in a semester, this limit was not a restriction on students nor was there anything in place to monitor students during the semester.

Since the OPS mission is to respond to the non-traditional student who balances professional and family responsibilities while advancing their education, we piloted a non-traditional support initiative for our students to regain academic qualification and be allowed to continue enrolling in courses. Pairing a student with an academic mentor was born.

Who the mentorship program serves

The Mentorship for Student Success program serves the OPS students who have been placed on academic suspension and who prior to the initiative were not allowed to continue to enroll in courses. Undergraduate students in the mentorship program failed to earn a minimum 2.0
cumulative GPA and a 1.7 semester GPA or a minimum 2.3 semester GPA during their probationary semester. Students who agreed to the terms of the mentorship program, through a phone conversation with their One-Stop Advisor, were allowed to continue under the terms of the mentorship program instead of being academically disqualified.

**How the mentorship works**

The Mentorship for Student Success program was developed in the fall of 2014 to assist select students currently on academic suspension in returning to CBU to finish their degree. The initiative allows students to have their academic suspension lifted for one semester if they agree to two conditions: 1) Enroll in one course per eight-week session resulting in total enrollment of two courses per semester. 2) Agree to be paired with a faculty mentor for an academic semester and connect weekly via the phone, Web-Ex and email with the mentor.

Under the mentorship program, students who are academically suspended the first time are given the opportunity to sign up for the program instead of going through the appeal process. The limit of just one class per 8-week session along with the guidance of a mentor assures us that we are giving students the best possible opportunity to be successful. If students are suspended again, they are still given the opportunity to appeal. However, the Admissions and Retention committee receives about half the appeal numbers than they did prior to the Mentorship for Student Success program. Students who are given the mentorship opportunity and are still not successful often do not submit an appeal. If they do appeal, the appeal is only approved if there were extreme extenuating circumstances for the student. When the committee denies students, the members do so with assurance that we have given the students every opportunity to succeed. The meeting process has been reduced to one two-hour meeting.
Innovate practice

The Mentorship for Student Success program allows the identified students to continue their education rather than be placed on academic suspension and cease enrollment in courses leading to a degree. Mentoring between a faculty member and an online non-traditional student is an innovative solution to promote student success and increase student retention.

Students receive a personal letter from the Associate Vice President of Academics offering them the opportunity to participate in the Mentorship for Student Success program. One-stop advisors maintain contact with the student promoting and explaining the advantages of participating in the mentorship. The Associate Dean for Student Development contacts, recruits, and supports faculty members who participate in the Mentorship for Student Success program.

How data is collected

The Mentorship for Student Success program uses cumulative grade point average and semester grade point average to determine which students are eligible to participate in the program. Data is collected at the end of each grading period and calculated to determine progress of each student. Participating students are assigned a faculty mentor and communications were originally logged by faculty members on an excel spreadsheet.

For this study, the enrollment was researched for every student suspended from Fall 2012 (2 years prior to creation of mentorship program) through Summer 2016 (2 years after creation of mentorship program). Individual student transcripts were evaluated for each student to determine the percentage of students that returned after their initial academic suspension. Additionally, the percentage was calculated of how many students were retained, as determined by each student’s current enrollment or by their posted degree. Once data was compiled on each student, comparison graphs were run in Microsoft Excel on the retention rates of students who
returned prior to the mentorship program versus the retention rates of students who returned through the mentorship program.

Student success from the initiative

Prior to the Mentorship for Student Success program, the identified students were placed on academic suspension and could not continue enrollment. By pairing each student with a faculty mentor for a semester and limiting the unit enrollment, students were able to continue their education and achieve success academically. OPS initiated the program in the fall semester of 2014, continued in the spring semester of 2015 and the summer semester of 2015. By the fall of 2015

The 2014-2015 academic combined data indicates that 108 (40.4%) students successfully navigated their Mentorship for Student Success program semester and were able to continue enrollment for the succeeding semester. It is too early to tell if there is an effect on the amount of students posting degrees because not enough time has elapsed. Many mentorship students are still enrolled, working toward their degrees but there was a 10.6% increase in amount of suspended students who were retained (currently enrolled or posted degree). There was also an 14.5% increase in amount of students who returned after suspension for at least one semester (corresponding 14.5% decrease in students who never returned).

The breakdown for each semester:

Fall 2014 data indicates that 33 (35%) students successfully continued enrollment

Spring 2015 data indicates that 45 (49%) students successfully continued enrollment

Summer 2015 data indicates that 30 (37%) students successfully continued enrollment
Adapting mentorship as the program grows

As the Mentorship for Student Success program continued for the 2015-2016 academic year OPS reflected on ways to improve the mentoring process for students based on the data collection both quantitative and qualitative. During the first year OPS solicited volunteer faculty to accept 3-5 students to mentor in addition to their regular faculty teaching load of courses. This process was not sustainable for the number of students OPS continued to mentor. Beginning in the spring semester of 2015 selected adjunct faculty were identified and recruited to mentor the students on a semester basis. The faculty were specifically selected based on student data suggesting that the faculty possessed exceptional skills involving encouragement and understanding of non-traditional student needs. For the spring of 2015 faculty members mentoring students began logging all communication during the mentoring semester so that additional qualitative data would also be available.
The Mentorship 101 Blackboard course has changed significantly since its inception. Initially, the learning management system (LMS) space was a community for students seeking assistance and a repository for their communication. The latest iteration contains eight weekly modules, each of which contains a devotional and check-in components. The weekly modules cover topics including managing stress, research tips, note-taking tips, Microsoft Office support and assistance, an introduction to internships, staying healthy, proofreading assistance, and staying positive while balancing work, home, and school commitments. The goal is to provide a high level of support in a highly sustainable manner, while not adding significantly to the student workload. In other words, providing the most value to the student, with the least possible investment in time.

Flipped lessons in Teaching EFL with Mobile Technologies

Hiroyuki OBARI, Aoyama Gakuin University

Abstract

Students were exposed to flipped lessons for 24 weeks using a variety of materials such as a digital text with iPad, ATR CALL Brix, Newton e-Learning, and TED Talks. An assessment of pre-treatment and post-treatment TOEIC, OPIc computer-based speaking test, and CASEC Computer test results showed that the students improved more in each test. Surveys administered to students indicated more satisfaction with their flipped lessons and more motivated by the blended learning environment.

1. Introduction

E-mobile learning technologies such as the iPhone, iPad, podcasting, and video-casting, and others, are rapidly gaining popularity as an effective means to improve foreign language skills around the world. E-mobile learning is highly motivating to learners, as it offers them a rich, informal, contextual, and ubiquitous learning environment, and ubiquitous learning environment in which it is possible for them to control their learning time, environment and speed (space and pace). m-Learning has other advantages over conventional teaching and learning methods, including the almost limitless number of English news programs, language learning apps, podcasting (audio series), vodcasting (video shows), and so forth, that can be easily accessible and downloadable for free or for little cost (2016, MaCarthy).

In this paper, several case studies are introduced to find out the effectiveness of blended and flipped learning with the use of ICT and mobile technologies in teaching EFL.

2. Theoretical Background

In the field of second language learning (L2), and in computer-assisted language learning (CALL) in particular, there has been an increasing body of research dedicated to the use of mobile devices in language learning in recent years. More technologically oriented teachers and researchers use the term mobile-assisted language learning (MALL) readily as an extension of CALL, as if the term were familiar to everyone in the L2 field. Regarding the roots of MALL and its place in language learning, see Stockwell (2012b) for a detailed discussion. My purpose here as educators is rather to try and determine whether mobile-assisted learning holds benefits for our students, to see how and why students come to use this technology, and how mobile learning compares with more traditional classroom approaches.

Gardner (2007), in a study pertaining to language learning in Spain, revisits his construct of the socio-educational model first proposed in 1985, which emphasizes integrativeness – how well a student wants to interact with members of another culture—and his or her attitude toward a learning situation as being the keys to successful language learning. Ryan and Deci (2000) return to their earlier Self-Determination Theory and further theorize on motivations, intrinsic and extrinsic, claiming that autonomy plays a large role in the former, while with extrinsic motivation, attitudes toward the teacher, methodology, and the learning environment are factors that promote or inhibit motivation.
e-Mobile or m-Learning technologies such as the iPhone or iPad, with Internet affordances such as podcasting, video-casting, and more, are rapidly gaining popularity as an effective means to improve foreign language skills around the world. Mobile learning is highly motivating to learners, as it offers them a rich, informal, contextual, and ubiquitous learning environment. Users can control the time, pace, and speed of their own learning, which is motivating and liberating for many learners. m-learning can also be more personalized than other methods of computerized instruction, as mobile devices can be more easily customized, resulting in the creation of an emotional bond between the user and machine (Sherimon, Vinu, & Reshmy, 2011).

m-Learning has indeed emerged as the next generation of e-Learning. One of the reasons for this has been the high availability of mobile devices worldwide. For example, nearly 100% of Japanese own a mobile phone, with the number of smartphone users in Japan rapidly increasing (Obari, Kojima, & Itahashi, 2010). The smaller screen size and touch interface of smartphones and tablets also leads to more focused learning, as the learner typically has running in the background just a single program at any given time, as opposed to the more common multitasking operations found on desktop and notebook PCs (Gualtieri, 2011).

3. **Flipped Learning**

“Flipping” the classroom is both a pedagogical approach and a theoretical framework rooted in constructivist and problem-based theories of learning. It involves reversing the traditional structure of the classroom, such that in-class time is dedicated to interactive activities and homework is dedicated to would-be in-class lecture materials (Kerry Pusey, Evelyn Doman, and Marie Webb, 2014).

The flipped classroom describes a reversal of traditional teaching where students gain first exposure to new material outside of class, usually via reading or lecture videos, and then class time is used to do the harder work of assimilating that knowledge through strategies such as problem-solving, discussion or debates (Brame, C. 2013).

4. **TED Talks**

TED is a foundation that, for the purposes of this book, makes professional quality presentations in many fields available freely from its Website http://www.ted.com or through various platforms including YouTube, podcasts, television, radio, and, significantly for the purposes of this chapter, mobile apps for smartphones, tablets, and other devices that can play digital videos. TED talks utilized for educational purposes typically feature innovative research presented concisely in less than 18 minutes, and made as interesting as possible with various media and appeals to human interest. Thus TED talks can serve as a relatively painless way for learners to explore a wide range of fields. For non-native English users at intermediate or advanced levels in listening comprehension, the recorded videos available online allow for control of the experience such as repeated viewing, and access to talks on the go with mobile apps.

Students were required to watch 20 TED Talks and write 20 summaries with 300 English words, sometimes made several presentations about the contents with Power Point slides.
The goal of this study 2014 reports on the effectiveness of blended and flipped learning activities using mobile devices for the purpose of improving the English language proficiency of Japanese undergraduates, including their writing, oral communication, presentation skills, and improvements in TOEIC, CASEC scores, and OPIc Speaking test. This study was conducted over a ten-month period during two academic semesters (April 2015 to January 2016). A total of 24 undergraduates were the participants of the study. All of the participants were native speakers of Japanese studying at a private university in Tokyo. The students were administered TOEIC as a pre-test in April 2015 and again as a post-test in January 2016. The purpose of this was to serve as a measurement to help determine if the students’ scores would improve as a result their exposure to the flipped classroom activities, and thereby help ascertain the effectiveness of the lessons.

5.1 Research questions

The research questions targeted in this study were as follows:

a. Are blended and flipped learning using ICT and mobile devices useful in improving students’ overall English skills?

b. Are flipped learning activities using a digital text of Lecture Ready 3 and the several projects of the world religions and Japanese cultural studies with a tablet or a smartphone useful for improving the TOEIC, CASEC, and OPIc scores of Japanese EFL students?

c. Is SNS (Facebook) useful in learning EFL?

5.2 Pedagogy

The blended and flipped learning activities of this study included the following: (1) students watched the online digital textbook Lecture Ready 3 (Frazier & Leeming, 2013b) with their iPads; (2) students spent extensive time watching the lectures with the support of COOORI (Web-based language learning software downloadable from iTunes) during their commuting hours and later wrote a 300-word summary of one lecture per week; (3) students created PowerPoint presentations and presented oral summaries of the e-textbook lectures to their classmates both face-to-face and in front of the entire class; (4) students used Globalvoice CALL software along with their Lecture Ready 3 summaries to attempt to improve their English pronunciation in terms of segmental and prosodic features before their presentations; (5) students used the online program Newton m-Learning with the use of a PC and mobile device during their free time; (6) students used the online program ATR CALL Brix in and out of the classroom during their free time with the use of a PC and mobile device; (7) students watched online TED talks with the use of PC or mobile devices; (8) students spent extensive time watching TED Talks during their commuting hours and writing a 300-word summary of each lecture each week; (9) students presented oral summaries of the TED talks to their classmates both face to face and in front of the class; (10) students used Globalvoice CALL software; (11) students prepared for the special seminar between NUS and AGU and had a join seminar at NUS in Singapore; (12) students made special movies about world religions and presented in the class.

At the end of the course, a questionnaire was administered to students after their exposure to the above activities for the purpose of ascertaining their impressions of their learning activities.
The blended and flipped learning activities of this study included the following: (1) students watched the online digital textbook *Lecture Ready 3* (Frazier & Leeming, 2013b), using a PC and with their mobile devices; (2) students created PowerPoint presentations and presented oral

5.3 Assessments

To assess the results, a sampling of the data is summarized and interpreted in the following sections, including the results from TOEIC tests and CASEC tests which revealed that the students’ overall English proficiency had improved after their exposure to the BL and flipped learning activities. Also included are some of the results of the survey administered to students for the purpose of attaining feedback on how they felt about using their learning activities.

A sampling of the data results is presented below, including the results from TOEIC and CASEC tests, which revealed that the students’ overall English proficiency had improved after their exposure to the blended and flipped learning activities. Also included are some of the results of the survey administered to students for the purpose of attaining feedback on how they felt about all the activities. Twenty-four students took the OPIc computer speaking test, a total of twice (in April 2015 and again in January 2016) to measure their oral proficiency.

a. **TOEIC Test Results**

The TOEIC results revealed that the mean scores increased from a mean TOEIC score of 639 (SD: 118) to a mean score of 727 (SD: 136), which indicated that the students improved their overall English proficiency. The TOEIC pre- and post-test results were analysed using a t-test, indicating that the difference between pre- and post-test scores of both classes were statistically significant at a 1% level.

b. **CASEC Test Results**

The CASEC results revealed that the mean scores increased from a mean CASEC score of 626 (SD: 90) to a mean score of 720 (SD: 65), which indicated that the students improved their overall English proficiency. The CASEC pre- and post-test results were analysed using a t-test, indicating that the difference between pre- and post-test scores of both classes were statistically significant at a 1% level.

c. **OPIc Computer Speaking Test Results**

An increase of roughly 20% in the OPIc speaking test was observed between the pre-test and post-test. This improvement would seem to indicate that the utilization of a learning environment of blended and flipped lessons did help the students to improve their overall English proficiency (cf. figure1 below).
d. Questionnaire

A survey was administered to the participants after their exposure to the blended learning lessons incorporating Lecture Ready 2 and TED Talks through the use of mobile technologies. In response to the survey question, “did you find the digital Lecture Ready 2 (1) useful in improving your English proficiency?” 91% of students felt that the online lectures were very useful. In response to the questions “did you find the ATR CALL Brix program (2), Newton m-learning program (3), and Globalvoice CALL software (4) useful in improving your English proficiency and pronunciation?” , the percentage of students responding that they felt they were effective and useful were, respectively: (2) 82%, (3) 84%, and (4) 91%. Finally, in response to the question “to what extent did you use mobile technologies to study with the online Newton m-learning program?” 30% responded that they had used their mobile devices to study the online English programs.
6. Discussion

An assessment of pre- and post-training TOEIC, CASEC, and OPIc scores revealed that various types of on-line materials and activities included in this study had a positive effect on the students’ overall English skills. Additionally, the students’ listening and oral communication skills improved as a result of integrating blending and flipped learning activities through m-learning.

The questionnaires indicated they were satisfied with the variety of online course materials and programs and were motivated by the BL environment incorporating m-learning. The students’ English writing and oral summary skills also improved after their exposure to Lecture Ready 3. Overall, these results indicated that blended and flipped learning using mobile technologies can effectively be integrated into the language learning curriculum and play a positive role in improving students’ overall language proficiency.

7. Conclusions

The flipped learning environments helped students to improve their English proficiency with the help of ICT and mobile technologies. Students who took part in these projects were pretty much satisfied with the way 24 students were highly engaged in various types of learning activities.

Mobile m-Learning can be motivating to learners to help improve their foreign language skills, as it offers them a rich, informal, contextual, and ubiquitous learning environment. This case study focused on examining a variety of emerging technologies, from speech recognition to Web-based learning, to help determine the effectiveness of flipped classroom activities. Various emerging technologies such as a mobile learning-oriented TOEIC Practice program, Course Power, online TED Talks, and other learning materials were utilized, including an empirical study that indicated their effect on improving the TOEIC, CASEC, and OPIc scores of native Japanese speaking undergraduates (Obari).

M-learning helped to increase the amount of comprehensible English input with the aid of revolutionary education/learning applications. It was also highly motivating to students by offering them a rich, informal, contextual, and ubiquitous learning environment which enabled them to control their learning opportunities or occasions (time), environment (space), and speed (pace).

Department of Dental Hygiene, Ulsan College

2Department of Preventive Medicine and Public Health, Yeungnam University

Objectives: The purpose of the study is to investigate the awareness and influencing factors of class evaluation in dental hygiene students. This study will establish the measures for educational quality improvement and basic data for effective way of education.

Methods: A self-reported questionnaire was filled out by 968 dental hygiene students in Busan, Gyeongnam, and Ulsan from August 26 to September 6, 2013. SPSS 19.0 was used for statistical analysis.

Results: 1. Senior students felt the necessity of class evaluation improvement. 2. In class evaluation items by grade, evaluation entity was the most significant factor. 3. The students answered that teaching sincerity was the most important factor in class evaluation.

Conclusions: The students thought that class evaluation depended on the entity and sincerity of the class contents.

Key words: class evaluation, dental hygiene, students factors

Performance of Self-Management Program for Hypertensive-Diabetic Patients

Seon-Hee Kim, Chang-Suk Kim1, Mi-Sook Lee2, Jung-Nyeon Lim3, Kyeong-Soo Lee4*

Cheongsong-gun Public Health Center
1Department of Dental Hygiene, Ulsan College
2Korean Industrial Health Association
3Department of Public Health, Graduate School, Yeungnam University
4Department of Preventive Medicine and Public Health, Yeungnam University

Objectives: To exchange mutual opinion and form a bond through the meeting of patients with the same disease. To promote cultivation of self-management ability for disease through empowerment-centered educational program.

Methods: Subjects consist of 12 hypertensive patients and 12 diabetic patients (applied diabetic program for associated hypertension). Conducted 2-hour program for 10 weeks from February to April, 2016.

1st – Orientation

2nd – To know correct self blood pressure (blood sugar) measurement method

3rd – Proper dietetic therapy for hypertension and diabetes

4th – To eat bland food and taste test

5th – Taking hypertension (diabetes) medications
6th – Prevention and management of hypertensive(diabetic) complication

7th – Exercise in life(stretching, walking), diabetic foot care

8th – Stress management

9th – To become a self-health leader(self-help experience)

10th – Promise for tomorrow(writing a letter to yourself)

Results: 1. Hypertensive patient- Systolic blood pressure showed 17mmHg of decrease with an average of 143mmHg to 126mmHg, and diastolic blood pressure showed 5mmHg of decrease with an average of 78mmHg to 73mmHg. 2. Diabetic patient– Systolic blood pressure showed 12mmHg of decrease with an average of 133mmHg to 121mmHg, and diastolic blood pressure showed 8mmHg of decrease with an average of 73mmHg to 65mmHg. Fasting plasma glucose showed 22mg/dL of decrease from 131mg/dL to 109mg/dL. 3. 11.35 points in average increased for self-efficacy.

Conclusions: Can work in health service area after completing the education, and is expected to get vitalized as a continuous self-management program.

Key Words: diabetes, hypertension, self-management program

Department of Dental Hygiene, Ulsan College
Department of Preventive Medicine and Public Health, Yeungnam University

Objectives: By looking into previous research studies for its methods and topics chosen for discussion, the following paper draws upon the problems of precedent researches, evaluates the current research standards and suggests the right direction to take for future studies.

Methods: The paper analyzed a total of 996 published thesis papers registered at Korean Society of Dental Hygiene website (www.ksdh.or.kr) from 2001 to 2015. The details of the analysis involved the following categories: number of researchers, researcher affiliation, research target, major location where the research is conducted, considerations for ethics, research methods, analysis methods, keyword classification and whether or not research funds were obtained. For each category, researcher affiliations (differentiated between lead author and corresponding author then further by professor, dental hygienist, graduate student and others)
were further classified. In terms of research subjects, the targets (dental hygienists, children, male, female, patients, adolescents, college students, adults, senior citizens and others) were categorized. Preschoolers were identified as children, and elementary school to high school students were identified as adolescents. Multiple selection was coded to be possible. In terms of research methods, quantitative research (surveying (self-recorded, interview-based, observation and others), experimental research, application of secondary data, method study and others), qualitative research (research phenomenon, content analysis, grounded theory and others), meta-analysis, program development and concept analysis were classified. Key words were classified as basic studies, clinical, educational and societal dental hygiene.

**Results**: 1. In terms of the number of authors, ‘2-5 people’ was 73.1%, ‘sole authorship’ was 21.5%, ‘6 or more’ was 5.4%. ‘professor’ made up 90.0% of lead authors and 95.5% of corresponding authors. 2. In terms of research subjects, ‘college students’ were 21.3%, ‘adults’ were 21.4%, ‘dental hygienists’ were 14.8%. ‘quantitative researches’ made up 97.5%. 3. In terms of survey methods, ‘self recorded’ was 83.8%, ‘oral examination’ was 11.8% and ‘interview-based surveying’ was 2.1%. As for keyword classification, ‘clinical field’ took up the most at 41.0%. 4. Funded research was 21.7%.

**Conclusions**: Because the overall research trend in dental hygiene was identified, the following paper expects it to be able to provide baseline data for setting future direction in dental hygiene research.
Key words: dental hygiene, research trends
Lesson Planning and Creation of Instructional Materials (IMs): Factors that Affect Teacher’s Delivery of the Curriculum

Jean A. Arellano

Department of Education
Schools Division of Ilocos Norte
San Nicolas National High School

Brgy. 8 San Antonio Sarrat, Ilocos Norte Philippines

Jean.arellano@snnhs.edu.ph

Lesson plan is a vital component in the delivery of curriculum. It serves as guide for the teacher of its target learning outcome and strategies to be incorporated in every learning session.

At San Nicolas National High School (SNNHS), lesson planning is not just a vital component in teaching but a major requirement to be submitted to school administrators. Teachers, either newly hired or has been in the service for many years, are required to write their lesson plan in a daily basis. A detailed approach is adopted wherein the teacher will also write down in the lesson plan everything that she will tell and do in the classroom.

Teachers complain about this very tedious work especially for one who has more than three subject preparations. They involve so much time in writing for the lesson plan and have limited time in preparation of instructional materials.

This gave way for the researcher to conduct a study about the perennial problem encountered by public school teachers. Findings and recommendations that will be generated from this study will be presented to local Schools Division office and this would somehow convince them to change some policies and guidelines in preparation of lesson plans and creation of instructional materials.

Objectives:

1. To determine the status and practices of the teachers of SNNHS in:
   a. Lesson planning
   b. Creation of instructional materials

2. To determine the problems encountered by the teachers of SNNHS in:
   a. Lesson planning
b. Creation of instructional materials
3. To examine what Department of Education states about lesson planning and creation of instructional materials based on memoranda.
4. To conduct benchmarking to other schools in terms of their practices in:
   a. Lesson planning
   b. Creation of instructional materials
5. To come up with recommendations based on the result of benchmarking that would address the problems encountered by the teachers of SNNHS.

**Method**

The respondents of this study will be the teachers of San Nicolas National High School. Other schools to be benchmarked will comprise (1) other public school; (2) private school; (3) school from other country. Interview, observation and questionnaire will be used as data gathering tool.
Background

In the heart of urban Nagoya, historic architectures of the late 19th and early 20th centuries have been preserved; moreover, some are open to the public. These buildings play the role of witness to the modernization of Nagoya. Here, we can find former residences of entrepreneurs—pottery manufacturers and exporters, inventors, bankers, educators, and missionaries, among others. The area is named the Cultural Path of Nagoya; recently, it has been attracting the attention of tourists from Japan and abroad.

Nagoya is the capital city of Aichi Prefecture, located at the center of Japan. Because of its geographical proximity to Toyota Motor Corporation and numerous other industrial production sites, Nagoya has been regarded as the center of the manufacturing industry. Although the city has attracted business-oriented tourists (Japan Tourism Agency, 2015), the Cultural Path of Nagoya has begun to be known as a new tourism destination. The Path used to be the residential area for middle to lower class samurai during the 17th and 18th centuries until Japan opened its doors to the international community. Many old houses have already been destroyed, and only a handful of them have been preserved. The Path is not just a remnant of the past that was left behind because of urbanization; rather, it is a unique and valuable asset that highlights the collaboration of city authorities and the owners of historic houses to overcome many difficulties and agree upon a preservation strategy.
Purpose

The purpose of this research is twofold. One aim is to shed light on inbound tourism (i.e., tourism focusing on visitors from foreign countries) associated with Japan’s traditional buildings of the late modern period located in an ultra-modern urban landscape. The author has attempted to demonstrate the cultural value of the buildings and roles played by the residents by gathering the hidden threads of their stories. The other objective is to explore pedagogic implications of programs integrating inbound tourism promotion and English language learning.

Method

The author conducted fieldwork regarding the Cultural Path of Nagoya in 2015 with participating university students from the Industrial Tourism and Oral English Guide class. The research theme for the 2015 academic year was “exploring remains of industrial sites and entrepreneurs of the late modern period and investigating linguistic hospitality of the area.” After having studied the Cultural Path of Nagoya in the classroom, students went to the site. They interviewed curators of preserved facilities, participated in a guided tour conducted in the Japanese language by volunteers of the local community, took photos of the entire area, and compiled their fieldwork achievements into a scenario of oral guide for visitors to the Path. They made presentations introducing the Path as they pretended to be giving an English language guided tour to foreign visitors. They concluded the presentations by pointing out several areas for improvement.

Results and Discussion

The students found strengths pertaining to current tourism strategies and areas for improvement, particularly in terms of receiving international tourists. In the post-work questionnaires, students replied as follows:

S1: I chose Nagoya City Archives (former appeal court) because I wanted foreign visitors to view the mixture of good old historical elements and the modernity of Nagoya. Since the English language brochure includes many specialized terms, I tried to paraphrase them so that people from different linguistic backgrounds could understand them easily.

S2: I chose Nanao-Tenjin Shrine because this religious place is not well known among foreign visitors. Although the site offers English-language fortune-telling slips, the “English” sign is not posted. This is an area for improvement; also, this shrine has an
interesting narrative about a turtle and a god of academics. I imagined that foreigners would not know how to worship at Japanese Shinto shrines, so I wanted to introduce that aspect.

S3: I chose the Futaba Museum because this place does not seem to be that famous among foreign visitors. I was able to understand that people living along the Cultural Path played important roles in developing Nagoya into an advanced industrial city.

S4: I chose the former residence of Sasuke Toyoda. I could see a unique combination of genuine Japanese architecture and Western-style architecture here. I felt the young entrepreneur’s enthusiastic spirit. An English-language leaflet was distributed at the residence, and I tried to change the written language into language suitable for an oral guide.

These excerpts are just a few examples of students’ feedback. Respondents evaluated the fieldwork and resultant oral guides as valuable for language learning. Having been asked as to whether they wished to guide actual foreign guests the following semester, they similarly replied that they would. They also acknowledged that this endeavor would necessitate greater preparation.

The paper emphasizes that English for Specific Purposes (ESP) tourism education can serve as a powerful means to facilitate students’ awareness of their local communities and motivate their learning intentions. Such theme-based, hands-on education will contribute to the development of students’ capacities as well as to tourism promotion within the local community.

Revitalizing the Zuni Pueblo Language through Student-Created Photo-Illustrated Dictionaries

Introduction

The Zuni: Engaging Teachers and Community (ZETAC) project is collaboration between the University of New Mexico and the Zuni Pueblo School District (ZPSD), both located in the southwestern United States, funded by the W. K. Kellogg Foundation. As a progressive and dynamic attempt to redefine the nature of teacher preparation within Indigenous communities, one important part of this work is professional development for classroom teachers, educational assistants, and Zuni Language Teachers in Project-Based Learning (PBL) focused on Zuni history, language, and culture.

The purpose of this paper is to provide a brief history of Native American education and the importance of refocusing that education on the Indigenous culture and context through professional development, and to describe the photo-illustrated dictionaries created by teachers and students as a result of these PBL experiences. In addition, the authors provide information on PBL in connection with the Zuni Language as a key to perpetuate Zuni history and culture with the Zuni children.

Early Indigenous Education

Though much has changed since the early days of Indigenous education, the residuals are engrained in the community consciousness. Traditional Tribal education of their own children involved storytelling and mentorship in aspects of daily life and necessary community skills. Once Colonialism began, first with the Spanish followed by the Mexicans, Franciscan friars educated the Indigenous children in the Catholic doctrine (Mondragon & Stapleton, 2005; Pewewardy, 2005).
In the late 1800s, the U.S. government created the Bureau of Indian Affairs (BIE), which placed Native children in boarding schools, with the goal of removing the children from their Indigenous homes and assimilating them into *American* culture. These boarding schools had, and continue to have, damaging effects on children and families through the generations. A key aspect of the boarding schools was to forbid any communication in the children’s Native language. (Mondragon & Stapleton, 2005; Pewewardy, 2005). By the 1930s, Indian Education was deemed a success by the U.S. Government. After all, 90% of Indian children were enrolled in schools; however, this statistic is misleading because of the high drop out rate and the few students who finished school and returned home could not apply their BIE training to life on the reservation as their coursework had no relation to their reservation environment or culture. In addition, the children were responsible for supporting the boarding schools utilizing essentially child labor to do the laundry, farming, cleaning, and servicing of the facilities as part of their required service (Szasz, 1999).

After closure of the majority of boarding schools in the mid-1930s, Indian Day Schools were created on the reservations and Pueblos. Even though the children were not removed from their homes to attend these schools, the curriculum of the Day Schools was still centralized and speakers of Indigenous languages were continually dissuaded from speaking and writing their home language ((Mondragon & Stapleton, 2005; Pewewardy, 2005). During the Depression and the New Deal of the 1930s and 40s, Indigenous education became more vocational, and in some instances focused on Indigenous artisan skills: pottery-making, painting, weaving, beading, and the like. However the move away from Indigenous language still continued. The strictly enforced rules of speaking only English in schools created an even deeper chasm between these children and their families and communities (Szasz, 1999).
When fast-forwarding to today, extensions of these assimilationist practices exist in the current school-based assessment systems, which favor Western knowledge over Pueblo cultural values and community practices. Even the Common Core State Standards are seen as an extension of Colonialism for the Indigenous children of our country. These standards are yet another way the centralized government has removed local control from school districts and created national standards for education, regardless of region, culture, or language. The Zuni Public School District, where this partnership operates, is a district under the jurisdiction of the New Mexico Public Education Department, and therefore, is accountable to the State of New Mexico for its operations.

The Zuni Public School District

The Zuni Public School District is located within Pueblo of Zuni, New Mexico. The Pueblo encompasses approximately 450,000 acres across counties in two states, where the Indigenous tribe has lived for thousands of years. The current population of the Pueblo is approximately 12,097, and 32% of its residents live below the poverty line (Public School Review, 2014). ZPSD encompasses approximately 600 square miles, and is located approximately 160 miles from the main campus of the university, a three-hour drive on highway and two-lane roads.

ZPSD was established as a way of asserting local autonomy over the education of Zuni Pueblo children, even though the District operates under the laws of the Public Education Department of the State of New Mexico. Four schools (Elementary, K-5; Middle School, 6-8; High School, 9-12; and Alternative School, 7-12) serve a total of 1,300 students (Zuni Public Schools, 1979).

Efforts to Reconnect Schooling to Culture

As a part of ZETAC, teachers and educational assistants participate in professional development in partnership with ZPSD. This professional development is
co-designed by university faculty and ZPSD personnel to assist the district and its teachers in creating meaningful ways to connect the learning of the Zuni language to the context of the Pueblo specifically. In the ZETAC Summer Institute in 2016, teachers worked with middle school and high school students to create photo-illustrated dictionaries of Zuni words for the Zuni Language Teachers to use throughout the year to instruct their students in the Zuni Language.

**The Zuni Language**

**Origins**

There are 19 Pueblo tribes in New Mexico and their languages come from three distinct language groups (Sando, 1992). The Zuni language is considered a language isolated and unrelated to the languages spoken by other Pueblo People of New Mexico. According to the Zuni, their language has been spoken since their emergence into this world (Cocke, Porterfield, & Wemytewa, 2002). As of 2006, 85.7% of Zunis spoke their Indigenous language at home with 14.3% speaking English only; most Zuni speakers are bilingual, speaking both English and Zuni. Generally, the Zuni children are fluent Zuni speakers, with 1,818 children between the ages of 5-17 being identified as fluent speakers of Zuni (Bonvillain, 2006). This trend is important in the continuation of the language into future generations, and reflects the vitality of the Zuni language. Comparatively, trends for other Indigenous languages indicate that only a small percentage of young people speak their Native languages (Bonvillain, 2006). Traditionally, language was learned in all the Pueblos verbally through daily use. These languages are essential to the continuation of the Pueblo way of life as they contain cultural knowledge, songs, kinship organization, and ceremonial rituals that will not survive otherwise.

Further, ceremonies and prayers cannot be conducted in English, nor can English be spoken in religious spaces (Zuni Pueblo, 1999). Due to the knowledge embedded in Pueblo
languages, tribes have been resistant to creating a written form of the language as a way to maintain control of sacred information. This thinking is changing to a degree as Pueblos attempt to maintain their languages by investigating multiple strategies including written forms (Bishop, 2008; Martinez, 2000).

**Transition to Print**

In the 1960s, linguist Curtis Cook wanted to translate the *Bible* into Zuni, but finding that an alphabet did not exist, proceeded to create one using the International Phonetic Alphabet (Romero, 2006). The written form of the Zuni language, or *Shiwi’ma Bena:we*, utilizes the English alphabet, minus eight letters (Cocke, et al., 2002). Other characters were added or altered to incorporate Zuni sounds not represented. Cook also recorded community elders and storytellers as part of his work to document the language. In 1974, Cook authored the *Zuni Language Learning Manual*, published by the Gallup-McKinley County Schools, for bilingual education use within the schools (Gallup-McKinley County Schools).

In 1989, the Zuni Literacy Project was created to support teachers in incorporating the language into their classrooms, however; development of classroom materials to support such instruction is a time-consuming and detailed process. The Zuni language teachers have worked to develop these types of materials that must then be reviewed and approved by the Zuni Tribal Council. Because the Zuni Language has only been written down for a little more than 50 years, there are still discrepancies by those who speak and write the language as to the exact spelling and usage of certain words. This review, critical to accuracy in the language, results in a shortage of classroom resources, and has therefore led teachers to create materials themselves for specific class projects, (D. Kostolecki, personal communication, April 25, 2015). The Zuni Photo-Illustrated Dictionary Project is an example of such student- and teacher-created materials as a result of a true PBL project, with an authentic audience and meeting a genuine community need.

What is ZETAC?

Developing the Project

ZETAC began in 2013 with funding from the W. K. Kellogg Foundation, which had been in conversations with the university and ZPSD, resulting in a collaboration seeking to redefine the nature of teacher preparation within Indigenous communities. The ZPSD invited the university to provide support, technical assistance, and professional development for its teachers, while at the same time recruiting and supporting students to earn degrees to become teachers. ZETAC serves as a model partnership for the ways in which necessary and culturally enabling collaboration can yield strong student educational attainment, as well as solidify community engagement in the educational process.

Goals of ZETAC

ZETAC takes a blended approach toward professional development by grounding the instruction in culturally sustainable pedagogy (Lee & McCarty, 2014) in order to create a solution for Indigenous communities challenged by creating strong curriculum that balances local Indigenous culture with the wider need for Western knowledge and skills. To this end, ZETAC established five goals as follows:
a) Provide a social and cultural orientation for current and future teachers in the Pueblo;
b) Reestablish a sense of empowerment among principals and teachers;
c) Facilitate collegial and collaborative work across the district;
d) Recruit current Pueblo students to become teachers; and
e) Provide educational opportunities through tuition support for teachers and future teachers to obtain graduate and undergraduate degrees.

The hope of the project has been to provide new teacher cultivation and a strong core of professional development that can serve as a foundation for the long-term development of the Pueblo schools and the Pueblo itself.

**ZETAC Goals in Action through Project-Based Learning**

A pillar of ZETAC is to integrate Pueblo culture, language, and history into PK-12 education. Workshops occur two weeks each summer with additional week-long follow up sessions three times during the school year. The focus of these workshops has been the integration of Pueblo language, culture, and history and Project-Based Learning (PBL) for teachers to implement in their classrooms.

Project-Based Learning is a fitting strategy to incorporate Pueblo culture in the classroom because of its focus on solving authentic issues, facilitating learning in community-based settings with authentic audiences where students do the work of real people, while incorporating specific curricular standards throughout the project (Buck Institute, 2016). The major components of PBL (see Figure 1) incorporate teaching the curriculum using inquiry methods, employing student voice and choice, with students revisiting their work through reflection, critique, and revision, and finally producing a public product that speaks to the authentic community issue of focus (Mergendoller, 2015).
Figure 1. The 8 Essential Elements of Project Based Learning. This figure illustrates the aspects of Project Based Learning and their intersections.

The Connection with Culturally Sustaining and Revitalizing Pedagogy

As a PBL Project, the ZETAC Photo-Illustrated Dictionary Project also exemplifies culturally sustaining/revitalizing pedagogy (McCarty & Lee, 2014). Zuni students’ literacy in their Zuni Language will be their key to sustaining and revitalizing their community and this project empowered the students through their language instruction. Students are reclaiming their history and heritage by being directly involved in saving their language in their community through partnering with parents and other community members through interviews, stories, and sharing, these students and teachers are directly responding to the community’s use of their Zuni language.

Project-Based Learning for Language Preservation and Revitalization

The Zuni Photo-Illustrated Dictionary Project is an authentic example of PBL. PBL incorporates the important elements of multicultural education through its major components of hands-on exploration, connection to community and curriculum, valuing local knowledge and expertise, and reflection. Seven Zuni teachers and educational assistants participated in a series of professional development workshops held in Zuni and facilitated by Partnerships Make a Difference (n.d.), a non-profit professional development organization that aims at
assisting teachers in implementing PBL in their classrooms. Middle school and high school students joined the sessions each afternoon to implement the PBL projects the teachers planned during the morning.

The students and their teachers followed the processes illustrated above during their PBL participation: a) Seek to solve or answer a challenging problem or question, b) participate in sustained inquiry c) provide authenticity, d) include student voice and choice, e) participate in reflection, f) follow-up with critique and revision, and g) create a public product. Specific examples illustrate the components of PBL as they connect to the Zuni Photo-Illustrated Dictionary Project.

**Challenging problem or question.** ZETAC participants were challenged to connect the Zuni Language to their own Zuni Core Values (Appendix 1) and to the ideas behind entrepreneurship. Entrepreneurism was one of the themes of the Summer Institute because of the need for economic development in the area. The participants focused on the idea of capitalizing on the incredible artistic skills of members of their community in order to create economic growth.

**Sustained inquiry.** Throughout the week, participants not only explored entrepreneurship, but they also explored their community. Using their phones and digital cameras, they explored their community through entrepreneurial eyes, and photographed ways entrepreneurship was evident in their community, and also lost opportunities for entrepreneurship. In addition, they photographed their Zuni Core Values in action in the community.

**Authenticity.** Because the Zuni Language Teachers led the students during their exploration, the students learned the Zuni words for the concepts they were exploring, such as value, opportunity, creation, dedication, innovation, and organization, as they photographed
representations of these ideas. They also created their own hard cover books using Snapfish, a free online software designed for such projects.

**Student voice and choice.** The students had total control over the key concepts on which their individual books focused and what they photographed. They also had autonomy regarding what photos they chose for their Photo-Illustrated Dictionaries.

**Reflection.** Each day after the exploration and photography sessions, students reflected on what they had learned by reviewing their photographs and the Zuni words that represented their ideas. They also reviewed what ideas were missing and set goals for the next day’s photography outing.

**Critique and revision.** After the initial one-week ZETAC Summer Institute, the students and teachers continued to meet for the next four Wednesdays to revise and finalize their work, continuing to add words and photographs to their books. They also revised the layouts of the books and their graphic design.

**Public product.** As a result of their work, they created four hard cover Zuni language books that are being used by Zuni Language Teachers in their classrooms to teach other students not only Zuni words, but also the Zuni Core Values and entrepreneurial skills necessary for success in their community.

**Conclusion and Next Steps**

As a result of this work, books were distributed to all Zuni Language Teachers, and were donated to all four ZPSD school libraries and the Zuni Public Library. In addition, copies were donated to the Zimmerman Library at the University of New Mexico. This partnership opportunity indeed met the goals of continuing to empower Zuni Pueblo members to use these types of strategies in their classrooms, and also to assist Zuni children in connecting with their language in personal ways, while creating an authentic product that will be used in the Zuni community for years to come.
Successful implementation of all components of PBL led to the creation of meaningful books that will be used by Zuni Pueblo members for years to come. Because teachers now have the knowledge and skills to implement PBL, other projects are being created within the District to continue to educate Zuni Pueblo members in Zuni history, language, and culture.

Title: Keeping Students Personality Types in Mind: Online vs. Face-to-Face Discussions

Authors: Dr. Elizabeth Alderton  
Ms. Ashley Reinke

Affiliation: University of Wisconsin Oshkosh

Address: University of Wisconsin Oshkosh  
800 Algoma Blvd., COEHS  
Oshkosh, WI 54901

Abstract: This study explored evidence of student learning perception in a pre-service methods course in relation to psychological factors such as personality type along with gaining insight about how to best utilize face-to-face and online discussions for diverse students in educational settings. Results suggest students preferred face-to-face literature circles regardless of personality type. Implementing pedagogical options such as Google Hangout and Skype in online settings is suggested to meet the needs of diverse learners.

Keywords: Face-to-face discussions, discussions, literacy circles, motivation, online discussions, personality types, technology, teacher learning, pre-service teachers
How will open source hardware influence our business and education in the future?

Yoshiyasu Takefuji  
Faculty of Environment and information studies  
Keio University  
5322 Endo, Fujisawa, 2520882 JAPAN  
takefuji@sfc.keio.ac.jp

Abstract—This paper presents how open source hardware will influence our business and education in the future. The open source hardware has been playing a key role in business and education. Historically, for example, the vacuum tube radios technology was invented and patented by Dr. Hiroshi Ando. Mr. Konosuke Matsushita (founder of Panasonic) purchased Ando’s patents and delivered the technology to the manufacturers in 1932 at no charge. Since 1932, every family in Japan has been owning an inexpensive consumer radio set. The vacuum tube radios technology is the first, and only the first open source hardware. Thanks to open source hardware, 3D printers and laser cutters are becoming cheap and available for personal use together with open source software. In this paper, our experience of building a laser engraving machine with less than US$70 is presented where gcode plays an important role. Innovations of open source hardware including Raspberry Pizero($5), CHIP($9), NanoPi-NEO($7.99), GPU, and others will bring us inexpensive artificial intelligent system. In other words, we may lose many of our jobs in the near future because such cheap AI system can put you out of a job. We must dramatically change the contents of education in order to prepare for the future human jobs. We must determine what contents of education will be needed in the future society. We should rethink how we can have a fun time or a good time with shortened working hours from the global viewpoints.

Keywords—open source hardware, vacuum tube radios, 3D printers, laser engraving machines, artificial intelligence, GPU, gcode

I. INTRODUCTION

Wikipedia states that Open-source hardware (OSH), consists of physical artifacts of technology designed and offered by the open design movement [1]. Both free and open-source software (FOSS) as well as open-source hardware is created by this open-source culture movement and applies a like concept to a variety of components [1].

Wikipedia also says that First hardware focused "open source" activities were started around 1997 by Bruce Perens [1]. This paper would like to correct the Wikipedia statement. The vacuum tube radios technology was invented and patented by Dr. Hiroshi Ando. Mr. Konosuke Matsushita (founder of Panasonic) purchased Ando’s patents and delivered the technology to the manufacturers in Japan in October 1932 at no charge [2]. Since 1932, every family in Japan has been owning an inexpensive consumer radio set. The vacuum tube radios technology is the first, and only the first open source hardware.

Since the advent of hardware description language (HDL), instead of schematics, sharing HDL code has been forming open source hardware where semiconductor intellectual property cores or IP cores have been playing a key role. ARM-based CPU is one of HDL incubated CPUs. However, ARM IP core is a proprietary product of ARM Ltd and not for free. ARM based devices occupies over 70% market share of embedded system [3]. ARM-based CPU market share in 2010: over 95% in smartphone market [4]. Inexpensive ARM-based CPU has brought a series of Raspberry Pi including Pizero ($5) [5], CHIP($9) [6], and NanoPi-NEO ($7.99) [7], and others. In February 2016, the Raspberry Pi Foundation announced that they had sold eight million devices.

From Gartner, iOS and Android have 98.4% of smartphone market share. Both iOS and Android operating systems are based on open source software as shown in Fig.1.

Fig.1 Open source operating system of smartphone market share:

http://www.macrumors.com/2016/02/18/ios-android-market-share-q4-15-gartner/

Downloading/updating/upgrading Linux operating systems, applications, development tools, device drivers, other software from the internet for free of charge, you can make a small artificial intelligent system with inexpensive open source hardware.

It is understood that ARM-based CPU and open source software play a key role with open source hardware which can build inexpensive artificial intelligent machines. The system of ARM-based CPU and open source software has globally dominated the smartphone market (95%) and the embedded system market (over 70%) as mentioned earlier.

Innovations of open source hardware including Raspberry Pizero($5), CHIP($9), NanoPi-NEO($7.99), and others will bring us inexpensive artificial intelligent system where they are
all based on ARM-CPU. ARM-based CPU will be a heart of IoT devices as shown in Fig. 2.

![Fig. 2 Pizero, CHIP, NanoPi-NEO from left](image)

Open source software libraries for machine learning include TensorFlow from Google, CrowdFlower, Keras, CNTK from Microsoft, Caffe from UC Berkeley, Deeplearning4j, MXNet, SINGA from Apache, Theano, Chainer, and others. Most of open source machine learning can be programmed by Python. Fig. 3 shows race for AI where many giant companies have been involved in the business competition.

![Fig. 3 Race for AI](https://www.cbinsights.com/blog/top-acquirers-ai-startups-ma-timeline/)

We have been using CPUs for long time. However, for machine learning, GPU has been used for fast computation. As shown in Fig. 4, the size of GPU core is much smaller than that of CPU core so that massive GPU cores can be embedded in a single silicon chip.

![Fig. 4 difference between CPU and GPU](image)

The latest NVIDIA GPU as of Aug. 5 of 2016, Titan X Pascal packs in 3,584 CUDA cores with a 1,417MHz base and 1,531 MHz boost clock in a single chip. The GPU chip is composed of 12 billion transistors with 11 TFLOPS (32bit floating point) capability. It is sold for $1200. The GPU can be used with open source machine learning libraries. Because of the recent progress of GPUs, a student can buy and own a supercomputer by himself/herself.

The GPU computing environment and open source machine learning software will make us to build inexpensive artificial intelligent system. Professor Andre Spicer said that AI could put you out of a job [8]. AI will quickly replace many forms of complex knowledge work ranging from lawyers to librarians, professors to policy analysts [8]. As of Aug. 5 of 2016, the google search result using keywords of AI and "out of a job" is 332,000. Many people believe that AI will be able to improve the efficiency of our jobs or to put you out of a job. In other words, sooner or later, our working hours will be significantly reduced by AI.

We must dramatically change the contents of education in order to prepare for the future human jobs. We must determine what contents of education will be needed in the future society. We should also rethink how we can have a fun time or a good time with shortened working hours from the global viewpoints.

Arduino is another open source platform which uses 8-bit microcontroller of Atmega328 (around $1) and related AVR 8-bit chips. Most of the existing sensors and actuators can be easily controlled by Arduino system where Arduino chip can be connected to GPIO, serial UART, i2c bus interface, spi interface. Arduino will be a heart of IoT devices as like ARM-based CPU.

With the progress of the Drone technology, a variety of MEMS (Micro Electro Mechanical Sensor) sensors have become cheaper for personal smart sensing. Recent two MEMS sensors are distinguished: GY-801 and BME280.

GY-801 is composed of four sensors for Drone: L3G4200D (three-axis gyroscope), ADXL345 (three-axis accelerometer), HMC5883L (three-axis digital compass), and BMP180 (digital pressure sensor). GY-801 module is sold for $8.39.

![Fig. 5 GY-801](image)

BME280 is composed of three sensors for sensing humidity( ± 3%), temperature( ± 1°C), and air pressure( ± 1hPa). BME-280 module is sold for $4.12.

![Fig. 6 BME280](image)
II. OPEN SOURCE LASER ENGRAVING MACHINE

**Fig. 7** Laser engraving machine kit

The kit is composed of a controller, two slide motors, a laser module where the controller controls motors and the laser without any software. Hacking the kit without manual is not so hard. The followings are described how to hack the kit:

1. Connect the kit to your PC through USB cable.
2. Find the port number (com number) of USB.
3. Use TeraTerm, picocom, or miniterm.py for USB connection between PC and the kit.
4. See the returned messages on the connected screen.

The returned messages include a keyword "GRBL". From "GRBL" we knew that the kit is based on open source laser engraving.

GRBL is a free, open source, high performance software for controlling the motion of machines that move, that make things, or that make things move, and will run on a straight Arduino. Most open source 3D printers have GRBL.

We need three software applications for laser engraving: one is to create a picture: picture editor, the second is to generate GRBL code (gcode) data, the last is to send gcode data to the kit from PC. "gcode" is a keyword for laser engraving/cutting and 3D printing.

The followings are shown how to reach three open source software applications for the purchased kit:

1. Search for "Lite Fire Laser" which is described on the kit web page.
2. We have found the interesting link:
   http://cnc-factory.eu/lite-fire-laser-engraver/
3. From the link, we have reached the name of "inkscape" which is an editor of open source engraving software.
4. Search for inkscape plug-in software.
5. We have found the import link for plug-in software:
6. Search for "Lite Fire Laser" for Windows device driver.
7. We have found that CH341 is a device driver.
8. Search for CH341 driver for Windows.
9. Searched result: CH341ser.zip
   https://docs.google.com/file/d/0B-mqOQablplXa1c1WV1COEZTU00/edit?pref=2&pli=1
10. Search for gcode sender
11. Download the gcode sender program:
    UniversalGcodeSender.zip

By hacking the kit, three software applications are found to be useful as follows: "inkscape" for picture editor, "JTP_Laser plug-in" inkscape software for generating gcode data, and "universalcodesender.jar" for gcode sender for sending gcode data from PC to the kit.

We have built the laser engraving kit within few hours and have learned a role of "gcode" for manipulating CNC (computer numerical control) machines including 3D printers, laser cutters/engraving machines, PCB fabrication machines, and others.

**Fig. 8** Engraving using the constructed kit

Fig. 8 shows the snapshot of engraving using the constructed kit. The picture was drawn by inkscape editor. The gcode data was generated by inkscape with the plug-in gcode generator. UniversalGcodeSender sent the generated gcode data to the kit. The kit successfully engraved the described picture which was edited by inkscape.
III. CONCLUSIONS

We would like to address that the first open source hardware (vacuum tube radio) was made by Konosuke Matsushita in 1932. The vacuum tube radio satisfies the statement of "open source hardware" described in Wikipedia [1]. From HDL (hardware description language), ARM-based IP cores were created. ARM-based CPU and open source software have dominated the embedded system business (over 70% market share) and smartphone business (over 95% market share).

Open source machine learning libraries make us to build inexpensive artificial intelligent system with open source hardware. GPU plays a key role for fast computation on machine learning. Two kinds of IoT devices are introduced: ARM-based CPU and Arduino.

AI will significantly reduce our working hours or will put you out of a job. We should also determine what contents of education should be needed for the future human jobs. We should also rethink how we can have a fun time or a good time with shortened working hours from the global viewpoints.

How to Motivate Students to Encourage Personal Growth and Envisage their Career Goals

Mayumi Hori
Hakuoh University
hori@fc.hakuoh.ac.jp

Abstract: It is essential to provide students with career education that enhances their qualifications for becoming highly capable professionals, and motivates them to enter the workforce. The attrition rate among college graduates in Japan during their first three years of employment is increasing. The significant gap between the readiness of college students and the qualities required for entering the workforce and sustaining employment is contributing to a national problem characterized by a growing number of students incapable of integrating into society. In this paper, I will introduce the educational overseas career program designed and executed by the author and validate the effectiveness for students.

Chapter 1. Overseas Career Program with the Active Learning Approach
Chapter 2. Report from Campus Career Center
Chapter 3. Change of Situation Surrounding Youth
Conclusion

Introduction

The attrition rate among college graduates in Japan during their first three years of employment is increasing. The significant gap between the readiness of college students and the qualities required for entering the workforce is contributing to a national problem characterized by a growing number of students incapable of integrating into society. With a declining birthrate and aging population, Japan already faces an inevitable reduction in the workforce and the prospect of a shrinking economy. Employment conditions continue to change as structural shifts in industries and economies are resulting in further diversification and mobility of labour, and lifetime job security has become a remnant of the past. In order to cope with these issues, it is essential to provide Japanese students with career education that enhances their qualifications for becoming highly capable professionals, and motivates them to enter the workforce. In this paper, I will introduce the educational overseas career program designed and executed by the author and validate the effectiveness for students.

Chapter 1. Overseas Career Program with the Active Learning Approach

In Japan, classes are often offered in the didactic lecture style where many students are enrolled, and it is only recently that they began to promote a more “Active Learning” style in
classes. This Overseas career program is Active Learning style. The program aims to cultivate general capabilities (cognitive, theoretical, social, and cultural skills as well as broad knowledge and experience) through students’ own proactive quest with active learning. The program entails discovery learning, problem-solving learning, experience learning, and explorative learning. It offers two credits and entails completing pre- and post-internship guidance in Japan, overseas training at local companies, and compiling a final report. The program started in 2008, and so far has conducted overseas programs in California, US (2008, 2009), Paris, France (2010), San Francisco/ Silicon Valley, California, US (2011), and New York City, US (2012-2016), with a total of 69 participating students.

Before students participate in the program, they have to take a class which aims to learn business communication skills that are the foundation and basic requirements for global business people, and are imperative for smooth interaction and transaction with colleagues and clients from a variety of backgrounds. Furthermore, it aims to learn cross-cultural communication skills and presentation skills that are essential for global business persons to exercise leadership, especially when major Japanese companies such as Toyota and Nissan rely on more than 70% of their sales from countries outside of Japan in a progressively globalized world economy. The program invites instructors with experience in international businesses to teach with a hands-on learning approach, as well as industry experts operating globally as guest speakers to give lectures. Moreover, in response to a pre-internship guidance request from students, the program invites a master of international protocols to teach table manners and etiquette at a French restaurant with a full-course dinner.

The program takes place in early February for 10 days. The purpose is to visit and talk with employees at local companies and a law office in New York City, a creative city in an advanced media nation. The students are encouraged to learn about current businesses conditions and the purpose of working overseas, and to utilize the findings for their own career planning by understanding the importance and value of having expertise in a region as diverse as New York City. Furthermore, they are encouraged to learn the importance of originality and creativity by experiencing local entertainment, and to understand the ways social media has become the foundation of the business society in the US with the development of information technology. They also have an opportunity to contemplate the reason for declining uses of older media, and to envision the nature of future business. Below is the summary of the overseas training in New York.

**Day 1:**
All day: Visit commercial facilities in New York City: The Museum of Modern Art (MoMA), The New York Public Library, Broadway musical theatres, luxury brand stores, etc.

**Day 2:**
Morning: Orientation at Global Labo
Afternoon: The United Nations (UN) tour
Evening: The Ride NYC bus tour

**Day 3:**
Morning: Lecture at Moses & Singer LLP, a New York City law firm
Afternoon: Visit Columbia University & Campus tour

Day 4:
Morning: Courtesy visit to Consulate General of Japan in New York
Afternoon: Lecture at JETRO (Japan External Trade Organization) New York office
Evening: Lectures from Japanese guest speakers working in New York at Global Labo

Day 5:
Morning: Lecture at Bloomberg
Afternoon 1: Lecture at the Permanent Mission of Japan to the UN
Afternoon 2: Debate at PricewaterhouseCoopers LLC (PwC)

Day 6:
Morning: Alexander Technique lesson and lecture
Afternoon: Lecture at Kodansha USA Inc.
Evening: Cross industry networking at Global Labo,
          The guest speaker, Mr. Yoroku Adachi, CEO of Canon USA

Day 7:
All day: Visit of cultural facilities in New York as a creative city: Indoor complexes such as Chelsea Market, Macy’s etc.

Day 8:
Departure to Japan

The active learning style includes students preparing and giving presentations, then taking part in discussions and debates, or colleges offering experience-based classes such as domestic and overseas fieldwork and volunteering. The students visit companies, collect information, conduct research, and find agendas on their own, then seek clues to address these problems though hands-on experience.

Chapter 2. Report from Campus Career Center

From the perspective of career centers, the problems students have are the following: lack of ability to write and articulate for preparing entry sheets (82.5%), difficulty in coaching mock interviews due to a lack of thinking ability and oral communication skills (70.7%), polarization of students among those who obtain job offers and those who cannot (70.3%), lack of basic academic skills (60.2%), increase of students with passive attitude toward job-hunting (53.0%), inability to project one’s own voice and instead use cookie-cutter answers (50.1%), lack of experiences that are appealing to employers (49%), and lack of corporate etiquette and ability to properly use honorifics (47.1%).

The following is a list of the important tasks for career education and placement support for the future: cultivation of general capabilities (problem solving ability through thinking, expressing, and reviewing), which is the foundation of employment competence (90.4%), building a stronger relationship between career centers and faculty members (89.7%),
professional development for career center staff (86%), integrative approach for planning and operation between career education activities and placement support (84.7%), head start of guidance in early college years (81.2%), enhancement of career education skills among faculty members (75.1%), and cooperation with high quality private recruitment support businesses (61.6%). Addressing the career-related challenges students face today requires a more comprehensive and unified approach that involves not just career education alone, but also increased cooperation among career centers, college departments, and private businesses.

Among the topics brought up by students for consultation, problems related to self-analysis (statement of purpose and self-promotion) and recruitment exams (interviews and written exams) are high on the list. However, career centers point out that a lack of basic academic skills including writing, problem solving, communication make it increasingly difficult to coach students during interviews. Prior to teaching career oriented specialized skills, it is important to cultivate self-analysis, communication skills, and basic academic skills. A growing number of Japanese students are unable to proactively and autonomously explore their own career choices, and information and consultation provided by career centers are not sufficient to cope with these challenges. Therefore, discussion on career education with a more comprehensive unified approach by the college as a whole calls for urgent attention. It should be noted that career education may not yield immediate results. Therefore, it is important to start implementing programs to cultivate general capabilities at the time of enrollment. It is also essential for colleges to collaborate with their faculty members and private recruitment support agencies.

In Japan, most companies hire new graduates as their core recruitment practice. Usually their aim is not necessarily to find work-ready graduates, but to discover students with potential who have a wide range of experiences and abilities to cooperate, solve problems, and take actions independently along with academic achievements. Acquisition of certifications or qualifications is a great opportunity to prove what one has learned, and it is important to study hard to pass the exam. Nonetheless, obtaining certifications alone is not enough if it cannot be utilized in the real world. Therefore, it is essential to review career education at the college level to find ways to cultivate the fundamental skills required in the workforce during the four years of schooling while pursuing academic achievements.

Chapter 3. Change of Situation Surrounding Youth

In Japan, school year starts in April and ends in March. Likewise, in general newly hired employees start working from April. Japanese students normally start participating in recruiting activities in the mid to end of their junior year, and some students start receiving job offers in May or June of their senior year. Many students wish to obtain a job offer as soon as possible, and enjoy the rest of their college life. The hiring rate for Japanese college graduates was 94.4% in 2013 (93.8% for males and 95.2% for females). The hiring rate for liberal arts graduates was 94% while math and science was 96.4%. Most students are currently hired upon graduation as full-time employees. It has been a norm in Japan for companies to invest in human resources development for new graduates regardless of their past professional experience. However, this traditional norm has changed in recent years.
Youth turnover rates have always been higher than that of the total workforce. According to a 2012 report published by Japan’s Health, Labour and Welfare Ministry, the turnover rate for new graduates who quit their job within three years was 32.3% among four-year college graduates, equaling approximately one third of the total workforce. Among those, the percentage of who quit within one year was highest at 13.1%, then within two years at 10.3%, and three years at 8.9%. In Japan, the norm was to spend an average of ten years training entry-level employees to become highly skilled professionals. Therefore, for those companies that can bear large costs for personnel training and development, employee’s resignation within three years poses a great risk. Furthermore, it makes re-employment harder for those who left the job before building enough career experience, leading many workers to land in new jobs as non-regular employees without benefits. The top reason for turnover within three years of employment is dissatisfaction with salary. Although the salary is disclosed before commencement of work, many feel the salary doesn’t match the job. The second reason is work-related stress, and the third is little hope in the company’s stability and future.

Professional skills development in Japan has excessively relied on corporate education and training. In Japan, students study general academic subjects at colleges that are less relevant to work, and they receive professional training at companies with their on-the-job training programs. However, when considering career education in Japan, it is imperative to motivate students and maximize their willingness to work and study. Listening to professionals and experts firsthand accounts of their purpose of career at their working place is a precious lesson for college students. Moreover, it is colleges’ mission to provide students with professional skills training coupled with career development opportunities, and that effort requires an interdisciplinary approach beyond departmental boundaries. Colleges must understand the characteristics of each business and industry, and offer students with employment support by teaching them how to conduct corporate and industry research, and how to find companies and job descriptions that match their visions and preference. Many Japanese youth quit their job without building a career. If this condition continues, Japan will fall into a critical situation where companies are unable to find competent professionals who serve as central roles in organizations.

Conclusion

The Council on Promotion of Human Resource for Globalization Development organized by Japan's Cabinet Office listed the requirements for global human resources as the following: linguistic and communication skills, self-direction and positivity, a spirit for challenge, cooperativeness and flexibility, a sense of responsibility and mission, understanding of other cultures and a Japanese identity, a broad and well cultivated mind and profound expertise, willingness to find and solve problems, team-work and leadership skills (in bringing together persons of various backgrounds), public-mindedness, moral sensibilities, media-literacy, presentation skills, and creativity and originality. The activities of overseas career training are compared to the above-mentioned factors along with international protocol, another factor the author considers important.

In career education, it is also essential to foster human resources that one can trust and rely on. For that goal, students must be able to think critically without prejudice, and assert
their opinions clearly. In order to articulate one’s opinion on a timely manner and persuade others, logical thinking and debate skills, as well as English fluency to communicate ideas are all crucial, hence these skills must be trained in early years. Japanese students often tend not to speak up even when they have their own opinions due to their shyness and fear of making mistakes, or fear of standing out in public. Likewise, teaching them explicitly at home and school the importance of actively speaking up is a good thing to do.

The reports submitted by students who participated in the New York training illustrate how much they were inspired and learned, even more so than we the professors had expected. These students will start participating in recruiting activities later this year. Many students reported that they would like to brush up on their English skills and become fluent communicators overseas, suggesting that they are no longer hesitant about utilizing English and have become more confident. Furthermore, upon their return from the overseas career training, they enrolled not only in English classes, but also international-relations classes, deepening their ability to understand more specific and concrete global agendas. They became more open to overseas travel, and many students started traveling alone by themselves. They now actively select and find employment at companies operating worldwide.

Along with the changes in environment surrounding companies and youth, teaching students not only basic academic skills and specialized knowledge but also communication skills to collaborate with others has become increasingly more important than ever. It was a great opportunity and the right timing for the students to consider their future. It would be meaningful to conduct a survey after their graduation, and find out which aspects of the training were beneficial and influential to their later career, and then reflect the findings onto the planning of future trainings.

In recent years, more colleges have started to engage in career education efforts. Nonetheless, students’ utilization and participation in career education activities is limited, and it is not well integrated into a whole college education from entry to graduation in a four-year program. Our overseas career training with the active learning approach is highly valuable and influential for students not only as career education activities, but also for their lives at large. The program offers students the opportunity to engage in conversations with professionals and experts, to actually visit their offices, and to learn in a group work setting overseas. The active learning approach enables students to engage in independent and proactive learning, and to cultivate general capabilities (cognitive, theoretical, social, cultural skills) as well as broad knowledge and experiences. It entails discovery, problem-solving, experiential, and explorative learning, all which make the whole learning experience more satisfying. It is highly recommended to incorporate an overseas internship program with the active learning approach into the curriculum, especially during early college years. It would motivate students to envision their career goals and plans earlier, and serve as the catalyst for building a stronger foundation for becoming more proactive and independent individuals who can thrive in the recruitment activities following their junior year.

Harvesting and Reaping the Benefits of Healing LAYnguage
Shari Joy Berman
Associate Professor
Center for Liberal Arts & Practices: Institute for the Promotion of Higher Education
Hirosaki University
1 Bunkyo-cho
Hirosaki-shi, Aomori-Ken
JAPAN
sjberman@hirosaki-u.ac.jp
As more and more doctors, nurses and allied health professionals in Japan are coming into contact with non-Japanese patients, being able to discuss a condition without sounding like a walking-medical-textbook is a highly useful skill set. Teaching lay terms enhances the core competency of medical professionals in training. While there has been concentration on “Plain Language” and circumlocution in the past, little or no research has been done on building a core vocabulary of lay terms. The author has created a series of classroom materials and two self-study trade books for professionals that call attention to these expressions. In addition to those the author has identified, terms have been elicited from actual student research and posted for learners to share on the university’s online learning management system, Moodle (Dougiamus). The ultimate goal is to create a unique “Lay Corpus” resource for medical English learners.

Medical English courses are often solely focused on teaching the same Greek and Latin words that native speaker medical professionals have to study. Much material is available on this subject. Most resources for non-native medical students are somewhat lacking when it comes to the inclusion of everyday words that ordinary people use to discuss diseases and conditions. Believing that being able to speak to patients naturally is a worthy goal, the author uses an original set of materials called Healing English© (Berman, 2013-2017) that employ English through Drama techniques (Via), (Nomura) in medical English classes to offer students dynamic practice with lay language mixed with some professional terms, representing plausible medical conversations in a variety of situations.

Students have also watched and analyzed scenes from scripted and non-scripted U.S. television shows in order to hear lay expressions in context. Shortly after the first group of Hirosaki medical students, in 2103, had studied the expression “Tender?” when questioning a patient about a painful area, the expression appeared in the reality show, “Top Chef” (Bravo TV), when one of the so-called cheftestants developed a “strep throat.” Of course, they did not refer to it as a “streptococcal infection,” but instead, a “strep throat.” The author shared the unscripted lines from the show with first year Japanese
medical students. The media not only provided immediate reinforcement of the use of lay language that students had been covering in class in a real situation, but also proved the point that this sort of language is very important in conversing with English-speaking patients. Predicated on the assumption that lay expressions such as “tender,” which, in this milieu means “sensitive to pain,” are less familiar to the learner, yet most familiar to patients, the author has created an array of materials that introduce, practice and reinforce lay language.

Theorizing that lay terms used in English often have equivalent lay expressions in Japanese, the instructor has asked students to start from their own awareness of non-medical terms used for conditions and diseases in their own culture and search for lay language in English. For the past three years, more than 300 learners have done independent research and contributed lay expressions to class Moodle forums. These students have successfully uncovered dozens of useful expressions and shared them with classmates.

The author is in the process of researching the citing of lay expressions in the various Brigham Young University corpora and other sources. The corpora seem to agree with the idea that lay expressions appear much more commonly in reference to familiar conditions. For example, in the latest Brigham Young corpus, “NOW,” News on the Web corpus, the term “chicken pox” appears 969 times. The technical equivalent, “varicella-zoster,” on the other hand, is mentioned only 50 times. Notably, in 6 of those 50 times the term “chicken pox” appears with the professional term, while as many as 29 times, the lay term “shingles” is present alongside the technical term.

Current research is focused on creating an official, independent Lay Corpus that offers a variety of information about everyday medical terminology. In conjunction with research on “Laynguage,” work has also been started on identifying seemingly professional terms for conditions and ailments that have found their way into the “Common Vernacular,” those which the author terms “CV” words. The contrast between CV words and lay terms, along with the knowledge of some cultural differences between English speakers and the Japanese in this regard, offer Japanese learners a broader window on how future patients will describe and discuss their conditions.

The average English speaker, for example, is familiar with the word “arthritis,” and it is used in the commonly, so it is a CV word, but “rhinitis,” is not. In conversation, rhinitis may be described as “nasal allergies.” On the other hand, the professional term for rhinitis, 鼻炎(bien) in Japanese is very
common. Japanese however don’t usually refer to their “sinuses,” in everyday conversation and may be surprised to hear a patient with nasal allergies complain of “sinus pain.” It is most likely true in both cultures that professional words have come into the common vernacular through television commercials for medication. At HICE 2017, the author looks forward to sharing a number of examples from ongoing research into both lay terms, including student examples, and common vernacular usage. It is hoped that this work will spark an interest in other EFL/ESL professionals teaching medical, nursing, pharmacy, and health science students.

Bio
Shari Joy Berman is an Associate Professor in the Center for Liberal Arts & Practices: Institute for the Promotion of Higher Education at Hirosaki University. She moved to Hirosaki in 2012 to help launch a new English center with self-access, consultation and skills-improvement called “The English Lounge.” Her main areas of research are “tolerance of ambiguity,” “deliberate practice,” and “medical lay language.” She has authored or co-authored 40 textbooks and countless materials that include conversations and simulated standardized tests. Two recent books have been published by Natsume Company, Ltd. and can be loosely translate as: 1) If You Send it They Will Reply: E-mail Communication for Physicians and 2) English Conversations to Conduct Proper Medical Examinations. She taught at secondary, university and adult education levels and trained teachers in Tokyo for more than two decades. She also co-facilitated a listening practicum at the Tokyo Campus of Columbia Teacher’s College. She has a home in Kona and she has taught Japanese at Kealakehe Intermediate School. She has also trained teens and adults in Japanese and Biblical Hebrew.

6. [Abstract]

[Aim]
This study aims to examine the effects of three-year nutrition education for high school students that is conducted through distance communication with ICT with the objective of “preventing lifestyle diseases during a lifetime.” The themes of the second year are “to understand the relationship between foods and vigor,” and “intake of energy, carbohydrates, fats and salt and the way of taking snacks and hydration.”

[Subject and Methodology]
The subjects of the study were Private High School N in SI Prefecture and Private High School U in SA Prefecture. Quasi-experimental design was structured setting up an intervention group and a control group in each class. The following activities were conducted in the course of the study: group work (hereinafter referred to as “GW”) for “creation of The Game of Healthy Life” in June, preliminary research in July (measurement of body composition, preliminary questionnaire survey, FFQg, and Between-Meal Food Mapping), GW on between-meals and hydration in September, a distance communication class (simulation to buy a lunch in a convenience store) in December, and follow-up survey in March.

[Results]
The preliminary research revealed the tendencies of loving meat-based diet, drinking beverages frequently and eating too much and the predicted lifestyle diseases of rough skin and pimples, high-blood pressure and diabetes. The FFQg results in the second year indicated the overall decrease in intake of confectionery with the exception of no change of the girls in the control group. Many students showed the between-meal pattern of eating at all
hours and the frequency to drink beverages was 4.6 times per week at 350 ml each time on average.
As for the convenience store lunch selection types by sex, many boys were the staple food + main dish (without vegetables) type and many girls were the staple food + empty type, which was statistically significant. The Skype function to share the screens was applied to the distance communication and LoiLoNote was used for submission of answers to GW quizzes. In comparison with the classes in the first year, the use of tablets in the second year gained a good evaluation because of promotion of understanding.
The results of the factor analysis on 100 % of the preliminary questionnaires about the dietary habit, dietary behavior and constitution associated with body weight were: Factor 1 - motive of eating due to a sense of fullness/hunger, Factor 2 - content of the meal, Factor 3 - overeating caused by stress, and Factor 4 - extrinsic motive of eating. The boys of School N in the intervention group showed decreased average scores for each factor (improvement in the problems), which was not statistically significant, while those in the control group finished with increased scores. The girls of School N in the intervention group showed significantly decreased score for Factor 4 while those in the control group finished with increased scores. The girls of School U in the intervention group showed significantly decreased score for Factor 4. The girls of both schools in the intervention group had the tendency of improvement in Factor 4 (extrinsic motive of eating), which means the reduction in frequency of eating that was not motivated by physiology but words or behavior of others or the five senses stimulated by foods.

[Conclusion]
The intervention of nutrition education practice for high school students is effective for girls who are concerned about overweight and the importance to control the extrinsic motive of eating is inferred.

6 Abstract
This poster presentation will report on the results of a study investigating the effects of peer feedback on student teachers’ perception of their ability to teach English. As Wallace(1998) describes, repeated self-assessment is indispensable for teachers to develop their professional expertise. Korthagen’s ALACT cycle of reflection(2011) consisting of five elements: 1) Action, 2) Looking back on the action, 3) Awareness of essential aspects, 4) Creating alternative methods of action, and 5) Trial also indicates the importance of promoting teachers’ reflective process.

This research focuses on the role of peer feedback to promote the above process in an English Teaching Methodology Course in Japan. First, students in class were asked to write comments and suggestions about a demonstration class conducted by a student teacher. Second, these comments were categorized into three: content knowledge and skills, pedagogical knowledge and skills, and classroom teaching skills, then returned to the student teacher. Finally, the teacher was asked to reflect his/her performance and to
create alternative methods in order to improve their teaching. This process was repeated for forty student teachers.

Analyzing the final papers reveals that the peer feedback has a great effect on encouraging the students to reflect on their teaching performance with deeper understanding as well as to create alternative and effective teaching methods.
STEM: Schools of Excellence in an Australian Context?

Topic Area: STEM Education

Presentation Format: Paper Session

Short Abstract: This paper looks at the current efforts to address the challenges of declining student number in science, mathematics, engineering and technology (STEM) in upper secondary and tertiary education in Australia. One solution proposed is through teaching STEM as an integrated suite of disciplines within a STEM School of Excellence. A framework describing the process by which a STEM School of Excellence might be developed is described. The challenges, including the Australian curriculum documents and the availability of qualified staff, that would limit the capacity for such a school to be developed are also described.

Abstract: The decline in student numbers at the upper secondary and tertiary level in STEM education in Australia has been identified as an ongoing problem for a number of years. The associated drop in the availability of qualified STEM graduates and its negative effect on Australia globally has also been described. A number of initiatives have been funded by the Australian Government since 2014 in an attempt to address these challenges. One approach that has been described as a possible solution to these challenges is the study of STEM as an integrated suite of academic disciplines using inquiry or problem based learning pedagogies. This paper proposes a framework that might be utilised to develop a STEM school of Excellence in Australia. It also describes a number of issues that exist within the Australian school context that limit the potential for an integrated approach to the study of STEM to be used.

Introduction

Much has been written in the last decade about the importance and associated challenges relating to science, technology, engineering and mathematics (STEM) in the educational arena. This situation has arisen because of concerns about the capacity of developed countries, such as Australia, the United States and England, to meet current and future needs in relation to the availability of graduates appropriately skilled in the STEM fields (e.g. Atkinson, Hugo, Lundgren, Shapiro, & Thomas, 2007; Chubb, 2012; HM Treasury, 2007). In the Australian context, it has been proposed that the lack of STEM qualified graduates will reduce the capacity for research and development in the future to such an extent that the country will not be able to compete effectively on the world stage (Chubb, 2012). The importance of this challenge and the need for Australia to be at the forefront of innovation globally has been promoted by Australia’s Prime Minister and has been accompanied by a federally funded innovation agenda (see http://www.innovation.gov.au/page/agenda). This agenda includes an allocation of $48 million over five years, commencing in 2016, to support the inspiration of scientific endeavour in STEM related activity.

This agenda has been supported by the Education Council, which has proposed a national strategy for Science, Technology, Engineering and Mathematics Education in Australia which recognised “that schooling should support the development of skills in cross disciplinary, critical and creative thinking, problem solving and digital technologies, which are essential in all 21st century occupations” (Education Council, 2015, p.3). The proposal calls for increased student STEM ability, engagement, participation and aspiration, increased teacher capacity in STEM areas, and support for STEM opportunities within school systems. The Australian curriculum (endorsed in December 2015) encompasses the required capabilities and conceptual understandings called for in this report, but have been presented
as discrete subjects, and not in an integrated form.

This is somewhat reflective of traditional teaching in that the disciplines that comprise STEM have been taught as separate school subjects, with little or no overlap. While there has been substantial movement towards integrating the study of STEM disciplines in the United States (Becker & Park, 2011), including the creation of speciality mathematics and science high schools (Atkinson et al., 2007), the situation in Australia is such that school subjects targeting science, mathematics and technology are still taught, almost without exception, as separate disciplines (Blackley & Howell, 2015). There is a need to consider how this curriculum can be used differently in ways that will allow development of the capabilities required to achieve excellence in the STEM area.

This paper will initially consider the epistemological difference in approach involved in achieving excellence when the STEM disciplines are pursued as separate areas of study and will contrast this with an integrated inquiry/problem based approach. The challenges associated with identifying the personnel resources that would allow either of these situations to be successfully achieved will also be described. A description of the possible structure and relationships that would be essential in supporting a STEM School of Excellence will be described, followed by a process by which such a school might be developed. The paper will conclude with an argument in relation to the limited capacity for development of an integrated STEM School of Excellence to be supported within the current Australian education context and the need for curriculum change to support any future endeavours in this area.

**STEM or S.T.E.M.**

In Australia, as in other western countries, there has been an ongoing decline in the percentage of students who have been studying mathematics at an advanced level and the various science disciplines (Ainley, Kos, & Nicholas, 2008; Goodrum, Druhan, & Abbs, 2011) with an associated reduction in mathematical and scientific literacy within the community (Thomson, De Bortoli, Nicholas, Hillman, & Buckley, 2011). A number of reasons have been offered for declining enrolments, including a lack of interest in the subjects, the inability of students to identify with career options in the STEM field, and a perception that STEM subjects are difficult conceptually. (Lyons & Quinn, 2010, 2012). These factors have been identified as a particular issue for students in rural and remote areas. It has been proposed that the point of disconnect with the study of science and mathematics occurs during the period associated with the transition from primary to secondary school (Lyons & Quinn, 2010; Tytler, 2007). One factor proposed as contributing to the problems with science and mathematics education at the lower secondary school level is the lack of qualified teachers (Harris, Baldwin, & Jensz, 2005; Marginson, Tytler, Freeman, & Roberts, 2013). Another primary area of discussion in relation to enhancing the outcomes from the study of STEM is the approach to the teaching pedagogies employed. Traditionally, science, mathematics and technology have been taught as separate disciplines. This separation has been evident in the syllabus documents available, with the science and mathematics documents making minimal attempts to address the substantial overlap between the disciplines. Most Australian States have not produced a syllabus document related to technology for primary and secondary school up to year 10. This was remedied with the production of the recent Australian Curriculum: Technologies
This syllabus brings together the related areas of digital technologies and design and technologies in a single document.

The Australian Curriculum: Science Rationale commences with the following statement:

Science provides an empirical way of answering interesting and important questions about the biological, physical and technological world. The knowledge it produces has proved to be a reliable basis for action in our personal, social and economic lives. Science is a dynamic, collaborative and creative human endeavour arising from our desire to make sense of our world through exploring the unknown, investigating universal mysteries, making predictions and solving problems. (see http://www.australiancurriculum.edu.au/science/rationale)

This description places science as an endeavour set within the students’ real and technological world that appears to require a wide range of academic disciplines to achieve successfully. However, the second paragraph immediately focuses the emphasis on school science as a specific discipline, seemingly separate from others.

The Australian Curriculum: Science provides opportunities for students to develop an understanding of important science concepts and processes, the practices used to develop scientific knowledge, of science’s contribution to our culture and society, and its applications in our lives. The curriculum supports students to develop the scientific knowledge, understandings and skills to make informed decisions about local, national and global issues and to participate, if they so wish, in science-related careers. (see http://www.australiancurriculum.edu.au/science/rationale)

An examination of the Aims of the syllabus includes no reference to disciplines other than science. The final aim includes the aim of enabling students “to select and integrate the scientific knowledge and methods needed to explain and predict phenomena”, but no reference to the use of any discipline outside of science is included when addressing this aim (See http://www.australiancurriculum.edu.au/science/aims).

The Australian Curriculum: Science does make specific reference to the relationship between the science and other disciplines, indicating that this would “offer opportunities to add depth and richness to student learning” (see http://www.australiancurriculum.edu.au/crosscurriculumpriorities/overview/learning-area-specific-advice), however the limit of the connection between these disciplines is via the use of an icon shown with the content description and is limited to the areas of Aboriginal and Torres Strait Islander Histories and Cultures, Asia and Australia’s Engagement with Asia and Sustainability. No explicit links are made between the syllabuses for science, mathematics and/or technology.

This situation with the status of the current Australian syllabus documents stands in contrast to attempts in recent years to improve the situation in relation to mathematics and science education through bridging the gaps between the STEM disciplines and approach the study of these subjects in an integrated manner in primary and lower secondary school. A primary goal of the integration is to enhance student engagement and learning through the study of real world contexts through focused inquiry, using mathematics, science, engineering and technology as appropriate (Becker & Park, 2011; Cantrell, Pekcan, Itani, & Velasquez-Bryant, 2006; Hurley, 2001). The similarity of what is being described and that stated in the Rationale of The Australian Curriculum: Science is evident. Tytler, Osborne, Williams, Tytler, and Cripps Clark (2008) support this integrated approach when they recommend that the teaching of science and mathematics should “reflect the way that these disciplines are represented and practiced in society more generally” (p. 15). The move to interdisciplinary approaches being explicitly incorporated into curriculum documents outside Australia is being evidenced. By way of example, Scotland has adopted such a curriculum...
and has moved towards the development of “schools of Excellence [that] arise out of an educational framework that uses broad themes, catalysts, or ‘hooks’ such as Space, to engage students” (Fairburn, 2011, p. 1139). Bruce-Davis et al. (2014), when examining the nature of STEM schools in the USA, propose that such a school will ensure that student learning is a live encounter and is done within a holistic and authentic learning landscape that applies to the curriculum, teaching pedagogy and assessment. They also propose that “the curriculum is centered around real-world problems and applications framed by the learner’s prior knowledge, lived experience, and the world’s and community’ ‘real needs’” (p. 296).

While the political support for STEM education has continued since the 1990s, the teaching of the STEM disciplines in an integrated way has not been evidenced in practice. Blackley and Howell (2015) argue that within the Australian primary and secondary school context, “the struggle to enact the STEM agenda, particularly in primary schools, has not been resolved as teachers have defaulted to the notion of S.T.E.M. rather than STEM” (p. 104). They identify a number of factors that have given rise to this approach, including “the curriculum structure [as described above] and the skill level and/or preparation of the teachers” (p. 106). Blackley and Howell (2015) also identify the core challenge to the effective integration of the STEM disciplines as the lack of understanding of what STEM education is: a view shared by others (Breiner & Johnson, 2012; Bruce-Davis et al., 2014; Dugger, 2010).

While there appears to be substantial challenges facing the individual STEM disciplines in terms of maintaining student numbers and adequately supporting society requirements for appropriately educated graduates, there appears to be positive educational outcomes that ensue from the successful integration of the STEM disciplines (Becker & Park, 2011; Stohlmann, Moore, & Roehrig, 2012). Kennedy and Odell (2014) propose that these outcomes will result when students address their study in STEM in a work-based contextual environment where “students have to apply the science and mathematics knowledge they learn to an engineering problem and utilize technology in finding a solution” (p. 254).

One challenge facing STEM education, identified by Blackley and Howell (2015), is a shortage of teachers at both the primary and secondary levels who would be appropriately qualified and experienced to be able to enact a truly integrated STEM curriculum. It is hypothesised that there exists within Australian education two principal reasons for the challenges that face the development of integrated STEM education in the future: the lack of a curriculum that adequately integrates the study of mathematics, science and technology, and the absence of an initial teacher training focus on STEM as an integrated area of teaching.

This situation presents two contrasting approaches to the situation in relation to current STEM education and the quest for excellence in the field. On the one hand, there is the traditional, teacher centric and, generally, didactic classroom, where the teacher ‘teaches’ and directs the process with the student being a passive recipient of the teacher’s knowledge. This contrasts with the integrated, inquiry and everyday problem based approach, where the teacher facilitates a student-centred learning process that utilises the different academic disciplines on a needs basis.

Possible requirements for a STEM School of Excellence

Overall Approach
Following on from the preceding section it is argued that before considering how to achieve excellence as a STEM school, the people tasked with the goal of setting it up need to be clear on what it is they are trying to achieve. There needs to be clarity in relation to what the overall epistemology is going to be for the school. One early decision that appears essential to the process, is whether excellence is sought in relation to academic performance within individual disciplines, or whether excellence is sought across the integrated STEM field. The goals for these approaches vary somewhat. It is proposed that the individual discipline approach will produce students who will be able to perform well in traditional assessment contexts, particularly in external, standardised examinations. It is also proposed that the external STEM approach will produce students who develop creative and adaptive approaches that utilise one or more STEM disciplines in the solution of real world problems. The integrated, inquiry approach to STEM is proposed as developing in students the skills that are appropriate in the workplace.

Once the overall epistemological approach to the idea of excellence is decided, there are a number of factors that have the potential to contribute to improving the quality of outcomes for students and setting a school culture that supports STEM excellence. Within the Australian and New Zealand context, Professor John Hattie (see http://www.aitsl.edu.au/about-us/directors/john-hattie) has conducted extensive research in relation to the factors that underpin excellence in teaching and has published a number of seminal articles. Hattie (2003, 2008) has identified a number of factors, based on a meta-analysis of the available literature, that he considers are essential to excellence in teaching and learning.

**Teachers**

Hattie (2003) proposes that the factor with the second highest influence on student outcomes is the quality of the teacher. In particular, it is what “teachers know, do, and care about which is very powerful” (p. 2) in the student experience. In a meta-analysis of many educational studies, Hattie (2003) identifies the greatest effect on student achievement as the quantity and quality of the feedback that students receive from the teacher. Of the factors which positively influence student achievement, eight of the top 10, when measured in terms of the effect size, relate to the teacher and their approach to teaching. It is at this point that the importance of the epistemological discussion presented earlier in this paper becomes important. The teaching staff that are chosen to be a part of a STEM school of excellence would need to be committed and passionate about the vision of excellence and the particular form that excellence is held to be.

While research would need to be conducted within the Australian context with a view to identifying exactly what teacher excellence in these two contrasting approaches would look like, it would be expected based on Hattie’s research (2003, 2008), that academic staff would demonstrate high level qualifications in the discipline content relevant to what they are teaching, previous experience demonstrating high quality outcomes for students and the possession of excellent teaching pedagogical approaches that support the epistemological approach adopted by the school.

These requirements present some very challenging issues when the earlier problems regarding a lack of qualified teachers in science and mathematics are considered. The research previously described in relation to this challenge (Harris et al., 2005; Marginson et
al., 2013) indicates an existing lack of qualified staff in mathematics and science which has existed while these disciplines have been taught with little integration. In the existing siloed environment, teachers only need to be qualified within a single field. If a school is to adopt an integrated approach to STEM education, staff will need to possess high level qualifications across multiple fields that would include science, mathematics and technology. Such a teacher would also need to be pedagogically sound across all of these individual disciplines, but also be able to demonstrate a teaching pedagogy that is able to successfully integrate them. Within an environment that already lacks highly qualified science and mathematics teachers, this staffing requirement would be very difficult to address without a long term strategy that looks to develop staff with the requisite content and pedagogical capacities to support an integrated STEM curriculum.

Students

Research indicates that a substantial amount of the variance in student achievement is based on what students bring to the school and classroom, with Hattie (2003) proposing about 50% and Watt and Barnholt (2000) proposing 64%. Fouad, Hackett, Haag, Kantamneni, and Fitzpatrick (2007), when examining the barriers and supports relating to subject choice for students in upper secondary school, identified that “the strongest predictor for pursuing a math career was math interest. For high school boys, the strongest predictor was parental support in making math decision and for high school girls, the strongest predictor was possessing math-related career goals” (p. 103).

The high level of variance associated directly with factors associated with the student suggests that one consideration in building a STEM school of excellence is the nature of the students who attend and whom the school seeks to attract through direct recruiting. It appears that a STEM school of excellence would need to promote itself as such and to be seen in the community as an institution devoted to excellence in the field. This promotion would promote the attendance of students with the requisite interest in STEM.

One feature that appears to be required before a school could be considered as a school of excellence in any field is the documented quality of the outcomes that are achieved by students. Towards this end, consideration could be given, particularly in the early stages of the school of excellence agenda is the use of scholarships for students who could be expected to provide high quality assessment outcomes.

Other factors

A number of other factors contribute to the success of schooling, including the home situation, particularly the quality of parental support available, peer support and the characteristics of the school and its culture that support students in their academic endeavours (Hattie, 2003, 2008; Tytler et al., 2008). Of these factors, the creation of a culture of STEM excellence within a collaborative learning community of staff, students and parents appears as the primary focus that school administrators would focus on.

STEM excellence and teaching
Lynch, Behrend, Burton, and Means (2013) provide a summary of the principles that underpin excellence in STEM education. These principles may be summarised as:

1. **STEM-focused curriculum:** Programs in all four STEM disciplines that are explicitly and intentionally integrated into STEM subjects and non-STEM subjects;
2. **Reform instructional strategies and project-based learning:** STEM education is characterised by instructional practices/strategies that provide the opportunity for project based learning;
3. **Integrated, innovative technology use:** Technology is used to connect students with the systems, models and existing research inherent in the STEM discipline and as a means of social networking and communication to facilitate learning both in and out of school hours;
4. **Blended formal/informal learning beyond the typical school day, week, or year:**
5. **Real-world STEM partnerships:** Student learning is integrated with the world of business, industry, research and the world of work through mentorships, internships or projects;
6. **Early college-level coursework:** Because excellence in STEM education is the goal of the process, it is expected that there will be high performing students in every year level. The capacity to cater for this diversity, by allowing students the flexibility to engage with work that is appropriate for their level of development, as opposed to their age, is essential;
7. **Well-prepared STEM teaching staff;**
8. **Inclusive STEM Mission:** The stated goals of the institution are written in the language of STEM and excellence;
9. **Administrative structure:** The structure of a school must be appropriate for inclusive STEM education and this will vary on a needs basis for each school.

These principles identify a number of aspects that will need to be pursued by the school administration to facilitate an educational climate that is supportive of excellence in STEM. A number of these requirements do not currently exist to any measure within the Australian education context. The challenges associated with the existing curriculum (point 1) and availability of well-prepared STEM teaching staff (point 7) have been previously described. Further challenges also exist in relation to the pedagogical approaches recommended. Project, problem and inquiry based approaches (point 2), while popular within initial science teacher education programs in Australia, are not common in mathematics. The current syllabus documents for these subjects are also not written to support an inquiry or problem based approach. Some steps are being taken to address this issue at the national level, including the funding of projects targeting inquiry learning in mathematics (see https://www.studentsfirst.gov.au/restoring-focus-stem-schools-initiative).

The need for partnerships with stakeholders outside of the school will be essential for a school to be able to support problem and inquiry based learning in real world contexts. These partnerships would include businesses, universities and individuals from the world of work that are able to provide safe and engaging contexts that support inquiry/exploration of real world problems. It is proposed that authentic STEM excellence cannot occur if students are confined to the classroom and school grounds.

**Conclusion – Developing a STEM School of Excellence**
This paper has presented a number of the issues associated with the establishment of a STEM School of Excellence. If all of the factors that have been identified are considered as an integrated whole, then the approach to creating such an institution would follow a process something similar to that shown in Figure 1. It should be noted that the process is presented as an iterative one, where the nature and quality of the whole process is evaluated and repeated to ensure a process that supports ongoing improvement over time and one which is able to achieve the standards of excellence desired.

Figure 1: STEM School of Excellence development process

The starting point for the process would appear to be a period of reflection by the school administration and key stakeholders in relation to what their vision of STEM excellence is. The culmination of this reflection would be the documentation of a school mission and culture statement in relation to STEM excellence that would articulate that vision for all staff, students, parents and others associated with the school. Once the school administration is satisfied that their vision of STEM excellence is soundly developed, the next phase would appear to be the identification of appropriate staff to implement that vision. It would not be expected that, in the first instance, curricula and the learning/teaching contexts would be developed until the teaching staff are available and able to be involved in the process. The particular teaching contexts that are used in real world, inquiry and problem based teaching contexts are very individualistic to the teachers who deliver them as often they are based on the teacher’s personal knowledge and experience base.

The resources and infrastructure that support a STEM school of excellence should reflect the curriculum and teaching/learning contexts that will be used as much as possible. Coherence between resources, infrastructure, curriculum and teaching/learning is essential to a high quality student learning experience. The final steps in the process would be the delivery of the learning and teaching experience for students and the evaluation of the entire process. It is important that evaluation is integrated into all aspects of the process and has the
capacity to change what exists. This has direct application to the staff that are involved in the process. Staff at all levels need to recognise that the development of a STEM School of Excellence does not occur immediately, but is an ongoing process that requires adaptability and resilience on the part of all concerned. It would not be expected that an endeavour such as the establishment of a STEM School of Excellence would be done quickly or through a single iteration of development.

The capacity for a particular school to develop itself as a STEM School of Excellence within the Australian education context appears very limited within the current curriculum and staffing context. The lack of a curriculum framework that adequately integrates science, mathematics and technology and which is written to support a problem and/or inquiry based approach to learning appears to be an essential pre-requisite to the task. The capacity to adequately staff such a school also appears problematic.

Considerations of STEAM for young children in Korea: A Delphi Study

Mi-Jin Lee (Andong Science College, Korea)

- topic area of the submission: STEM education
- presentation format: Paper Session

Abstract

This study showed some suggestions for effective STEAM education of young children (preK-K) conducting three-round Delphi with 11 experts of ECE and STEAM education in Korea. The experts agreed to set the necessities and goals of STEAM education and to find out the features STEAM education for young children considering the difference between the preK-K and other schools. Also, they proposed recommendations in four areas that need to implement STEAM education. From the results, we’re supposed to develop developmentally appropriate STEAM education for young children. And effective STEAM education is based on effective instruction design, serving teaching material and resource for teachers, collaboration, professional development programs for ECE teachers.

Key Words: STEAM education for Young Children, Delphi study

I. Instruction

STEAM that includes arts in STEM has come from the needs for artistic sense and creativity in the field of A (art) (Ashbrook, 2010; Moomaw & Dvis, 2010; Yahkman, 2008). STEAM education is suitable way to enhancing science, technology, engineering, arts and mathematics by integrated curriculum. Especially, arts is encouraging children’s creativity and stimulating children’s affective area. Also, it is to utilize the knowledge of science and mathematics for technological engineering procedures and methods, and solve problems by combining arts and humanities in Korea (Kim, 2011).

In Korea, it is necessary that accompanying the integration of subject matters, creative design, and emotional touch for effective STEAM education. And the lesson plan for STEAM education has ‘contextualizing’, ‘creative design’, and ‘emotional touch’. Contextualizing means understanding a problem, making children clarify ‘why I have to do this work’. Finally, the problem becomes children’s one not teacher’s one. From this part of lesson, children will have motivation and attention to activities and lesson. Usually, the problem need to come from children’s daily life (real life) or children’s fairy tale.

1 This work was supported by the Ministry of Education of the Republic of Korea and the National Research Foundation of Korea (NRF-2015S1A5A8016837)

2 simplicity1024@gmail.com
Creative design is the process of solving problems that is associated technology and engineering. The creative design needs children’s various ideas and opinions, and collaborative learning, too. The emotional touch occurs when children are engaged in activities totally, or absorbed in activities. It is called Csikszentmialyi’s ‘Flow’, to. The emotional touch is easily occurred with hands-on activities and from experience of accomplishment. Children will take other new challenge from the emotional touch(Cho, Kim, & Huh, 2012). Korean STEAM highlights 4C-STEAM, that is stands for convergence, creativity, communication, and caring. They are the core competency pursued from STEAM education(Baek et al, 2012) Therefore, STEAM education is suitable not only for being interested in math and science and developing creative problem-solving ability but also a good personality that is knowing how to collaborate with other people having caring others.

Actually, Korean students have high academic achievement in math and science, but show low self-efficacy and interest in them. But young children are already scientists and engineers. They have a curiosity about the world and like to make and construct something they want or need in their play(Stone-MacDonald, Batolini, Douglass, & Love, 2011). STEAM education is emphasized by strengthening not only national economy not also problem-solving ability through 'learning by making'(Kim, 2011). For encouraging children’s curiosity about world and their creative problem-solving ability, STEAM education can give a meaningful way for young children and teachers.

Otherwise, STEAM education has emerged in early childhood education (Sharapan, 2012) and got attention from the STEAM education workshop for ECE teachers(Cho, 2013) in Korea. STEAM education pursues common educational ideas for young children with Nuri curriculum that is national curriculum for pre-K-K in Korea(Lee, 2014) and is appropriate for young children(Ashbrook, 2010; Moomaw & Davis, 2010). STEAM education has been implemented by Korean ministry of Education for elementary and secondary students, but young children(preK-K) hasn’t included in. Also, researches on guidelines and the factors for effective STEAM education, teaching materials and resource, and teacher training are for elementary and secondary teachers but for ECE teachers(Noh, 2015).

In the meantime, since the early childhood education already has the integrated education curriculum and the activity-centered and the child-centered curriculum is in operation (Lee, 2013), the period required to accept the STEAM education is relatively short compared to the elementary and secondary teachers. Even early childhood teachers have agreed the necessity and possibility of applying STEAM education, STEAM education is still unfamiliar and understandable to them(Noh, 2015). In this situation, STEAM education materials of other schools or other countries must not be borrowed unconditionally. It
is necessary first to identify the characteristics of STEAM education in the existing integrated education curriculum and to find the direction of STEAM education (Kim, Cho, & Kim, 2014).

For STEAM education that will help children to possess integrative understanding and problem-solving, to have interest and curiosity in STEAM subject areas to bring high self-efficacy and strong motivation, and to be considerate of others' feelings, it is necessary to find out a guideline and considerations for application of STEAM education for young children. The purpose of this study is figuring out the necessities and goals of STEAM, features of STEAM, and recommendations for STEAM of young children with Delphi study. Delphi study is adaptable for investing the formation of a group judgment, the exploration of ideas and information for making decision, and also facilitate consensus among expert of the area that is not enough professional researches and hasn't clarified like STEAM education for young children (Lee, 2001).

Research Questions

1. What are the necessities and goals of STEAM for young children?
2. What are the features of STEAM for young children?
3. What are the recommendations for STEAM of young children?

II. Research method

1. Panels of Experts

In the Delphi survey, panelists first referred to experts who had studied STEAM education in early childhood education or experienced STEAM education (have teacher training or field application). There are two groups in the panels of experts. 5 field teachers: Teachers who have experience in STEAM research, experience in STEAM training and on-site application of STEAM education, teachers who have experience in teacher competence research on STEAM, and teachers who have experience in teaching development for STEAM education. Although STEAM was not implemented, teachers who have more than 10 years of experience in daycare and kindergarten curriculum have been contacted in the field of early childhood education. 6 researchers: Researchers who have develop STEAM education program for students and teacher training, and research on early childhood science education.

A comparison of the Delphi research reliability and the size of the Delphi panel group shows that a group of 10 to 15 people can obtain useful results (Cochran & Delbecq, 1975).
2. Data collection

In this study, the items were composed based on the results of analyzing the literatures related to STEM and STEAM education. Based on this, the preliminary questionnaire was completed and the open questionnaire was completed by one doctoral student who had experience in STEAM education for young children and two doctoral students who had experience in making Delphi research and questionnaire for survey.

In Delphi 1st Survey, Delphi panel was used to explain the purpose of the study and the procedure of the study, and related contents and the first questionnaire were distributed and retrieved by e-mail. The data collected in the Delphi 1st Survey were categorized through content analysis.

The second questionnaire of Delphi was revised and supplemented to two researchers in the field of early childhood education who have experience of Delphi survey or have experience in making questionnaire. Panelists were asked to rate the level of consent of the 5-step Likert scale (1: totally disagree, 2: almost disagree, 3: moderate, 4: largely agree, 5: very agree). In the second phase of the Delphi survey, the questionnaire was distributed via e-mail, and the questionnaire was collected from 11 panelists except two who were absent due to personal circumstances.

The third questionnaire was based on the results of the second survey and presented the mean, median, quartile. In the questionnaire, the results of the Delphi 2 are shown as M, the median as Md, the range between the quadrants as shaded, and the opinion of the second opinion of Delphi as ×. Based on the comments of the other panels, 3rd round of Delphi was asked to display their final opinion. The questionnaires were distributed by e-mail and the questionnaires were collected from the final 11 panelists.

![Delphi study process](image-url)
3. Data analysis

The data collected in the Delphi 1st Survey were categorized through content analysis. In Delphi 2nd survey, the frequency of opinions, mean, standard deviation, median, and quadrant statistical values of the panel were used. In the third survey, CVR(Content validity ratio) and the consensus, the variance of coefficient of the panels. The formula for deriving CVR, consensus, and convergence is shown in Figure 1 (Lee, 2001).

The CVR standard is more then 0.59(Lawshe, 1975; Oh, cited again in 2008). The consensus must be over then 0.75 and the convergence must be less than 0.5. The degree of consensus and convergence is indicating experts opinion is converged(Choi, et al., 2012). Stability was analyzed by the coefficient of variation obtained by dividing the standard deviation of each item by the arithmetic mean. When the coefficient of variation is less than 0.5, additional questionnaires are not required and when the coefficient of variation is 0.5 ~ 0.8, it is relatively stable (Hong, Choi, Yeol, & Lee, 2015).

\[
\text{CVR} = \frac{N_e - N}{N} \\
\text{convergence} = \frac{Q_3 - Q_1}{2} \\
\text{consensus} = 1 - \frac{Q_3 - Q_1}{M \text{d}} \\
\text{variance of coefficient} = \frac{SD}{M}
\]

N: total cases, Ne: positive answer cases
Md: median, Q1: 1st quartile Q3: 3rd quartile

Figure 2. Formula of CVR, convergence, consensus, variance of coefficient

III. Findings

1. Necessities and goals of STEAM education for young children

1) Necessities of STEAM education for young children

The stability of all items was less than 0.5, the consensus was more than 0.75, and the convergence was less than 0.50. Since the content validity (CVR) is over than the standard 0.59, the contents of the items except item3, are statistically valid. Table 1 shows experts' opinion as follow.
Table 1. Necessities of STEAM education for young children

‘Effective STEAM instruction design’ was derived from experts’ opinions as follows.

‘Activity designed with content and concepts’ was derived from opinions “When STEAM is actually executed, it can be continued similar to the existing class in the form associated with creative art activities. Therefore, it is necessary to plan that the contents and concepts of education that should be provided to children are included in STEAM activities”. ‘Design that can converge various disciplines and elements’ was from “It focuses on integrating diverse disciplines through the process of solving problems in various ways”, “In addition to integrating science and art, it is necessary to develop a STEAM program for young children who experience M (mathematics) and S (science) principles and artistic expression (A) around T (technology) and E (engineering)”, and “It is necessary to integrate
various elements as well as science and arts”. ‘Utilizing various methods of activity development’ means “It is important to avoid a way in which simple activities are listed and to use various methods such as deepening and expanding themes according to age and purpose of activities”. ‘Age-appropriate design’ means “Teachers should have a class that be suitable to child's age or developmental stage. For example, 2 ~ 3 years old can be set as theme - centered, 4 years old as concept - centered, and 5 - year - old as problem - solving center”. ‘Deriving educational contents around the daily life of young children should be ensured to follow problem-solving process’ was from “We must find various elements of science and art that children can experience in everyday life. And when we think that the contents of education in basic concepts of mathematics and science related to real life are starting, we should find enough education contents for infants. Otherwise, it can be a process of expression rather than a process of inquiry for resolution”. ‘Direct experience required’ came from “We encourage creative ideas to be displayed through the processes that children touch and experience(hands-on)”. ‘Design to integrate into the daily activities of early childhood institutions’ meant “It should be an integrated educational and daily activity, not a special activity separated by a scientific activity or a mathematical activity”.

The experts gave the opinions of part ‘Collaboration with members involved in STEAM education’. That was “Because the teachers involved in STEAM differ in their abilities, they are encouraged to participate in the STEAM class through consultation between teachers and to approach them in various ways”.

Last part of recommendation was ‘Professional development programs for ECE teachers’. Specific opinions of experts were as follow. ‘Teachers need prior knowledge and experience of STEAM education’ was derived from “STEAM, It is necessary to educate young children after teacher's prior knowledge and experience about STEAM education is fully achieved”. ‘Teachers need to understand technology and engineering’ meant “Teachers must reach a certain level of engineering and technology in order to solve problems using the principles and systems of engineering and technology”. ‘STEAM requires professional knowledge in topics for education’ came from “Teachers must have a certain level of expertise in the field, such as the academic meaning and basic definition of the topic, to be able to converge”. And ‘Develop teacher's ability to promote children to express their opinions’ was derived from “Because the expressive power of the infant is different from that of the adult, it is necessary to have the capacity of the teacher as a facilitator to clearly understand and guide young children’s intention”
IV. Conclusion

The survey showed making developmentally appropriate STEAM education for young children based on ‘effective lesson design’, ‘supporting teaching materials’, ‘collaborating’, and ‘teacher professional development’. Finally, developmentally appropriate STEAM education for young children can bring to children ‘being interested in science and math’, ‘convergence thinking skill (interdisciplinary understanding)’, ‘creative problem solving ability’, and ‘good personality’ as showed figure 2.

Therefore, when conducting STEAM education for young children, we’re supposed to consider the children’s developmental features and be integrated early childhood education with enough preparation to conduct STEAM education.

Integrating Creativity Training into Cross-disciplinary Courses to Stimulate Engagement and Promote Higher Level Learning

Author:
Emanuel LELEITO,
Associate Professor,
Nagoya University, Graduate School of Engineering,
Furo-cho, Chikusa-ku, Nagoya, 464-8603, Japan
Email: leleito@nagoya-u.jp

Abstract
Teaching cross-disciplinary courses in higher education often requires more effort to successfully foster genuine engagement that promotes higher order learning. Drawing from the author’s experience teaching the cross-disciplinary topic of disaster risk reduction, this paper proposes purposeful integration of creativity training into course content in order to stimulate engagement by tending to the interests of a wide range of students without compromising on the learning objectives.

Keywords:
Cross-disciplinary Education, Creativity Training, Higher Education, Disaster Risk Reduction

1. Introduction
Student disengagement from learning is an issue that many teachers have to face. With access to the vast resource of increasingly well-curated information online, students can at little or no cost acquire knowledge on any topic of their interest including content similar to what is offered in most of the conventional college courses. In addition, the ubiquitous access to this information is making memorization of such information seem frivolous. Furthermore, manifest socio-economic impacts brought about by rapid advances in science and engineering technologies (such as the loss of traditionally attractive jobs to robots and artificial intelligence systems), is exacerbating concerns among students on the cost benefit of higher education or the value of any learning outcomes that do not explicitly cater for these changes or the student’s perceived future needs.

Educators have to contend with the demands of this new teaching environment and the need to adapt teaching styles to create more engaging learning experiences and
make the value of learning evident to the students is becoming stronger. This can be daunting for many educators in higher education, especially those in charge of cross-disciplinary courses which often require more effort to achieve genuine engagement and promote higher order learning. Drawing from the author's experience teaching the cross-disciplinary topic of disaster risk reduction, this paper proposes purposeful integration of creativity training into course content in order to stimulate engagement by tending to the interests of a wide range of students without compromising on the learning objectives.

2. Cross-disciplinary Teaching and Engagement

The many research papers and articles on the topic of engagement (or involvement) underscore both its significance as well as its elusiveness. A major distinguish characteristic of engaged learning is that students are not only able to retain what they learn, but they can also flexibly use it or transfer it to a different context. Being able to gauge students' engagement level is an important first step towards improving teaching for meaningful learning. Thinking of student engagement from the 5 levels of student involvement (Rebellion, Retreatism, Ritual Compliance, Strategic Compliance, and Authentic Engagement) suggested by Phil Schlechty (Schlechty 2002) gives this concept a perspective that's easy to understand. To achieve engagement, most researchers of this topic agree that stimulating and maintaining the learner’s intrinsic interest or motivation is key. For example, the ARCS Model (Keller 1983) which gives Attention, Relevance, Confidence, and Satisfaction (ARCS) as the 4 key components for motivating learners, emphasizes the importance of designing instruction based on an understanding of the learner’s motivation and connecting the teaching with that learner’s needs.

Therefore, a shortcut to student engagement would be to focus on teaching that which catches a student’s intrinsic interest (for example something that satisfies their curiosity), and can be easily transferred to different contexts. The challenge then lies in finding a way to integrate such “interesting” content without dilution of the course content knowledge. But it is also important to note that engagement is not just a student-side issue. Teacher engagement and student engagement are two sides of the same coin because engaged students often affect teacher engagement and fulfillment, and vice versa. Lack of engagement on one side can result in a vicious cycle that undermines the learning process. Teachers too can use Schlechty's categorization, mentioned above, to judge their own level of engagement. And, when redesigning their courses, they should remember that the teacher’s interest in addition to the student's interest increases the chances of achieving real and sustained engagement.
3. Disaster Preparedness Class

3.1 Overview

The example used here is taken from a class on Disaster Preparedness taught and coordinated by the author. The class is open to international undergraduate students in their first and second year. The students typically have varied motivations for taking this module and diverse backgrounds in terms of disaster related experiences or knowledge, fields of study and home country. The objectives of the course are (1) Content Knowledge: introducing students to the Disaster Risk Reduction (DRR) concept and an understanding of the related science and technology, and (2) Problem Solving Skills: nurture students who can flexibly and effectively apply the knowledge gained in this class to different contexts of DRR or other diverse contexts. For a natural hazard prone country like Japan, such education on DRR is of great importance. However, DRR education is only well established up to the secondary level curriculum but not in higher education. While this means that there is more freedom on the choice of content and method of teaching, the lack of a textbook means that the DRR teacher in higher education has to take on the challenge of designing the content as well as finding an effective strategy to promote engagement in a class that covers a lot of information spread out over a wide range of topics that essentially requires cross-disciplinary collaboration.

A number of educators have shared methods they use to overcome some of the challenges arising from cross-disciplinary teaching. For example, Dr. M. Avraham suggests the use of systems theory to “help teachers and students control, manage and understand a large amount of information better” (Avraham 2006). Dr. Rajesh R. Parwani discusses some common problems from having a class with students from diverse disciplines and the need to “sustain interest of all students over long periods” (Parwani 2006). He solves some of the issues by providing the right balance of content that is “neither too easy nor too advanced”, using non-standard examples, constantly relating abstract concepts with real life examples and showing the connections between different disciplines. In the sections below, the author explains some of the teaching strategies adopted in the DRR class and how integrating creativity training has enhanced engagement and greatly helped with keeping the class content manageable.

3.2 Teaching Strategies Adopted in the Class

(1) Omnibus lectures: A number of speakers (university professors as well as from the public and private sector) with deep knowledge in a particular DRR related topic are invited to give a lecture on their field of expertise. Lecturers who physically cannot be in class have the option of delivering the lecture via online videoconference system
(Leleito, et al. 2015). The main reason this style of teaching was adopted was to enable the class access a wide variety of experts in the field of DRR. There are also a number of other merits of collaborative teaching discussed in literature (Letterman and Kimberly B. Dugan 2004). Focusing only on student engagement, the author found that the omnibus style teaching was better at sustaining student interest mainly because: (1) the lecturers had condensed all the interesting bits of information from their field of expertise into the one lecture, and (2) just by having a different lecturer each time tackling the DRR topic from a different perspective brought a sense of change and newness to each class which in turn kindled the students' interest. Some drawbacks were that each lecturer had a lot of content to fit into the one lecture, meaning the time for discussion was limited which impacts on student engagement. The author also had to coordinate the lectures to ensure continuity and avoid overlaps between the different lecturers and their content. A useful feedback from the students was that the lectures should be recorded on video and made available online for viewing outside class, and that way the class time could be dedicated to in-depth discussions between the lecturers and the students.

(2) Onsite studies and Workshops: The class also includes a number of field study tours to disaster affected areas such as Tohoku region which is still struggling with effects of the Great Tohoku Earthquake/Tsunami/ Nuclear Plant Meltdown disaster of 2011. In addition to witnessing for themselves the impact of the disaster, the students have the opportunity to meet with a local citizen group formed by disaster evacuees (currently living in temporary housing) whose aim is share their personal experience during and after the 2011 Tohoku disaster in the hope that such activity will promote future DRR efforts. Another onsite study activity is a visit to Kobe City, which has officially recovered from the devastation of the Great Hanshin Earthquake in 1995. In Kobe, students visit a museum dedicated to the Earthquake where they learn about the disaster management process from the preparedness phase, the immediate aftermath, the recovery process and the post recovery phase. In addition, students get firsthand information from the museum guides, usually local citizens who experienced and survived the Great Hanshin Earthquake.

Apart from the above, the class conducts visits to critical facilities that have high impact in case of disruption (e.g. Power Plants), and workshops with local citizens aimed understanding the actual preparations being made to safeguard human life as well as property in case of highly destructive disasters such as the imminent Nankai Trough Earthquake in Nagoya area where the university is located. At each of these field studies, the students participate in workshops or free discussions with the local residents or company employees. For example, the author recently organized a workshop with a citizen group representing a busy shopping street at one of the most
visited tourist spots in Japan (Great Ise Shrine) where students from the class joined by several other international students from over 20 different countries tackled the topic of disaster evacuation plans for foreign tourists. The feedback provided useful reference material for improving DRR targeting foreign tourists because international students bear very similar characteristics with typical foreign tourists (e.g. little or no Japanese language ability). I must emphasize here that these site studies and workshops are open to any international student at the university in an attempt to promote university-wide disaster awareness. During the site studies, the DRR class students participate as a core team of organizers and facilitators and thus gain extra experience on DRR and the required leadership skills.

4. Integrating Creativity Training

4.1 Creativity's Charm

For a person in the Science and Technology field, the word creativity brings to mind famous inventors such as Da Vinci, Edison, Tesla, Jobs, etc. These are people who consistently used their remarkable problem solving skills to come up with original ideas that brought immense benefit to society. It is not just fun (intrinsic motivation) to come up with creative solutions to existing problems, but success in modern society is increasingly being attributed to creativity and innovation (extrinsic motivation). This means that creativity is an important keyword that can be used to elicit a positive response to learning among a majority people. It has the potential to stimulate engagement in class if students can make meaningful link to the learning outcomes.

Creativity features prominently in the so-called “Transferrable Skills”. These are the skills recognized as essential for individuals to flexibly meet the dynamic demands of modern society. A majority of experts on creativity (e.g. (Robinson 1999)) concur that people’s creative capacities can be enhanced. In Japan, an increasing number of universities are providing courses on themes such as “Creativity and Innovation”, “Critical Thinking”, “Entrepreneurship and Innovation”, and “Leadership”. As an addition to these course modules focusing on teaching Transferable Skills, the author sees an opportunity for educators to increase engagement through deliberate integration of transferable skills such as creativity training into conventional disciplinary or cross-disciplinary courses.

Deliberate integration of creativity training means that the courses should be designed with such training (e.g. effective problem solving skills), forming the core part of the course. In the DRR class, the author focuses on teaching systematic problem solving with applications to DRR related topics. From the outset, students are aware that the focus of the course is on creativity training and that while the class deals with DRR, the knowledge they gain can be applied to any other topic of their interest.
4.2 Systematic Problem Solving and Brainstorming

Effective problem solving follows a systematic process. Although there are slight variations, the generic process involves the following sequential steps: (1) Definition of the Problem, (2) Determination of the Root Cause, (3) Generation of Solutions, (4) Selection of best solution, (5) Implementing the Solution, and (6) Evaluation of Outcomes. It has been shown that systematic problem solving outperforms intuitive or ad hoc problem solving (Tyre, Eppinger and Csizinszky. 1993). Therefore, helping students understanding this process and encouraging them to deliberately apply the knowledge will greatly improve their problem solving.

Brainstorming is one of the most commonly used methods for supporting several steps in the problem solving process. Brainstorming does not only stimulate active participation, but it can also play a central role in nurturing skills such as critical thinking, teamwork and communication. In addition, brainstorming sessions are often enjoyable, can be flexibly fit into any teaching scenario, and gives the participants a feeling of achievement. On the other hand, bringing a highly interactive technique such as brainstorming into the core of class instruction can be intimidating even for skilled facilitators. Among many other challenges, the facilitator has to skillfully ensure productivity by stimulating idea generation in stagnating groups while at the same time help those that are engaged in enthusiastic but out of topic discussion to get back on track without affecting their zeal. In addition, while some of the ideas gained can provide solutions that are highly creative and practical, brainstorming can easily lose its appeal and the initial feeling of achievement can turn into dissatisfaction if care is not taken to ensure that appreciable learning is achieved from the brainstorming process.

4.3 Utilizing Established Problem Solving Tools

To enhance the problem solving process and avoid some of the shortcomings of the conventional brainstorming technique, the author suggests the introduction and utilization of established structured problem solving techniques, frameworks or tools that support creative thinking such as TRIZ, SCAMPER, SIT, and et cetera. In the DRR class, the author uses TRIZ (Theory of Inventive Problem Solving /TIPS) as an example, but noting that the other techniques can be used as well.

TRIZ was developed by a Russian inventor (Genrich Altshuller) based on a study of the patterns and trends of invention in thousands of patents. From these studies, Asthuller established that regardless of industry inventive solutions try to solve a contradiction, that they share generic problem and solution patterns, and that the evolution of technological systems also follow recognizable patterns. These insights have resulted in the powerful tools and concepts that apply these generic patterns to
find innovative solutions. The TRIZ toolkit is being used successfully in industry to enhance problem solving and promote innovation. Some of these tools and concepts which can easily be introduced and use in class include:

(1) **The Contradiction Matrix and the 40 Inventive Principles:** The core of TRIZ problem solving is in finding solutions for conflicting features in a system. Contradiction Matrix presents 39 common features that can be tweaked to improve a system. These are presented in the form of a matrix table, which, based on the conflicting features being examined, points to generic solutions in the 40 inventive principles, which is a list of known solutions to technical contradictions.

(2) **Ideal Final Result (IFR):** this concept is used in defining the ideal (Perfect) solution for a problem as opposed to compromise solutions. The solution delivers all the required functionality, all the benefits without any harmful effects and no costs. The IFR is a powerful thinking strategy that promotes breakthrough solutions by leading individuals to think of solutions free of any constraints inherent in the problem space.

(3) **Laws of Technological Systems Evolution:** these are trends that show how technological systems are improved over time. Knowing about this concept helps one understand current technology and even predict the likely future advancement, which greatly improves an individual's inventiveness.

In class, TRIZ is easy to associate with intellectually stimulating keywords (such as creativity, patents, invention, innovation, problem solving) that elicit a positive response to learning. The author has successfully used this to stimulate and maintain the interest of students in the DRR class. At the beginning of the module, students are given a short introduction of the TRIZ as one of the most useful inventive problem solving tools and for understanding technological trends including the DRR content knowledge that will be taught in the subsequent classes. Students are shown examples of how TRIZ is being used successfully in industry to enhance problem solving and promote innovation. At subsequent classes, knowledge of TRIZ is deepened through application during brainstorming and other interactive sessions. Each class of 90 minutes has at least 30 minutes set aside for discussions and brainstorming on the topic introduced in that particular class.

For example, to deepen understanding of the Great Tohoku Earthquake, students are first asked to watch a documentary on the disaster before coming to class. Then in class, students use TRIZ is in discussions aimed at first defining the problem(s) that the class is trying to understand, and then analyzing or determining the root cause of the problem. In subsequent class sessions, TRIZ is used in the generation of solutions to address the root causes as well as in selection of the best solution. Usually, to define the problem and analyze the root cause using TRIZ, the class focuses on finding a contradiction that needs to be solved. This is an important technique that accelerates
the problem definition step. Students also learn to use Root Conflict Analysis or Cause-Effect Analysis.

Another useful technique the students learn is how to convert the specific problem they have identified into a generic or abstract form which can then be easily solved using knowledge or prior inventions borrowed from across disciplines. To assist in finding solutions to the problem during the idea generation stage, the 40 Inventive Principles and the Contradiction Matrix is used as triggers for ideas. The IFR is also a very useful and fun tool which gets the class to set a high standard and encourages outside the box thinking.

The idea generation sessions are conducted similar in format to conventional brainstorming, but different in that the TRIZ guided brainstorming process greatly reduces the work load of the facilitator and the ideas generated are usually of very high quality with the output solutions mostly innovative and practical. This is due to the inherent quality of the TRIZ method to focus on correct problem definition, finding the root cause, and using abstraction to point problem solvers at examples of existing solutions and advanced knowledge that directly relate to the problem at hand. Some key advantages gained from introducing creativity training in the DRR class using TRIZ include: (1) TRIZ in itself provides a topic all students can relate to and apply to other areas regardless of their fields of study, (2) TRIZ helped in the clarification of the context and content of the class, (3) TRIZ successfully changed the class from teacher centric delivery model to a learner-centered model with active engagement by the students, (4) Following the structured problem solving process using the TRIZ tools lessened the burden of facilitation compared to conventional brainstorming, and finally, (5) focusing on creativity training using provided an anchor point that bound the widely varied topics into coherent and manageable content.

5. Conclusion

Purposely integrating creativity training should be considered by educators not only as a method for stimulating genuine engagement in class, but for fostering individuals with the skills to cope with today's and tomorrow's challenges. While there might be courses fully dedicated to teaching about creativity, this paper suggests that in addition to these, integrating creativity training especially to cross-disciplinary courses will enhance the learning of both the specific course content as well as the other important transferable skills. This paper shares an example of integrating creativity training into course content based on the author's experience with a cross-disciplinary DRR course. This serves as a good example of often taxing cross-disciplinary classes that involves a group of people with varied interests (multidisciplinary group of students, a collaborative teaching team, etc.) that need to be taken into consideration.
At the end of the course, students had not only acquired adequate content knowledge, but they also greatly appreciated their newly acquired creative problem solving skills which they strongly felt offered them a new and interesting perspective on how to approach immediate issues related with their current academic challenges and even their future careers.

In the modern class, teachers need to be always aware that their students have instant access to online information, information that most often is presented well enough to render the need for the conventional classes obsolete. Educators in higher education might find integration of creativity training into their classes will help them adapt and transition to meet the challenges of educating the modern student.

An Examination of the Priming Effect

Abstract

This paper presents the findings from a quantitative study that examined the priming effect, which is the phenomenon whereby an individual’s behavior is unconsciously influenced by exposure to a stimulus. To examine the priming effect, a survey was given to 98 non-Japanese English teachers at universities in Japan. The survey results suggest that the priming effect may have influenced the participants in an unexpected way.

Introduction

One definition of the priming effect is: “The process by which recent experiences increase the accessibility of a schema, trait, or concept” (Aronson, Wilson, Akert, & Sommers, 2016). Daniel Kahneman illustrates the priming effect with the following example: If asked to complete the word fragment $SO_P$, a person who has recently heard or seen the word eat is more likely to complete the word as soup rather than soap. And the opposite would be true if the person had recently heard or seen the word wash (2011). An influential study on priming was an experiment (Higgins, Rholes, & Jones, 1977) in which the participants read a passage that ambiguously described a character named Donald and were asked to characterize him with adjectives. In a prior activity before the reading, the participants were exposed to trait terms with either positive desirability or negative desirability. The study found that the subjects who were exposed to positive trait terms were more likely to characterize Donald with positive traits and participants who were exposed to negative trait terms were more likely to characterize with negative traits.

Another well-known study on priming was conducted by psychologist John Bargh (1996). In the experiment participants had to unscramble the order of words to make short sentences. In the experimental group, the participants’ sentences included words associated with the elderly, such as wrinkle, forgetful, and bald. The control group received words not associated with the elderly. At the conclusion of the task, participants had to walk down the hallway to a
different room and their walking speed was secretly timed. The results revealed that the experimental group walked down the hallway more slowly than the control group. Other studies have also demonstrated the priming effect. However, the priming effect is controversial, as the results of some studies have proven difficult to replicate, including Bargh's study (Bartlett, 2013).

Methods of Research

To carry out our research, a ten question survey was created via SurveyMonkey. The primary purpose of the survey was to examine self-inflation effects, which is the subject of our other paper. The secondary purpose was to examine the priming effect by running various statistical tests on the data we received from the surveys. The survey included two versions, one given to the control group, the other the experimental group. To study the priming effect, the order in which one question appears in the survey was altered. In the survey, participants were asked to rate their own teaching ability on a scale of 1 to 10 (1 being extremely poor and 10 being superb). In the experimental group, directly preceding this question the participants were asked to think of a great teacher they had as a student and answer if said teacher was at elementary, junior high, high school, or university. The purpose of this was to examine if having participants first think of a great teacher would influence their answers to the subsequent question in which they had to self-rate their own teaching ability. For the control group, the question about a great teacher they had in their past was moved to the end of the survey and immediately preceding the self-rating question the participants were asked how many years they have taught at the post-secondary level.

To collect the opinions of non-Japanese teachers at the tertiary level in Japan the survey was distributed through email and announcements on social media such as Facebook. The participants were directed to the control or experimental survey version depending on the month of their birthday. 102 teachers participated in the study and of these, 4 were thrown out due to incomplete answers.

Demographic Data on the Participants

The survey participants were non-Japanese instructors at Japanese universities, mostly male, and represented a wide range in age. Of the 98 participants, 73 were male and 25 were female (see figure 1). The youngest age range represented was 25 to 34 years old and the oldest was
75 years old or over (see figure 2). There were no participants under 25 years old.

![Figure 1: Male and Female Distribution](image)

![Figure 2: Age of the Participants](image)

**Results**

The descriptive statistics of the two groups’ answers to the self-rating question are given in table 1. The average self-rating score for the experimental group was approximately 7.82 and for the control group
approximately 7.62. Thus, there was no statistically significant difference between the self-rating scores of the two groups. It is also notable that there is a significant difference in deviation of the self-rating scores between the two groups. This will be further demonstrated below with other statistical tests.

Table 1: Descriptive Statistics for Experimental and Control Groups

Table 2 shows the degree of correlation between number of years the participants had taught at the university level and their self-rating scores. The Pearson correlation coefficient for the control group was .519, which signifies a significant correlation, and the experimental group was .178, which signifies no significant correlation between the number of years taught at university and the self-rating scores.

<th>Years taught at university</th>
<th>Self-rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open-Ended</td>
<td>1</td>
</tr>
</tbody>
</table>
A t-test assuming unequal variances was conducted (see table 3), and there was no statistical significance involving the means of the two groups since the t-stat is between the negative and positive value for the t critical two-tail value. Therefore, the null hypothesis was confirmed for this test, meaning that there was no statistical difference between the means of the two groups.

To test whether or not there was a statistical difference of variance between the control group and experimental group, an F-Test was conducted. Table 4 shows that the F value is greater than the F critical value, and thus we reject the null hypothesis. Therefore, the variances of the two samples are unequal.

Conclusion

We came to several conclusions from the statistical data. First, there is no statistically significant difference between the average self-rating scores of the control group and experimental group (this will be discussed further in the final section). Second, there is statistically significant correlation between years of teaching experience and self-rating scores for the control group but not the experimental group. Thus, it is possible that the priming effect caused participants to anchor their scores more closely than in the control group. Second, the variances of the two groups are unequal as shown by the data from the F-test. More specifically, the responses from the participants in the experimental group were more clustered around the average than in the control group. It is possible that with the schema of their favorite teacher activated, participants in the experimental group were more likely to cluster their answers in a narrower range. Further research with larger sample sizes will be needed to confirm this result.

In sum, a statistical correlation was established for participants in the control group between years of teaching experience and self-rating scores, but this effect was not found in the experimental group. Furthermore, there was a statistical difference between the variances of the control and experimental groups. Therefore, based on our statistical results, we can tentatively conclude that there may have been a priming effect in these two areas.

Ideas for Improvement

Upon completion of this study, we have doubts regarding our methods of examining the priming effect. Initially, we supposed that by having the experimental group participants first think of a great teacher, that it may result in lower self-ratings if it would cause them to consciously or
unconsciously compare themselves to the great teacher rather than their colleagues or other less impressive teachers. However, this may have been an erroneous assumption. Perhaps it is possible that having the participants think of a great teacher could also have had the opposite effect and cause participants to self-rate themselves higher instead of lower. If participants have the thought of a great teacher activated in their minds, perhaps it could lead them to consciously or unconsciously associate themselves with the great teacher, or great teaching in general, and hence result in a higher self-rating. Or, it is even possible that the question could influence participants differently, some towards a higher self-rating and others towards a lower self-rating. Thus, the predicted influence from the priming question was not as straightforward as we initially supposed.

As one possible solution, instead of having participants think of a great teacher they had in their past, we could have asked them to identify the perceived strengths of their own teaching. If this question influenced the participants’ self-ratings, it would be expected to influence the self-ratings to be higher. Whereas for the question about a greater teacher they had in their past, for the reasons stated above, it is unclear to us whether this would potentially influence the self-ratings to be higher, lower, or both depending on the individual participants.

An Examination of Self-inflation in Teachers

Abstract

This paper presents the findings of a quantitative study that examined the following main research questions: 1) Do EFL teachers generally believe they are better teachers than most of their colleagues? 2) Do EFL teachers, when comparing themselves to their colleagues, rate their teaching skills more highly than skills that are not directly related to teaching? 3) Do EFL teachers think they are less likely than other teachers are to overrate their own teaching ability? This study sought to expand on the research of Jonathan D. Brown, whose findings support the claim that people tend to believe they are more competent than others, especially for characteristics and skills that are important to them. Based upon the survey responses of 98 EFL university teachers in Japan, the answers to the above research questions appear to be yes.

1. Introduction

Teachers are faced with difficult judgments: Are my current teaching practices preferable to alternative approaches? Could modifications to my lessons and teaching style result in higher student motivation and a more efficient learning environment? Are my lessons providing students with the knowledge and skills that they most need? The complexity of the classroom, among other factors, can make it difficult to answer such questions. Furthermore, teachers may be prone to overvalue the effectiveness of their teaching. If so, could self-bias lead to undue complacency in one’s teaching? Could it even contribute to poor teaching decisions? We strongly believe that these questions merit consideration.
2. Theoretical Background

Traditional views in psychology held that it was beneficial for individuals to possess accurate self-perceptions, yet subsequent research has suggested that overly-positive self-evaluations are normal and may be advantageous (Taylor and Brown, 1988). Most people tend to view themselves as unique rather than common and believe themselves to be more talented, capable, competent, honorable, moral, compassionate and sympathetic than others (Brown, 2011). Moreover, the tendency to self-inflate is heightened for characteristics and abilities that the individual regards as important (Brown, 2011).

There are various explanations to account for self-inflation. It may derive mainly from self-enhancement needs – the desire to feel good about oneself – and may at times be solely produced by cognitive factors, such as an asymmetry of knowledge and the tendency to focus on oneself when making comparative judgments (Brown, 2011). Moreover, its origin may be traced to natural selection. When competing for resources and mates, there is a selection advantage in inflating one’s worth (Varki & Brower, 2013), and evolutionary psychologist Robert Trivers (2011) argues that self-deception evolved in the service of deception of others, since a self-deceived liar can more easily escape detection. Furthermore, Trivers believes there is a “systematic deformation of the truth at each stage of the psychological process.” He adds, “from its biased arrival, to its biased encoding…to misremembering and then misrepresenting it to others, the mind continually acts to distort information flow in favor of the usual good goal of appearing better than one really is” (p. 139).

3. Methods of Research

A ten question survey was created via SurveyMonkey. The survey included two versions, A and B, with the only difference between them being the order in which one of the questions appears. Having two versions allowed us to study the priming effect, which will be discussed in our other paper. To collect the opinions of non-Japanese teachers at the tertiary level in Japan the survey was distributed through email and announcements on social media such as Facebook. 102 teachers participated in the study and of these, 4 were thrown out due to incomplete answers. The participants were directed to version A or B depending on the month of their birthday. The data from the two versions was combined to present the findings below.
4. Demographic Data of the Participants

The survey participants were non-Japanese, mostly male, and represented a wide range in age. Of the 98 participants, 73 were male and 25 were female (figure 1). The youngest age range represented was 25 to 34 years old and the oldest was 75 years old or over (figure 2). There were no participants under 25 years old.

![Figure 1: Male and Female Distribution](image1)

![Figure 2: Age of the Participants](image2)

5. Results

Three main findings will be discussed. Firstly, the vast majority of participants rated their own teaching skills highly and better than average. Secondly, participants rated their teaching skills compared to their present and former colleagues more highly than they rated their computer literacy skills compared to present and former colleagues. Thirdly, the
majority of participants answered that they are less likely than other teachers are to overrate their own teaching ability.

5.1) Participants were asked to rate their own teaching ability on a scale of 1 to 10 (1 being extremely poor and 10 being superb). Almost all participants rated themselves highly. The average self-rating was approximately 7.7 (figure 3). Four participants rated themselves as a 10. Only one participant rated himself as less than a 5, and notably this participant was still in his first year of university teaching in Japan.

![Figure 3: How the Survey Participants Rated Their Teaching Ability on a Scale of 1 to 10](image)

Next, participants were asked to compare their teaching ability to present and former non-Japanese colleagues. Only 2 of the 98 participants rated themselves as below average. Furthermore, one of them had only been teaching at a Japanese university for two-and-a-half years and the other only for one year. In theory there should have be an even distribution of answers above average and below average, yet the distribution is highly skewed towards a positive self-rating (figure 4). These results seem to confirm Brown’s (2011) claim that most people tend to view themselves as above average.

![Table 1: Descriptive Statistics of Self-Rating Score](image)

5.2) Participants were asked to rate their computer literacy skills in comparison to present and former non-Japanese colleagues. The purpose of this question was to test Brown’s (2011) claim that the self-inflation effect is heightened for skills and characteristics that the individual views as important. It would seem likely that teachers would regard their teaching skills as more important to them than their computer literacy skills, and thus a higher self-rating may be expected. The results seem to confirm Brown’s claim as the average score for computer literacy skills is comparatively lower and there is a higher number of teachers who rated their computer literacy skills as being below average (figure 5).
5.3) Participants were asked if they think they are most likely to overrate, accurately rate, or underrate their own teaching ability (figure 6). Of the 98 participants, 60 answered that they are most likely to accurately rate, 20 answered that they are most likely to underrate, and only 18 answered that they are most likely to overrate their own teaching ability. Next, participants were asked if they think other teachers are most likely to overrate, accurately rate, or underrate their own teaching ability (figure 7). Of the 98 participants, 51 answered that other teachers are most likely to overrate, 31 answered that other teachers are most likely to accurately rate, and only 16 answered that other teachers are most likely to underrate their own teaching ability. There is a significant contrast between the answers for these two questions. Most participants believe that they would be most likely to accurately rate their own teaching ability, yet they believe other teachers are most likely to overrate their own teaching ability. These results seem to suggest that teachers are more skeptical of other teachers than they are of themselves when it comes to self-evaluation.
6. Conclusion

The main motivation for conducting this survey was born out of a curiosity to find out if and to what degree teachers exhibit self-inflation, as well as a concern that being unaware of this tendency could have negative repercussions for teachers. Overall, the results of the survey seem to suggest a bias towards one’s teaching. Having a high opinion of one’s own teaching is often justified and may even benefit teachers in
some ways. However, in some cases perhaps an overly-high opinion of one’s teaching could lead to complacency and thereby undercut motivation to improve. Additionally, perhaps self-bias could result in teachers being less willing to try alternative teaching approaches if they have undue confidence in their current ones. It is our hope that raising awareness regarding the pervasiveness of self-inflation may encourage teachers to do more self-reflection and obtain more feedback on one’s teaching practices from colleagues and students.

7. Room for Improvement

A few ideas occurred to the authors after the study was completed. First, it may have been useful to have participants rate the teaching abilities of others on a scale from 1 to 10 in the same way they were asked to rate themselves, which would have allowed for more quantification of results and greater ability to analyze the data more efficiently. Secondly, for the question that asked participants to rate their own teaching ability on a scale of 1 to 10, some participants chose non-discrete answers such as 7.5, which proved slightly problematic when graphing the data. Thirdly, having the participants explain the reasons for their answers may have been informative, such as the reasons for thinking that other teachers are more likely than they are to overrate their own teaching ability. Lastly, a larger sample size would provide for a more accurate statistical result.

8. Further Analysis and Research

This paper focused on only three main aspects of the data. However, there were other aspects that may have merited analysis. First, there may have been a correlation between the years of teaching experience and self-rating scores. Secondly, there may have been a distinction between male and female participants’ answers to some of the questions. Thirdly, it would be interesting to expand this study to different levels of education, rather than limited to university teachers, to see if the results would hold. Lastly, this survey could be altered to do a cross-cultural study to find out to what degree self-inflation may be a culturally based phenomenon.

6. [Abstract]
Development of Healthy Menu Recipes for Diabetes Prevention Using Local Ingredients of Mishima City, Japan

[Aim]
For the purpose of subjective involvement of the students, this seminar
deploys active learning. This report describes the joint activities with the Health Promotion Division, Health Promotion Department of Mishima City to develop the menu recipes using local ingredients of Mishima for diabetes prevention.

[Subject and Methodology]
The subjects were a wide variety of citizens. Mishima City specified the requirement to use local products of Mishima within the range of 500 to 600 kcal of energy, 50% of glucide, 40 to 50 g of Food Exchange List 1 foods (carbohydrate), about 1.5 to 2 units of List 3 foods (protein), at least 100 g of List 6 foods (vegetables, mushrooms and seaweeds) and up to 3 g of salt equivalent. The menus were created with rice as the staple diet according to these specifications so that they were suitable for boxed lunches.

[Results]
The menus were considered first with reference to “Food Exchange Lists - Dietary Guidance for Persons with Diabetes” and then Excel Eiyo-kun Version 6.0 (Kenpakusha) was used for nutrition calculation. The information about local ingredients of Mishima in season was obtained from JA Mishima Kannami Fresh Calendar.

The menus for spring and summer were devised. The spring menu is shown in Picture 1. It was composed of “rice boiled with barley” as a staple diet, “steam roasted salmon and cauliflower” as a main dish, “simmered Japanese mustard spinach and atsuage deep fried tofu” as a side dish and “vegetable miso soup.” One of our ideas was the use of spring cabbage and cauliflower to represent the sense of the season. No oil was used for the main dish but it was steam roasted, leading to reduction in energy. The nutritional values were 541 kcal of energy, 28.1 g of protein, 77.7 g of carbohydrate, 2.9 g of salt equivalent and 170 g of vegetable weight. The local ingredients used were cauliflower, cabbage, Japanese mustard spinach, carrot, daikon radish, lemon, shimeji mushroom and shiitake mushroom.
The summer menu is shown in Picture 2. The recipes created were “rice with green soybeans cooked with green tea” for the staple diet, “tofu steaks” for the main dish, “boiled spinach dressed in sesame sauce” for the side dish and “eggplant miso soup.”

The dish of spinach dressed in sesame sauce was featured by the use of mentsuyu noodle soup base instead of soy sauce to decrease the salt equivalent.

The nutritional values were 431kcal of energy, 19.0 g of protein, 60.9 g of carbohydrate, 3.0 g of salt equivalent and 240 g of vegetable weight.

The Health Promotion Division, Health Promotion Department of Mishima City then added the idea to modify the menu into the one shown in Picture 3 that consisted of “zakkokumai rice,” “boiled tofu and mushrooms topped with thick ankake sauce,” “boiled spinach and canned tuna dressed in sesame sauce,” and “miso soup with eggplant and onion.” This menu was introduced to a health promotion cooking class for diabetes prevention.

[Conclusion]
The healthy menus for diabetes prevention have been developed by devising the cooking methods so that they are satisfactory to the persons who take the meals with much intake of vegetables despite the low energy level.
Learning Technology through Collaboration

Learning Technology through Collaboration

Over the past twelve years, the authors/university colleagues collaborated becoming partners in learning of technology tools as applied to online teaching. The online environment at their university became, in the same period of time, 90% of its instructional delivery systems for university teacher certification programs. This paper and its presentation will trace and analyze the authors’ collaboration within the context of instructional delivery development within the university’s teacher education programs.

If you really want to do something and you meet someone who also wants to, you can learn together! You both bring very different things to the collaboration…different skills, perspectives and experience. Ken Blanchard is an advocate of collaboration whose mantra is “no one of us is
as smart as all of us.” Working together and collaboration are and were solid practices of Blanchard. How did he collaborate with so many people over the years? He reached out to people to learn from them and to learn together. He has written over sixty books with only two books by himself. His “One Minute Manager” is his most popular book. Ken Blanchard was affiliated with Ohio University and the University of San Diego and by 1980, he formed his own company, Ken Blanchard Companies where he is considered an expert in leadership and specifically spiritual leadership. He maintained that leadership was a process of influence. At 77 years of age he is still active in leadership studies and resides in the San Diego area. (Wikipedia, Ken Blanchard, October 17, 2016)

Stating that "no one of us is as smart as all of us," Ken Blanchard (2012) proposed that there are three aspects of successful collaboration.

1. If a person meets another who wants to accomplish something and decide to work together to do so, the collaborative experience is meant to be dynamic.
2. Collaboration relies on the different skills and experience each person brings to the table.
3. Further, Blanchard described "essence" and "form" as the two characteristics of a solid collaboration.
   
   Essence is heart to heart: values to value
   
   Form: who does what; who gets what (Blanchard)

The authors, Anderson and Weegar, had essence: both loved teaching and had both experienced administrative ups and downs and a whole lot of teaching success. They intended to make a difference in the world…both came from strong history of collaboration with other peers. Anderson was in an administrative position and had witnessed Weegar, a Program Lead Faculty, organize the student teaching supervisors, lead the initiation and completion of a first student teaching handbook, teach successfully, and submit well written dossiers. Weegar was very thorough…almost exacting in her performance as a faculty member.

After exposing sexual harassment incident within the department (having been sexually harassed on the job and at a university), Anderson was considered the problem and returned to faculty. Searching for a meaningful place within the department, she was approached by an empathetic Weegar who provided an opportunity to teach online with assistance. Ergo, Anderson and Weegar began their collaboration in 2005 teaching online. Side by side, they taught for the month, a single course, co-teaching, meeting two days a week at Weegar’s home. Anderson built on Weegar’s good practice—mostly impressed with the amount, the quality, and the timeliness of feedback. With a few stylistic features that were closer to her background and experience, Anderson learned to bring her own good practice into online delivery of instruction. Subsequently, the authors sat again side by side each with their own class, kind of like team teaching. Pacing and feedback and communication were important skills practiced…plus calibrating the evaluation of student work. Both preferred high quality performance and used face-to-face teaching skills to bring students to a high level of performance.

Then, came another golden opportunity…Weegar was named new program lead lending had a whole list of online courses to design. Weegar was a digger of resources with her tech skills.
Anderson’s strength was in innovative lessons that became better through collaboration. Courses that were designed have stood the test of time over nearly ten years…with few and minor upgrades. Online teaching and course design interest and skills were off and running. They worked off their personalities and what they are inclined to do. Weegar began and completed her online doctoral degree with Anderson assisting on the dissertation. Suggested she honor her mother on her birthday and get her doctorate like her mother did…and become a full professor as her mom had been…and, away she went. She was very good and independent on her coursework. And she graduated…proudly.

Understanding personalities, people, and their individual needs is essential to collaboration and good teamwork. Indeed, Emily Eldridge (2012) shows us that there is an "I" in "Team," and that the individual has a lot of power in an over-connected world. Eldridge’s personality piece entered the authors’ collaboration. Myers/Briggs was Eldridge’s framework. Weegar is INTJ (also Jefferson, Newton, Eldridge). Anderson is ENTP (also Obama, Ben Franklin, Chris Rock). Notice, the NT portion is the same in both of the authors. Weegar is a perfectionist…Anderson wants to get it done. Anderson moves out to the person first…Weegar studies first. Anderson is guided by principles and Weegar tends to be guided by experience/judgment. They worked together as “I”s” enjoying their similarities and complementing their differences.

In the past few years, Weegar’s illness became a barrier to her work at the university. She had to resign and use her lessened energy to stay alive. The authors had an agreement to co-present at HICE as done earlier…so this year, that history of their collaboration is being honored.

Let’s Share about 21st Century Teaching and Learning

Lynne E Anderson, Ph.D.

Teacher Education Department

National University

11255 North Torrey Pines Road

La Jolla, CA 92037

landerso@nu.edu
College and university faculty sharing favorite tech tools and apps heightens interaction whether at a conference workshop or in other formal/informal sessions. Faculty become motivated to try tech tools that work for their enthusiastic peers. Experience of university faculty and of faculty with their university students provides real time, sophisticated use of tech tools. Such use of tech tools in teaching provide information for action research projects as well as added teaching and learning development.

In just one quick Google search, two tech tool sources are shared in references, fresh and new articles by Katrina Schwartz (2016). Faculty can Google to find many new tools and apps. What is your favorite tech tool? What is your favorite tech tool used in teaching? The author asked her students and colleagues those questions over the last year. To begin students were queried in Live Chat sessions of an online class. The popularity of the question led to a follow up question, what is your favorite tech tool and why? The popularity and generosity of responses led to a more permanent discussion forum for methods classes in a teacher licensure program. Another question was what is your favorite tech tool in teaching? The sharing was rich as students learned best practices in teaching with technology…they seemed hungry for real time sharing of teaching with technology. Favorites helps the learner prioritize and think about usage and importance. The ratio of responses for favorite tech tool fell into three groups in this ratio, 8:1:1, eight smart phones, one MacBook, and one other. Teaching tech tools was a broader assortment of programs, apps, and tools (or devices). Students became more specific about their teaching programs, apps, and tools/devices. Each person seemed to want to brag a little

The 21st century with booming technological advances has provided teachers and learners new tools to make teaching and learning more exciting and fun! Inquiry and projects solve problems in ways that teachers and learners find more in sychn with the world around them. Technology has brought us closer together and has created anew at record speed. Budhai and Taddei (2015) in a very small, easily read and processed book, Teaching the 4Cs with Technology, spoke to the development of critical thinking, communication, collaboration and creativity through learning activities using tech tools

Finland has led the pack in international test scores, becoming a source of fascination for education policymakers and experts. Going forward, Finnish schools will be placing less emphasis on individual subjects like math and history, and will instead focus on broader, more interdisciplinary topics. The goal, according to Finnish leaders, is to provide students with the necessary skills for a more technological, global society. (Klein)

A joy of learning is what Finns want for their children as an end product of schooling. Schools, states, and countries are shaping education of the future with tech experience and are being revitalized.

As an example, Flatley (2012) found blogging increased student interactivity, extended classroom discussions, and increased equity of student voice. Those findings affirmed an earlier study of Flatley’s with collaborators Dyrud and Worley (2005) in which blogging enhanced student collaboration, interactivity and creativity. The New York Times reporter, Matt Richtel, told of a Stanford Professor who had studied over a six year period, 2001-2007, 16,000 student writings by blogging. Stanford Professor Lunsford related students were impassioned and more expressive in when blogging. She replaced a term paper with student blogs in her research class.

At the author’s tech teaching tools of blogs, presentations of learning in videos, movies, digital storytelling, blogging, website construction have been employed in her courses of her responsibility, that is, single subject methods and Master’s degree best practices online courses. Required was the training of key adjunct faculty, who also teach those courses, to use designated tech tools, largely new to them and occasionally quite new to the world. For over six consecutive years, those tech tools have been in place and upgraded regularly and often within those courses. Adjunct faculty reported their students had more
personal expressiveness, greater creativity, more interactivity, and an increased relatedness with other students. Adjunct faculty have picked up those tools for their own personal and professional use. Adjunct faculty have contributed to increased use of technological tools for their learners to express findings and feedback. In revising and updating online courses adjunct faculty have actively engaged.

Connectivism proposes a perspective similar to Vygotsky's 'zone of proximal development' (ZPD) implying the influence of social and cultural context in learning as a result of teaching and learning with technology. Connectivism is somewhat similar to Bandura's Social Learning Theory that proposes that people learn through contact with each other. Setting connectivism apart from theories such as constructivism are the view that learning can reside outside of oneself (within an organization or a database as focused upon connecting specialized information sets) and the view that the connections enabling learning are more important than one’s current state of knowing. A learning theory for the digital age indicates an emphasis that connectivism gives to technology's effect on how people live, work, and communicate and learn. In the 21st century technology strongly impacts how people learn, with and from others within the virtual world. People develop relationships with technology and sharing what they learn in real time.

This year’s workshop is a real time event of sharing teaching with technology. Merriam-Webster (October 3, 2016) defined real time as the actual time during which something takes place. In this workshop, in real time, college and university faculty can share favorite personal and teaching tech tools and learn from their peers within the Hawaiian International Conference on Education, January 2-6, 2017 workshop.

Abstract

Excellence in Elementary Education: The challenge of partnering for reform and sustainability

Barbara R. Ridener, Valerie J. Bristor, and Gracie Diaz

EXCEED: Excellence In Elementary Preparation is a multi-faceted initiative to redesign elementary teacher preparation and improve pre-service teacher training in core subject areas (math, science, social studies, English language arts/reading) as well as align clinical experiences with district practices to better prepare candidates for classroom success and transition to becoming successful professionals. The partnership between Florida Atlantic University, the School Districts of Broward and Palm Beach Counties (two high-needs LEAs), Learning Sciences International (LSI), and New Teacher Center (NTC) links content, teaching, and assessment strategies in university coursework with clinical experiences and measurable outcomes.

EXCEED will improve pre-service candidates’ preparation and impact on K-5 student achievement through a comprehensive program redesign with specific goals that will:

- Improve candidate content knowledge of the increasingly rigorous requirements for K-5 students and prepare candidates for graduate coursework;
- Identify and train highly effective teachers to serve as cooperating teachers in accordance with FL Statutes
- Use districts’ Marzano Teacher Evaluation Model© to document pre-service candidates’ instructional effectiveness after extensive professional development for supervisors, cooperating teachers, faculty and pre-service candidates;
• Develop data-driven performance feedback systems to provide continuous program improvement.

The project design includes a quasi-experimental time series using learning gains of K-5 students taught by FAU teacher candidates as primary outcome measures. EXCEED personnel also created objective candidate performance feedback systems for use during practicum and internships to measure effectiveness of methods and content strategies in field experiences through comparison of actual to predicted student learning gains (short duration value-added growth measures). EXCEED personnel also identified and measured the success of interventions and support of student teachers in instructional practices identified during practicum and internship experiences.

The significance of the project is the development and implementation of a strengthened, replicable, sustainable teacher preparation program that equips novice teachers with individualized instructional competency profiles, showing strengths and growth areas that will lead them to sustained and supported self-improvement.

While the project is in its final, funded year, this discussion focuses on the detailed planning that has led to course and program redesign and the extensive coordination and training of all personnel for aligned and reliable practice as well as the data collected that documents continuous improvement. Plans for program sustainability are also presented.
Piloting a Year-long Field Experience in PDS Schools

Abstract

This paper describes the advantages and disadvantages of a year-long field experience as contrasted with the traditional one-semester field experience. Public school and university faculty members implemented a new Urban Education Model in five local elementary schools, one middle school and one high school. The authors interviewed groups of stakeholders in the five elementary schools about the efficacy of the longer field experience. In this Teacher Quality Grant Program, another model we followed was the professional school development [PDS] model. This paper will describe how this model worked in the schools (five elementary schools and one middle school), explaining the reactions to the program that we received from stakeholders. The findings of this study (and of other studies conducted for this grant) were overwhelmingly positive in favor of the year-long field experience. Additionally, the schools’ principals and district school boards requested that the year-long internship remain in place after grant funding was exhausted. As a result of this grant*, the local school districts have made lasting changes in the field experiences they offer to preservice teachers.

How students problem solve after completing a DNA replication modeling activity – a pilot study

**Topic:** STEM Education

**Paper Presentation**

**Abstract:** The Next Generation Science Standards (NGSS) has stipulated an increase in the use of scientific models and modeling in biology classes. The goal of this research is to discover how students problem solve about DNA replication after a DNA replication modeling activity. Students solved a DNA replication activity out loud and the findings of how they think through the problem will be discussed.

How students problem solve after completing a DNA replication modeling activity – a pilot study (in progress)

Introduction:
As more countries are stressing the use of more authentic classroom experiences that focus on science models and modeling, it falls on teachers to develop these type of activities since few exist, especially in the area of biology. However, it has been shown in studies that teachers do not have a solid understanding of science models and modeling (Moritz & Kruger, 2016; Ware, Malone, Irving, & Mollohan, 2016). Both of these studies, one set in Germany and one in the United States, determined that teachers mostly understood models to be copies or physical models. Teachers rarely use models in the classroom nor evaluated them against other models, tested, modified or used them in a predictive sense. Thus, teacher understanding hampers the development of true modeling activities if their understanding is limited.

To alleviate limited understanding, there have been some science model-based and modeling curriculum units that have been developed for classroom use (Dukerich, 2015; Jackson, Dukerich, & Hestenes, 2008; Malone, Schuchardt, & Schunn, 2015; Passmore and Stewart, 2002; Posthuma-Adams, 2014; Schuchardt, & Schunn, 2016). However, many of these are in areas other than biology. In addition, the studies usually focus on student content gains between treatment and comparison groups (Hestenes, Wells, & Swackhamer, 1992; Malone, Schuchardt, & Schunn, 2015; Schuchardt, & Schunn, 2016), understanding of scientific models (Passmore and Stewart, 2002) or gains in scientific reasoning (Coletta, Phillips, & Steinert, 2007). There are not many studies that focus on the benefits of model based and modeling focused activities on students’ problem solving abilities in biology. This pilot study is an attempt to fill this gap.

Research Question: How do students solve replication problems after a modeling based activity focused on DNA replication?

Meselson-Stahl Classroom Modeling Activity: Prior to the Meselson-Stahl activity the students had completed an activity that allowed them to come to the consensus that daughter cells had identical copies of chromosomes. At the start of the modeling activity students are asked how they think the DNA replicates. After the students have time to develop different ideas about how DNA might replicate the instructor introduces them to the historical figures of Meselson and Stahl and explains that they had puzzled over that same question. The students are then introduced to the experiment developed by Meselson and Stahl. They are told that the experiment developed insured that cells replicated their DNA in a condition that only allowed the cells access to heavy isotopes. Therefore, they created cells with “heavy” DNA. The students are then introduced to the second phase of the experiment when Meselson and Stahl took the cells with the heavy DNA and allowed them to replicate
in a condition where they only had normal or “light” isotopes available during the replication process.

The instructor then explains to the students that they will be using chenille sticks and pony beads to model this experiment and determine how DNA replicates. Each pair of students gets a DNA strand (chenille stick with “heavy” isotopes represented by blue pony beads) – see figure 1.

At this point the instructor can ask the students what would happen if they put heavy and light isotope strands in a solution. The majority realize it will produce a density gradient. If necessary due to the background of the students’ density gradients can be explored. Next, the students are asked to predict and justify what banding pattern they would expect to see if the heave isotope labeled DNA they initially have was centrifuged and a density gradient was developed. The students write down their predictions and then the instructor passes out to each group the lab result strips (see figure 2).

The next step in the modeling activity is to allow the students to replicate their “heavy” DNA using the normal or light isotope/pony beads. The student groups are given a few minutes to reach consensus about how they believe the DNA might replicate. They are given two chenille stick strands and light beads represented by a different color (see figure 3). The students replicate the DNA per their consensus model. The students use a mixture of replication methods with usually dispersive, conservative or semi-conservative being represented. See figure 4 to see a semi-conservative replication, figure 5 for conservative replication and figure 6 for dispersive replication results.

After the replication the students are asked to predict where the bands would be located if a density gradient experiment were run. Finally the second strip is handed
out to the students to compare with their model’s results (see Figure 7). The instructor at this points can tell the students that the lab sent them the results of their first replication and hands out copy of Meselson-Stahl’s chart 2 strip to each group. At this point most students predictions match the chart strip in Figure 5. If their model results do not match the actual results of the density gradient the student have to reinvent their model of DNA replication and attempt the experiment again.

Once the group’s model predictions matches the data as shown on strip 2 the group can move onto the next or second replication. During the second replication the students will end up with four replicated strands of DNA. The students again predict what the density gradient would look like based on their modeling results. Then the instructor can give them the lab results or Strip 3 (see Figure 8).

These strips are copies of the actual data recorded by Meselson and Stahl. Students will need to analyze the results and determine if it matches the possible outcome of their model. If it does not they will need to change their model so that its results meet the data shown on the third chart strip. By this point students should have developed the semiconservative model of DNA replication.

Participants: Seven high school biology students were interviewed after participating in a modeling based activity focused on the Meselson-Stahl experiment. The students were from a rural school in the Midwest of the United States and had been taught using a newly designed Modeling Instruction™ course in biology. The students’ had taken part in the Meselson-Stahl modeling activity [X weeks] prior to the interviews.

Study Design: The students were asked to talk aloud as they solved a biology problem based on DNA replication. The problem designed for the talk aloud it listed below:

I 1: A single E. coli has a DNA strand that looks like this;

When one new strand is being made a mutation occurs at one point. This caused a bacteria with a mismatched base pair in its sequence, resulting in a G-G pair. (see the figure below).
During replication phase of one single E. coli a nucleotide substitution occurred on one strand of its DNA.

E.coli that have the point mutation are resistant to penicillin.

For the next two generations produced from this bacteria,
   a. Draw circles to show how many bacteria will be produced.
   b. Place a star in each of the bacteria that will contain the mutation.
   c. Place an R in each of the bacteria that are resistant to penicillin
   d. Under each offspring bacteria draw the DNA sequence that it contains.
   e. Show which first generation bacteria produced each second-generation bacteria by connecting them with arrows.

The audio of the videos was transcribed then linked back to the videos. A coding scheme will be developed to analysis the talk aloud using grounded theory (Glaser & Strauss, 1967). The coding will be checked via inter-rater reliability.

**Analysis and Results:** The findings will be discussed at the presentation. Examples of the students’ responses will be shown as well as how those responses were coded using the developed coding scheme.

**Conclusions and Ramifications:** During the presentation we will discuss our findings and how they impact on suggested changes to the modeling based curricula.

**Limitations:** This is a pilot study and has a limited number of students. Plus, there are only treatment students and no comparison group of students. Finally, there was only one problem used. The final study will contain a comparison group as well as a minimum of two problems to solve during the talk aloud.

Presentation Format: Research Paper for paper session (but will also present it as a poster session if necessary)

Abstract
The Next Generation Science Standards (NGSS)) have stipulated an increase in the use of scientific models and modeling at all grade levels as well as within all science disciplines. The goal of the research question is to discover current beliefs about models and modeling held by in-service K-12 STEM instructors. Teachers were interviewed and preliminary results about their views will be discussed.

Models and Modeling: An evaluation of teacher knowledge

Introduction:

In order to promote deep understanding of concepts, the recent NRC Framework for K-12 Science Education (2012) recommended a move away from memorization of routine facts towards a focus on learning via scientific practices such as the construction of scientific models and the use of science modeling. According to the Next Generation Science Standards (NGSS) scientific modeling requires students to develop, refine and use models to explain and predict scientific phenomena (Next Generation Science Standards, 2013).

A model of a natural phenomena can include a number of representations. For example, it can include a physical object, virtual image, or even a mental theory internalized completely in the mind. A model ranges from natural science diagraming to mathematical graphing and physical applications (Raghavan, Sartoris, Schunn, and Scott, 2005). No model representation provides a complete picture of the student’s ultimate mental model, but as a coherent, interacting set, the different representations provide a more complete description both of the phenomenon that it represents as well as the student’s mental model (Giere, 2004; Hestenes, 2010). A model is useful because it provides an insight on the world and allows students to be predictive about their environment (Shwarz, Reiser, Davis, Kenyon, Acher, Fortus, Shwartz, Hug, Krajick, 2009). Thus, models are used to simplify otherwise complex abstract ideas in a fashion that helps students internalize scientific concepts (Raghavan, K., Satoris, M., & Zimmerman, C., 2002). Therefore, models can be considered idealized representations of the real world that can be used by students to describe, explain, explore, communicate, and predict (Giere, 2004; Svoboda & Passmore, 2013).

The use of models and modeling have been shown to help students to connect their understanding in the classroom with real life examples. However, modeling will be new to most educators and is rarely found in education, particularly in the elementary and middle school classrooms (Schwarz, Reiser, Davis, Kenyon, Acher, Fortus, Shwartz, Huh and Krajicik, 2009; Malone, Schuchardt, & Schunn, 2015). According to Jackson, Dukerich & Hestenes (2008), when a physics teacher named McDowell began using modeling instruction in his classroom students would bring up applications of the topics themselves, most based on real life experience. For example, McDowell was told by a student while attending a baseball game all they could think about were all the physics problems involved. The use of Modeling Instruction in physics was shown to be quite successful in the 1990’s through the use of the Force Concept Inventory (FCI). In classes where students were taught using Modeling Instruction there was a 56% increase in conceptual understanding, this is nearly triple the gain that occurs in traditional classes (Hestenes, Wells, & Swackhamer, 2008). The use of models and modeling in physics seems to allow for the development of coherent expert-like models (Malone, 2008). It has been found that students taught using models and modeling in multiple subject areas have demonstrated not only greater conceptual gains but also improved scientific reasoning skills (Coletta, Phillips & Steinert, 2007, Malone & Reiland, 1993; Malone, Schuchardt & Schunn, 2015, O’Brien & Thompson, 2009, Schuchardt, Malone, Diehl, Harless, McGinnis & Parr, 2008 and Schuchardt & Schunn, 2016). Teachers who consider themselves modelers rate themselves as better prepared to implement NGSS conventions (Haag & Megowan, 2015). Since the use of
models and modeling seems to promote improvement in conceptual gains as well as scientific reasoning it is important that we make sure that our in-service and pre-service teachers conceptual knowledge of scientific models and modeling in science is quality, in order to support the learning of their students.

**Research Question:** What are K12 in-service teacher’s perception of science models and scientific modeling?

**Participants and setting:**
Six elementary, five middle school and nineteen high school teachers were interviewed to investigate our research question. The teachers in this study taught in school districts in and surrounding a major mid-western urban area. The majority of the teachers were from inner city as well as high needs schools districts.

**Study Design:**
All teachers participated in individual semi-structured interviews where they were asked three questions to determine their current notions regarding models and modeling.

The main interview questions were:

- Have you ever used models with your students?
- When we say the word model what does that mean to you?
- What does modeling in biology/science mean to you?

The elementary and middle school teacher’s audio files were transcribed by the researcher while the other teachers were transcribed by an external party. All transcriptions were checked for accuracy by the researcher. All transcripts of interviews were coded by the researcher using grounded theory (Glasser & Strauss, 1967). The coding of the transcripts were checked for interrater reliability by two parties. Prior to discussion the interrater reliability score was 84% based on the number of codes agreed upon, but after discussion the score was 100%.

**Methodology**

*Definitions of models and modeling for this study:*

For this study we define models in science as the NGSS has that they are constructions that help simplify real world complex phenomena, by providing an understandable representation (Next Generation Science Standards, 2013). These representations can include a mathematical equation, physical object, mental theory, diagram, written statements or graphical depictions.

Our definition of modeling in science follows the guidelines of the NGSS. Modeling in science is to application of models to the world around us through inquiry based learning. Modeling in science necessitates that a K-12 instructor allows their students to use science models to predict the outcome of an activity and, will then allow students to investigate the ability of the model to be predictive using inquiry methods. The model could either be developed by the students via inquiry activities or presented to them as a finished product produced by a scientist or someone else.
Thirty K12 teachers attending STEM education summer workshops in the Midwest of the United States were interviewed for this study. 30 teachers consisted of six elementary (K-5), five middle (6-8), and nineteen school (9-12) teachers. The majority of the teachers were from inner city as well as high needs schools districts.

Codes that emerged from the transcripts during data analysis:

- Models:
  - Physical model- physical representation of a process or natural phenomena such as a model of DNA structure
  - Mathematical model- mathematical representation of idea or natural phenomena such as F=ma.
  - Virtual model- simulated representation of a process or natural phenomena such as a weather computer model.
  - Theoretical model- theory or image that is implicitly represented in the mind such as Murphy’s law.
  - Experimental model- use of an experiment to enact a process or natural phenomena, such as biological lab experiment.
  - Diagram model- representation of an idea in written/drawn form, such as Punnet squares.
  - Modeling a process- Applying the use of models to the world around us through instruction.

- Teachers reported some of the same answers for modeling, answers that were repeated are also posted in conjunction with modeling specific answers.

- Modeling:
  - Modeling a process- applying the use of models to the world around us through instruction such as using a physical model to model a process such the crossing of materials across the cell membrane.
  - Modeling in science- applying the use of models to inquiry based learning, such as showing students a scientist generated model and having them recreate it by drafting and collecting experimental data
  - Physical model- physical representation of a process or natural phenomena such as a model of DNA structure
  - Diagram model- representation of an idea in written/drawn form, such as Punnet squares.
  - Experimental model- use of an experiment to enact a process or natural phenomena, such as biological lab experiment.

Analysis and findings:

When asked about the use of models in the science classroom twenty-five of the thirty K12 instructors interviewed responded that they had used models. The majority of the teachers described models in science as the use of physical models to teach students science, such as a plastic model of a cell and its organelles. There were other ideas about what a science
model could consist of but these were used much less frequently (see Table 1). 12 teachers thought a model in science was modeling a process.

When teachers were asked “What does modeling in science mean to you” thirteen of thirty teachers continued to mention the use of physical models, while ten of thirty described “modeling a process.” Only one participant described modeling in science to be the use of models to predict the outcome of a physical situation while then testing whether the outcome matched the prediction.

In order to compare beliefs across grade levels we divided the data into three grade level distinctions: elementary (K-5), middle school (6-8) and high school (9-12). The graphs located in figure 2 and 3 display what teachers at multiple grade levels think about models and modeling.

Figure 1 Raw proportion of teachers beliefs about Models (the proportion adds up to greater than 100% since multiple teachers mentioned more than one example of a model)
When asked what a model is, the elementary teachers were the only category to report modeling a process at a higher rate than physical models. None of the middle school teachers described “modeling a process” as a model. Both middle and high school teachers reported physical models as their definition of a model.
Across all grade levels teachers believed modeling in science/biology was the creation of physical model, or modeling a process. Physical models were the highest reported answer used to define both models and modeling.

**Conclusions:**

Eighty-four percent of all the teachers interviewed mentioned that they had used models in their classrooms. Seventy-four percent of the K-12 STEM instructors interviewed believed a model to be physical in nature. These in-service teachers may be limited in their implementation of modeling practices since the majority solely take advantage of physical models. While this might be one representation of a scientific model it limits student understanding as well as their ability to learn to make connections between multiple representations. On of the two teachers included mathematical models in conjunction with physical models also taught mathematics. However, this allows their students to consider at least two model representations during their study of science.

While many may think that high school science teachers (teaching students age 14-19) may have a stronger grasp on models and modeling, Figure 2 shows that this is not necessarily the case. Overwhelmingly these science teachers reported an answer that classified a model as physical. High school science teachers were the only ones to report theoretical models, however this was only one teacher out of 19. These are surprising findings because the expectation is higher level science teachers will have a more profound understanding of models, as they are teaching at a higher, more rigorous level. Figure 2 suggests middle school teachers may have a
better understanding of what models are. Although high school instructors had the most variety in answers, the middle school teachers were the only class that did not confuse “modeling a process” for a model.

This study has increased our knowledge of current teacher’s beliefs on models and modeling. Our new understandings will help inform upcoming professional development workshops focused on creating a better teaching environment through models and modeling. It is obvious that our in-service teachers need to be trained in models and modeling in order to appropriately incorporate college ready standards in their classrooms. Future professional development workshops need to start with physical models and show teachers how the other multiple model representations can be developed in the classrooms. In addition, how the representations are linked coherently to each other needs to be implicit as well as explicit in future professional development.

**Limitations:**

The small number of teachers’ interviewed, especially elementary and middle level teachers, limits this study. In addition, these teachers were located in only one area of the United States. The ability to extrapolate this to other areas of the world might be limited.

**Acknowledgments:** This research was funded by the Ohio Department of Education thought a Math Science Partnership Grant.

Abstract

The Relationship between Classroom Activity and Competency in Japanese Elementary School

Yusuke HASEGAWA
Satoshi SHIRAMATSU

The purpose of this research is to clarify the relationship between classroom activity and competency, based on analyzing survey data about Japanese elementary school life.

In recent years, many countries have attracted a strong interest in the development of students' competencies. It is progressing curriculum reform based on competencies in Japan. In elementary education, it has become a major research issue to analyze the relationship between the educational activities in school and the competencies.

This research aims at the classroom activity in elementary schools. In Japanese classroom, the self-government by students is carried out in addition to the classroom management by teachers. Classroom activity (Gakkyuu Katsudo) works on the self-government by students. The following activity is carried out in classroom activity. For example, meeting to create the better classroom (Gakkyuukai), duty of the students in the classroom, fun event for students which is planned and executed by themselves. Features of the classroom activity have two points. The first one is activities which is carried out with the students' initiative. The second one is creative and cultural activities. Classroom activity is one worthy of attention in a unique educational activity that shows the characteristics of the Japanese education model. Classroom activity is especially actively practiced in elementary schools.

It's thought that classroom activity has the fixed effect on developing of the competency in Japanese elementary schools. In recent years, the importance of non-cognitive ability is pointed out in elementary school education. As an important activity to develop non-cognitive ability, there is a classroom activity in Japan. However, there are few preceding researches which a positive analysis about the relationship between classroom activity and competency.

Using survey data about Japanese elementary school life, we analyze the relationship between classroom activity and competency. Questionnaire survey for fifth grade elementary students has been carried out in February and March, 2016. The number of valid response is 487 (19 classes). Questionnaire items include efforts related to classroom activities, competency (ability related to morality, psychological and social ability), state of classroom life, and items related to family. More important findings, even if the control variables related to family, classroom activity and competency is related.

Based on the results of the analysis, we discuss the possibility of Japanese classroom activity, which is a characteristic of educational activities as compared to the school education in other countries.
Transforming Climate Change Attitudes for Middle School Students Participating in Energy Monitoring Activities

Rhonda Christensen
Gerald Knezeck
University of North Texas, USA

Abstract: The Going Green! Middle Schoolers Out to Save the World (MSOSW) project aims to direct middle school students’ enthusiasm for hands-on activities toward long-term interest in STEM while guiding them to solve real-world problems. The MSOSW project is funded by the U.S. National Science Foundation Innovative Experiences for Students and Teachers Program. In the MSOSW project, treatment classroom teachers attend a two-day institute to learn about the energy/climate curriculum and how to implement the hands-on activities with their students. MSOSW teachers are also provided with classroom sets of energy monitors, web enhanced teaching resources, the curriculum itself and ongoing support from the project personnel. Students in this project are taught by their teachers to use energy monitoring equipment to audit standby power consumed by electronic devices in their homes and communities. The focus of the curriculum and activities is standby power – electricity that is being used by appliances when they are plugged in but serving no useful function, and how this waste contributes to greenhouse gas emissions and global climate change. The meters used for the monitoring activities can be adjusted for local electricity costs and have single button calculations of the connected appliances for kilowatt hours, cost per month and CO2 released into the atmosphere while generating the electricity consumed in standby mode.

The Climate Change Attitude Survey (CCAS) assesses two constructs – beliefs in climate change and intent to take action based on those beliefs – regarding climate change. For the 792 students in the treatment classrooms across all grade levels, there were significant \((p < .05)\) positive changes in both their beliefs \((p < .0005)\) (ES = .43) and intentions \((p < .05)\) (ES = .20) to make changes to help address climate change issues. For the 508 students in the comparison classrooms, there were also significant increases in positive beliefs \((p = .02)\) (ES = .15) from pre to post test time periods, and for intentions the comparison group gains were significant \((p < .05)\) as well \((p = .046)\) (ES = .21). The gains for the treatment group in Climate Change beliefs (ES = .43) were much larger than for the comparison group (ES = .15), with the treatment group gaining significantly \((p < .05)\) more than the comparison group regarding Climate Change beliefs. Because of the focus of the project, an item analysis of the Climate Change Attitude Survey was conducted. For the treatment group all of the individual items increased with 13 of 18 items having a significant \((p > .05)\) increase. For the comparison group, 10 of the 18 items increased significantly \((p > .05)\). For the item, “Environmental problems can be solved without big changes to our way of life”, there was a large difference between treatment students and comparison students. Students who participated in the standby power monitoring activities increased significantly \((p = .03)\) while the comparison students actually decreased (although NS). Additional items that had significant \((p < .05)\) increases pre to post for treatment students but not for comparison students included: “I
am concerned about global climate change”; “The actions of individuals can make a positive difference in global climate change”; and “I think most of the concerns about environmental problems have been exaggerated (reversed).”

Findings result from year 3 of a four-year scale up project supported the U.S. National Science Foundation Innovative Technology Experiences for Students and Teachers (ITEST) Grant #1312168.
Stepping Into the Role of Teacher:

A Case Study of a Secondary Teacher Expanded Practice (STEP) Internship

Amanda D. Lickteig, PhD

School Leadership/Middle & Secondary Teacher Education

Emporia State University

alicktei@emporia.edu

Visser Hall 204 | Campus Box 4037 | 1 Kellogg Circle

Emporia, KS 66801-5415 | United States of America
Abstract

Research demonstrates that providing teacher candidates with more field experience opportunities is essential to their preparation as future teachers (Baeten & Simons, 2016; Kyndt, Donche, Gijbels, & Van Petegem, 2014). While these field experiences (also known as clinical experiences) have long been a part of teacher education programs, these opportunities may lack variety in the types, settings, and duration of these placements. The purpose of this qualitative research is to review the benefits of a pilot program aiming to expand the clinical experience—called the Secondary Teacher Expanded Practice, or STEP, internship—with over forty-five undergraduate secondary-level pre-service teachers at one university in the Midwest United States during the course of one sixteen week fall semester. Through a case study approach, researchers will utilize observations, semi-structured interviews, and questionnaires to develop an understanding of the impact these diverse experiences may have on contributing to a well-rounded and effective future educator. Data from this pilot semester will be analyzed through the "Research on Teacher Preparation as Historically Situated Social Practice" theoretical framework (Cochran-Smith & Villegas, 2015; Cochran-Smith, Villegas, Abrams, Chavez- Moreno, Mills, & Stern, 2015). We anticipate that pre-service teachers in the study will report that this expanded clinical experience enriched their training and expanded their repertoire of instructional skills. Further studies might consider investigating the specific attributes of field experiences that cultivate skilled and versatile secondary-level educators.

Keywords: teacher education, field experiences, clinical experiences, internships, pre-service teachers, secondary education, STEP

**Workshop Abstract**

The purpose of this workshop is to create a safe space for White educators to discuss and confront our own racist conditioning in order to move toward antiracism in our schools. This workshop will focus on the inner personal work of White educators to cultivate awareness of racial injustice. We will work to build an understanding of the structural realities of race in the American educational system (Ladson-Billings, G. 2006). We will explore conceptual frameworks for racism and Whiteness (Helms, J. 1990) – including white privilege, White fragility (DiAngelo, R. 2011) and our notions of the “good” white self (DiAngelo, R. 2011). We will discuss White Identity development (Helms, J. 1990) and build awareness of our racial conditioning. We will explore the impacts of our own White racial conditioning on our awareness of and role in addressing racism in our classrooms. We will consider various forms of racism including active racism, passive racism, and antiracism (Tatum, B. 2001). Throughout the workshop we will practice mindfulness and explore ways of working with the challenging emotions that arise as we address racism - our own internalized racism, that of our colleagues, and the institutional racism we encounter in our daily lives as educators. Finally, we will consider possibilities for moving forward in this work, through mindfulness (Berila, B. 2016), community building, and activism. We approach this work as a practice and believe that there are no experts, we hope that you will partner with us in this work today.

**Teaching While White: Workshop Agenda**

**Our Intention, Our Perspective & Community Norms**
- Our Intentions and Perspective
- EBMC Agreements - Suggestions, Requests

**Race in our Schools, Being with the Discomfort & Building Capacity**
- History & Context
  - Opening Quote & Statistics
  - Racism is Normal in Our Society - Critical Race Theory
  - Structural, Institutional & Cultural
  - Racism in Education - Structural Inequities & Educational Debt
Being with the Discomfort and Building Capacity

Activity: The Power Flower

Racial Conditioning & Whiteness as Normal
- Racial Conditioning and Whiteness
  - White Identity Development
  - Protecting the “Good White Self” - Privilege, Shame, Guilt
- White Fragility / Cognitive Dissonance
- Avoiding Race
- Silencing, Racially Coded Language, Color Blindness / Muteness

Activity: Opting Out vs. Learning In - Dyads

Active Racism, Passive Racism, Anti Racism & Skillful Means

Dialogue & Debriefing
Abstract: DESCRIPTION (provided by applicant)

School dropout rates for Hispanic students continue to be higher than any other population (NCES, 2016). Particularly difficult is retaining SLIFE (Students with Limited or Interrupted Formal Education) including immigrants, refugees and unaccompanied minors new to the country needing to be admitted to public school in an age appropriate grade level.

To date, little is shared about schooling for the underserved, refugees or the mobile population of developing countries of Latin America and the United States. Through a research award provided by Fulbright (Distinguished Awards in Teaching 2015), the researcher was able to observe three types of schooling that address underserved students in Mexico.

The research was completed in Merida Mexico - a mid-sized city located in the state of Yucatan which is home to the largest indigenous population in the country. The three types of education programs observed are applicable to any education programming in the United States and several components have already been successfully implemented in programs in the researcher’s school district.
Expanding notions for teaching ELs: Revelations on ESL teacher professional development eight years post-training

The paper presents comparative findings of an in-progress study on teaching and learning of previous cohort participants relative to language, culture and advocacy. The original study and post review is of secondary mainstream teachers of English learners (ELs) in one urban school district completing training from 2008 through 2013. Teacher participants completed an ESL based professional development (PD) program as a means to become dually certified in ESL and their current area of content instruction.

This university district partnership project supported teachers from one urban school district schools, with high numbers of English learners (ELs) largely in response to drastic changes in state policy relative to instruction of English learners statewide. The project was in response to implementation of Structured English Immersion (SEI) (A.R.S § 15-756.01) and Prop 203, requiring all instruction in Arizona schools to be provided in English-only. All teacher participants had already met the Arizona minimum state requirement for instruction of ELs, a 45 credit hours of Sheltered English Immersion (SEI) training, as a baseline requirement prior to starting this specialized, long term ESL program. Participating teachers taught in urban areas and were mainstream teachers with less than 10 years of teaching experiencing. As it pertains to content area instruction, the majority of teachers participating instructed mathematics, English/Reading, social studies and science. The majority of participating teachers were English monolingual with Spanish as the second language most reported, and few self-reported as bilingual.
This project, like other university-district partnership sponsored projects intended to support teacher capacity (Garcia, Arias, Harris-Murri, & Serna, 2009) by providing a quality professional development program, intended to reform teaching practices of teachers of English learners. The program would be completed by university faculty at various district school sites. The project, while serving one entire urban school district of 12 schools, had the majority of EL students within seven schools. Teachers and administrators participating in the program were from these school sites. Moreover, the entire district’s student demographics indicate lowered social economic status and first language speakers of a language other than English (LOTE). These demographics are reflected in higher numbers of student eligibility for free and reduced lunch, as well as having a majority of students classified as non-native speakers of English through the primary home language other than English (PHLOTE) assessment completed by parents, and predominantly Spanish first language speakers. Other salient student demographics include lowered graduation rates of ELs in comparison to mainstreamed students as well as higher incidence of early school exit (drop-out) while students were classified as limited English proficient and receiving services for English language development (Author, 2010).

The success of the project’s teacher participation is unfortunately a result an overall lack of multicultural and multilingual emphasis in teacher preparation. Often pre-service teachers lack requisite knowledge, skills and dispositions (Arias, 2012; de Jong, Arias, & Sanchez, 2010) for effectiveness. Additionally state policies relative to professional development instructional emphasis may not necessarily have convergence with foundational and practical knowledge relative to the instructional needs of EL classrooms (Marcos & Arias, 2015). The result is teachers experiencing a skills gap relative to instruction as EL students are underserved. District leaders and teachers’ voiced concerns became the impetus for establishing and finding funding for this project.

**Theoretical Perspectives and Previous Findings**

Previously completed special research project surveyed four cohorts of participants of the ESL endorsement (n=88) of which (n=70) completed the entire 18 credit endorsement program from January 2008 through July 2011. Of those completers, (n=40) responded to an extensive
survey on post teacher learning. This current study seeks to contact all previous cohort members of the original study who are currently within the district (n=66) as well as well review the program evaluation for all five cohorts who completed the ESL program, (n=68).

Upon completion of any cohort, teachers in their final day of the program would complete their post evaluation survey in compliance with their participation in a federally funded program. At the time of the specialized study, completed in 2011, participants completed an in-depth survey three months to three years after their initial cohort participation. Researchers, Garret, Porter, Desimone & Yoon (2001), posit that there are specific factors underscoring PD program effectiveness such as PD program coherence and relativity to teachers’ classroom experience in addition to program duration and instructional methods that activate learning. The 2016 survey will touch upon broad conceptual understanding on culture, language, and sociocultural awareness for teaching English learners as well as some pedagogical aspects (i.e. sheltered instruction, student interaction, comprehensible input). These questions will attempt to align to the original study.

The revised study, proposed in this paper, commenced in August 2016, will utilize knowledge-for-practice, Cochran-Smith & Lytle (1999) as its theoretical perspective. This is in alignment with a special research project of selected cohorts in 2012 (Author, 2012). The overall findings from the in-depth special research project revealed themes in participants’ understanding of sheltered instruction, second language acquisition, scaffolding, and a number of both affirming, neutral and non-affirming dispositions as it pertains to EL students’ culture, language, instruction, and teachers as advocates. Overall, teachers’ reported understanding of ESL teachings, instructional techniques and sociocultural perspective reflecting cultural and linguistic sensitivity to their instructional approaches (Villegas & Lucas, 2002; Lucas & Villegas, 2010).

The specialized project revealed the complex nature of teacher understanding in developing affirming dispositions towards ELs (Walker, Shaffer & Liams, 2004) including an empathetic disposition (Mcallister & Irvine, 2002) and understanding the sociolinguistic nature of language development (de Jong & Harper, 2005; Lucas & Greenberg, 2008, Zentella, 2005). Findings also demonstrated an understanding of the need for students’ native language as part of the instruction and recognition of language needs (Walqui, 2008; Walqui & Van Lier, 2010).
The broader notions of language development included recognizing how language needs can be utilized in the classroom (Faltis & Coulter, 2008; Lucas, Villegas, & Freedson-Gonzalez, 2008). The advocacy role was reported by teachers as including both advocating on behalf of ELs as well as taking on leadership roles. However, participants also presented conflicted views relative to English-only and to the extent the policy was either supportive or detrimental to ELs. The advocacy role was reported by teachers as including both advocating on behalf of ELs as well as taking on leadership roles.

Previous findings from the special project and the program evaluation support this completion study of participants. The research question presented for this paper considers the notion of perceived teacher efficacy and related sociocultural notions for instructing ELs after an extensive period following post-program participation. The proposed study considers the following guiding research question: What to do cohort teachers report relative to their ESL related knowledge, skills and sociocultural notions within five to eight years after completing their initial ESL program?

Data & Method

The paper will present preliminary findings of the new study comparing survey data findings from the in-depth study and program evaluation surveys. The triangulated data collected will be analyzed using constant comparative method (Strauss & Corbin, 1994) as a means to compare themes.

The new study uses a 25 question electronic survey sent to completers of the ESL professional development program from 2008 through 2011 and participated in the previous study.

Delays in the research study were not anticipated as many of the previous participants (n=88) are no longer available to participate in the study due to the tremendous retention issues facing many of school districts in Arizona.

Findings and Significance
Currently, the researcher has no specific findings but will present findings at the HIC presentation in 2017.

Fundamentally, instruction for multilingual and multicultural learners requires preparation beyond initial preparation (Banks et al, 2005; Gandara & Maxwell-Jolly, 2006; Hollins & Guzman, 2005). This follow-up study is significant relative to understanding teacher learning post professional development. While long term professional development is considered beneficial to participants (Boyle, While & Boyle, 2004) and effectiveness is enhanced with certain PD constraint (Desimone, Porter, Garret & Yoon, 2002), teacher learning is impacted without follow-up of learned content and an opportunity to actually implement practice changes (Authors, 2015).

6. **Abstract:**

For the past seven years, I have been teaching advanced doctoral qualitative research courses in blended and online modalities and supervising doctoral students pursuing degrees in various fields of higher education. Changing trends in higher education within a highly competitive and technology-driven global economy necessitate the choices of online and blended instruction often in favor of traditional modalities. The “digital revolution” has been affecting ways in which we perceive the goals of higher education and its advancement. What are the models and practices of distance education that can re-enact authentic teaching and learning environments in an accelerated doctoral program? How can we *engage* and *connect* when teaching and learning in virtual classrooms?

Abstract
The use of authentic materials in foreign language learning has been widely discussed (summarized in Gilmore 2007, for example). Although it could be hard for students with low proficiency, authentic materials are claimed to be a motivating force for learners, and more effective in developing communicative competencies than textbook materials (Gilmore 2011). It is generally considered to be desirable for English learners to use authentic English materials at some point especially in university level English classes.

Authentic materials typically discussed in literature are those from media sources such as news stories, films, television shows, YouTube videos. The use of media complements traditional teaching materials such as textbooks and course readers. By using media sources, students can: a.) learn useful phrases; and b.) improve their knowledge of accurate collocation by analyzing which definitions best fit the context of the news media they are studying. Students furthermore can enter discourses not available in their own country and learn new things not taught at their home universities. We are interested in what type of materials can and should be developed for Japanese classrooms. This paper provides two case studies of using authentic materials in Japanese university English class. The first case analyzes students with relatively low proficiency (TOEIC score 300-500) and the second case analyzes students with relatively high proficiency (TOEIC score 450-650). In reporting, the cultural aspect is discussed with special attention since authenticity relates to cultural understanding of a target language group and how cultural and political differences shape the choice of and student reactions to authentic materials.

1. Introduction
The use of authentic materials in foreign language learning has been widely discussed (summarized in Gilmore (2007), for example) in the field of English language teaching (ELT). Although potentially hard for students with low proficiency, authentic materials are claimed to be a motivating force for learners, and more effective in developing communicative competencies
than textbook materials (Gilmore 2011). It is generally considered to be desirable for English learners to use authentic English materials at some point especially in university level English classes.

**The importance of using authentic materials at university level English classes**

In most Japanese high schools, it is required to use textbooks approved by the Japanese Ministry of Education, Culture, Sports, Science and Technology. Most of Japanese high school students study English so they can get admission to a “better” university. Some of the problems of learning English with textbooks in Japanese high schools are that the textbooks they use in high school tend to be designed to train the students to get a high score on university entrance exams rather than to obtain higher proficiency of English (Kudo 117-118). These textbooks often focus on students getting the right answers when they study English.

After students are finally freed from the overwhelming pressure of Juken Eigo (English for entrance exams), university level English classes should provide them with more thought provoking materials to learn English. Students can directly experience the target language use in context. Students can learn more about the content provided in English.

Another reason that it is essential for students to be exposed to authentic materials at the university level is that in some ways, English in textbooks is not the same as English used in the ‘real’ world. According to Carter & McCarthy’s (2003) analysis (cited in Gilmore 2007) with spoken corpus data from CANCODE (Cambridge and Nottingham Corpus of Discourse in English), textbook English and ‘Real’ English are different. The ‘external’ language of real-world communication consistently differs from the language of introspection. Carter & McCarthy (2003) states that in spoken language, question tags, relative clauses and subject-verb concord often fail to conform to prescriptive descriptions. More specifically, the frequent use of words such as LIKE, the morpheme -ISH, and response tokens such as RIGHT, which all play an important affective role in discourse but are rarely taught in ELT (Carter & McCarthy 2003, cited in Gilmore 2007). Because of this overall lack of real-life English words and expressions, potential counter-arguments that textbooks will help students learn essential grammar that will help them to speak English may miss some things that authentic materials can help with.

**The type of authentic materials focused in this paper: Defining ‘Authentic text’ in EFL contexts**

‘Authenticity’ could be a concept with multiple meanings (for example, (Gilmore 2007: 3-4) listed at least eight possible meanings of “authenticity” from the literature). We consider ‘authenticity’ the following way: ‘An authentic text is a stretch of real language, produced by a real speaker or writer for a real audience and designed to convey a real message of some sort.’ (Morrow (1977: 13), cited in Gilmore (2007)). The purpose of an authentic text within its own
language could be multiple, ranging from advertising, to poetic communication, to political discussion. The texts could thus follow multiple formats and uses of grammar. The texts could be a one-way communication or a conversation. They could be at multiple-levels of difficulty for both native-speakers and EFL students. Nonetheless, a detailed discussion of how to define authentic text outside of English as a Foreign Language (EFL) classrooms is beyond the purpose of this study, and perhaps merit other detailed studies not possible here. We instead focus on authentic materials that we have used in real-life Japanese college classrooms in order to chart out some initial benefits, challenges, and limitations of using authentic materials in EFL classrooms in Japan.

Authentic materials typically discussed in previous literature are from media sources such as news stories, films, television shows, YouTube videos. The use of media complements traditional teaching materials such as textbooks and course readers. The concept of media is expanding recently including social networking services. In this paper, we focus on the authentic materials from media, which excludes recordings of natural speech recorded by the teacher for purposes of instruction, for example.

Kobayashi (2006) provides four reasons for individual teachers to obtain and reprocess their own authentic materials to use it in his/her classrooms. 1) The types of authentic teaching materials in textbooks are limited to those broadcasted from the major broadcasting networks such as BBC, CNN, VOA, and NHK. 2) It takes at least a couple of months to publish teaching materials which means that the content to be dated by the time it is published. 3) Teachers can adjust and customize the materials for his or her own students. 4) Teachers can also develop their own English skills. We are interested in what type of materials can and should be developed for Japanese classrooms.

Some difficulties in typical Japanese EFL classrooms in using authentic materials

A factor that may impact the use of authentic materials the most in Japanese EFL classrooms is class size. Having to teach 40 or even 50 students in one class is not rare. This presents challenges for teachers because, with a large number of students, introducing any type of group works or active learning activities is not easy without well-planned logistics and students’ cooperation. Such logistics are time consuming. Students’ cooperation varies from between different universities and even within the same universities. Different majors may have different levels of skill and motivation leading to more, or less cooperation. There are other factors class size and attitude that may enable or hamper the success of using authentic materials. We discuss these next.

Different ways of thinking and reacting can lead to variation in interpretation of authentic materials. Cultural differences can lead to unexpected challenges. Differences in non-language
based knowledge, such as major or knowledge of the subject from the mass media change how students will react and analyze authentic materials. An economics major may react differently than a drama major. Political and cultural tensions also influence students’ reactions. Students may have different political outlooks and subsequent ideas of right and wrong than teachers and creators of authentic materials. Students from different cultures come to class with different moral and ethical frameworks that may influence their analysis of authentic materials.

Japanese classroom dynamics also may influence discussion of authentic materials. Many Japanese students have not been exposed to controversial issues often discussed in authentic materials. This entails uncomfortable discussion. Also, there is an unwillingness to discuss things considered personal (Japanese students consider far more things personal than do Western students.) For Japanese students, a personal view may include political or social issues. To some degree there are solutions such as pair-work and group work. However, these are partial solutions to a desire to synchronize consensus before speaking and a related unwillingness to differ from the teacher’s opinion. In classrooms where the abovementioned things are dominant, use of authentic materials provide an opportunity for students to learn about foreign culture but not so much to express their own points of view.

2. The two case studies of using authentic materials

This section consists of two case studies about using authentic materials in Japanese university English classes. The first case analyzes students with relatively low proficiency (TOEIC score 300-500). The second case analyzes students with relatively high proficiency (TOEIC score 450-650). This paper focuses on culture because authenticity is impacted by cultural understanding(s) of a target language group.

2.1 Case study 1

The first case study focuses on students with relatively low proficiency (TOEIC score 300-500) at a women’s university. The size of the class analyzed was 10-15 students. The major of the students analyzed was Media and Global Studies. The study focuses on materials from the 2013-2014 academic years covering both the Spring and Fall semesters). The courses studied here focused on introductory level media English. In these courses, an average of 45 minutes used textbook for pre-intermediate level. The textbooks used were *Welcome to BBC on DVD*, by Morita et al., Seibido). On average, the remaining 45 minutes of the class were used for authentic materials outside of the textbook.

*Craigslist activity*

In this activity, students read the Housing and Apartments section of *Craigslist Oahu*. In class,
the instructor went over a real estate ad with class and the class discussed the following questions; 1) What kind of apartments are there? 2) What is the price range? 3) What type of ads look more attractive? After the class, for homework, students chose a city that they would like to visit as an exchange student, checked the Craigslist of that city, and tried to find an apartment to stay for a month. In the next class, students discussed pros and cons of using such a website in Japanese.

Activity using Super bowl TV commercials

The students watched the video titled ‘TOP 10 FUNNIEST SUPER BOWL ADS - Best Ten Super Bowl XLVIII 2014 Commercials’. This approximately 6-minute video uploaded in YouTube was chosen because it was relatively short and therefore convenient to watch several times in class. This activity was the most challenging one for the students because at their English proficiency level, to understand the contents of the commercials as well as the cultural contexts and the well-known celebrities acting in the commercials were considerably difficult and unfamiliar. However, contrary to expectations, this activity attracted students’ attention more than any other activity conducted in the class.

After watching the video a few times, many of the students were not sure whether they understood the contents well. The class discussed what each ad was about. Then students decided which ad they like most, provided reasons why, and presented to the class briefly. After the presentation, the class discussed what the frequently used characters were (children? animals? beautiful / sexy women?) and why they were chosen for the advertisement.

There is another report about using English advertisements for the class activity (Yoshida 2016). In that class, students not only watched advertisements video, but made their own advertisement in group work. If the students’ English proficiency level in our papers’ first case study was higher, Yoshida’s activity would enhance students’ active learning process. Therefore, differing levels of English proficiency our important for designing authentic materials assignments even when using the same type of authentic materials.

Students’ presentation about an article of their choice

In this activity, each student chose an article of her choice. Some of the articles they chose include articles from Student Times, The Japan Times, or an article about idol group from a magazine. They were told to underline unfamiliar vocabulary and provide meanings in Japanese written directly on a print-out of the article, and submit a copy to the instructor so the instructor could make copies for everyone in class. The handout and presentation was to be evaluated as part of the grade. In the following week, using a copy of an article as a handout, each student provided approximately 5 minute presentations about the article, explaining why she chose the
article, and what was the new information for the presenter among other topics.

2.2 Case study 2

The first authentic material assignment was done in three communicative English classes at a coed national university in Japan. These classes had on average 20 students each. One of the class majors was economics. The two others were engineering, with the first a standard engineering class and the next mostly design-based engineering including architecture. The classes used a mix of authentic materials and teacher-designed conversations. Some of the conversations were about real life situations, others were to practice grammar and phrases. Prior to the class meeting times where this activity was done, all three classes had engaged in both authentic material use—watching clips from Michael Moore’s film, *Capitalism: a Love Story*, about the decline of the blue collar middle class and had done teacher designed conversations on serious topics such as political economics. The students had experience discussing authentic materials and serious topics. However, there is always a subtle expectation that Japanese people will shy away from discussing their views on social or political topics. The department these courses are taught at is usually supportive of teaching serious topics, though teachers I have discussed using political topics for EFL classes outside this university are not always so positive.

*A Documentary about Undocumented Immigration*

Students watched a film about undocumented immigration, *Crossing Arizona*. This film dealt with undocumented immigrants, their allies, and anti-immigrant nativists in Arizona and Northern Mexico. The film looked at the dangers, hardships, and hopes of undocumented immigrants. We watched short sections from this movie showing undocumented immigrants crossing deserts, which can be fatal, and working in fields. The voice-overs provided historical context explaining the United States’ troubled, inconsistent, and often contradictory relationship to immigrants.

For a class of economics majors, students were asked fairly-easy questions. These students had background training to understand the overall economic issues, whereas the other two classes did not. The questions were: 1) What are peoples’ personalities like; and 2) Do you think everyone has the same freedom to make good choices? The students answered these questions in writing while watching the movie. Instead of collecting the answers and doing sentence-level grading or factual correction, the teacher asked the students to write a paragraph or two about their answers to these questions.

The students did not answer these questions out of the blue, but rather did so in the context of having watched another documentary on economic problems in the United States, Michael Moore’s *Capitalism: a Love Story*. This showed people with serious economic problems: often
times Caucasians or African Americans. This also showed America’s idea of the middle class in the post-World War II Keynesian economy and its destruction by the Reagan administration. The students also in a previous class discussed a worksheet designed by the teacher called “Economic Reality” which has students respond, based on their experience and opinions, about ethical issues related to political economy.

Simple background information about the causes of undocumented immigration to the United States from Mexico and Central America was given. This included a map of the Western hemisphere drawn on the classroom white board explaining the U.S.-Mexico border fence and how it causes undocumented immigrants to migrate through the harsh desert in Arizona causing fatalities. The teacher then explained that in Mexico and Central America significant loss of land and subsistence agriculture caused undocumented immigration (subsistence agriculture was explained in simpler terms). The teacher also mentioned that the civil wars in Central America which the United States and Soviet Union supported have caused persistent problems to peoples’ safety which has caused them to become undocumented immigrants.

To some extent, it is expected that the Michael Moore documentary and the worksheet may have influenced some of the students’ response to Crossing Arizona. It is not uncommon for Japanese college students to frame their response to perceived viewpoints of the teacher. While this probable framing prevents me from saying that the students were sharing their own viewpoints, compared with discussions about immigration that the teacher had in a private university classroom, the teacher noticed an overall awareness and knowledge of immigrant issues which I will explain next.

There was an overall understanding of causes and effects, but perhaps not so much that undocumented immigration is a dangerous process for immigrants or the associated legal problems they may face in the United States. As per the causes of undocumented immigration, students understood why immigrants are immigrating and this was occasionally explained in terms of political economy. As per effects, students understood that immigrants had less choice, i.e. diminished agency, when compared to Americans. Some students understood that immigration does not always create success.

Overall, students understood that undocumented immigrants come to the United States out of necessity rather than pure choice, greed, or other desire to take advantage of Americans. Largely, these ideas were expressed through an understanding of political economy rather than culture. It remains to be seen whether or not students of engineering have the same grounding. If engineering students come to this conclusion, it might be safe to say that some aspect of higher quality national universities equips students to grasp the issue of undocumented immigrants, rather than their different knowledge received because of being from a different major.

A few students mentioned more abstract terms of political economy. For example, the term
“Mother country” was mentioned by one student and “developed country” by two students. These terms suggest an awareness that undocumented immigrants are coming from Mexico (the “mother country” to the “United States” a developed country for economic reasons. This echoes generic immigration debates about “push and pull.” Another student, from a communist country mentioned that the undocumented immigrants were in the United States because of “reasons of capitalism.” This suggest Marxist critiques of both immigration and the racialized political economy of immigration suggested by scholars such as Ettaine Balibar (albeit in far more simplistic and economically determinist forms).

Students also could pick up on the fact that undocumented immigrants have less choice about immigrating to the United States and hence are not regular law-breakers. This contrasts with many situations teaching in private universities and occasionally national universities where students have a “the law is the law” point-of-view which prevents them from seeing the complexities of undocumented immigration, which is not (yet) a regular breech in U.S. law (Plascencia 2014). To a certain extant this echoes the above paragraph about political economy (political economy often focuses on structure rather than agency). Therefore, the political economy arguments mentioned above will not be restated though they belong in this category too. Some grey area between the lack of choice and the political-economy arguments already mentioned occur in the realm of micro-economic explanations. One student for example mentioned the immigrants as a group: “They barely make their ends meet.” Hence, people will conduct undocumented immigration for money. Another student compared undocumented immigrants to “people with assets” suggesting an understanding that wealthy Americans would never feel compelled to do undocumented immigration.

As per the consequences of undocumented immigration, one student understood that problems of immigration follow immigrants across the U.S.-Mexico border. One student mentioned thinking that “immigrants will be successful when [they] leave their own country” but was surprised to learn that things were difficult in their new country. In other words, the student could tell by watching scenes of undocumented people walking through deserts and working in a field, that immigrants do not have it easy.

While many of these students understood various aspects of immigration, there were some limitations to their understanding. In contrast to other students who focused on the illegality of undocumented immigration, these students completely ignored the legal aspects altogether. For example, no one considered the legal consequences of undocumented immigration. I did not play the scenes with anti-immigration activists. In part this was due to time constraints. In part, it is due to the fact that the majority of Japanese peoples’ focus on immigrants—especially undocumented immigrants—comes in terms of negatively biased media reports (Shipper 2008). Thus, the teacher expected that Japanese students would latch on to nativist attitudes and ignore
some of the arguments in favor of immigrants. Another reason the teacher avoided the nativist scenes was due to the current far-right anti-immigrant climate in the United States and Europe. That said, given the overall nativism in Japan, the teacher was somewhat surprised to hear empathetic evaluations of undocumented immigrants.

Even though students were empathetic, they did not make distinctions between undocumented Mexican immigrants and documented Mexican immigrants. In part, the scenes did not focus on documented Mexican immigrants, so this may be chalked up to some bias introduced by Crossing Arizona. Yet, it also shows some limitations in using films about undocumented immigrants. After the lectures, the teacher corrected this lack of distinction by saying that not all Mexican immigrants are undocumented.

Music Lyrics to Discuss Counter Culture and Male Gender

In another general English class at a national university, students learned about gender using lyrics from music. The overall focus was on countercultures. The class discussed hippies, early glam rock, punk music, and heavy metal. Two classes discussed this: a science class and a political science class. In addition to reading lyrics and listening to the music, the students also did a 3-minute presentation on subculture based on research (usually reading an article or finding a musical example of a subculture, i.e. a song by the Clash to discuss punk).

Two songs that I would like to focus on are “The Man Who Sold the World” by David Bowie, an example of early 1970s glam rock and “No Remorse” by Metallica, an example of heavy metal. The songs were chosen based on their ability to comment on gender and relative lack of obscenities or insensitive languages (the latter is a time-consuming aspect of using music as an authentic materials). “The Man Who Sold the World” contained ambiguously male-female references, an obsessive, dream-like memory of a male friend which signaled some aspect of homosexual relations. “No Remorse” expressed an opposite notion of male gender; the American love of war with lyrics that at face value promote a willingness to take part in brutal warfare. These are two sides to Western male culture.

Perhaps as can be expected, students in both classes did not really pick up on any deep meaning in the David Bowie song. They saw it more as just lyrics and were overall confused by the explanation that it might be a love song written by a man for another man. This is despite having seen artwork in the liner notes for the CD that I brought to class, Aladdin Sane, which shows David Bowie wearing a dress. (The only mainstream depictions of gay men in Japan are of transgender men.) Therefore, it seems that the visual cues in the CD artwork might help students understand the subtle LGBT theme in the song, but this was not the case.

The reactions to the Metallica song were somewhat different than expected too. In a country with a traumatic experience of being invaded during World War II, the teacher wondered if the
song would be offensive. The science students did not quite understand the lyrics. Perhaps this was due to time constraint or level differences. However, the political science students seemed to understand it better. Some did not see it as belligerent masculinity per se, but saw the lyrics more as an expression of the horrors of war.

A good point of this activity is that it helps students fairly quickly understand the concept of gender to include not just female issues or differences between men and women, but to include issues that affect men as well. The use of music that was not contemporary presented students with something that they were not able to quickly look up on their smart phones and thus had to think about on their own merits. The use of non-standard music also caught students’ attention, being different from typical ESL activities.

The presentations on subcultures present some knowledge about the students’ attitudes toward studying music and subcultures, even if it is not a direct evaluation of the activities. A student in the science major class presented on punk subculture by bringing in his smartphone, playing a song by the Clash, and explaining why it was a musical and political example of punk subculture. Another student in the science major class discussed J-Pop and said it is perfect for Japanese people whereas Western subcultures are not, based on the type of beat used. He said Punk is probably the teachers’ favorite music, though Japanese people have other tastes. This suggests that the student did not quite understand the political implications of the punk subculture and filled in the gaps with his own personal experiences and viewpoints. A student in the political science majors class presented on punk music, correctly emphasizing the left-wing political aspect of the subculture. However, the student over-generalized punk as always standing for good things. This statement was not true. In more recent classes where the teacher mentioned subcultures s/he has been more careful to use qualifiers to characterize intent and points-of-views, though in EFL teaching there is often pressure to present things in easier to understand ways, lest the students do not understand.

For future classes, the music lyric activities need to be further developed. One potential limitation of these activities is that song lyrics generally are more complex than they seem. The David Bowie lyrics contained subtle allusions of staring someone’s eyes which would be both obvious in meaning to a native speaker—love, attraction—but also easy to ignore in the overall mix of surreal lyrics and music. Thus, it would be somewhat easy for students not to understand, especially since it is not considered normal male behavior in Japan. Moreover, the Metallica lyrics for “No Remorse” were rather long and open to interpretation as to what the meaning was. This forces a choice between focusing on authentic materials only to create English-language discussion, whatever the content may be about, or finding less ambiguous songs that are about the subject matter.

Another limitation is the time spent on studying subcultures. This was done as a three-week
section of a class (including one week of presentations). I would like to include more background reading and explanation, though students’ willingness to do extensive reading when they are required to research presentations and that the classes are already fairly short limit the amount of reading or lecture that can be completed. Some other improvements might be to include gender as a separate three-week unit taught before musical subcultures, thus giving students an example to understand gender more before applying it to musical lyrics. Another limitation is that the songs must be relatively free of obscenities and disturbing content. This means that the choice of songs is limited and imperfections such as over-complexity or slightly too-long lyrics may be something that have to be endured when using song lyrics.

3. Discussions

This section will first discuss the merits and shortcomings of using authentic materials in each case study. The section will then explore some of the limitations of using authentic materials and how they can be addressed by instructors.

In Case Study 1, the benefit of using authentic materials is that in many cases students show more enthusiasm about the activities. They appear to be more focused on the activities, and the materials trigger good discussion on cultural differences and intercultural communication skills. At the end of the semesters, the instructor received good comments about the materials in students’ evaluation of the class, some of which are as follows;

“The instructor of this class used interesting type of materials that other classes don’t usually have. (the original comment was in Japanese, presenters’ translation)”

“It was a very fun class. (the original comment was in Japanese, presenters’ translation)”

Another good impact on the class, from the viewpoint of the students, is that by using authentic materials, it was possible to accomplish a good balance of input (using textbook) and output (activities employing active learning with authentic materials). Also, the instructor was able to adjust the level of activities as the semester proceeded and got to know the students’ English level and interests more.

As for some challenges in using authentic materials, coming up with and preparing (obtaining and reprocessing) the materials that fit students’ interest was very time consuming. Also, sometimes it required more time than the teacher expected to complete the activities in the classroom. When we had class discussion on any aspect of the materials, facilitation by the instructor was necessary because the students were not very active initiating discussions at the beginning; however, once the instructor start facilitating and leading the discussions, students tended to volunteer their own opinions actively.
As per the merits and shortcomings of using authentic materials in case of the Case Study 2, a positive aspect of English language documentary films and music with song lyrics is exposure to cultural and historical differences. The film *Crossing Arizona* provides quite different views on undocumented immigration and the legal methods for helping them than students encounter in Japan. In America, there have been flexible legal and moral responses to undocumented immigration, and other issues, where many Japanese students I have worked with tend to see the law on this—and other subjects—as universally applicable and morally universal. The musical subcultures studied in the class exist in Japan and the area where the university is located. Thus, they are not totally foreign. Yet, they provide some opportunity to discuss issues in America and The United Kingdom as well as different cultural responses to the problem. For example, David Bowie’s song “The Man Who Sold the World” provided a more masculine example of LGBT culture than present in Japan and Metallica’s song “No Remorse” discussed an aspect of masculine militarism which has not been popular in Japan since the end of World War II.

A general issue for both using documentary films and song lyrics is the issue of the amount of authentic materials which can be used. While it is optimal to use short clips of films, even for classes of native-speakers, the short clips limit the amount of different viewpoints that can be used. They also can be taken either out of context or with too little explanation. When using short clips outside of EFL there is usually five minutes of movie watching and the rest of the class can be used for explanation and/or discussion. In EFL classes the clips need to be repeated three times for students to absorb the English language conversations and sufficiently answer questions. This means that at least fifteen minutes will be used for movie watching (excluding time for set-up, students to write answers to questions, and for the teacher to deal with technical difficulties in showing the movie). A similar problem exists for song lyrics. The students need to hear the songs at least twice to both understand the lyrics and integrate meaning with abstract emotional qualities of music. Introducing lengthy homework reading assignments to offset lost class time is not usually a realistic option for EFL classes. In another more recent class, the teacher had a section on subcultures which was studied to understand subcultures only and another where the students studied gender as a separate subject. Perhaps as mentioned earlier de-compressing and simplifying the amount of material and then reintegrating it cumulatively would help, though it would also lead to slightly different assignments.

One other option which would be helpful but is not available for English teachers at my university would be to select the majors we teach. As previously mentioned economics students had a fairly-good background to understand undocumented immigrants, political science students seemed to understand the political aspects of subcultures, and science students were mixed in their understanding. The assignments were neither targeted to the type of work that undergraduate economics, political science students, or science students would normally do. In
all three classes, there was success with the assignments. Thus, it is not a matter of tailoring
assignments to what could be expected from majors. Yet, the assignments overall may have been
more appropriate to the pre-existing analytical skill sets of social science students. But, it cannot
be said that they were undoable or unrewarding for all engineering or science students.

Aside from increased motivation and opportunities for analysis, authentic materials also aid
students in skills promised by textbook learning. But, authentic materials often may be more
efficient and effective in this regard. As per the effects on students’ skills to learn vocabulary
embedded in appropriate contexts and in correct collocations, were among many benefits. We
believe that the impact on students’ skills to learn vocabulary is significant. Rather than
memorizing the meaning of each vocabulary dictionary definition, they can learn appropriate
contexts for each vocabulary to be used in. Also, they can learn appropriate collocations that
each vocabulary is used with. They also can get used to multiple and subtly different definitions
for each word.

Finally, regarding how to expand teaching ideas using authentic materials, good authentic
materials are the ones that are always changing and updated to follow current issues in the world.
The contemporary, constantly updated aspect of authentic materials is a merit, though issues of
preparation call for the expansion of networks of teachers that are using authentic materials.
Regular textbook teaching and other types of EFL teaching, for example grammar-based or
translation activity based teaching, may have networks of scholars and publishers. There is no
shortage of conference panels or textbooks on these subjects to assist ELT teachers in teaching
these subject. This seems natural and could easily be taken for granted, but many teachers of
authentic materials may be working on their own with neither support nor examples of what an
effective activity is, how it works, or how to evaluate student responses. This is not just
important to raise the inconsistent support for using authentic materials, but also to make the use
of authentic materials more practical and effective for busy teachers. Networks where people can
share advice would be helpful for a few reasons. Creating authentic materials takes a lot of
preparation times for each teacher. Teachers who use authentic materials could help others to
streamline this process so teachers could more efficiently prepare and choose authentic materials.
Also, knowing what types of authentic materials work best at different types of universities—i.e.
community college, municipal, private, prefectural, or national—would make it possible for the
creation of effective authentic materials and classes to be less a matter of trial and error, hence a
risk for teachers, and more effective in a shorter timeframe. Authentic material assignments
could also be more helpful and rewarding for students from the beginning of their use.

Since authentic materials often reflect current affairs and issues that students face in the
short-term, there needs to be relatively quick dissemination of information about techniques and
issues. It would be ideal if there was a website or place to share and exchange the ideas to use
authentic materials. Due to issues concerning copyrights, it is not desirable to exchange the materials themselves. (dealing with copyrights is another time-consuming process) Rather, sharing classroom activity ideas and links to each authentic material suffice.

Lists of the Materials Used in Class

Exploring Cultural Identity and Language with First and Second Generation Latino Youth

Conference Proceedings
for the
Hawaii International Conference on Education 2016

**Topic Area.** Other Areas of Education – Multiculturalism within Education

**Presentation format.** Paper Session

**Description.** The purpose of this study was to collect qualitative data on the lived connections between cultural identity and language for five first and second generation Latino youth in the Southwest region of the United States, specifically Arizona and California. It describes the personal struggles, realizations, and experiences revolving around cultural identity and language both in and out of the classroom. The insights gleaned from these interviews contribute to scholarship by highlighting the complexities and cogent recommendations that address the increasing Latino population within the education system.

Abstract

Identity is comprised of the multiple group memberships in which one belongs (Tajfel & Turner, 1985). One of the most significant means of proving and attaining membership into certain groups is through language. Language is a symbol of group membership that displays multiple facets of identity, such as membership to types of social groups, and social role (Crystal, 2004, 2010). Accordingly, language is a significant indicator of both permanent and transient identities (Ghafournia, 2015). Studies exploring the connection between Latino identity and language have demonstrated increasing complexity due to shifting linguistic demands (Hernandez, 2010; Weisskirch, 2005; Ramsdell, 2005). The purpose of this research is to further tease out these complexities to identify transient themes, implications, and recommendations for Latin@ students currently within the education system.

Keywords: cultural identity, language, language loss, Latino education
The diversification of the U.S. is not only reflected in census findings and projections (Colby & Ortman, 2015), but also in the increasingly complex spaces in which cultural identity and language are frequently negotiated (Bhabha, 1994). To address these cultural and linguistic complexities within the physical and socialized space of the classroom, many states have mandated very linguistically restrictive and culturally subtractive instructional models for the education of English Language Learners (ELLs) in an attempt to standardize instruction (Cummins, 1997; Mahoney, MacSwan, Haladyna & Garcia, 2010). Furthermore, states, such as Arizona and California, have implemented English-only laws that require public schools to only provide instruction in English, under the misconception that, namely Latinos, “are resistant to surrendering their native language usage following immigration to the United States, and that only a national language policy can ensure language shift to English” (Padilla, Lindholm, Chen, Duran, Hakuta, Wallace, Tucker, 1991, p. 121). Consequently, the cumulative effects of the linguistically restrictive and culturally subtractive instructional models and the English-only laws are most often implicated in the high dropout rates and overrepresentation of Latino students special education programs (Fernandez & Inserra, 2013; Watt & Roessingh, 2001).

However, various studies demonstrate that Latinos typically adopt English as their primary language within one to two generations of living in the U.S. (Lopez, 1982; Veltman, 1988). While developing proficiency in English is pivotal for participation in U.S. society, ultimately, it is proficiency in one’s first language that serves as a “critical marker of one’s identity and connection to one’s cultural heritage (Mercuri, 2012, p. 14; Smoliez, Hudson, Secombe, 1998). As cultural identity and language are inextricably connected, the loss of language results in the loss of cultural identity (Baker, 2001). Therefore, the legal mandates that require the implementation of the restrictive linguistic and English-only instructional models not
only result in the loss of Latino youth’s first language, but also significantly impacts their cultural identity (Mercuri, 2012)

Identity is comprised of the multiple group memberships in which one belongs (Tajfel & Turner, 1985). One of the most significant means of proving and attaining membership into certain groups is through language. Language is a symbol of group membership that displays multiple facets of identity, such as membership to types of social groups, and social role (Crystal, 2004, 2010). Accordingly, language is a significant indicator of both permanent and transient identities (Ghafournia, 2015). Studies exploring the connection between Latino identity and language have demonstrated increasing complexity due to shifting linguistic demands (Hernandez, 2010; Weisskirch, 2005; Ramsdell, 2005).

**Language Policies within the Arizona Context**

While many states have implemented very restrictive instructional models for the education of English Language Learners (ELLs) in an attempt to standardize instructional approaches and increase access to education, Arizona has mandated the most restrictive referendum and legislation to date (Mahoney et al, 2010). Before the landmark passage of Proposition 203 in 2000, schools were allowed to locally select the instructional programs they determined as most effective for ELLs. However, after this Proposition, all school districts and charter schools were required to solely implement the Structured English Immersion Model (SEI) (Gandara & Hopkins, 2010). The SEI model also requires that ELLs be grouped according to their demonstrated proficiency in English as determined by the Arizona English Language and Literacy Assessment (AZELLA), the state’s English language proficiency test. Additionally, based on the AZELLA scores, the exact number of minutes allocated for each component of
language instruction (reading, writing, listening, and speaking) is also mandated (Arizona Department of Education, 2014; Wiley, Lee, & Rumberger, 2009).

The establishment of the Arizona English Language Learners Task Force resulted in greater restrictive practices by mandating the 4-hour English language development (ELD) block model (Mahoney et al, 2010). The Arizona Revised Statutes (A.R.S.) 15-756 requires that ELLS receive “a minimum of four hours per day of English language development (ELD) for the first year in which a pupil is classified as an English Language Learner” (ADE, 2014, p. 1). Students who are classified as ELLs are expected to achieve proficiency in English within a year when placed in an English-only instructional environment (Garcia, Lawton, Diniz de Figueiredo, 2010; Title 15, Chapter 7, Article 3.1, A.R.S., 1998). Furthermore, the SEI model also requires that ELLs be grouped. However, exiting from the 4-hour block is only possible when the students demonstrate “mastery” of English on the AZELLA (ADE, 2014).

Additionally, in regard to the English-only mandate reaching beyond the classroom, although 18 states have enacted laws designating English as the official state language, a federal district judge in Arizona declared Arizona’s constitutional amendment of English as the language of all government functions and action a violation of federally protected free speech rights (Padilla et al, 1991).

**Method**

The purpose of this study was to collect qualitative data on the lived connections between cultural identity and language for five first and second generation Latino youth in the Southwest region of the United States, specifically Arizona and California. It describes the personal struggles, realizations, and experiences revolving around cultural identity and language both in and out of the classroom.
1. How might language experiences shape proficiency?

2. How might school experiences shape language proficiency?

3. What is the connection between cultural identity and language?

4. In what ways, if any, are the participants re-gaining their language and cultural identity?

For this study, the participants were selected based on their connection to a group of Latina professors who regularly meet to discuss their experiences. The participants were selected based on convenience sampling and satisfying the criteria of being between the ages of 18-21 and first or second generation Latino (Creswell, 2013). This study focused on teasing out the intimate connections between cultural identity and language. All of the individuals who were recommended fit all of the participant requirements and were all suitable candidates for the study.

Four of the five participants were born in Arizona or California while one was born in Mexico. While all of the participants described having family members speak Spanish to them when they were children, four of the five participants indicated that these interactions were mostly with extended family members, such as grandparents and cousins. One participant stated that she only speaks Spanish at home with her parents, but is often positioned as a translator. Although all of the participants indicated that they were not allowed to speak Spanish in school, which negatively impacted their cultural identities and proficiency in Spanish, they have all taken Spanish classes either in high school or college to continue to develop their linguistic proficiencies.

For this study, the qualitative data were collected through semi-structured interview questions revolving around three topics: language background, identity and language, and school experiences. Each participant completed a semi-structured interview that ranged from 45 minutes
to 2.5 hours based on the depth of responses. The interview data were then transcribed and analyzed using grounded theory and constant comparative analysis to identify themes (Creswell, 2013).

**Findings**

The analysis of the qualitative data underscore the clear, but complicated relationship between cultural identity and language. The tension between learning and speaking Spanish and English influence the extent to which Spanish was learned, especially when the participants were younger. One participant stated that “I regret that I don't speak Spanish now, but hearing my mom's experiences growing up trying to learn English in school and speaking Spanish at home. I just know it wouldn't have been a lot harder than I expect. I guess I'm glad that I didn't have that struggle to deal with early on in my educational career” (Interview, 2016).

However, as adults, the participants indicate that their proficiency in Spanish determined how and in what ways they were able to engage with both the White and Latino communities both as youth and adults. One participant stated that he “didn’t speak [Spanish] so the times I would hear it, because I didn’t understand what it was, I felt like it almost distanced me further. I wouldn’t try to interact because I knew that I couldn’t fully engage, and so I wouldn’t take the opportunity to try to learn it at that point. Then next time I hear it, I still don’t know it and I’m a little bit older” (Interview, 2016).

Additionally, all of the participants have already taken steps to develop their proficiency in Spanish and plan on continuing their development. One participant recalled his interest in proactively learning Spanish when “the first time, sophomore year of high school, I had a friend who was using it. She was actually a native Spanish speaker, but she was using it to learn French. That got me interested in it. Then the second time around it’s because it had been a while
before I’d taken a Spanish class, and I was enrolling in one so I kind of wanted to catch up the summer before I started” (Interview, 2016).

These findings have powerful implications and lay fertile grounding for recommendations in reconciling the tensions of between the cultural identity and language of Latino youth within the education system. One such poignant insight given by a participant for the education system is to have “an emphasis [that] there is no one right way of being a certain culture. That’s something if you ask anyone my age to sit and think about, they’re all going to give you that answer. At least the people I know. I mean almost subconsciously there is a right way to be Mexican, there’s a right way to be Black, or there’s a right way to be White…having that as more of an overt message…might help a little bit” (Interview, 2016).

To Be Continued

In the full paper, we will have more in-depth findings as they relate to the lived experiences of cultural identity and language as well as their implications for education.

Abstract

As public school districts and teachers in states that have adopted the Common Core State Standards (CCSS) seek to understand the standards and what this means for literacy/reading instruction, preservice teachers in universities are also learning about the literacy/reading instruction and standards as well. The International Literacy Association’s (2016) defines literacy as “Literacy is the ability to identify, understand, interpret, create, compute, and communicate using visual, audible, and digital materials across disciplines and in any context.” How is this definition applied to real-life teaching in the classroom? What exactly are the perceptions that practicing teachers have about literacy/reading instruction and the CCSS? What and how are public school teachers teaching? In this study preservice teachers are involved in analyzing interview data in regards to practicing teacher perceptions and attitudes about literacy/reading instruction and the CCSS.
Introduction

Many public school districts and teachers in states that have adopted the Common Core State Standards (CCSS) in the United States have been in the process of realigning their existing curriculum, adopting new curriculum to align with the CCSS, and negotiating the new assessments (Partnership for Readiness for College & Careers/PARCC, 2016; Smarter Balanced Assessment Consortium/SBAC, 2016). Teacher education programs in universities are preparing their teacher candidates to be knowledgeable about the CCSS as well as the many literacy methods and materials.

Teacher candidates in a literacy course at a regional university in the Pacific Northwest have been involved in collecting, discussing and critically analyzing interview data in regards to teacher perceptions and attitudes about literacy instruction and the Common Core State Standards. So what exactly are the perceptions that practicing K-6 teachers have about the CCSS and literacy? What are K-6 public school teachers doing? How have teachers changed their teaching? Are teachers’ perceptions of literacy and the CCSS who teach in rural and urban schools similar? The International Literacy Association, the association for reading/literacy teachers internationally and in the United States, state in their CCSS guidelines,

The Common Core State Standards (CCSS) have the potential to ensure that every child in the United States is prepared for college and careers. It is a worthy goal and one that we must work together to achieve. However, information, policies, and products aimed at helping educators to implement the ELA Common Core State Standards are being produced rapidly, sometimes with conflicting messages
about literacy practices, (International Reading Association Common Core State Standards (CCSS) Committee, 2012).

**CCSS Research**

Research regarding the CCSS and implementation is in the early stages, although there are many websites explaining what the CCSS are and their limitations. For example, the Common Core State Standards Initiative (2012) lists CCSS considerations such as:

1. The Standards define what all students are expected to know and be able to do, not how teachers should teach.
2. While the Standards focus on what is most essential, they do not describe all that can or should be taught.
3. The Standards do not define the nature of advanced work for students who meet the Standards prior to the end of high school.
4. The Standards set grade-specific standards but do not define the intervention methods or materials necessary to support students who are well below or well above grade-level expectations.
5. It is also beyond the scope of the Standards to define the full range of supports appropriate for English language learners and for students with special needs.
6. While the ELA and content area literacy components described herein are critical to college and career readiness, they do not define the whole of such readiness.

Although most school districts and states have already changed from their state standards to the CCSS, studies about K-6 teacher perspectives about teaching literacy and the CCSS are limited. However, studies of high school and K-12 teacher perspectives are
beginning to be included within the literature. In one such study (Lasisi, 2016), twenty-three ELA high school teachers from one California school were surveyed. The findings suggested that teachers wanted to acquire more knowledge about the English Language Arts (ELA) CCSS; their professional development and curricula were inadequate to meet the CCSS; and they perceived they were not ready to teach the ELA CCSS. In another national study, 456 K-12 teachers from the adopted CCSS states responded to an online survey. The findings suggest

Almost all respondents believe that the common core will have an impact on their classroom instruction in the long run. Thirty-six percent report that the new standards will influence their instruction “a great deal.” With another 44 percent indicating their classroom practice will change “somewhat.” Only five percent of respondents feel the common core will not change their teaching practices at all (Education Week, 2014, p. 30).

Other current research on the CCSS has focused on investigating the comparisons between current state standards and the CCSS, policy research and development, and surveys. In one study, differences in the changes between US state standards, international standards in other countries and the CCSS were explored (Porter, McMaken, Hwang, & Yang, 2011). In another CCSS arena, McDonnell and Weatherford (2013) investigated the educational policy making of the CCSS, while another study documented policy groups meeting to establish a research agenda for the CCSS (Center on Education Policy, 2013).

In regards to surveys, one CCSS Math survey of 12,000 teachers stated that 80% of the teachers had read the standards for their grade. 77% of the teachers said the CCSS
were similar to their own state standards and 94% liked and would teach the CCSS (Schmidt & Borroughs, 2013). Teacher unions (American Federation of Teachers/AFT) surveyed 800 members regarding the CCSS resulting in a 75% favorable support for the CCSS, however, 83% supported a moratorium on consequences for students, teachers and schools until the standards and related assessments have been fully in use for one year, (AFT, 2013). Other union (National Education Association) surveys report that teachers are unfavorably impressed with the CCSS (Van Roekel, 2014). Van Roekel goes on to state,

Seven out of ten teachers believe that implementation of the standards is going poorly in their schools. Worse yet, teachers report that there has been little to no attempt to allow educators to share what’s needed to get CCSS implementation right. In fact, two thirds of all teachers report that they have not even been asked how to implement these new standards in their classrooms (2014).

**Method**

**Setting**

This study took place at a small regional university located in the Pacific Northwest. The teacher education program at this university graduates approximately 250-300 elementary education majors (ELED) each year. Literacy education is an important component within the ELED major with four courses (15 credits) focusing on literacy methods K-8. Each elementary education certification candidate also seeks an endorsement in another area such as literacy, bilingual/TESL, Special Education, with Early Childhood Education (ECE) being the most popular. The cumulative practicum experience for the ELED major is the traditional academic quarter of student teaching. If
the candidate minors in a specialist endorsement area (literacy, bilingual/TESL, ECE) he or she has an additional classroom practicum. Practical teaching applications are crucial for candidates to connect theory to practice.

**Participants**

The participants in this study consisted of 75 teacher candidates enrolled in the EDLT 308 Literacy I course during three separate quarters. Candidates were either in their sophomore or junior year in the Teacher Education Program. Literacy I is the initial Literacy course within the ELED major and is an introductory, foundational K-8 literacy teaching course. The participating 75 K-6 teachers were currently teaching in public schools in the state of Washington. Both teacher candidates and practicing teachers are the participants in the study where the teacher candidates are the interviewers and the teachers are the respondents.

As part of the Literacy I course, teacher candidates were introduced to the Common Core State Standards (CCSS), with the English Language Arts (ELA) standards having the main focus. According to the CCSS website of the Washington State Office of Superintendent of Public Instruction

The standards insist that instruction in reading, writing, speaking, listening, and language be a shared responsibility within the school. The K–5 standards include expectations for reading, writing, speaking, listening, and language applicable to a range of subjects, including but not limited to ELA. The grades 6–12 standards are divided into two sections, one for ELA and the other for history/social studies, science, and technical subjects. This interdisciplinary approach to literacy is based on research indicating that students who are college and career ready must be
proficient in reading complex text from many disciplines (Washington State OSPI, 2012).

**Description of Teacher Interview**

In order for teacher candidates to understand and connect to the application of the philosophical principles, literacy methods and materials they were learning about in their class sessions and course text, students interviewed practicing K-6 teachers in Washington State regarding the ‘practical’ aspect of teaching literacy. The teacher interview consisted of twelve open-ended questions developed by faculty with teacher candidate input. The questions ranged from what programs/publishers, materials and strategies do you most often use, to what technology do your students use in the classroom for reading and writing and how do they use it? To concentrate on teachers’ perspectives of literacy and the CCSS, five questions were focused on in this study. The questions were: What are the guiding principles in the teaching of literacy in your classroom, what programs/publishers, materials and strategies do you most often use to help teach/meet the Common Core State Standards, how many hours in a typical school day do you focus on teaching literacy, if you could change something about the way in which literacy is taught, what would it be, and how has the Common Core State Standards changed the teaching of literacy for you in your class?

**Data Collection**

Teacher candidates interviewed 75 elementary teachers in 58 public school districts (26 rural and 32 urban) in Washington State. The teacher candidates had a choice of interviewing their selected teacher in person or over the phone.
All teachers in Washington state had been introduced to the CCSS at a variety of levels. The Office of Superintendent of Public Instruction’s website (OSPI, 2012) listed the timeline for CCSS adoption in the public schools for Washington state.

Table 1
Washington State & the CCSS Adoption Timeline

<td>2012-13</td>
</tr>
<tr>
<td>Phase 4: Statewide application and assessment</td>
<td>2014-2015</td>
</tr>
</tbody>
</table>

The interviews were collected during the academic quarters Fall (2015), Winter (2016) and Spring (2016) and encompassed Phase 4 and beyond of the WA state timeline.

In analyzing the data from the teacher interviews, using the constant comparative method of analysis (Glasser & Strauss, 1967), themes emerged. Spradley (1980) refers to analysis as a search for patterns: “Analysis of any kind involves a way of thinking. It refers to the systematic examination of something to determine its parts, the relationship among parts, and their relationship to the whole” (p. 85).

**Findings**

For each question, findings are organized by question, ranking of the theme, percentage of teacher responses and specific titles of the themes. The themes are presented in a table comparing and ranking teacher responses from the East (25 teachers) and West (50 teachers) side of the state. Washington state is split into the East and West as the East side of the state included the majority of the rural schools while the West side
included the urban schools. Example teacher responses that connect to themes are presented.

**Question #1: What are the guiding principles in the teaching of literacy in your classroom?**

<table>

</tr>
</tbody>
</table>

**Example teacher responses:**

**The Common Core State Standards:** They are mandated; I use the CCSS to plan lessons and align student work; Mostly mandated standards dictate the guiding principles.

**The Big 5 Areas of Reading:** I want to teach the 5 basic foundations; I teach decoding and reading that shows comprehension and fluency; We start with the basic phonics and after skills are learned then we apply them.

**Mandated curriculum and methods:** I use the basal curriculum with leveled readers; Lucy Calkin’s Reading Units; Daily Five/CAFÉ, Reader’s Workshop; Walk to Read; Gradual Release Model.
All students are capable and come with different abilities: With guidance and encouragement all children will learn to read given their perseverance; All children can learn to read and write well; Understand how children read and write and they are capable.

Engage in daily reading for enjoyment: Kids should read every day for 20 minutes at least; Teach a love of reading, I try to stress the importance of reading for pleasure.

Question #2: What programs/publishers, materials and strategies do you most often use to help you teach/meet the Common Core State standards?

Example teacher responses

Mandated Big Publishers: We use a mandated curriculum that is used district wide, Journeys; Our district has adopted a new curriculum called Wonders.

Mandated Small Publishers: We use Read Well, an intervention program that focuses on phonics; The Read Well curriculum is mandated in our school.
**Variety of Mandated Supplements:** Accelerated Reader (AR) is used to inspire reading and goals are set for achievement, it is highly recommended, but is an addition; CIA, or Collect, Interpret, Analyze, is used to help with chapter books; We use Good habits, Great Readers a phonics program; This year we have started using the Lucy Calkins Reading Units of Study as our main curriculum.

**Question #3: How many hours in a typical school day do you focus on teaching literacy?**

<table>
<thead>
<tr>
<th></th>
<th>East N-25</th>
<th>West N-50</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>#4</td>
<td>11%</td>
<td>#4</td>
</tr>
<tr>
<td></td>
<td>Diverse – No set time limit</td>
<td>#4</td>
</tr>
</tbody>
</table>

**Example teacher responses**

**60-90 Minutes:** Distract mandated 90 minutes; Forty-five minutes of core reading guided practice every day and 45 minutes of differentiated instruction during independent time, about 90 minutes.

**2-3 hours:** At least 2 hours a day; 200 hours is the goal, but there is not enough time.

**All day long:** All day, about 5.5 hours excluding lunch and recess. I teach literacy in every content area, writing & reading go hand in hand in all lessons; If students cannot read or comprehend a text, they cannot learn in the other content areas.

**Diverse:** Usually 90 minutes, but if the testing shows low scores, it changes to 120 minutes; Sometimes 60 minutes in reader’s workshop and sometimes 45 minutes with guided reading.
Question #4: If you could change something about the way in which literacy is taught, what would it be?

Table 5

Example teacher responses

**Freedom: Curriculum & standards too structured with no connections to student lives:** The CCSS is too structured with no exploration or creativity; Get rid of the adopted basal reading curriculum, The curriculum has a more forced structure, no freedom to teach for enjoyment.

**Slow down: Too much for abilities; not enough time:** Too much, I have concerns about how developmentally appropriate the CCSS are for young children; The CCSS are not developmentally appropriate for children, especially those in high poverty schools.

**Too much testing:** I think there is too much emphasis on standardized assessments; The testing has gotten out of hand; I have to teach to the test.

**No changes, instruction hasn’t changed:** Not much has changed, it hasn’t affected my teaching; No changes.
Question #5: How has the Common Core State Standards changed the teaching of literacy for you in your class?

Example teacher responses

Specific skills to teach: The CCSS has brought awareness to the specifics of what students should know at each grade level; Focused curriculum, more specific skills.

No change in instruction: The CCSS were very similar to what the state standards were before, so there are not many changes; It is not different for me; For my class it hasn’t changed.

More testing: There is more testing; Everything focuses on assessment.

Too structured – More stress: The CCSS overwhelms student and teachers; More pressure, kids have to learn to adapt.

Raised the bar – rigorous: Rigorous, everyone has to teach the same thing; The CCSS has increased the rigor; It has raised the bar and holds teachers more accountable.

Discussion

The purpose of this study was to explore practicing K-6 teachers’ perceptions and attitudes regarding literacy teaching and the Common Core State Standards. The 75 interviews of teacher perceptions of what reading/literacy programs, how reading/literacy is taught, and how much literacy should be taught within the Common Core State
Standards (CCSS) served as a practical moment to help preservice teaching candidates connect theory and current practice in Washington schools.

Teacher candidates interviewed teachers during an introductory literacy course. Five questions were focused on in this study: What are the guiding principles in the teaching of literacy in your classroom, what programs/publishers, materials and strategies do you most often use to help you teach/meet the Common Core State Standards, how many hours in a typical school day do you focus on teaching literacy, if you could change something about the way in which literacy is taught, what would it be, and how has the Common Core State Standards changed the teaching of literacy for you in your class?

The findings were organized by question, ranking of the theme, percentage of teacher responses and specific titles of the themes. The broad themes are presented in tables comparing and ranking teacher responses from the East and West side of the state. Example teacher responses that reflected the themes were presented.

For question #1: What are the guiding principles in the teaching of literacy in your classroom? For the East side of the state the #1 (41%) and #2 (36%) responses from teachers were fairly close. Teachers stated that the CCSS was the guiding factor of the teaching of literacy in their classroom, or they focused on The Big 5 areas of Reading (National Reading Panel, 2000). Twenty-three percent of the teachers from the East side stated that their chief principle of literacy instruction was to make sure that children engaged in daily reading for enjoyment. The teachers from the West side of the state were close in their rankings. Thirty-one percent focused on The Big 5 areas of Reading (NRP, 2000), while 28% of the teachers stated that the mandated curriculum was the driving force behind their instruction. While the East side teachers had the CCSS as the #1
ranking for guiding principles, only 24% of the teachers from the West side indicated that the CCSS were the guiding principles behind their literacy instruction, which was ranked as #3 in terms of responses. Finally, 17% of the West side teachers indicated that daily reading for enjoyment was their guiding principle for literacy instruction in their classrooms.

As the CCSS were adopted in 2011 by Washington state, implemented by 2014-15 on the Washington state timeline, and mandated to be the guiding principles or goals for instruction, teachers from both sides of the state had differing responses. It seems that teachers’ beliefs strongly affect the guiding principles, materials and activities they choose for the classroom (Harste, Woodward & Burke, 1984). While many teachers have ‘bought in’ to the CCSS, other teachers seemed to be focused on the results of the Reading Panel’s report, indicating that phonemic awareness, phonics, fluency, vocabulary and comprehension were the main pillars and guiding principles of literacy instruction. Richardson (1998) states that teacher change may hinge on who is directing the change. Is it a top-down change or does it come from personal teacher research? Teachers often resist change mandated or suggested by others, but they do engage in change that they initiate (Richardson, 1998).

For question #2: What programs/publishers, materials and strategies do you most often use to help you teach/meet the Common Core State Standards? An overwhelming 64% of the East side teachers utilized only two basal reading curriculums (Journeys & Reading Wonders) published by big publishers (Milliot, 2016). Nineteen percent of the East side teachers focused on a basal reading curriculum published by a smaller publisher, and 17% used a variety of mandated supplements in their classrooms. The West side
teachers indicated that they used a much wider variety of mandated curriculums (59%), than the East side teachers. While 24% of the West side teachers used Journeys and Reading Wonders from the big publishers, only 17% focused on a mandated reading curriculum from a small publisher.

As many school districts began to shift to the CCSS, teachers in committees during 2013-2014 were working on realigning existing reading basal curriculums, or schools were adopting new commercial, CCSS aligned basal curriculums (Butterfield & Fennerty, 2014). A commercial basal was ready-made for teachers. For example, McGraw-Hill (2016) touts on its website, “Reading Wonders provides the instructional support and materials you will only find in a program that was created to teach the rigor, intent, and depth of the new Common Core State Standards.” Questions remain however. If the CCSS is mandated for all Washington schools, why do the West side teachers (urban districts) have such a wider variety of curriculum than the East side teachers (rural districts)? Does teacher choice, knowledge and expertise impact the curriculum decisions, or are school districts ‘playing it safe’ by selecting a teacher-proof reading basal curriculum that is “built upon a research-based instructional design with proven efficacy results” (Houghton-Mifflin Harcourt, 2016)?

For question #3: How many hours in a typical school day do you focus on teaching literacy? East side teachers were fairly evenly split between teaching literacy for 2-3 hours a day (34%) or for teaching a 60-90 minute block a day (32%). Twenty-three percent indicated that they teach literacy all day long, while 11% stated that they had no set time limit. In other words, teachers may teach literacy for 2-3 hours for one day, and 90 minutes the next day. West side teachers overwhelming indicated that they teach
literacy for 2-3 hours every day (69%). Twenty-six percent of the responses indicated that
teachers teach literacy for 60-90 minutes a day and 5% of the teachers indicated that they
teach literacy all day long.

A question the preservice teacher candidates asked was why the differing
instruction times? The differences could be connected to how teachers define literacy.
Do they define literacy as The Big 5 areas of Reading (National Reading Panel, 2000),
where literacy is broken down into discrete skills (phonemic awareness, phonics, fluency,
vocabulary, comprehension)? Teaching literacy for a 90-minute block was an ideal
recommendation coming out of the National Reading Panel report. However, in many
classrooms, a 90-minute reading block, or even less time spent teaching literacy produces
only 10-15 minutes of actual reading, or less than 20 percent of the allocated reading time
is spent reading (Allington, 2002). In the effective classrooms that Allington (2002)
studied over ten years, teachers with a much broader definition of literacy had children
reading for over half of the school day. Rather than holding a skill perspective of teaching
literacy, broader definitions may define literacy as what we want all students to know,
learn and do. In other words, literacy encompasses the knowledge and skills students
need to access, understand, analyze and evaluate information, make meaning, express
thoughts and emotions, present ideas and opinions, interact with others and participate in
activities at school and in their lives beyond school (Ewing, 2016). If teachers hold this
perspective, literacy instruction permeates the school day.

For question #4: If you could change something about the way in which literacy is
taught, what would it be? The overwhelming response from both East (56%) and West
(64%) side teachers was freedom. Teachers indicated that the adopted curriculum and
standards were too structured with no connections to student lives. Again, both East (23%) and West (21%) side teachers indicated that the pace of teaching with the CCSS was just too rushed. They responded that the pace needed to slow down. There was too much to teach for abilities and not enough time to teach. East (18%) and West (7%) side teachers stated that there was too much testing, while East (3%) and West (7%) side teachers indicated that there was nothing to change as their instruction hadn’t changed as the result of the CCSS.

It has been known for a long time that changes in teachers’ beliefs precede changes in their teaching practices (Bailey, 1992; Golombek, 1998). Top down sweeping mandates much like the CCSS and mandated new curriculums take time and sustainable conversations with professional development to have a successful impact in the classroom (Darling-Hammond, 1990). Teachers may resist or not see the benefits of change when they feel change is imposed by those who think they know what teachers should be doing in the classroom (commercial basal curriculums), and are in a position to tell them what to do (administrators & state mandates). Morimoto (1973) states

When change is advocated or demanded by another person, we feel threatened, defensive, and perhaps rushed. We are then without the freedom and the time to understand and to affirm the new learning as something desirable, and as something of our own choosing. Pressure to change, without an opportunity for exploration and choice, seldom results in experiences of joy and excitement in learning (p.255).

**For question #5: How has the Common Core State Standards changed the teaching of literacy for you in your class?** It was interesting to note that for the #1 ranking,
East side teachers (36%) stated that there were now specific skills to teach while West side teachers (38%) indicated that the CCSS had no impact on their instruction. For the number #2 ranking, East side teachers (27%) responded that the CCSS had not changed their instruction and 23% of West side teachers indicated that for their instruction the CCSS were too structured. There was more stress in trying to meet all that was expected. Both East (27%) and West (23%) side teachers indicated that with the CCSS there was much more testing involved. Ten percent of the East side teachers and five percent of West side teachers stated that the CCSS has raised the rigor in their teaching.

Some of the results from this last question seem to contradict the responses from question # 4. Preservice teachers were intrigued and wondered why, if a majority of the teachers wanted freedom from mandated curriculum and the CCSS, 27% of East and 38% of West side teachers stated that the CCSS had not change their literacy instruction. What could this mean? Could it mean that teachers were feeling generally dissatisfied with the CCSS and adopted curriculum and chose not to incorporate them in their teaching? Or could it be that teachers did not want to appear overly negative in their responses to the teacher candidates who were interviewing them?

The responses to question #5 also seemed to contradict the responses to a national survey of 500 teachers on their perspectives on the CCSS. Thirty-six percent reported that the new standards will influence their instruction “a great deal,” with another 44 percent indicating their classroom practice will change “somewhat” (Education Week Research Center, 2013).

Both East (27%) and West (23%) side teachers indicated that with the CCSS more testing seemed to have a larger focus than before the CCSS were mandated. As one
teacher stated, “Everything focuses on assessment.”

In a previous study of teacher perceptions of the CCSS (Butterfield & Fennerty, 2014), Washington state teachers seemed more positive about rigor where the CCSS “brings more critical thinking and helps prepare student thinking for what is ahead. Students will be better prepared for college & career, read more informational text, and have deeper knowledge” (p.7). Instead only 10% of East side teachers and 5% of West side teachers expressed positivity in that the CCSS raised the bar for students.

Conclusion

General findings seem to indicate that teachers have moved beyond the WA state timeline and are currently in Phase 4: Statewide application and assessment, and beyond. The CCSS are touted as a major advance not only because of their shared nature, but also because they represent a more rigorous set of goals than most individual states had previously adopted (Shanahan, 2013). It is said that the CCSS will change the climate of literacy instruction in the classroom. They will raise the bar by requiring complex text and close reading practices that will challenge children. The CCSS place the text – not the teacher - at the center of students’ negotiation of text meaning (Shanahan, 2013).

However, the findings from this study do not seem to support the goals of the CCSS as stated above. Teachers seem to have mixed feelings about the CCSS. Some are focusing on the CCSS as teaching goals and as specific skills, some are teaching literacy the way they have always taught literacy, and some are still focusing on the Big 5 Areas of Reading. At this time, for teachers in this study, there does seem to be a general dissatisfaction with the CCSS and literacy instruction as indicated by the responses from question #4. Perhaps the concrete realities of teaching with numerous factors such as
large classes sizes, varieties of student abilities, socio-economic status and languages spoken in the classroom, to name a few, don’t mesh with what looks good on paper policy.

**Further Analysis**

The original intent of this study was to gather the perceptions of practicing teachers to inform and inspire preservice teacher candidates. However, the data collected has been useful in helping preservice candidates connect theory and text-book learning to the practical applications of practicing teachers. Preservice teachers have been able to question, discuss, refine their own teacher beliefs as well as engage in reflective, critical analysis of curriculum, methods and materials for teaching literacy.

To further explore teacher perceptions of the CCSS and literacy teaching, additional questions could be added to the existing interview. The questions below could be added to further investigate teacher perceptions, but would also serve to broaden teacher candidate awareness of the CCSS and literacy teaching.

Such questions include: Where did you receive your information about the CCSS? How has the CCSS impacted the teaching of literacy to English as a Second Language students? If you had the freedom to teach literacy any way in your classroom, what methods and materials would you use?

Title: Teachers’ Conceptions of Mathematical Problem Solving: A Path to Teaching Secondary School Math for Understanding.

Topic Area: Secondary Education

Presentation Format: Paper Session

Description of presentation: This paper presents part of a research conducted in Nigeria to determine secondary school mathematics teachers’ conception of mathematical problem solving and how their conception is related to what they teach and how they teach mathematics through problem solving. The purpose was pursued through the following three research questions:

1. What are secondary school teachers’ conceptions of mathematics problem-solving?
2. What are teachers’ believes about how problem solving should be incorporated into mathematics lesson?
3. How do teachers teach mathematics through a problem solving approach and what type of problem do mathematics teachers typically present to their students?

Qualitative and quantitative data were collected by means of a questionnaire instrument and an observation coding sheet. The target population was secondary school mathematics teachers in two major states in Nigeria. A total of 226 mathematics teachers from 61 secondary schools participated in this study by responding to a seven-item open-ended questionnaire, thereby providing the data that were analyzed. Additional data were collected from 21 of those teachers who were selected and their teachings were observed to determine how much of problem solving characteristics they exhibit during their classroom teaching of mathematics.

The result showed that mathematics teachers have varied conception of problem solving with the most dominant ones in their order of magnitude being a process and procedure of solving mathematical problem, practice and working on exercise problems, dealing with unfamiliar situation, an instructional approach, and working on word and /or application problems.

The result showed that teaching mathematics through problem solving will entail teacher and/or students solving problems on the board, teaching students problem solving strategies, having a high involvement of students, Setting a class period aside for problem solving, and
allowing students time to struggle with problems on their own. Also the result showed that the most type of problems teachers assign to students in math classes are end of chapter exercises from textbooks, this is followed by application and word problems with the least type of problems being non-routine problems. The result also indicated that mathematics classrooms are teacher dominated with minimal student/student interactions since according to findings from this study teachers talk for about 85% of the time while students talk for less than 20% of class period. The final analysis is that Nigerian mathematics teachers should rethink about their mathematics classroom practices if they want to be teaching through problem solving.

Title: Teachers’ Conceptions and Approaches to Problem Solving: A survey of Nigerian Secondary School Teachers

Introduction: Ever since problem solving became topical in mathematics education in the 1980s, it has continued to play a fundamental role to the teaching and learning of mathematics as it has remained the focus of many research activities (Foland & Becker, 1988; Funkhouser, 1993; Buschman, 2003; Cai, 2010; Curcio, Curl, Artzt, & Sultan, 2013; Leatham, Lawrence, & Mewborn 2005; Lester & Charles, 2003; Schwartz & Curcio, 2013) over the last two decades.

Many studies have continued to show that teaching mathematics through problem solving is effective in improving students’ performance. More specifically, it has been documented that the more problem solving students are exposed to, the more confident and willing they are to solving problems and the more they continue to develop methods for solving future problems (Boaler, 1998; Cai, 2003; Lesh & Zawojewski, 2007).

In spite of its widely acclaimed relevance in the teaching and learning of mathematics, problem solving is still viewed and interpreted in different ways. Schroeder and Lister (1989) summarized the different perspectives people have of problem solving as they relate to teaching and learning of mathematics and he came up with three approaches that depict 1) teaching for problem solving which entails teaching a skill so that students can later use it to solve problems; 2) teaching about problem solving, which teaches students how to problem solve; and 3) teaching through problem solving which means that students are presented with real problems and they learn mathematics by identifying and learning the skills that emerge through the process. According to Reys, Lindquist, Lambdin and Smith (2015), problem solving
engages students in a task which the solution method is not eminent, but requires students to draw on their knowledge and by so doing, students will develop new mathematical understanding. This was the vision of problem solving as was outlined by the National Council of Teachers of Mathematics (NCTM, 2000) and echoed in the Common Core State Standards Initiative (CCSSI, 2010). Taplin (2009) outlined six specific actions that are paramount when teaching mathematics through problem solving as: (1) interactions between students/students and teachers/students; (2) mathematical dialogue and consensus between students; (3) teachers providing just enough information to establish background/intent of the problem, students clarifying, interpreting, and attempting to construct one or more solution processes; (4) teachers accepting right or wrong answers in a non-evaluative way; (5) teachers guiding, coaching, asking insightful questions and sharing in the process of solving problems; and (6) teachers knowing when it is appropriate to intervene, and when to step back and let the students make their own way. Taplin’s outline of actions indicate that in a typical problem solving classroom environment, the teacher is mainly a coach who provides guidance and encourages dialogue in the classroom through an appropriate and effective instructional pattern.

It is pertinent to note that teachers may have correct conceptions and perception but fail to communicate effectively to students because of their pattern of interaction in the classroom. This paper focuses on what how teacher view mathematical problem solving and how do they teach mathematics through problem solving. Over the past two decades, many curriculum reforms in mathematics education have centered around paying more attention to basic skills
and/or focusing on problem solving. It became more obvious later on that problem solving continues to gain more attention in many countries and across continents.

Over these years, considerable efforts have been made by Nigerian scholars to make problem solving the center of mathematics teaching and learning. Some studies have documented positive effects of teaching mathematics by following Polya’s (1957, 1962) four-step framework that involves 1) understanding of the problem, 2) devising a plan, 3) carrying out the plan, and 4) checking the reasonableness of the solution in different forms (Agwagah, 1993; Alio, 1997; Adigwe, 1998; Kolawole & Ilugbusi, 2007). In some cases, the studies emphasized teaching of reading and comprehension as a means of understanding the problem (Agwagah, 1993), while others focused on applying the entire Polya’s four stages (Alio, 1997), or teaching specific strategies (Adigwe, 1998; Kolawole & Ilugbusi, 2007). These studies focused primarily on identifying effective pedagogies but did not investigate the extent to which those at the center of the implementation are conversant with the approach. Therefore, the aspect of research that needs investigated in the efforts to improve students’ performance in mathematics through problem solving is the role of classroom teachers, more specifically, their understanding of problem solving. The classroom teacher is an important factor for any meaningful reform and classroom improvement since he or she is the pivot on which classroom activities rest, as he or she has direct contact with students (the learners). This implies that, as Griffiths and Howson (1974) noted, the success or failure of any innovation in education such as problem solving in mathematics ultimately hinges on the receptiveness and flexibility of the classroom teacher. The receptiveness and flexibility of the classroom teacher in relation to
problem solving in mathematics will depend on his/her conceptions and beliefs of problem solving.

It is important to note that students’ performance in mathematics cannot be improved by merely including problem solving in the secondary school mathematics curriculum or simply by recommending that teachers teach mathematics through problem solving. Rather, a significant positive change can be made by ensuring that students are properly engaged in mathematics context, situation, and are challenged through the presentation of non-routine problems. The teachers are there to guide them rather than prescribe what to do. These are the conditions that leverage students’ learning of mathematics successfully through problem solving. Thus, the locus for change resides in the classroom. If any meaningful change is going to take place, the culture of the classroom has to change significantly, and any classroom change must begin with the teachers (Hiebert et al., 1996).

The purpose of the study

This paper focuses on determining secondary school teachers’ conceptions and beliefs about problem solving and how these conceptions are related to how teachers teach mathematics in secondary school. The specific questions that this paper tried to address include:

1. What are secondary school teachers’ conceptions of mathematics problem-solving?
2. What are teachers’ believes about how problem solving should be incorporated into mathematics lesson?
3. How do teachers teach mathematics through a problem solving approach and what type of problem do mathematics teachers typically present to their students?
Methodology:

The study combined survey questionnaire and classroom observations to elicit information on teacher’s conceptions of problem solving and how much of problem solving characteristics teacher incorporate their teaching and learning of mathematics. The study was carried out in Anambra and Enugu states. These two states are considered to be few of the academically privileged states in Nigeria. Anambra state in particular has been ranked the best in secondary school performance according West African Examination Council (WAEC) results. Four education zones (two from each state) from these two states, were selected because they have major cities that are considered to be the most diversely populated cities in the two states; they also have the highest concentration of secondary schools and mathematics teachers and, as such, would have secondary school mathematics teachers who would be a good representation (in terms of academic qualifications, gender, and years of experience) of secondary school teachers in the two states.

The population for the study consisted of secondary school mathematics teachers in Anambra and Enugu states. A sample of 226 teachers was selected from a total of 850 secondary school mathematics teachers from 61 different secondary schools in two states. A multistage random sampling technique was employed for the selection of schools and subsequently the teachers who responded to 11 open-ended questions that elicited information on teachers’ conceptions and beliefs about problem solving. Specifically, these questions required teachers to describe their understanding of problem solving; how they integrate problem solving in mathematics instruction; what they do in mathematics classroom when they teach problem solving; their beliefs about how problem solving should be taught in schools. In addition to eliciting
information from 226 teachers who responded to the survey instrument, 21 of those teachers were selected and their teachings were observed to determine how much of problem solving characteristics they exhibit their classroom practices.

**Data Analysis and Results:**

**Research Question 1:**

What are secondary school teachers’ conceptions of mathematical problem solving?

To answer this research question, respondents were asked to describe their understanding of the phrase “mathematical problem solving”. Table 1 shows a variety of teachers’ conceptions of problem solving. By parsimoniously grouping through open coding of responses five distinct categories of conceptions were derived. Aligning each respondent to one category to identify the relative weight of the categories showed that the teachers identified most with “a process of solving mathematical problem” and the least with “word and/or application problems”. According to this result 73 (32.3%) respondents view problem solving as a process of arriving at a solution to mathematical problems; 54 (23.9%) see it as working on exercises, while 24 (10.6%) of teachers believe that problem solving is a process of getting out of a difficult situation. The remaining three themes that emerged from the analysis are that problem solving is an instructional approach, a way of teaching mathematics 22 (9.7%) respondents; or it is solving word/application problems 11 (4.9%) respondents. There were 42 respondents (16.6%) who provided no answer to this question or whose answers were not useable.

• Asking students to solve some exercise problems as a means of checking the desired objective or goal of the lesson  
• Expose students to problem solving exercises  
• Giving students some problems to solve in mathematics after which you mark and write corrections.  
• Exposing the students to problem solving exercises both to enhance and assess their understanding after teaching a concept in mathematics.  
• Involves the solving of problem associated with the topic one have delivered in the class  
• Practicing on the content covered in class  
• One of the methods used to assess the students after teaching a topic  
• Using formula learned in class to solve problems. | 54 | 23.9|
| Word and/or application problems           | This involves mainly solving textbook and application problems.  
• Using mathematics operations to solve application problems  
• Solving word or application problems                                                                                                 | 11 | 4.9 |
Research Question 2:

What are teachers’ beliefs about how problem solving should be incorporated into mathematics lesson?

To answer this research question teachers were asked to respond to the question “What are your beliefs about how problem solving should be taught in secondary schools?” Table 2 below shows that teachers’ responses to the open-ended question showed a wide range of beliefs. By clustering their beliefs into distinct categories, eight classes or categories of beliefs were achieved and by aligning each respondent to one of the eight categories to show the relative attraction of these categories showed the following patterns of beliefs: integration into instruction through appropriate steps and strategies (60 teachers or 26.5%); teach concept first, follow with real life practical examples from simple to complex (27 teachers or 11.9%); active student participation in a friendly environment (23 teachers or 10.2%); use of practice exercises (22 teachers or 9.7%); separate time on the time table (18 teachers or 8.0%); many solved examples (17 teachers or 7.5%); use of instructional materials (13 teachers or 5.8%); use appropriate teaching techniques (12 teachers or 5.3%); and problem solving should not be taught in schools (5 teachers or 2.2%). There were 29 teachers (12.8%) who provided no answer.

Table 2. Qualitative responses of teachers’ beliefs about how problem solving should be taught
| Use of practice exercises | • After teaching each topic, allow the students to try the exercises on their own. Collect and mark and emphasize on their mistakes.  
• By use of practical exercises, involvement of students in practice of solving problems.  
• Through the use of analytical process; Relate similar problem; use of practical exercises.  
• Always give exercise to students at each topic taught even the ones to teach.  
• My belief is that it must be taught through exercise solving in the classroom.  
• My belief is that problem solving should be integrated in math instruction and at the end more exercises be given to them.  
• It should be inculcated in the practice exercises. |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------|-------|
| Use of appropriate instructional materials | • You should have enough instructional materials  
• Problem solving should be taught by use of teaching aids by using concrete examples  
• 1) use of specified methods 2) use of available instructional materials 3) allowing the participation of learners  
• Problem solving should be taught in schools using some concrete teaching aids if available or improvise teaching aids.  
• Make use of concrete visual aids involve students while teaching.  
• t should be taught by employing the efforts of the students as well as effective use of teaching aids  
• By using teaching aids and giving the students enough problems  
• They have to provide instructional material which will help in problem solving. |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------|-------|
| Use of appropriate teaching techniques | • Using the appropriate techniques when teaching  
• This should be done using appropriate teaching techniques.  
• Problem solving should be taught in schools using the appropriate techniques in teaching.  
• My belief about how problem solving should be taught in schools is through the use of methods and techniques so that the teaching will be effective.  
• I believe that any problem solving followed with appropriate methods and steps should be learnt very well. |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------|-------|
| Active participation of students in a friendly environment | • It should be taught in groups and thus should allow active participation of the students and complete solution of a problem should not be provided to the students.  
• Explain the strategies and make it participatory.  
• Give students chances to come up with ideas use leading questions to direct them then practical problems on daily use.  
• Students should be involved more in problem solving.  
• To enable students to use their own words in relation to any problem solving in mathematics.  
• The students should be completely involved in problem solving themselves by giving individual assignments and group work.  
• Problem solving should be taught in schools by allowing the students find the best way to tackle a problem  
• Through peer learning; Through team teaching; Group teaching and learning |

| **Integration into mathematics instruction through appropriate steps and strategies** | • Give the students guidelines that would help them in solving problem  
• It should be integrated while teaching and make it part of the instructions  
• Problem solving should be taught in schools by explaining the concept step by step  
• Using problem solving instructional strategies e.g. Polya, Greeno etc. Teaching via problem solving  
• More emphasis on step by step (processes) solving of problems; Practicalising mathematics problems; Encouraging students to always interpret or restate problems the way they understand it using their own words  
• My beliefs are 1. to use the ways these authorities in mathematics tried to solve problems related to math. They include division Earp’s principles, Darhruns and Polya’s principles of problem solving. |
| **Separate time on the time table**                                    | • More time should be introduced into the mathematics school curriculum  
• Problem solving should be given a period of its own in the school timetable  
• Problem solving should be given a period in the time of the school  
• My belief is that more time should be given such as double period or more  
• A lesson should be set aside for problem solving after teaching the concept topic  
• Integrate mathematical problems solving in the time-table |
| **Many solved examples**                                               | • Many solved examples should be done in the class –Classroom platform test should be given to be solved under the supervision of the teacher – Constant take home assignments should be given to students  
• By use of practical examples – by involving students themselves in the problem solving  
• My belief is that problem solving should be taught using as many examples as possible  
• In that as many example the teacher uses to teach students will make it clearer for the students to understand. |
| **Problem solving should not be taught**                               | • I do not believe that problem solving should be taught in school as a topic because teachers have been solving mathematical problems using many strategies.  
• Problem solving should be taught as a general studies because it applies to day to day life of students and even teachers  
• By programming workshops and bringing people that have expertise knowledge in the subject to the teachers as well as students |
| **Teach concept first, followed with real life practical examples**     | • After having taught the students, break up the problems into little units and allow them fund solutions to them. Guide them later during revision or correction.  
• People who teach mathematics should make it interesting by relaying it to known issues of life  
• It should be linked to non-mathematical problems. But maths is easier because one links one topic to the other in order to arrive at the solution  
• Teach the aspect or branch of mathematics; What the question is all about; The |
Research Question 3:

How do Mathematics teachers teach mathematics through a problem solving approach?

To elicit information for this research question, teachers were required to answer two related questions that prompted them to “describe what teachers do in mathematics classroom when teaching problem solving” as well as to “describe how they integrate problem solving approach in their mathematics instruction”. Responses to these two questions constituted how teachers teach mathematics through a problem solving approach.

The result in Table 3 shows five distinct categories of things teachers do when teaching problem solving. Aligning each respondent to one of the five categories showed the following pattern of what they do: applying problem solving strategies (23 teachers or 10.2%), students engage in solving exercise problems (42 teachers or 18.6%), students’ participation in group work (14 teachers or 4.9%), teacher solves problems for students (20 teachers or 8.8%), catching up and solving problems from previous lesson (12 teachers or 5.3%). There were 11(4.9%) responses that could not be classified and 103 teachers or 45.6% did not respond to this question.

Mathematics teachers have considerable latitude in choosing the type of problems to present to their students during mathematics instruction. Teaching mathematics through problem solving takes into consideration the manner of concept presentation and types of problems presented to students in the process. To further determine how teachers teach mathematics through problem solving, teachers were required to indicate the type of mathematical problems teacher typically present to their students. Table 5 below indicates the types of problems teachers presented.

More investigation of how teachers teach mathematics through problem solving was carried out through classroom observations to determine pattern of interactions. The duration of time interactions occurred was coded for each of the 37 observations. The summary of the results are presented graphically in figures 1 and 2 below.
Figure 1. Pattern of interaction in a typical mathematics classroom

Figure 1 above shows that teachers’ lecturing and solving problem on the board takes more than half of class time period. Specifically, teachers lecture 33% of the class time and they solve problem on the board for 25.6% of the time. Following teachers’ solving problem on the board, for 12.5% of the time, the class time is silent or students are solving problems on their own. Also teacher asks questions 10.5% of class time, this is followed by students solving problems on the board which made up 6.1% of class time. Other interactions in order of magnitude are teacher discusses 3.6%, teacher answers questions 1.1%, students ask questions 0.9%, and teachers’ praises 0.6%. The last in this sequence are discussion among students 0.2% and students suggest idea 0.1%. In addition to providing the general interaction, the actual teacher and students talk time were analyzed and the result is presented in figure 2 below.
Figure 2 above shows that 37 classroom observations were done for a duration of 86699 (97.8%) seconds of class time. During these observations the total talk time was 75839 (87.47%) seconds of the observation time. Of all the total talk time, the teacher talked for 64515 (85.1%) seconds of the time while students talked for 11324 (14.9%) of the time.

Discussion and Conclusion

The major findings that emerged from the analysis of data collected are presented as follows.

Secondary school mathematics teachers have varied conceptions of mathematical problem solving and the most dominant conception is that problem solving is a process by which students work on textbook exercises which can be achieved by extensive practice and drill. Teachers also associated problem solving with working on word and or application problems. Very few teachers conceive of problem solving as an instructional approach and as way of dealing with an unfamiliar situation.
On the status of problem solving instruction in secondary school, close to 50% of respondents could not explain what they do with respect to problem solving indicating that they do not teach or integrate problem solving in their mathematics instructions. Teacher who reported that they teach problem solving said that they involve students in group work; give them ample time to explore, and discuss among themselves; and solve problems for students on the board to copy.

Results of classroom observations showed that secondary school mathematics classrooms in Enugu and Anambra states are teachers dominated. Analysis of interaction pattern showed that teacher lecturing, solving problems on the board, asking questions and silence in class when students worked on problems individually dominated mathematics classroom. The result showed that teachers talk for about 85% of class time while students talked for less than 20% of class period. For classroom instruction pattern, the result showed that teachers did not engage students in group work and classroom instruction was predominantly whole class instruction.

Just as was found in this study, other researchers have documented diverse teachers’ conceptions of problem solving. Whereas teachers conceptions of problem solving in this study fell into five categories, Grouw, Good, and Dougherty (1988) reported four categories, Jones and Jones (2011) and Xenofontos and Andrews (2007), reported three categories respectively, and Meier (1989) reported two categories. The result of this study is in congruent with the literature in categorizing problem solving as a systematic approach to overcome a difficult situation (Montague, 2004; Owen & Fuchs, 2002; Holton et al., 1999); an instructional approach
that teachers can employ in teaching science and mathematics (Dancy and Henderson, 2007; Devlin, 2006; Barak & Shakhman, 2007); a process of solving word or application problem (Grouw, Good, & Dougherty, 1988; Meier, 1989; Xenofontos & Andrew, 2007; Jones & Jones, 2011); and a process of finding solutions to a problem (Grouw, Good, & Dougherty, 1988).

However, conceptions of teachers in this study differed with those reported in the literature by overwhelmingly reporting that problem solving is working, practicing or drilling students on textbook exercises. Also, respondents in this study did not view problem solving as the use of higher level thinking and critical reasoning skills to solve multiple step problems. The big picture here is that many secondary school teachers view problem solving as working on textbook exercises using algorithms and basic skills with numbers. Whereas it is important to expose students to basic computational skills with numbers which they can apply to a variety of everyday use and also use as a foundation for higher level mathematics, today’s mathematics students need more than computational proficiency, they need critical skills and a better understanding of problem solving skill embedded in mathematical ideas and principles to function in today’s work place. Therefore it is bothersome to see the many secondary school mathematics teachers who conceive problem solving as a practice or drill on exercises. This conception needs to be addressed because if teachers view problem solving as merely practice or drill on exercises it then means that students are only exposed to routine type problems which may not help their critical thinking rather it may encourage rote learning and memorization. Having correct conceptions is the beginning of teacher preparation because wrong conception can easily lead to wrong ways of teaching.
As important as correct conceptions are, they can be influenced by teachers’ beliefs about how problem solving should be taught. Teaching methods can affect the results of learning, and teachers’ beliefs about teaching methods can determine how instruction is delivered. Thus, respondents’ beliefs in this study were accorded high significance especially when many teachers as presented in Table 2 expressed their beliefs about how mathematical problem solving should be taught in schools. Teachers believe that problem solving should be integrated into mathematics instruction through appropriate steps and strategies, involve active participation of students, teach concepts first and followed with real life practical examples, devoting a separate time for problem solving, and solving many examples

Results presented in Table 4 indicated that some teachers integrate it into mathematics instruction in several ways such as, having teachers and/or students solve problems on the board, teaching problem solving strategies, and having a high involvement of students in classroom activities. High involvement of students may comprise giving them time to explore, discuss among themselves, think about answers to a problem or even express their ideas in class, which were approaches that many teachers agreed with. Nonetheless, these reported teachers opinions were contradictory to classroom observation results presented in figures and 1 and 2 which did not reflect the fact that students are given time to explore and discuss among themselves. It is then not surprising that this study did find relationship between teachers’ conceptions and beliefs and what they do in the classroom. The overall picture here is that problem solving is not given adequate attention in the schools, starting with many teachers not setting aside time on their class schedules for problem solving and equating teaching mathematics through problem solving to teachers and/or students solving problems on the
board. This study confirms the claims that problem solving is not taught in Nigerian secondary schools (Ogundare 1992; Adeleke 2007; and Kolawole & Ilugbusi 2007). A low status of problem solving in schools would not augur well, as popularity is supposed to accord with better and more effective uses of approved problem solving methods and strategies. It will be commendable to have more teachers set aside specific times on the class schedule for teaching problem solving.

There are many types of problems to use in illustrating the principles and methods of problem solving in the mathematics classroom. The teachers reported end of chapter exercises or examples from their textbooks as the most commonly used problem types, ostensibly reflecting easy availability rather than best choice. Not surprisingly, application problems came next, thereby supporting the view that concrete examples and strategies that use real life examples are preferable to abstract and hypothetical references, lending further credence to the view that real life examples and concrete strategies are better. Generally, teacher reported that they do not present non-routine problems to students. Non-routine problems are the types that help students to develop their critical thinking and analytical skill. The clear picture that emerged showed problem types to come from end of chapter exercises and application problems from the textbook. Teachers should rethink and vary type of problems they present to students in mathematics classes.

The dynamics of teaching plays a critical role on how much students learn in every classroom instruction. Although students’ performance may not have a direct link to teachers’ interaction and instructional patterns, nonetheless, a combination of these patterns determines the level
of students’ classroom participation all of which leads to classroom social environment that may have a direct effect on students’ attitude and achievement. The clear picture that emerged from this study is that mathematics classrooms are teacher dominated. In terms of the number of interaction that takes place in the classroom, the teacher’s activities constitutes about half of the total activities. However, in terms of the amount of talk time exhibited in mathematics classroom, teacher’s talk time takes about 85% of total talk time which is more than two-third rule found in other studies (Flanders, 1967; Inamullah et al., 2008). In terms instructional pattern, whole classroom instruction dominated mathematics classroom with absolute no room for group work and little individualistic (Okebukola, 1984) or individual seat work.

This study has found noteworthy variations among teachers’ conceptions and beliefs of problem solving. Even though many of the conceptions are correct, while some are incorrect; the fact is that what these teachers know and believe in is not reflected in what they do. It is, therefore, unlikely that students are graduating from our secondary schools with the ideal problem solving abilities. For instance, although teachers believe that students should be taught problem solving strategies, it is reported that problem solving is not yet integrated in mathematics instruction in Nigeria. This finding could suggest that either the teachers are not familiar with how to integrate problem solving in mathematics instruction or enough time is not provided in the school time table for them to be able to teach problem solving in mathematics classes. Also, that teachers are not familiar with how to integrate problem solving in mathematics instruction, would imply that their training was deficient in this area.
This study also has some implications for curriculum developers and textbook writers. Teachers believed that problem solving strategies are emphasized in secondary school curriculum, and that if problem solving strategies are included in secondary school mathematics textbooks, many of them (teachers) will teach it. This implies that there are no set standards on how to integrate problem solving in mathematics instructions. This is the work of curriculum developers and textbook writers who should flesh out what it means to teach mathematics through problem solving. It is not enough to mandate teachers to teach children how to solve problems. Curriculum should be very explicit to ensure that all teachers have common conceptions of problem solving.

It is obvious from the result of this study that many teachers did not understand problem solving as a way of thinking, thus those teachers may not likely teach students how to think for themselves. This study has a contribution in the psychological dimension as it helps in the understanding of teachers’ knowledge of problem solving and how their knowledge is related to what they teach and how they teach. The study, therefore, may provide information that can lead to in-service training that will be targeted at modifying teachers’ problem solving behaviors in terms of how they teach mathematics.

Result of this study showed that the secondary school mathematics classroom instruction was teacher-dominated with the teacher talking for about 85% of the total talk time in the class while students’ engagement was only for about 12% of class time. This shows that even the two-third talk rule does not apply in our secondary school mathematics classroom
thereby suggesting that teachers may have not been exposed to how to teach mathematics through problem solving which emphasize child-centered instruction.

Title Page

A. **Title:** Breaking the Gender Barriers and Minority Involvement in STEM Education through Elementary teaching and learning

B. **Topic Area:** STEM Education

C. **Presentation Format:** Workshop

D. **Presentation Description:** This presentation will expose elementary-aged minority girls to Science, Technology, Engineering and Mathematics (STEM) education.

   Professional development is important for elementary teachers to increase their comfort level and competence in teaching STEM education, as research shows that these teachers typically do not receive enough preparation in teaching mathematics and science.

   Participants will be shown creative ways to integrate STEM lessons/activities into their existing curriculum, and STEM enrichment activities to support classroom instruction in after-school programs.

   Crumpg2@yahoo.com
The overall purpose of this presentation is to expand STEM education that leads to career opportunities for underrepresented groups, specifically women and minorities. In particular, the focus of this presentation is to increase elementary-aged minority girls’ participation and interest in STEM education and careers, by providing elementary educators and school leaders with innovative ways to integrate STEM into their daily existing curriculum during the school day, as well as STEM enrichment activities to support and enhance classroom instruction in after-school programs and/or activities.

This workshop will focus on three over-arching themes. The first is being able to provide engaging STEM focused lessons/activities that can be incorporated into any kind of elementary curriculum, to support regular day classroom instruction, as well as after-school programs. Second, to provide activities that will increase the comfort level of the teacher to teach mathematics and science within the curriculum that is already established. Last, provide avenues of a more engaged interest among minority and female gendered students to develop a love for STEM, at an early age, with the hopes of providing more minority women into the STEM fields of education careers later in life. Thereby, the true goal of this workshop is to close the achievement and participation gap; a goal that aims to increase women and minority participation and interest in STEM fields, in order to tap into the country’s full potential.

**Workshop Overview**

Participants will engage in a highly interactive presentation including a video presentation and hands-on activities. Audience participation will be essential to the success of the workshop. Participants will leave the workshop with resources and activities that may be implemented immediately into their practice.
Learning Disabilities: Improving the Spelling Skills using Apps on the iPad

Linda Chmiliar
Athabasca University, Canada

Abstract

The iPad is currently being used by students in many North American schools for learning and research data on the effectiveness of this device as a learning tool for students is documented in the literature. However, less data is available that examines the use of the iPad with student with disabilities, particularly with students with learning disabilities. This paper presents findings of a study exploring the use of Simplex Spelling apps on the iPad in two classrooms of middle school students with learning disabilities. The results indicate that the apps were very effective in helping students to develop spelling skills.

Introduction

This paper presents findings of a study exploring the use of Simplex Spelling apps with students with learning disabilities in two middle school classrooms specializing in the instruction of students with learning disabilities. The participants were 23 grade 8 students with learning difficulties in language arts. The students used the Simplex Spelling apps on the iPad for 10 -15 minutes a day, for approximately 1 -2 days a week, for 18 weeks. The student’s spelling skills were assessed at the beginning, and end of the study. The study focused on the use of Simplex Spelling Phonics 1 and Phonics 2 apps however, several students who completed the Simplex Spelling Phonics 2 app were able to move on to the Simplex Spelling Phonics - Advanced app during the study. This short paper provides a brief description of the study and the results.

Background

The use of mobile technologies such as the iPad are becoming increasingly more common, and many schools utilize these technologies in the classroom to facilitate learning. There are several benefits to the use of the iPad. They are smaller, thinner and lighter than a conventional laptop, making them highly portable. The touch screen is naturally intuitive, requiring little training and practice to master, and can be easily viewed from most angles. This device also has a quick start-up time, and extensive battery life, permitting the user greater access to the technology (Pyper, 2011). Additionally, Kukulska-Hulme (2013) indicate that the availability of the iPad makes it “cool” for students to use, promoting higher participation in learning tasks. Learners with learning disabilities may benefit from the use of mobile technologies as a learning tool, by becoming more independent learners, as well as learning academic skills. Due to the possible benefits, it is important to research the use of iPads with students with learning disabilities. This study examine how spelling apps focusing on phonemic awareness on the iPad, can support students with learning disabilities in the classroom.
Method

The central question for this research study was:

What improvement in spelling skills do the students display while using Simplex Spelling apps over an eighteen week period of time?

Twenty-three grade eight students, in two separate classroom groups, and their teacher participated in this research. The Simplex Spelling apps are series of apps that progress from simple to complex phonetically based spelling practice.

This qualitative research study that employed an observational case study design. The study consisted of an in-depth exploration of a specific bounded system of two classes of grade 8 students (23 students total) using the apps on the iPad. The students used the apps for approximately 10 – 15 minutes on one or two days a week over an 18 week period of time. This study used document review and analysis, observation, and interviews as data-gathering techniques. The document review consisted of a spelling test completed by the students at the beginning and conclusion of the research. Observations of the students using the apps occurred on a weekly basis. Informal interviews occurred with the students in the classroom as they were using the apps to see how the students were using the apps, and to ask the students what they thought about their learning as they used the apps. A semi-structured interview was conducted with the teacher at the beginning and conclusion of the study.

The purpose of case study was to gather comprehensive, systematic and in-depth information. The case study consists of all of the interview data, observations of the students, and the spelling assessment of each student before and after the study. The data was organized into a description that includes all of the major information that was then edited, parts fitted together, and organized topically. This short paper only reviews a small portion of the data set, focusing on the major findings.

Results

Overall, the spelling test results indicate that the students evidenced a very strong increase in spelling skills during the research. The average grade level change in the spelling performance of all the students involved in the study over the 18 weeks was 1.9. The spelling performance change ranged from 0 grade levels to a change of 4.4 grade levels. The greatest change in spelling performance was evidenced by the students scoring the lowest scores initially.

The students expressed some concerns about some elements in the apps. Several student had difficulties understanding the verbal cues in the app despite the use of headphones. It was also observed that several of the students had a tendency to skip through the spelling items on the apps. Reminders were provided to help students work through the apps in a consistent fashion. A couple of the students went through the spelling on the app as quickly as possible. They did not use the hints, did not sound out the words, and appeared to be not focusing in on the word patterns that were presented. Even though the students were encouraged to make use of the learning strategies structured into the apps, several students failed to use these strategies for the majority of the study. A few difficulties were experienced with the placement and function of the letters. Some students had difficulties with the letter
placement initially, but indicated that once they learned where the letters were that it got
easier. Others students had continuing difficulties with the touch on the letters.

Student comments regarding the use of the app were very positive. The students reported
that they really liked using the app for their spelling practice and many students expressed a
preference for working on the iPad, indicating that it was fun and easier to learn with
technology. One student even indicated that he would like to work on his spelling for
homework. For most of the students, the navigation through the app appeared to be quite
intuitive. After the first few weeks, the majority of the students worked on the apps
independently. Even the students in the study with significant attention deficits were able to
sustain attention while working on the apps in the classroom. Observations in class, showed
that many of the students used the hints provided and listened to the sentences to understand
the words. One student said, “The sentence is really helpful because sometimes words sound
the same but aren’t spelled the same.” Other students commented that they were picking up
the patterns in the words as they practiced and they found that the number of boxes provided
made it easier to know how to spell a word. Several students also commented that they relied
on the color change of the letters that showed when the word was incorrect. This provided
them with instant feedback and the opportunity to change their response immediately.

The teacher in this study indicated that she liked the apps as they allowed all of the
students to progress through the apps at their own level and pace. The teacher also indicated
that she liked the organization of the apps and the emphasis on phonemic awareness. At the
conclusion of this research study the teacher was very surprised at the spelling achievement
of both her classes of students and reported that the results were “well above” what she would
normally expect.

Discussion and Conclusion

The Simplex Spelling apps are series of apps that progress from simple to complex
phonetically based spelling practice. This range of spelling words at different levels from
grade 1 to middle school level, makes this app series very attractive to teachers who are
working to meet a diverse range of student needs in the classroom. The apps could help
teachers provide individualized spelling practice to students spelling at different levels in
their classrooms. The apps also allow students to work independently at their own pace.

Students enjoyed using the apps and found them “cool” and “fun” to use. They were
motivated to use the apps and engage in their weekly spelling practice. Students expressed
interest in using the apps more, and several students indicated that they would be willing to
practice their spelling at home for homework. The students worked independently on the app
in the classroom and students with significant attention difficulties were able to work on the
app with minimal direction. Students reported that they liked the built in features in the apps
and found that they supported learning. These features would not be available with traditional
spelling practice. In addition, the results were obtained in busy classroom, not a clinical
setting. Although the teacher had some initial support to set up the research project, the
monitoring and supervision of app use was primarily done by the teacher. This would seem to
indicate that the applicability and usefulness of this series of Simplex Spelling apps in the
average inclusive classroom to support students is very good.

Affective Confusion: 
A gateway to academic performance or learning anxiety

E. Woodruff, Zhenhua Xu, Stephanie Buono, Rose Schable, Matthew Moreno
OISE/University of Toronto

Real-time measurement of facial expressions can be used to improve academic performance with higher levels of engagement through the real-time monitoring of student emotions—emotions that Pekrun et al. (2011) have directly linked to academic learning, classroom instruction, and achievement. These emotions include enjoyment, hope, pride, relief, anger, anxiety, shame, hopelessness, and boredom. Our goal is to understand the different ways emotion may be impacting engagement and self-regulation of learning. One means, that could potentially have the greatest effect on engagement and self-regulation, is by making learning an enjoyable experience even when the material is difficult. Another means would be to help students manage their learning anxiety; for example, using the technology to help students overcome math anxiety. Finally, another way academic emotions may be impacting engagement is through mounting confusion resulting from low knowledge or misconceived ideas.

For decades now, researchers have been motivating students and promoting conceptual change, with varying degrees of success, by presenting them with conflicting information and theories to promote deeper learning (c.f. Chi, Slotta, & De Leeuw, 1994; Chan, Burtis, & Bereiter, 1997). We can now look at some of this research on conceptual change and knowledge building and observe that creating confusion and a state of cognitive disequilibrium can produce deeper learning (D’Mello, Lehman, Pekrun, & Graesser, 2014; Leutner, 2014) in some instances.

D’Mello, et al., (2014) suggest, however, that there is a zone of optimal confusion that requires the duration of the student’s cognitive discrepancy and the severity of the discrepancy be neither too high nor too low—a level of affect we are referring to as a Goldilocks zone for confusion. In this paper we look at some preliminary work conducted in our Emotions and Learning Optimization lab and examine the role of confusion when it is within and outside the zone of optimal confusion.

Study 1 examined the relationship between task difficulty and real time math anxiety. Five instruments were applied to gather information on 12 university students’ math learning and the emotions experienced while performing math tasks in a repeated measures design. Measures recorded were: (1) an adapted version of the Mathematics Anxiety Rating Scale Questionnaire- Revised (MARS- R) (Plake & Parker, 1982), which was used to measure the level of anxiety participants generally experience during math related tasks, on a Likert-scale from 1-5. (2) A self-report measure of task difficulty was
used to group 12 math questions into easy or difficult categories. These binary ratings were used to devise a six-item math test, with three items randomly chosen from the participants’ easy ratings, and three items randomly chosen from the participants’ difficult ratings. (3) The math test devised from participants’ difficulty ratings was used to measure performance on a math task. (4) Self reported math anxiety experienced during the math test was rated using a 5-point Likert scale, with answers ranging from 1 (No Anxiety) to 5 (Extreme Anxiety). (5) Emotional expression was measured while the participant completed the math test, using real-time facial expression monitoring software, Emotient (iMotions). \(^1\)

The results examining task difficulty revealed that three of the seven emotional expressions exhibited during the math test were significantly different as a function of task difficulty—Cronbach’s alpha on task difficulty inter-rater agreement was 0.91. Significant differences were found in anger \([t(11)=-3.15, p=0.01]\), confusion \([t(11)=-2.26, p=0.05]\) and frustration \([t(11)=-3.54, p=0.01]\). These results indicated that while completing questions rated as difficult, participants scored significantly higher on expressions of anger, confusion and frustration. The effect sizes for the differences in emotions on easy and difficult items demonstrated a large effect for anger \(d=0.91\) and frustration \(d=1.02\), and a medium effect for confusion \(d=0.65\).

Within the easy and difficult items, test scores were significantly higher on the questions rated as easy \([t(11)=3.53, p=0.01]\) and the anxiety participants experienced during the math test showed higher ratings of anxiety on difficult items \([t(11)=-2.51, p=0.03]\). Items rated as difficult were further explored to understand the relationship between anxiety and emotions experienced during the math test. Within the difficult items we observed, at times, an increases in both anger \((r=0.89, p=0.04)\) and confusion \((r=0.95, p=0.01)\) and on some items an increases in anger \((r=0.74, p=0.04)\) and confusion \((r=0.73, p=0.003)\) indicating that the increased anxiety participants reported was significantly related to increases in anger and confusion as evidenced on their face when answering this item.

Although our results are only preliminary, they suggest that the combination of affective confusion and anger may be instrumental in developing and sustaining learning anxiety. Task difficulty plays a major role in differentiating the effect of confusion on learners. It appears as though difficult tasks induce higher levels of confusion compared to easy tasks. Learners who are not able to resolve their confusion begin to enter a state of cognitive disequilibrium. Consistent with the findings of D’Mello, et al., (2014), it is our conjecture that when students experience unresolved confusion over an extended period

---

\(^1\) The Emotient iMotion software uses the Facial Action Coding System (FACS) developed by Ekman & Friesen (1978) to measure the musculature movement in the face at 19 different Action Units (AUs) and codes these action units into scores for the seven basic emotions (anger, frustration, joy, surprise, fear, disgust, and contempt). Facial Action Coding System (FACS), and labels each element of a facial expression with 19 numbered Action Unit (AUs) that correspond to the activating facial muscles.
of time this effect creates fear and, eventually, the fear leads to anxiety. This state of anxiety heightens fear, frustration and anger resulting in reduced learning performance. Anxiety in this situation becomes an inhibitory emotion and further prevents a learner from returning to a state of cognitive equilibrium from where they can sufficiently regulate their affective response to their learning task and improve their performance. Indeed, this is one of the negative effects that can be experienced when there is too much confusion for too long of a time; that is, when confusion extends beyond the affective Goldilocks zone. Optimally, students need a controllable level of confusion to ensure that they are in an aroused state and can deliver their optimal performance. If students are able to control their response to confusion, by minimizing its negative properties that lead to anxiety, they stand a greater chance to improve their performance.

**Study 2**, addresses part of the thesis work conducted by Stephanie Buono where she investigated the effect social cognitive understanding and task frustration and can have on performance in emerging readers. Participants were 6-9 year-olds (N=22) that were asked to tell a story about a wordless picture book. During this task, Emotient software recorded facial musculature movement to produce a rating for each of the seven basic emotions. The following measures were collected: *Demographic Questionnaire* to measure parent-reports about the child, the family environment, and family attitudes towards language and reading; *Emotional Expression* measured real-time facial coding; *Narrative Competence* was measured using coded narratives produced from the wordless picture book “Frog where are you?” (Mayer, 1969); *Emotion Comprehension* was coded from children’s narratives, using coding scheme adapted from Peterson & Slaughter (2006); and, *Vocabulary* was measured using the NIH Toolbox Picture Vocabulary Test (TPVT) to serve as a control variable.

The relationship between understanding emotion, emotional expression, and narrative competence was examined using a correlational analysis and a hierarchical regression analysis. Three AUs were significantly related to emotion understanding, AU14, the dimpler (r = -0.47, p = 0.03), AU 24, the lip pressor (r = -0.45, p< 0.03), and AU28, the lip suck (r = -0.53, p = 0.01). These AUs matched three out of four AUs in incidence and direction that were also related to overall narrative competence. Further, a hierarchical regression model with three predictors demonstrated that emotion understanding was a significant predictor of narrative competence, over and above the effects of emotional expression [F(1, 15)= 8.4, p= 0.01 -Adjusted R² =0.68].

Early results from this study demonstrate that emotional expressions indicating frustration or tension during a narrative task can indicate negative performance in emerging readers. These findings align with research on the relationship between emotion and cognition and suggest that not understanding the emotions in the picture story generates confusion. Not being able to resolve the confusion is then expressed as frustration and tension, which we conjecture, is an early manifestation of what happens when student confusion exceeds the affective Goldilocks zone limits.
Study 3, emanating from the dissertation work of Zhenhua Xu, examines student emotions in a computer game called CRYSTAL ISLAND (a 3D microbiology narrative game). A facial expression recognition system was used to detect both middle school and university students’ (N = 65) facial movements while they were working on the problem-solving and scientific-reasoning tasks with CRYSTAL ISALND. Two questionnaires were administered to obtain students’ background information including age, gender, ethnicity, year of school enrollment and prior knowledge on life science. Multi-channel process data was collected while participants played the 3D narrative game and they were: 1) software log files and (2) real-time participants’ facial data using the webcam video and Emotient software. The log-file data captured students’ interactions with the game environment including timestamp and action type (e.g., reading books, completing questions in the concept matrix and making a final diagnosis). This study first used R software to track the frequently occurring emotions and facial action units from the raw output generated by the facial expression recognition software. Following that, linear regression models were constructed to examine the predictive effects of frequently occurring facial action units on learning performance. The findings indicated that outer brow raising (AU2) was a strong predictor of the number of questions in concept matrix that were answered incorrectly (R2 = .11, F(1, 57) = 6.00, p < .05) and the number of answers corrected (R2 = .16, F(1,57) = 9.18, p < .05) and the number of attempts students made before submitting the correct answers to the system (R2 = .09, F(1, 57) = 4.82, p < .05). Results from correlation analyses also suggested that students with little prior knowledge of life science tend to experience negative emotions such as eyelid tightening (AU7) and mouth dimpling (AU14). These findings parallel to the previous studies on emotions and agent-based learning environment (c.f. Grafsgaard, Boyer & Lester, 2011). In the past research, AU2 was identified to be associated with frustration, surprise and anxiety (D’Mell & Graesser, 2010; Grafsgaard, et al. 2013). When an individual is confronted with obstacles (e.g., consistently to correct wrong answers in the concept matrix) and does not know how to proceed, s/he is more likely to experience negative emotions (e.g., frustration). Studies on facial expressions and deep learning also indicate that both eyelid tightening (AU7) and mouth dimpling (AU14) are correlated with confusion and concentration (D’Mell & Graesser, 2010). This study highlights the potential for large-scale analyses of moment-by-moment affect in game-base learning since automated facial action unit tracking allows for close examination of persistence cognitive-affective states.

Crystal Island is a well-designed game where the designers are aware there is a zone of optimal confusion that is sensitive to prior knowledge. Study 3 suggests that, when carefully designed, confusion can be a positive element in deep learning if the confusion remains within the optimal zone and that overall, too much or too little arousal/stress could potentially tip confusion levels outside the optimal zone.
Finally, in a study examining emotion and the optimal learning zone (Schnabel, 2016), psychophysiological measures were used to capture emotion during a cognitive load task. The participants were 14 volunteer staff members at an athletic and academic coaching centre. In this preliminary study Galvanic Skin Response (GSR) was observed and analyzed while participants participated in a 3-dimensional perceptual cognitive task, the Neurotracker. This game is a 3D multiple object tracking at increasing difficulties to develop high-level brain functions critical to learning. Each session (six minutes long) delivers a series of 20 mini-tests/games (14 seconds each) where the student needs to remember key targets, then track them moving among distractors for several seconds and then identify them. The game provides constant cognitive load since it adaptively optimizes task difficulty to each participant's level, maximizing cognitive stimulation for the 14 seconds of each game. Difficulty and challenge, changes each game so that the game automatically adjusts itself to the individual's performance of the penultimate game. This allows for observation of autonomic responses (i.e. GSR) during individualized cognitive load and optimal levels of confusion during win versus an increased confusion in games they lost. For the purpose of this study win games represent optimal cognitive performance.

A Repeated Measures ANOVA analysis of the win/lose scores revealed statistically significant differences in GSR change scores during the 14 seconds of the game, (p < 0.001). An increase in GSR scores was observed for the first 7 seconds, followed by a decrease in the last 7 seconds within winning games. Observation of GSR scores that increased in the games’ first 7 seconds and that did not decrease or that continued to increase in the last 7 seconds of the game, resulted in game loss (i.e. decrease in executive function and an increase in confusion). Spontaneous statements from participants indicated self-reports of “feeling lost” “feeling confused”. These finding align with D'Mello's model of optimal confusion zone. The win games are a representation of optimal increase of emotional arousal that generates optimal levels of confusion within the optimal performance zone. This is similar to the pattern of the Yerkes Dodson’s optimal zone of arousal and Demello’s optimal zone of confusion. Too much arousal can tip confusion out of the optimal zone and ultimately reduce access to the zone of optimal executive functioning and learning.

**Discussion and Conclusions**

D’Mello et al., (2014) have modeled the optimal zone of confusion wherein, when engagement is low, the confusion remains unresolved and, when the confusion increases, the student becomes frustrated. Persistent failure, when the student is frustrated results in
boredom. This model is highly consistent with Csikszentmihalyi’s (1990) theory of flow. It also finds support in the U-shaped Yerkes-Dodson Law (1908) of emotional arousal\textsuperscript{2}.

It is our conjecture that when confusion persists, unresolved, over multiple learning episodes the emotions of anger and fear promote anxiety in the students. Our early work with math anxiety reveals that students experience anger when working on their difficult questions. This suggests that confusion may be involved in a more sinister affect than boredom. In the affective Goldilocks zone model, an outcome of long unresolved confusion can be learning anxiety. At this point, the evidence for the affective Goldilocks zone model is extremely thin, but the implications of the model are far-reaching and important. If the model is correct, then the following research questions become critical to answer:

1. Can we identify when confusion is moving the student outside the optimal zone for confusion?
2. For students already suffering math anxiety, can reducing the anxiety, and the frustration, move the student back into the optimal zone for confusion?
3. Can students learn to monitor and self-regulate the level of confusion with feedback and meta-cognitive strategy training?

Further study is needed to strengthen the affective Goldilocks zone model and begin to address the above questions.

References

\textsuperscript{2} The congruence of these two theories is being investigated in our lab by Rose Schnabel (2016).

Abstract
The following paper will discuss survey results collected from nursing and engineering students at a Southern New Mexico Hispanic serving institution. The purpose of the study is to determine if female minority nursing students in a program where advising is structured have a higher GPA in comparison to their peer female minority students who are majoring in engineering in a program where advising is not structured. The survey encompassed open and close-ended questions which cover demographics and student success initiatives in both disciplines to identify how two different advising systems affect female minority students in nursing and engineering disciplines. The survey was designed to evaluate variables regarding the impact structured advising has on student success and persistence in engineering or nursing degrees. The survey results were significant utilizing a Spearman $r$ correlation test, proving the positive impact of a structured advising system in the school of nursing in comparison to the unstructured advising system in the college of engineering.

Longitudinal Impact of a STEM Professional Enrichment Program on Middle School Teachers

Rhonda Christensen
Gerald Knezek
University of North Texas, USA

Abstract

The longitudinal impact of participating in a STEM professional enrichment program is examined in the context of data collected over the past six years as well as the number of years teachers have participated in the program. Findings include that teachers who have participated in the program seven or more years have higher dispositions toward STEM indicators as well as higher technology integration means compared to teachers who have been in the program fewer years. Implications for teacher professional development for STEM include the need for a sustained program that includes professional development, tools for teaching in the classroom and the technical support to assure success in the classroom.

Introduction

For decades, researchers have studied the influence of teachers on their students and have concluded that teacher effectiveness is the most important factor in student achievement (Darling-Hammond, 2000; Hattie, 1987). Recently, researchers have studied factors that increase student participation in STEM subject areas and have identified highly qualified teachers as a critical element for student success in STEM subjects (Museus, Palmer, Davis, & Maramba, 2011). Even students who are high STEM achieving students recognize that it is critical to have a high quality teacher in the classroom in order to improve STEM education in schools (Christensen, Knezek, & Tyler-Wood, 2014). Teacher dispositions have also been shown to have an impact on student dispositions (Christensen, 2002) and therefore it is important that teachers have positive dispositions toward the subjects they are teaching their students.

Many programs currently focus on improving the STEM pipeline by preparing both teachers and students in engaging activities aimed at creating and increasing interest in STEM careers. In this paper, the focus is on teacher development and the impact of focused, ongoing science and technology training and support for teachers, on the teachers’ perceptions of their own preparation and enthusiasm for their professional roles.

Literature Review

Multiple components are important for improving learning in the classroom. Teachers must be competent and confident in their teaching and they must be supported with the necessary resources, including human support.

Quality teacher professional development is one of the most important components in achieving the goal of learning. One of the main findings from a study of
professional development with a framework provided by the National Staff Development Council was the need for systemic professional development programs that occur over time rather than one-time workshops and seminars (Harwell, 2003). Researchers have demonstrated that teacher quality is dependent on effective and ongoing professional development (PD) opportunities (Desimone, 2009). The learning environment, especially regarding technology, has changed in the last decade and teachers who have been in the classroom for many years may not have the PD support needed to transform their practices to meet the needs of the newer learning environments (Johnson, 2013). In addition to quality professional development, access to tools/technology and support are also critical components in the successful implementation of STEM programs in schools. Teachers should be challenged beyond their comfort level while being provided with the resources and support necessary for success (Jeanpierre, Oberhauser, & Freeman, 2005).

Research has shown that the successful integration of technology into the classroom can increase student achievement as well as support students’ self-regulated learning skills (Bates, Hopkins, & Kratcoski, 2012; Minor, Losike-Sedimo, Reglin, & Royster, 2013).

The Study

This study examined characteristics of STEM educators in Hawaii and the impact of a program longitudinally. The study was guided by the following research questions:

1. What is the impact of providing STEM professional development, tools and support personnel resources to middle school teachers?
2. To what extent do teachers who have participated in a sustained STEM program over time differ from teachers who are new to the program?

Methods

Participants

Responses were received from 95 teachers in May - June 2016 for the Hawaii Pre-Academy project. Surveys administered to Hawaii teachers contained questions about participant activities, perceptions of the impact of the program, level of technology integration, and attitudes toward science, technology, engineering, mathematics as well as STEM careers.

The STEM Pre-Academy Program

The main goals of the STEM Pre-Academy program are to support the development of problem-based and applied learning experiences in STEM for middle school teachers by leveraging research, innovation and technology that serves, motivates and engages students with experiences in STEM. The program began in 2004 as a National Science Foundation (NSF) funded Research Experiences for Teachers (RET) grant for two teachers in one school. Following the initial program, the state and federal governments
funded expansion to include all middle schools. As of 2015, 76% of the middle schools have teacher participation. There have been more than 370 teachers and 10,600 students impacted through the program.

The program includes three components: technology-focused workshops for teachers, hardware and software with technical support to help with implementation an interaction among teachers, university researchers and industry professionals. Curriculum activities and professional development opportunities include a broad scope of STEM areas such as sustainability, aquaponics, water quality, 3D modeling and mathematics, microbial oceanography, and the engineering design process.

Instrumentation

The STEM Semantics Survey (Tyler-Wood, Knezek, & Christensen, 2010) was the primary instrument chosen to assess dispositions toward STEM, given that it has been used in many projects across the country in recent years. The STEM Semantics Survey is an instrument used to assess general perceptions of STEM disciplines and careers using Semantic Differential adjective pairs from Osgood’s (1962) evaluation dimension. The STEM Semantics Survey is a 25-item Semantic Differential instrument based on Osgood’s Evaluative Dimension and containing five scales assessing perceptions of Science, Technology, Engineering, and Mathematics, as well as STEM Careers. This survey was created by adapting Knezek and Christensen's (1998) Teacher's Attitudes Toward Information Technology Questionnaire (TAT), which was derived from earlier Semantic Differential research by Zaichkowsky (1985).

The five most consistent adjective pairs of the ten used on the TAT were incorporated as descriptors for target statements reflecting perceptions of STEM subjects. A fifth scale representing interest in a career in STEM was also created. Each of five scales consisted of a target statement such as “To me, science is:” followed by five polar adjective pairs spanning a range of seven choices. For example, “To me, science is: exciting _ _ _ _ _ _ _ unexciting.” Internal consistency reliabilities for participant perceptions of science, math, engineering, technology, and STEM as a career ranged from alpha = .84 to alpha = .93 for this sample of participants. These numbers are in the range of ”very good” to “excellent” according to guidelines provided by DeVellis (1991).

The Technology Proficiency Self-Assessment for the 21st Century (TPSA C21) was also used to assist in the evaluation of the project. The TPSA measures teacher confidence in their competence in technology proficiency. The instrument included 34 items measuring four subscales: (1) E-mail, (2) World Wide Web, (3) Integrated Applications, (4) Teaching with Technology, (5) Instruction with Emerging Technologies and (6) Use of Emerging Tools. The instrument is a Likert type survey ranging from 1 = Strongly Disagree to 5 = Strongly Agree. Cronbach’s Alpha internal consistency reliability ranges from .73 to .91 with an alpha of .96 for the entire instrument.

Additionally, three measures of technology integration were included in the survey battery. These were Stages of Adoption of Technology (Christensen, 2002), the Concern’s-Based Adoption Model Level of Use (CBAM-LoU) (Griffin & Christensen, 1999), and the Apple Classrooms of Tomorrow (ACOT) teacher stages instrument (Dwyer, Ringstaff, & Sandholtz, 1991). Hancock, Knezek, and Christensen (2007) found that these three single-item instruments, taken together, produce a Technology Integration
scale with an internal consistency reliability of Alpha = .84 for a typical set of preservice or inservice teachers.

Two questions were included for the Hawaii teachers regarding the use of technology tools, resources (training) and support for retaining teachers in the classroom. Teachers were asked to respond to the following statements regarding the extent (1 = Strongly Disagree to 5 = Strongly Agree) to which teachers thought the Hawaii FIRST tools and resources might impact the retention of teachers. Two statements were posed:

1. Availability of new tools and resources with technical support increases the retention of teachers in schools (Tools 1).
2. I am personally more inclined to stay in teaching because of the added tools, resources and technical support provided by programs such as the Hawaii FIRST Academy (Tools 2).

Demographic items included gender, age, years of teaching, number of years participating in the Pre-Academy program, access to technology at home and in the classroom as well as grade level taught.

Results

Longitudinal study of impact over time

Data have been collected by the authors from middle school teachers participating in STEM-related professional development activities for the past six years. The data were gathered from 201 teachers in spring 2011, 147 teachers in spring 2012, 134 teachers in spring 2013, 48 teachers in spring 2014, 117 teachers in spring 2015 and 95 teachers in spring 2016 for the Hawaii STEM Pre-Academy program. Teachers from middle schools across the State of Hawaii responded each year.

Table 1 includes means, standard deviations and sample sizes for each of the samples of teachers from the past six years for the STEM Semantic subscales as well as the technology integration measures. For the STEM Semantic subscales, the group of 2016 respondents rated themselves higher than any prior years on all five of the semantic measures (science, mathematics, engineering, technology and career). The means for each of the six years are depicted in Figure 1.

Figures 2, 3, and 4 display the longitudinal trends for the technology integration measures for teachers participating in the STEM program. CBAM Levels of Use is highest for the most recent year of data, 2016. Over the six years of data collected for Stages of Adoption of Technology, the trend is upward over the time period with consistent means after the increase from 2011 to 2012. For the ACOT measure, it appears 2014 reported the highest means with 2016 as the next highest.

The Tool 1 and Tool 2 measures were added in 2012. These measures that are related to retention of teachers who have access to the Pre-Academy tools and resources have remained stable over the five years as shown in Figures 5 and 6.

Findings by Number of Years Participating in the STEM Pre-Academy

Teachers were asked to respond to a categorical demographic item regarding how long they had participated in the STEM Pre-Academy program. The options ranged from “this is my first year” to “7 or more years”. An additional option was “not sure” but those responses were removed for the analysis of variance. Regarding technology integration measures of CBAM Levels of Use, Stages of Adoption of Technology and the Apple Classrooms of Tomorrow measures, it appears that for each of these measures the teachers who were in the first year of the program reported the lowest means with significant ($p<.05$) differences for both CBAM and ACOT.
As shown in Table 2 and depicted in Figures 7,8 and 9, for each of the technology integration measures the means for teachers who have been in the program the longest reported the highest means. Access to the tools and resources of the program over time appears to increase levels of classroom technology integration. For the CBAM Levels of Use and ACOT, the differences were significant ($p<.05$).

Figure 9. Teacher self-ratings for ACOT by number of years participating in the STEM Pre-Academy program.
The two tools measures were related to availability of tools and resources with technical support and the relationship to retention. Tools 1 is “Availability of new tools and resources with technical support increases the retention of teachers in schools” and Tools 2 is “I am personally more inclined to stay in teaching because of the added tools, resources and technical support provided by programs such as the Hawaii STEM Pre-Academy.” As shown in Table 3 and depicted in Figures 10 and 11, teachers who have been in the program 4 or more years, reported higher means regarding the increase in the retention of teachers in general and them personally to stay in teaching.

Figure 11. Teacher self-ratings for Tools 2 by number of years participating in the STEM Pre-Academy program.

While there were no significant differences between reported means for the STEM Semantic survey subscales, the teachers who have been in the program seven or more years reported higher means for Science, Engineering, Technology and Career. The STEM Mathematics measure for the teachers who have been in the program seven or more years was second only to the teachers in the first year of the program. Means for each of the measures by categorical years in the program are shown in Table 4.

For all six of the technology proficiency scales from the TPSA, the teachers who have been in the STEM Pre-Academy the longest reported the highest means even if only by a small amount for Email and WWW. While not significant, the Teaching with Technology measure may be of most interest. While other teachers may have similar technology skills, the teachers who have been in the program seven or more years reported higher means on Teaching with Technology, an important measure that is related to the technology integration measures reported earlier.

**Discussion and Conclusions**

This longitudinal study seems to indicate that sustained participation in a quality program improves dispositions toward the subjects taught as well as raising levels of technology integration. For the teachers who have participated in the program for more years, they also see the value of the resources for retaining teachers in the schools. While not significantly different, teachers who have participated for seven or more years show a trend of higher dispositions toward science, technology, engineering and a STEM career. This study also found that the teachers who have participated in the program longer also rated higher in the Teaching with Technology proficiency.

The teaching environment is changing rapidly with new tools and strategies for increasing student learning. It is important that teachers receive effective professional development that allows for continuous learning that is ongoing throughout the year. Teachers need opportunities for active learning that models what they will be doing in the classroom. Programs that provide this type of learning are valuable and can increase teachers’ dispositions and skills related to STEM and technology integration. In addition, these types of programs may also increase the retention of teachers in a school system or teaching in general.

Background

Previous research has demonstrated the importance of both curiosity and intrinsic motivation for achieving academic success (Deci & Ryan, 1985; Guay, Vallerand, & Blanchard, 2000; Leslie, 2014; Ryan & Deci, 2000; Vallerand, Pelletier, Blais, Briere, Senecal, & Vallieres, 1992). In a meta-analysis of the relationship between motivation and academic success, 22 of 28 studies found a positive relationship (Rosen, Glennie, Dalton, Lennon, & Bozick, 2010). Both are also key for the development of the entrepreneurial or innovative spirit. This mindset is widely recognized as essential for personal and professional success, especially in the field of engineering (Ertuna & Gurel, 2011; Solesvik, Westhead, Matlay, & Parsyak, 2013).

According to Self-Determination Theory (Deci & Ryan, 1985), there is a continuum of levels of motivation which include intrinsic motivation, multiple types of extrinsic motivation, and amotivation (Guay et al., 2000). Intrinsic motivation is associated with more positive learning outcomes while amotivation is associated with the most negative effects (Guay et al., 2000). When individuals are intrinsically motivated, behaviors are influenced by internal reasons such as personal enjoyment (Bruning, Schraw, & Norby, 2011). By contrast, when extrinsically motivated, individuals are influenced by external factors, such as a grade or a paycheck (Bruning et al., 2011). Amotivation is when individuals are neither intrinsically nor extrinsically motivated. As noted by Guay et al. (2000) amotivated individuals have, “…no sense of purpose and no expectations of reward or possibility of changing the course of events” (p. 177). Thus, it is incumbent upon instructors to encourage intrinsic motivation whenever possible.

Curiosity is an integral aspect of the classroom experience and necessary for innovation to occur. “It is the curious child that becomes tomorrow’s innovator…” (Arnone, Small, Chauncey, & McKenna, 2011, p. 195). Curiosity refers to an emotional-motivational state that is characterized by a “desire to know, to see, or to experience that motivates exploratory behavior directed towards the acquisition of new information” (Litman, 2005, p. 793). Curiosity requires novelty and is performed with the intention of some form of closure. While satisfying one’s curiosity may be intrinsically rewarding, if one does not act upon his/her curiosity, then he/she is not intrinsically motivated.

In order to encourage both intrinsic motivation and curiosity, thereby stimulating the entrepreneurial or innovative spirit, IDEAS studio courses were developed at one U.S.
University. These are two-credit-hour engineering electives were designed to include seven core characteristics:

- Each IDEAS course is voluntary; students elect to take the course and the course itself acts as a free elective.
- In IDEAS courses, most students make a physical artifact.
- The work students do in IDEAS courses is motivated by real-life problems. Many times the problems are supplied or inspired by industrial sponsors.
- Students apply broad perspectives to their work in the IDEAS course. Besides the technical viability of their ideas, students must explore the social impact, value, market viability, and other aspects.
- Students are encouraged to apply an open process to generate solutions in the IDEAS course. In many cases, students explore the process as an outcome for the course; they are told that neither the resulting solutions nor the process to reach them are pre-determined.
- IDEAS courses are open to all disciplines in engineering, and in some cases, to all majors throughout the University, resulting in an inter-disciplinary mix of students.
- IDEAS studios courses are small, and in most instances, the enrollment is limited to 16 students.

There are number of different IDEAS courses including: Creative System Design, Concept to Commercialization, Should we Start this Company? and Build Your Idea.

Although these courses were designed to promote many positive consequences, there can be a disconnect between course developers’ and instructors’ intentions and students’ perceptions and outcomes. Research is necessary to determine whether intrinsic motivation and curiosity are fostered in specific courses and classroom settings. Additionally, there is a need to explore comparable situations (in this case, courses) with analogous activities that have high and low interest so they can be distinguished (Chen, Darst, & Pangrazi, 1999).

**Purpose of the Study**

The purpose of this exploratory study was to investigate how intrinsic and extrinsic motivation, as articulated by Self-Determination Theory and curiosity were differentially impacted by undergraduates’ participation in two contrasting courses, an IDEAS studio course and a self-selected comparison course (designated as Course X). For the purposes of this study, amotivation, two measures of extrinsic motivation, intrinsic motivation, and curiosity (operationalized as situational interest) were examined. These variables were measured by the Situational Motivation Scale (Guay et al., 2000) and five questions from the Situational Interest Scale (Chen et al., 1999).

The study was guided by the following research question: How does students’ motivation and curiosity vary by course type (IDEAS studio course vs. Course X) across the semester (beginning, mid-term, end)?
Methodology

Design and Procedure

A one-group pre-test-post-test design was used to investigate amotivation, extrinsic and intrinsic motivation, and curiosity to see whether they were differentially impacted by undergraduates’ participation in an IDEAS studio course and a student-selected comparison course, designated as Course X. Course X was independently and anonymously chosen by each student. It was to be a course in which they were simultaneously registered and that, from their viewpoint, shared as few of the IDEAS course qualities as possible. Students were asked to select their own comparison course for a number of reasons. The key reason was that students enrolled in the IDEAS course were from a variety of majors and therefore had no one other course in which they were all enrolled, preventing a direct comparison of courses. In addition, because the students’ perceptions of the courses might be different from faculty intent, it was felt the students themselves would be the best judge of which other course was most different from their IDEAS course.

Descriptive statistics were used to compare mean scores for each level of motivation and curiosity for each course across the semester. Paired samples t-tests were used to determine whether there were significant differences between mean scores by course type. Cohen’s d was used to determine the magnitude of the difference between the scores when there were significant differences.

Students were assessed three times throughout the semester and asked to respond to the questions from the perspective of the class they were in (either the IDEAS course or Course X). The assessments were conducted online in the 2nd, 6th, and final weeks of the semester. In addition, a questionnaire at the end of the semester asked students to reflect on the extent to which, in their view, the seven characteristics of IDEAS courses were or were not present in both their IDEAS course and Course X. All identifiers were removed before analysis. Instructors did not have access to survey results during the semester, and were not involved in the assessment collection process.

Participants

A sample of convenience (n = 92) from one university was used in this study. The participants were from three different semesters, two fall and one spring. There were 66 males (71.7%), 25 females (27.2%), and one individual who did not identify his/her gender. Over three-fourths of the sample was White (76.1%), with the next largest group Asian/Pacific Islander (9.8%). The majority of participants were seniors (55.4%) and engineering majors. The largest identified major was Mechanical Engineering (30.4%).
Instruments

The Situational Motivation Scale (Guay et al., 2000) was used to measure motivation and amotivation. This validated instrument has 16 questions, designed to measure four kinds of motivation hypothesized by self-determination theory (Deci & Ryan, 1985): intrinsic motivation, two measures of extrinsic motivation (identified regulation and external regulation), and amotivation. Four Likert-style questions are used to measure each type of motivation with a range from Strongly Agree (5) to Strongly Disagree (1). A score is obtained by summing the responses to individual questions for each type of motivation. Curiosity was measured by taking five questions from an existing Situational Interest Scale (Chen et al., 1985). Four of the questions came from the Exploration Intention factor and one from Instant Enjoyment.

Results

Results showed that at each of the three times students completed the assessment, there were mean differences in situational motivation and curiosity between the IDEAS course and Course X. With the IDEAS courses, students consistently had higher scores in intrinsic motivation, identified regulation and curiosity than Course X. With Course X, they consistently had higher scores in external regulation and amotivation than the IDEAS course.

</tbody>
</table>
Paired samples t-tests showed that each of the differences between the two courses were significant.

However, for the IDEAS courses there was a decrease in Intrinsic Motivation, Identified Regulation, and Curiosity with an increase in External Regulation and Amotivation over time. This decrease occurred between the first and second assessments and was maintained until the end of the course. By contrast, there were no significant differences in any areas over time for Course X.

**Discussion/Implications**

Building and maintaining both intrinsic motivation and curiosity are of key interest to educators. Results from the current study suggest that students were more intrinsically motivated and curious while taking the IDEAS course, compared to Course X. This could be due to a number of reasons including the voluntary nature of the IDEAS courses, the fact that IDEAS courses provided opportunities for close communication with industrial partners, along with professors, as they worked together to solve a “real world” problem, and/or that the incorporation of real-life situations of interest to students in the IDEAS courses. Interest can spark curiosity.

The decrease in participants’ intrinsic motivation, identified regulation, and curiosity in the IDEAS course throughout the semester is of particular interest and could be the result of a number of factors. One explanation could be students’ prior views of the IDEAS courses, similar to their preconceptions about concepts taught. These views might have been based on knowledge of the curriculum or previous students’ assessments of the courses. Whatever the source, this prior knowledge could have acted as a filter while students were in those courses, affecting their motivation and curiosity. Just as with other misconceptions, differing methods of instruction may be needed to alter them. This warrants further investigation.

One limitation in this exploratory study was the selection of Course X. While there were advantages to students self-selecting a comparison course (designated Course X), it could have resulted in multiple kinds of courses being compared with the IDEAS courses. Because students did not list the name of Course X, the researchers did not know how many different courses were being compared. Future research should confine students’ selection of a comparative course to either another engineering course or a known course outside of the major, in order to determine if there are any commonalities that could be impacting students’ intrinsic motivation and curiosity.
Acknowledgements

The authors gratefully acknowledge the support of the Kern Family Foundation to offer the IDEAS Studios through an Institutional Grant and to conduct the assessment study through the grant entitled Assessing Situational Curiosity and Motivation in IDEAS Design Electives.

Creating Coherent State Systems of Mathematics Education from Birth through Postsecondary Education: Opportunities and Challenges for Researchers and Policymakers

Saeyun D. Lee
Erica N. Walker

Abstract

In this workshop, the presenters (one an experienced policymaker and researcher with significant policy experience at state and local levels, the other an experienced researcher and professor in math education with significant school teaching experience in grades 9-12) will share a tool designed to assess policies and also local and state practices related to mathematics teaching and learning outcomes. This tool, which includes multiple categories for assessment and action at various stages in the educational pipeline, has the potential to enhance the alignment of existing policies and practices to support positive math outcomes from birth through postsecondary education. In addition, it may also spur initiatives when various constituencies (teachers, administrators, school district leaders, representatives from early education and higher education institutions, and policymakers) identify gaps related to opportunity, achievement, or resources.

After a presentation by the authors, the participants in this workshop will work collaboratively to discuss an issue/issues in mathematics education and use the tool to develop and identify systemic goals and strategies to effectively address that issue/those issues. For example, substantial research has demonstrated that algebra is both a key mathematical topic and gatekeeper for secondary school students (e.g. Star & Rittle-Johnson, 2009). But the pedagogical, organizational, and curricular structures for success in algebra do not begin in secondary school. Best practices related to algebra success have been identified in pre-school and elementary school settings (National Research Council, 2001) as well as in home and community practices that support school learning (Masingila, Davidenko, & Prus-Wisniowska, 1996). Further, it is clear that algebra’s importance does not dissipate once students complete an algebra course in high school. It is important for subsequent courses, college admission and graduation, and career options (Walker, 2001). Thus, we would argue that educators, researchers, and policymakers should evaluate at various points in the birth through postsecondary educational pipeline where there are gaps in systems’ practices to support success in algebra learning. For example, a number of initiatives have focused on “algebra for all”, initially focusing on coursework offerings in 8th and 9th grade (College Board, n.d.). Subsequently, such initiatives addressed issues such as algebraic thinking in the elementary and middle school and the need for increased professional development for teachers related to inquiry-based instruction (Ham & Walker, 1999; NYC Algebra for All Initiative, 2015). The proliferation of early college high schools, in which students are prepared to enter college before completing high school coursework, makes high school preparation for credit bearing college mathematics courses (the first of which is usually college algebra). It has also been determined that many students, despite
graduating from high school, are not prepared for credit bearing college mathematics courses. This is an example where there should be more synergy and alignment throughout the educational pipeline to support college and career goals.

At the conclusion of the workshop, the presenters will present policy and other recommendations for building coherent state systems of mathematics education.

As a result of attending this workshop, the participants will have the opportunity to engage in a robust discussion about how to change discourse, policies, and practices and improve mathematics learning outcomes for all children.

References

Abstract

After attending this presentation the attendees will have a better understanding of the process for an effective academic program review. They will also be provided with some tested and validated tools that can be used for the assessment of the quality of their programs.

Academic programs assessment is an on-going process designed to enhance the educational mission of the academic institutions, and provide a means for faculty to evaluate strengths, and weakness of their programs and suggest modalities for improvement in weak areas. This review will foster improvement in teaching, scholarship and student learning in programs and departments that are amenable to change.

The Council of the Graduate Schools, suggests that a successful program review provides answers to the following examples of questions: 1) Is the program advancing the status of disciplines and professions? 2) Is its teaching and training of students useful and effective? 3) Does the program meet the institutional goals and objectives? 4) Does it respond to professional needs and/or requirements for employment? 5) How is it assessed by experts and educators in the fields? To be able to respond to these questions, faculty should develop explicit statements of what students should learn; verify that the program is designed to foster their learning, collect date that indicate student attainment and use data to improve student learning. The highlights of our recently completed five-year review of our forensic sciences program will also be discussed.
Enhancing intrinsic motivation through teaching medical English vocabulary: An exploratory study

TANAKA, Hiroaki
(Kindai University)

Traditionally, motivational researchers have been concerned about the theoretical constructs of motivation rather than how to enhance students’ motivation. Recently, research interests have shifted away from simply identifying certain types of motivation to developing ways in which motivation might be enhanced. Motivational strategies refer to “methods and techniques to generate and maintain the learners’ motivation” (Dörnyei, 2001, p.2). However, only a limited number of studies have investigated how students become motivated in a language learning classroom. Therefore, the purpose of this study is to identify key factors for motivational strategies for enhancing intrinsic motivation through teaching medical English vocabulary. For the medical English learners, vocabulary has been considered one of the most important and difficult parts of learning and maintaining motivation to learn medical English vocabulary is a crucial part of the learning process.

17 Japanese EFL (English as a foreign language) university students majoring in pharmacy participated in this study. They were enrolled in a first-year English language course. The students met twice a week in a 90-minute class. After four weeks of instruction, open-ended questionnaires were administered to the participants. Open-ended questions are generally preferred to collect information from relevant topics and to determine the full range of possible answers. The data were analyzed on the basis of Self-determination theory (Deci & Ryan, 1985, 2002, 2012). I determined and defined three main categories derived from the Self-determination theory; that is, the need for autonomy, the need for competence, and the need for relatedness.
In addition, data which could not be coded into one of the three predetermined categories were coded with new categories. All qualitative data were carefully examined, coded, and constantly compared to other data.

The main finding of this study indicated that the learners’ need for competence and autonomy were key factors for enhancing intrinsic motivation to learn medical English vocabulary, as Self-determined theory anticipated, though factors related to the need for relatedness were not observed in this study. Implications for theory and practice were also discussed.

Disciplinary Approach to Creative Science Teaching for Elementary Preservice Teachers’ Practicums

**Topic area of submission:** Elementary education

**Presentation format:** Paper session

**Short description of the submission:**
This study investigated how elementary preservice teachers conducted creative science teaching modules for their practicums. Disciplinary approach in science and educational technology was applied to design of creative science teaching modules. We analyzed teaching sequences, educational technologies, and specific inquiry strategies used in science classes. The effect of disciplinary approach to design of creative science teaching will be discussed.

ABSTRACT:
This study investigated how elementary preservice teachers prepared and conducted creative science teaching modules for their practicums. We employed the idea of discipline-specificity of creativity. Disciplinary approach, therefore, was applied to design of creative teaching modules so that each disciplinary provided its own perspective on creative teaching such as creativity in scientific inquiry teaching, creative task design and linguistic creativity in English teaching, non-algorithmic decision making and adaptiveness for creative math teaching, and so on. We gathered voluntary preservice teachers who would conduct disciplinary creative teaching modules in their practicums. Among their practicum teaching experiences we video-recorded science classes. Teaching sequences, educational technologies, and specific inquiry strategies used in the science classes were analyzed in terms of fostering elementary children’s creativity. The creativity we analyzed were not general thinking skills but science-specific thinking skills embedded in science practices and used in understanding science contents. We will discuss student teachers’ creative science teaching practices which facilitate elementary children’s creative thinking skills. Also the effect of disciplinary approach to design of creative science teaching for preservice teachers will be discussed.

Fostering the System that Leads Creativity Education for Pre-service Elementary Teachers in Korea

**Topic area of the submission:** Higher education

**Presentation format:** Paper session

**Description of the submission:**

The purpose of this research is to revise and implement university-wide curricular for pre-service elementary teachers in Korea. Throughout the University, we reached at a consensus that the current curricular have several limitations to cultivate creativity of pre-service teachers, which is one of most critical competencies of 21st century learners. Seven out of 13 departments within the University jointly participated in the project to redesign the curricular to foster pre-service teachers’ creativity.

ABSTRACT:

The purpose of this research is to rethink, revise, and implement university-wide curricular for pre-service elementary teachers in Korea in order to foster pre-service teachers’ creativity. The high quality of teachers in Korea is well-known to the world; we believe the high competencies and devotions of Korean teachers are one of the major driving forces that lead rapid economic developments of Korea after the Korean-War in 1950. A teacher is an attractive profession in Korea due to its high level of job security, a decent level of salary, and respect for teachers as a social norm.

Thus, Seoul National University of Education, the top pre-service elementary teacher education university in Korea, has been able to recruit the best and brightest students in the country. The average freshmen of our university typically rank top 3-5% of the national college entrance exam every year. There is no question that our students have a high level of knowledge and understanding of each subject area as pre-service elementary teachers. Most of our students are very good at studying and following instructions since they have been high achieving model students throughout their K-12 schooling.

In the past, it was believed that a teacher with a high level of content knowledge can be a good teacher as well. However, it’s not true anymore; having solid content knowledge alone is not enough to be a good teacher. The purpose of education is not teaching and learning content knowledge itself anymore. Many countries and organizations have addressed the importance of core competencies of 21st century learners, and teachers should be capable of cultivating those core competencies in the classroom. Core competencies may include creativity, problem-solving, communication, critical thinking skills, etc. In order to foster students’ core competencies, teachers themselves should be taught and have opportunities to develop those core competencies of themselves.
Recently, many educators and researchers are interested in those 21st century learners’ core competencies. Nevertheless, the studies in teachers’ core competencies that can enable them to be confident in teaching and cultivating those core competencies in the classroom are still rare.

The Korea National Curriculum of K-12 schools has been emphasized the creativity since the 6th National Curriculum in 1996. In particular, the current Y2015-revised Korea National Curriculum strongly advocates the importance of fostering ‘the talented student with creativity and convergence’. However, it has been questioned whether the school teachers are prepared to cultivate students’ creativity. We as a pre-service teacher education institution asked ourselves whether our students – i.e., future elementary teachers- are prepared to foster elementary students’ creativity or not. To this end, throughout the University, we reached at a consensus that the current curricular have several limitations to cultivate creativity of pre-service teachers, which is one of most critical competencies of 21st century teachers as well as learners. Seven out of 13 departments within the University jointly participated in the project to redesign the curricular for pre-service teachers.

Before we began to revise the curricular, faculty members from the seven departments sat together and had regular meetings and seminars to openly discuss about our operational definitions of key concepts; namely, creativity, creative teachers, creative education, teaching creativity, teaching creatively, etc. For now, we tentatively define “creative teachers” as teachers who can confidently show creative teaching behaviors in the classroom along with a high-level of teaching competencies and creative thinking skills of their own.

The participating faculty members have been developing or revising their lesson plans
and teaching & learning materials based on the on-going cross-department discussions and seminars. Revised curricular will be implemented throughout the Fall semester, 2016. While implementing the revised curricular, systematic evaluation will be conducted as well to see whether the revised curricular may have any effects on the development of creativity and creative teaching competencies of the pre-service teachers. In addition, we are also interested in finding that to what extent the university-wide, cross-departments curricular reform efforts can be realized.

At the conference, we will share some of our preliminary findings from the above evaluation processes. We hope our case can give you some ideas for revising pre-service teacher education programs, and we would like to discuss with you about issues and concerns on reforming higher education for the future.

Abstract

This study is implemented for finding out the demand of parents and its priority sequence on the qualifications of early childhood teachers and collect the base data for structuring the community of the early childhood by comparing demands on qualification following the children age and institution type.

This study has administered for the subject of 194 pairs of mothers and fathers having children of 3, 4 and 5 years of age that are enrolled in kindergartens and childcare facilities located in B City, one of the large cities in Korea. The level of demand for qualification of early childhood teacher is divided into the required level (importance) and present level (self examination) of the phrase of ‘scale of perception of parents on the qualification of early childhood teacher’ of Shin Hwa-yeon (2014) to assess in the 5-point Likert scale to find out the level of demand on the teacher qualification by facilitating the demand level formula of Borich (1980).

In addition, in order to find out the difference in the level of demand among parents following the children age and institution type, the t-verification is implemented by facilitating the value of the level of demand on the teacher qualification sought by the formula of Borich.

As a result of finding out the difference of required level and present level regarding teacher qualification of entire parents, it is shown to have the difference of statistical significance in all lower categories. In addition, as a result of calculating the level of demand on the teacher qualification through the demand formula of Borich, for fathers, it has the higher level of demand in the sequence of humanity characteristics, teaching attitude, professional knowledge, and teaching skills of teachers and, for mothers, the level of demand is shown in the sequence of teaching attitude, teaching skills, humanity characteristics, and professional knowledge. Also,
fathers showed the tendency of higher level of demand in teacher qualification and entire lower categories than mothers.

As a result of finding out the difference of demands in parents regarding teacher qualification following children age, there is a statistical significance only for parents of 4 years old, and, in the lower categories, the difference of statistical significance is shown only in the teacher humanity. Namely, the fathers of households with any child of 4 years of age, it shows higher level of demand than mothers in the teacher humanities from the lower category. And, regardless of the children age, fathers showed trend of higher level of demand than mothers in teacher qualification and all lower categories.

As a result of finding out the difference of demands in parents regarding teacher qualification following institution type, the demand of statistical significance is shown only for parents of early childhood enrolled in childcare homes, and, in the lower categories, the difference of statistical significance is shown only in the teacher humanities and teacher attitude. Namely, for the households that send children to childcare homes showed higher level of demand in teacher humanities and teacher attitude for fathers and teacher attitude for mothers. And, regardless of the institution type, fathers showed tendency of higher demand in qualification of teacher and all other categories than mothers.

The foregoing result requires the parental education for enhancing the recognition for each parent on qualification of early childhood teacher for structuring the early childhood education community, and in particular, it implies that searching for plan to improve the qualification of teachers as reflecting the high level of demand of father is urgent.

Abstract

We conducted a study to consider the potential of information ethics education in early childhood curricula.

With rapid developments in technology, there has been an increase in the number of children using electronic devices such as smartphones and tablets (often referred to as information communication and technology devices or ICT devices.) In particular, there has been a marked increase in the number of preschool aged children using these devices. At the same time, there has been an increase in the number of problems reported related to ICT device usage and it has been a pressing matter to find ways to deal with this issue through education. In Japan, the Ministry of Education, Culture, Sports, Science and Technology (MEXT) began to include education on information ethics in the public school curricula in 2007 to cultivate an understanding of information ethics and appropriate attitudes required in order to perform necessary activities in an information society. Since then, information ethics has been taught in elementary, junior high, and high schools. However, reports from classrooms show that teachers are struggling with how to present this topic. They still don’t have a clear and uniform strategy on what values need to be established and how to guide students in this matter. In addition, there are no clear descriptions and/or guidelines on which age(s) ethics education should be introduced. Preschools have, thus far, not been included in the curricula, and consequently there have been no guidelines on this topic for early childhood education. Considering this, we decided to examine the possibilities of education on information ethics for preschoolers. We conducted model lessons
and interviews with children aged 4-5 years old, as well as surveys and interviews with their teachers. This project pointed out that it is, in fact, possible to teach information ethics to preschoolers and that preschoolers are quite capable of understanding information ethics. It also revealed, however, that this education requires different approaches and teaching methods for those younger age groups. In addition, because of significant developmental differences between 4 and 5 year old children, it is better to wait to teach some topics until children are 5 years old. We believe that starting this education in early childhood will greatly contribute to the continuation of such education at older ages. In that sense, we believe this research is significant because these are critical ages when the basic values of people's lives are established.

The purpose of this study was to development and apply the positive personality program for the pre-early childhood teachers and validate its effectiveness for optimism, self resilience, life competencies. The study was carried out about 15 weekly programs for pre-early childhood teachers 106 people enrolled in early childhood education and child care related departments of the three-year college in busan, republic of korea. To investigate the effect of the program optimism, self-resilience, using the life competencies scale pre-test and post-test was carried out. Frequency analysis was performed with the paired t-test to the results of processing, were also analyzed with the journal of the pre-early childhood teachers. According to the study results it showed that the positive personality program applies the effect in optimism and self-resilience and life competencies of pre-early childhood teachers.

Keywords: pre-early childhood teachers, optimism, self-resilience, life competencies

This study was to reveal the feasibility to develop the right tools and applying them to measure the multipliership of preschool administrator. Utilizing assessment tools on the leadership of school administrators and managers that was developed in 2010 by Wiseman. The subjects were 123 people manager is being worked on kindergarten and daycare center. The validity of scale is examined item quality and test appropriateness. In the item quality analysis the item response distribution and the item discrimination were examined. In the test appropriateness analysis the construct validity and reliability were confirmed. In conclusion, multipliership scale for decades has consisted of nine factors, a total of 33 questions. Factors are ‘it makes an open space’, ‘lead productive discussions’, ‘to create a culture that recognizes the value of personal’, ‘to take advantage of the strengths found’, ‘help the chain growth through investment’, ‘improve solidarity between members’, ‘broaden the width of the contribution’, ‘it comes with responsibility and self-reliance’, ‘happily help you work’. I figure out the strengths of leadership administrator it appeared to have secured the validity and reliability.

Keyword: multipliership, preschool institution administrator, self-assessment
This paper presents an analysis of campus sustainability discourse at four universities that are part of a growing higher education campus sustainability movement in Japan. Our research objective is to examine some of the different ways that the global discourse of higher education campus sustainability is adapted and co-opted to serve local and non-local needs.

In many higher education sectors throughout the world, the notion of campus sustainability has become a key organizing concept for mission-driven research and the coordination of faculty, administration, and student action around environmental and energy challenges (Cortese, 2003). There is broad recognition that universities have a significant role to play in creating sustainable campuses that serve as models for the communities they serve. Koester et. al (2006) have pointed to the value of a “whole institution approach” to campus sustainability, and many North American institutions have started to adopt integrative sustainability measures, as evidenced by the growing number of member institutions in the Association for the Advancement of Sustainability in Higher Education (AASHE).
Internationally, campus sustainability efforts have also gained popularity, especially in Europe. In Asia, however, though there is a growing movement towards more integrated approaches to campus sustainability, Abe and Nomura (2010) have noted that examples of successful whole institution approaches to campus sustainability are still rare. This paper, which is part of an ongoing (3-year) research project on campus sustainability, asks why this is the case. By examining the way four universities at different positions in Japan’s higher education ecosystem employ the discourse of campus sustainability, we identify factors that could help lead to more integrative approaches, and also identify obstacles faced by institutions in their own contexts. Broadly we seek to answer the following three research questions:

- How prominent is discourse about campus sustainability on the websites of the four Japanese universities?
- How are notions of campus sustainability being adapted to the needs of Japanese universities in their local contexts?
- What cultural values can be seen in the Japanese university discourses on campus sustainability?

Our main data source is the websites and mission statements of two public universities and two private Japanese universities that are leaders in Japan’s growing campus sustainability movement. Each university is representative of a different tier of Japan’s higher education hierarchy. We explore the prominence of sustainability discourse in comparison to other dominant discourses, and consider the roles of language and other forms of representation related to campus sustainability in Japanese higher education.
Following a grounded theory approach (Strauss & Corbin, 1998) the methodology of this research (currently in progress) is for two bilingual researchers to identify four suitable university cases, collect (Japanese language) text and image data from these university’s websites, open code this data independently for themes related to our research questions, and to then collaboratively analyze and synthesize our findings.

We employ Stibbe’s straightforward definitions of discourses as “standardized ways that particular groups in society use language, images and other forms of representation” (Stibbe, 2015, p.22) and present critical discourse analysis that draws on the work of Fairclough (2001), and also theoretical work of Kress and Van Leeuwen (2001) on multimodal discourse analysis.

Our analysis of four university webpages found significant variance in the prominence of campus sustainability discourse amidst the primary four discourses that we identified: internationalization, technological innovation, contribution to the community, and pastoral campus life. Of the four different types of universities we studied from one geographical region, we found that the national university and the local private university employed discourse about campus sustainability most prominently on their websites. The public university we studied also included information about campus sustainability as central to its mission, and provided easily accessible (though not as prominent) information about “eco-campus” or “green campus” activities. Information about campus sustainability was least prominent on the website of the elite private university included in our study despite the fact that
this university is one of a small group of Japanese universities that is a member of an international campus sustainability network.

Campus sustainability has become a global discourse in academia and it is increasingly serving as a cross-disciplinary trading ground for cultural capital among elite universities. At the local level, however, universities such as the small private one studied here are able to leverage their campus sustainability efforts to appeal to the communities they serve, and also to mark themselves as internationalized through their tackling of global problems locally.

Title of the submission: Who are the participants? Characteristics of schools participating in multi-city private school voucher programs

Name(s) of the author(s): Yujie Sude, University of Arkansas; Corey DeAngelis, University of Arkansas; and Patrick J. Wolf, University of Arkansas

Address(es) of the author(s): 201 Graduate Education Building, University of Arkansas, Fayetteville, AR 72701

E-mail address(es) of the author(s): ysude@email.uark.edu; cadeange@uark.edu; pwolf@uark.edu

Abstract:

Since enacted in the 1990s, private school voucher programs have been considered a policy solution that addresses education inequity concerns by funding individual students and not schools, empowering families to control their child’s education. The hypothesis is that the market-oriented voucher programs would have positive effects on student achievement by a) providing more opportunities for students to attend high quality private schools, and b) allowing parents to choose the schools that are more suitable for their child. The underlying presumption that the average quality of the private schools that accept voucher students would exceed the average of all the local public schools, and those private schools would be more effective in improving the disadvantaged student’s learning, however, is uncertain and understudied. Despite some survey studies, little attention has been paid to the supply side of voucher programs. The public, scholars and policymakers have little systematic knowledge regarding what kinds of schools are participating in voucher programs and how and why they decided to participate. In this study, we discuss the decision-making model of the schools participating in private school voucher programs in four states and one federal district. Specifically, we estimate the key factors that drive schools’ choices to participate based on cross-sectional data from 2016 from the private school voucher programs in District of Columbia, Wisconsin, Louisiana, Florida and Indiana.

Our general theoretical frame is simple decision-making in the school context. We focus on individual schools as the unit of analysis. We customize that framework for the specific case of participating in a voucher program by considering the benefit (decreased marginal cost per student) and the cost (tuition substitution) of enrolling voucher students, as the voucher amount will rarely cover the average cost of educating a child at the private schools. Our preliminary results confirm our hypothesis that lower quality schools are significantly more likely to participate in a voucher program. This study will make substantial contributions to both the scholarly and practitioner fields. A better understanding of the supply side of voucher programs will help new and existing school choice programs refine their quality constraint regarding market entry. Our analysis also will provide scholars and policymakers with a new approach to understanding the mechanism of how voucher program effects are mediated by the quality of schools that are induced to participate in such programs.
Inclusion of Evidence-Based Practices in IDEA: Moving forward

Topic Area: Special Education

Description of Presentation: This poster presentation will focus on the implementation process in state early intervention systems of the DEC RP. It will include activities to promote the understanding and use of DEC RPs including fidelity checks, coaching, mentoring, and professional development systems. Implementation science will be highlighted as a lens to review how the state structure is employing the evidence-based practices and reviewing their effectiveness as the practices are put into place.

Abstract

To meet federal regulations in Special Education under IDEA, state Part C agencies must develop professional development systems to prepare early interventionists to understand and implement evidence-based practices. The Division of Early Childhood’s (DEC) Recommended Practices are the foundation of evidence-based practices in early intervention. The practices provide guidance to professionals and families about the most effective ways to improve learning outcomes and promote development of children age birth through 5 (DEC, 2014).

As states support practitioners in understanding and use of evidence-based practices, it is vital that state systems use implementation science (Fixsen, Naoom, Blase, Friedman, & Wallace, 2005) as the foundation for their plan. The following steps are identified to support early intervention in the use of evidence-based DEC RP in their implementation:

- Infrastructure review
- Training and staff support review
- Identification of DEC practices
- Implementation plan

Introduction

This presentation describes the steps and activities a Midwestern state completed in supporting Regional Early Intervention (EI) programs in identifying and implementing specific Division of Early Childhood Recommended Practices (DEC RP). Programs that utilize best practices will better support the families and children they serve (Smith, 2000). These practices were chosen as the foundation of implementing evidence-based practice to support the state-identified measurable result (SIMR) in Part C. The SIMR is based on practitioners supporting caregivers in promoting the social emotional skills of their infants and toddlers.

Understanding the steps and processes of preparing early interventionists in understanding and implementing evidence practices in promoting social-emotional development and challenging behaviors is important. As research related early social-emotional development, self-regulation, attention, and appropriate social skills to the development of higher-order cognitive functioning and future success (Shonkoff & Phillips, 2000), attention turned to the preparedness of early interventionists to work within the domain. The Hemmeter, Santos and Ostrosky (2008) study discussed the need for mentoring, coaching, feedback, and technical assistance focusing on daily routines for early childhood educators to work with children and their families.

As states work to develop a process for their State Systemic Improvement Plan (SSIP), and implementation of evidence-based practices. It will be important to understand and use implementation science (Fixsen, Naoom, Blase, Friedman & Wallace, 2005) as the foundation of their plan. An understanding of this process will inform administrators and practitioners of the specific implementation practices and the personnel preparation necessary to support early interventionists in the implementation of DEC RP.

Framework

In order to change practice, this state utilized a systematic process based on strategies supported through implementation science. Throughout the plan development, a variety of stakeholders were involved to survey basic foundation skills and to establish the initial priorities.
in order to identify the main areas of focus in supporting the Early Interventionist in their use of DEC RPs.

The following steps were used with EI’s to identify the evidence base DEC RP and support staff in their implementation:

1) **Infrastructure**: This included staff survey of their perceptions in knowledge in area of social emotional development (perception of competency across screening, assessment and intervention), pilot teams identified, and focus groups with administrators, interventionist and broad stakeholder group. A community resource plan was also developed.

2) **Training and staff support plan completed**: This included an introduction to DEC RP standards, ranking of standards (in order to choose one or two DEC RP practices), reviewing the states theory of action and action strands.

3) **Implementation plan**: This included the development of an administrator and practitioner support plan. The plan also included activities to promote the understanding and use of DEC RP fidelity checks (practitioner rating and mentor ratings) and the use of internal and external mentors.

**Process**

**Step 1 Gathering information and involving stakeholders:**

- **Survey**: This included a survey of administrators, practitioners, families and stakeholders of their perceptions in knowledge in the area of social emotional development (perception across competency of screening, assessment and intervention).

- **Focus groups**: This was completed with administrators, practitioners and stakeholders in regard to their gaining information into the needs and priorities in the area of supporting professional development needs in the area of early intervention practices and social emotional skills.

- **Ranking of DEC RP standards**: This process started with introducing a variety of stakeholders to the DEC RP (ICC members, Early Intervention practitioners, experienced parents, families, and administrators) and the resources available on the DEC site. Once this was completed, various stakeholders ranked their top five practices that they felt would assist practitioners in supporting caregivers in promoting social emotional skills of their infants and toddlers. The next step was for the early interventionists and service coordinators to review the top five op ranked practices and choose two of those practices as the initial focus of practitioners in supporting caregivers in promoting their infants and toddlers social emotional development.

**Step 2 Training Plan:**

- **Introduction to DEC standards state wide**

- **Provide intensive face to face training to pilot program**
  - Introduction to the DEC site, videos, recommended practices reviewed
  - Review and re-teach foundations of early intervention including philosophy, family assessment and routine based intervention.

- **Ongoing support**
  - Monthly conference calls
  - Short electronic videos weekly targeting “thought” of the week
Call for papers: Inclusion of Evidence-Based Practices in IDEA: Moving forward

- Onsite visits
- Technical assistance mentoring
- Data collection-use of reaching potential observation scale home visits

**Step 3 Implementation Plan:**
- Development and implementation of an administrator support plan outlining responsibility and action steps at each level
- Development and implementation of an individualized practitioner support plan
  - Individualized application steps developed with practitioners
  - Use of DEC fidelity checklists (completed by practitioner, mentor and family)

**Step 4 Future steps:**
- Design a formalized plan to incorporate family understanding and involvement in this process
- Replicate with other programs in the state

Abstract

Research Objective

The purpose of this research study was to examine early childhood/elementary teachers’ pedagogical practices related to integrating technology. The research was guided by the question: How do teachers define “individualized,” “personalized,” and “differentiated” learning as they integrate technology?

A Brief Background of the Study and Research Methodology

Research on how people learn shows that human beings have diverse learning styles, and instruction should be delivered in such a way that it responds to the needs of diverse learners (Darling-Hammond & Bransford, 2005). In addition, Universal Design for Learning (UDL) provides a framework to support all learners, including those with disabilities, in inclusive classrooms and aligns with the vision and mission of special education services (Cast, 2008). The demands of such responsive instruction have resulted in three terms being “tossed around” in schools: “individualized,” “personalized,” and “differentiated” instruction. Most teachers use these words interchangeably (Basye, 2014). However, research indicates that these pedagogical practices are different and have specific conditions under which they would be applied to address the instructional needs of diverse learners. If teachers do not understand the nuances of these pedagogical practices, it is obvious that they may apply instructional strategies where they are not necessary. Therefore, this misunderstanding may negatively influence how they integrate technology in the classroom and how they leverage technology for student learning beyond the classroom. To date, there is limited research on how teachers define these three terms and how understanding such terms influences their integration of technology.

This presentation emanates from a mixed method study that sought to examine the pedagogical practices of 54 early childhood/elementary teachers as they integrated technology in the classroom. Specifically, the study sought to discover teachers’ understanding of the terms “individualized,” “personalized,” and “differentiated” learning as they integrated technology. An explanatory mixed method design was used, whereby quantitative data was collected and analyzed in phase one, followed by a second phase of qualitative data collection and analysis (Creswell, 2013). In the first phase, quantitative data were collected using a survey with open-ended and closed ended questions. In the second phase, a qualitative approach was implemented, which employed one-on-one interviews with a typical sample of 10 participants. “A typical sample would be one that is selected because it reflects the average person, situation, or instance of the phenomenon of interest” (Merriam, 2009, p.62). It is important to note that this presentation will use refined qualitative findings from the typical sample.
Discussion of Expected Outcomes

This Participatory Collaborative Reflection Workshop will be grounded in the work of Mor, Winters, & Warburton (2010, 2012), whereby participants will be invited to actively engage with presenters around the research and how participants’ understanding of the research can influence their future practice. After the presenters have defined individualized, personalized, and differentiated learning and shared findings from research on teacher perceptions of their pedagogical practices as they integrate technology in the classroom, participants will be invited to reflect, share, analyze, and scrutinize their experiences related to the research explained by the presenters (Mor et al., 2010, 2012). Specifically, participants will be invited to:

- Share their experience with integrating technology to support all learners;
- Reflect on their understanding of individualized, personalized, and differentiated learning as pedagogical practices;
- Analyze how these pedagogical practices are related to how they integrate technology in their current practice; and
- Scrutinize how they can leverage what they have learned about individualized, personalized, and differentiated learning as they intentionally integrate technology in their future practice to support success for all learners.

Participant Outcomes

It is anticipated that participants in this workshop will include currently practicing teachers, school administrators, and university instructors involved in teacher preparation.

1. All participants will define and distinguish the pedagogical practices of individualized, personalized, and differentiated learning.
2. Participants who are currently practicing teachers will reflect on how such practices influence their choice of technology integration strategies.
3. Participants who are school administrators will examine how their understanding of the relationship between individualized, personalized, and differentiated learning and technology integration can influence how they conceptualize in-service training for their teachers.
4. Participants who are university instructors involved in teacher preparation will evaluate how they teach and model individualized, personalized, and differentiated learning for their teacher candidates and how such practices influence instructors’ and candidates’ choices of technology integration.

Abstract: The NASA Heliophysics Education Consortium (HEC) is a five-year initiative funded by the U.S. Congress in 2016 to promote interest in and learning of space science in informal learning environments such as museums and after school and summer camp events. More than one-dozen partners are working with NASA’s Goddard Space Flight Center in Greenbelt, Maryland on this initiative. UNT’s Institute for the Integration of Technology into Teaching and Learning (iittl.unt.edu) is collaborating with the STEM Innovation Lab at NASA Goddard. IITTL’s primary role is to conduct design-based formative research and selected empirical research studies, on the impact on STEM interest and learning, of the products/programs spawned through the STEM Innovation Lab at Goddard. These products/programs will be refined in UNT’s Design Research Lab environment, and pilot-tested in informal learning environments to produce a sound and timely research base of demonstrated effects on knowledge of and interest in technology-infused activities related to space science. Publications demonstrating measurable effects will be produced.

This poster will feature brief descriptions of several of the technologies under initial consideration by NASA and the instruments to be used to assess impact. Visitors to the poster session will be encouraged to give feedback on the initially targeted technologies and provide additional suggestions. One component of the NASA initiative is to encourage participation by indigenous peoples. Connections with Pacific Islanders will especially be sought.
Operationalizing a Vision: A Single Case Study

Abstract

The culture of a school is a critical component of school improvement efforts. However, changing the culture of a school is no easy feat. This qualitative case study presents how a female principal, newly assigned to a chronically underperforming middle school in an urban setting, approached changing the culture of the school from that of poor academic performance to a place of engaged students. Themes that emerged from this study focus on the principal’s vision in motion and perceptions of leading the vision. A discussion of these findings and their implications for research and practice are discussed.
Operationalizing a Vision: A Single Case Study

When a school experiences chronic stress, the role of the principal is heightened; it is imperative that the principal balance leadership functions to implement strategies that will change the trajectory of the school from struggle to success (Finkel, 2012; Lynch, 2012; Waters, Marzano, & McNulty, 2003). Leithwood, Louis, Anderson, and Wahlstrom (2004) argued that principal leadership is second only to teaching among variables that impact student learning. Furthermore, principals are often assigned to chronically underperforming schools with the specific expectations of rapidly increasing academic achievement and changing the culture of the school.

At every academic level, from preschool through elementary and secondary to postsecondary levels, learning is the central purpose. The uniqueness of middle school is its very status of serving young people who are between childhood and adolescence. Lounsbury (2015) argued that, in addition to learning specific academic content and skills, middle school is a time when young people learn to believe in themselves and discover their interests; it is a time when character is formed and students develop critical humanitarian and social skills. Leading middle schools can be challenging at best; leading middle schools that are under stress can be daunting.

Education change theory is relatively new (Glickman, Gordon, & Ross-Gordon, 2014). At its foundation, the theory explores the human dimensions of change and focuses on strategic changes at the local or school level. Evans (1996) identified the elements of education change theory: teamwork, two-way communication, culture, and leadership. He further provided a toolkit for implementation of education change; the toolkit included methods for understanding and communicating change, goal setting,
measuring performance, feedback/coaching, and establishing rewards/recognition (Evans, 1996). Evan’s theory did not remain stagnant; Fullan (2009) expanded education change theory to include specific strategies to actually lead successful change. In particular, Fullan emphasized efforts such as professional learning communities, shared leadership, and mentoring.

Glickman et al. (2014) argued that education change theory is unique because it is “based on the study of actual efforts at school change” (p. 353). Critical components of education change theory have been identified: (1) capacity, (2) commitment, (3) leadership, (4) evolutionary planning, (5) problem solving, (6) support, (7) coherence, and (8) school cultures of continuous improvement. In addition to building capacity for change among teachers and school leadership, ownership of the process is essential. As leadership is shared and distributed, continuous improvement and evolutionary planning allows for feedback related to ongoing changes. Planning and subsequent feedback help identify problems, which are interpreted as opportunities to resolve issues. Education change theory does not reflect a short timeframe; time is necessary to work through the changes during which relationships are built and sustained (Glickman et al., 2014).

Education change theory recognizes that “overload and fragmentation” can occur when there too many change initiatives or they are disjointed (Glickman et al., 2014, p. 357). Thus, a degree of logic and consistency with the education change process is needed. The resulting coherence creates predictable or dependable change efforts and, ultimately, new cultural norms are developed to create a school culture of continuous improvement.
This study presents how a middle school principal, newly assigned to a chronically underperforming middle school in an urban setting approached changing the culture of the school from that of poor academic performance to a place of engaged students. The findings presented were derived from a larger, comparative case study for which quantitative and qualitative data were collected over the span of three years at 18 middle schools. In the larger study, the middle schools were identified as part of the federal grant, Gaining Early Awareness and Readiness for Undergraduate Programs (GEAR UP). The GEAR UP grant was awarded to these schools to help develop and sustain a college-going culture. Schools that were selected under the grant had a federal free or reduced lunch school rate of 50% or higher, tended to have a history of poor academic achievement as defined by state benchmarks, and were often situated in a community that reflected low numbers of college attainment among adults. The research question that guided this study was: How does a principal of a chronically underperforming middle school operationalize a vision of student success?

**Study Design**

This investigation used a case study methodology (Creswell, 1998) to examine how a principal operationalized her vision to change the culture of a school. The larger study included extensive qualitative and quantitative data (state available school data, in-person observations, teacher surveys, core class teacher interviews, principal interviews, and pictures at the school). However, for this particular article, only the data from one school principal during the first three years were examined. The names of the principal and school are pseudonyms.
Participant and Setting

When Karen was hired as principal at Zone Middle School, she had been in education for almost three decades. Karen had been a teacher, a dean, an assistant principal, and a principal. She had experience working within the secondary level at both the middle and high schools. At the beginning of data collection for this study, she had just been hired to be the principal at Zone Middle School.

Zone Middle School is situated in a large, urban community setting. At the time the study began (2012-2013), the school’s population was approximately 1,300 students and included Grades 6-8. Of these students, 90% were from an underrepresented ethnic group. Most of the students, 73%, identified as Hispanic/Latino; the English language learners represented 20% of the overall student population. The school’s federal free or reduced lunch rate was 88%, which reflected students having a high-poverty socio-economic background. From 2007-2011, the school had been identified as In Need of Improvement each year, indicating it did not meet Adequate Yearly Progress under the state’s school accountability measures with No Child Left Behind (NCLB). In 2012, the state changed from NCLB’s model to a growth model with a 5-star rating system. Under the new evaluation system, Zone Middle School needed improvement in whole school growth and proficiency, rating as a 2-star school. However, in 2013, at the end of Karen’s first year at Zone Middle School, the school had a 3-star rating. This indicated that the school was acknowledged for its successes with public recognition, and Karen earned negotiated flexibility in decision-making.
**Data Source & Analysis**

Semi-structured interviews were the data source for this study. During the first year (2012-2013), the interview began by asking the principal to provide a description of her professional background. This was followed by perceptions about her school, including general questions about the school, personal and school goals for the year, and the school improvement process. For the second year (2013-2014), the interview simply began by asking the principal to describe how things were going at her school and how many new teachers she had that year. This was followed by exploring specific improvement efforts undertaken at the school. During the third year (2014-2015), the interview again began by asking the principal to share how things were going at the school.

This study was approved by the university’s Institutional Review Board (IRB) before data collection occurred. During each of the three years, the principal was contacted by email to schedule a date/time to conduct the interview, which occurred in the principal’s office. The interviews were approximately 60-90 minutes in length; each interview was audio-recorded and transcribed verbatim at a later time.

**Data Analysis**

The data analysis occurred in several phases. First, the interviews were heard in their entirety, in chronological order by year. Upon listening to each interview, memos were written after each interview. Next, each transcription of the interviews was read holistically. Broad themes, such as goals, teachers, and initiatives were identified. The final phase consisted of a line-by-line analysis to gain clarity and refine the themes. In addition to a thorough review by the research team, member checking occurred by
providing the principal with an opportunity to review the findings. The findings of this study only apply to the school under study and are limited to the principal who was interviewed.

**Findings**

Karen worked to operationalize her vision at Zone Middle School through various actions. For example, she set her vision in motion by addressing effective teaching and student discipline. In addition, her perceptions of leading the vision were instrumental in the process. These findings are discussed below in more detail.

**A Vision in Motion**

As Karen assumed the role of principal of Zone Middle School, both the assistant principal and dean left; as a result, she had to hire individuals for two key administrative positions while she navigated her new assignment leading a school that had been designated as chronically underachieving. Karen indicated that the school had “lost its way for a while” and that she had been hired to make changes quickly. Because this was a school where “kids didn’t want to go,” and she expressed determination to dramatically change that reality. She likened the situation to being at the edge of a cliff, indicating that they could fall over or “make an amazing leap and be on solid ground again; and I think that’s the direction we’re, we’re going.”

Karen’s first approach was to align and streamline existing programs and processes in order to leverage resources while developing a new strategic plan. She implemented a block schedule, brought in a new curriculum, and wrote a grant to furnish every student with a laptop. In addition, to demonstrate that she would be “here for a
while” she painted and decorated the administrative suite of offices in soft, welcoming tones and artwork to make it feel more like one’s home.

When discussing her actions, Karen used several terms to describe herself: change agent, visionary bully, and task master. Reflective of these self-identifiers, she administered culture and climate surveys to identify successes and challenges expressed by her staff. To force accountability, she regularly conducted walkthroughs and asked for lesson plans. Indeed, she indicated “it’s culture shock!”

Not only did Karen assess the school’s status, she intentionally acted on the results she was accumulating through the surveys, walkthroughs, review of lesson plans, and other forms of data analyses. For example, the block schedule was adjusted to include a common planning time for teachers. For students, electives were added to help excite student learning while still maintaining a focus on student needs within core subjects. Also, a “playtime” session was added during the lunch break; students were encouraged to play basketball, football, or just run around the school grounds.

Additionally, a “college corner” was established in an unused classroom; a welcoming staff member was available during the lunch period and between classes to encourage students to pursue their goals, such as being successful middle school students, graduating from high school, and pursuing college. Furthermore, the grant to supply laptops for every student was funded. With that grant, she implemented an online program in which every teacher could provide course details, materials, missing homework, etc. She also created a Netbook Café, which was a designated area in the cafeteria where students could continue to use their laptops to work on assignments or play online games during lunch (either before or after eating). Trusting every student with
a laptop supported her argument that students should be empowered to be responsible for their own actions. She stated, “Give them [students] that responsibility and teach them how to own it.” Karen referenced that student engagement had “skyrocketed” and described students as “calm” and “relaxed.” Altogether, she described a cultural change in the way students behaved and added, “Students are happy; they are allowed to be kids, and there is no state test for that [success].”

**Addressing effective teaching.** In addition to having to hire two key administrative positions immediately, Karen had to assess the existing teaching and support staff. She shared that she had very high expectations for everyone and focused on the quality of teaching. She appeared to hold a strong belief in teacher growth and that she could “teach anybody to be a better teacher.” Karen described she was strategic about visiting classrooms, providing feedback, and constantly coaching her teachers to improve. She referred to some teachers as “old school” and not doing her kids any good. Karen noted that she asked her teachers to “Prove to me you’ve taught the standard.” Every time she was interviewed, she indicated that there were still teachers who were not living up to her standards and had to deal with those teachers.

She discussed continuing to work on teacher growth. This growth included time for teachers to conduct peer observations; teachers conducted walkthrough observations two times per week and were required to suggest a strategy that could help the teacher, as well as identify a strategy that the observing teacher could put to use. Karen had also implemented a teaching template that all teachers could use in an effort to help teachers understand her instructional expectations with respect to quality and consistency.
During the three years of the data collection, she hired numerous teachers. When asked what she sought in teachers, Karen stated that the most important quality was how the individual related to people and that everything else could be taught. Karen shared an example in which a person acted negatively when not being watched and vowed “that’s not what we need in here…it’s the subtleties – do they believe all kids can do this…or is it just lip service?” Karen stated that she knew rigor was important and that kids needed to be accountable, too. She noted that improvement would happen by building “skills, confidence, and lots of practice.” Karen summed up one interview by stating that if teachers believe students can succeed and the teachers act on that belief, the student will learn.

**Addressing student discipline.** District (and national) initiatives called for solutions to the disproportionate number of school suspensions among males from underrepresented groups. Karen’s response was to restructure the suspension process through a progressive suspension plan. The plan included: (1) a simple “walk & talk” by which a teacher could take a student out of the classroom to help reduce negative behavior, (2) a few minutes or class period in which the students would go to a separate classroom, and (3) full-day, in-school placement for an extended period of time. Karen explained that the plan reduced suspensions/expulsions and kept students learning in school. She stated that students were doing “better; parents are grateful.” Of note, Karen was given a flexible budgeting schedule (i.e., zero-based budgeting) in her third year that allowed her to get staff allocations for this practice.
Perceptions of Leading the Vision

Karen recognized the dramatic changes she was leading at Zone Middle School. Rather than being overwhelmed, she described all of the efforts as “a platter” that she was working to hold up. In reference to juggling the platter, she noted, “Yeah, that part is easy because we have amazing people here.” Karen was confident about the efforts put in place to build capacity; she said, “I know what to do; I know how to get us there.” She ended with, “…so it’s a good place; I know my school.”

Karen described everyone’s involvement in the new efforts. A representative sample includes words such as, “my kids,” “our parents,” “our community,” and “we encourage it.” Karen believed she had changed (and turned around) the school culture at Zone Middle School. She specifically said, “It has taken all this time to have this new culture.” Karen went on to say that the school had reached a cultural change and point in which learning could occur and specifically noted that everything was in place. She concluded, “Can you tell I love this school?”

Discussion

Karen demonstrated an understanding that change would take time and was persistent in seeing follow-through in that change. Interestingly, the progression toward change was evidenced by the differing focus in the interviews each year. In her first year, Karen’s actions appeared to be a reflection on her vision of success; a vision of no excuses, and a vision of what could be. In her second year, it was clear that having others know about her vision was not enough; Karen wanted to ensure that everyone was an active part of the vision; it was about building capacity to see the necessary changes. Finally, by the third year, she had included what she believed were critical components to
sustaining her vision of student success, including structures and process, beliefs, and programs. While the vision was a fundamental force, and staff were carrying the vision forward, it was at this point that risk-taking and experimentation efforts were applied to sustain and enhance a learning organization. What emerged is that there were very specific actions taken by Karen that set her vision in motion. However, the actions alone were not sufficient; her perceptions of leading the vision were equally critical in operationalizing a vision of student success.

Interestingly, in operationalizing her vision, Karen’s vision in motion and perceptions of the vision reflect key components in education change theory discussed by various researchers (Evans, 1996; Fullan, 2009; Glickman et al., 2014). Moreover, she seemed to unconsciously apply Senge’s (1990) habits of a learning organization. Karen modeled Senge’s habit of personal mastery; she actively focused on what was valued and important to the current reality and expected the same of her staff. Her high expectations were guided by challenging existing mental models, which Senge (1990) identified as critical to creating a lasting paradigm shift within individuals and as an organization.

Karen was able to press on while supporting others; she had buy-in and follow-through, and a contributing factor was that she had a well-defined vision and was able to share that vision. Karen, therefore, was able to have her staff work toward a common aspiration, as Senge (1990) suggests for creating a learning organization. By having a common aspiration, Karen generated team learning, in which everyone was constantly building their capacity and enhancing redefining needs. Thus, within three years, Karen and her team embodied systems thinking; Zone Middle School became a learning organization.
Indeed, Senge et al. (2000) affirmed that schools could become learning organizations. Within a school setting, the creation of a learning organization provides an opportunity for schools to “reach a state of continuous change or transformation” (Coppieters, 2005, p. 134). This has become increasingly necessary as principals face added pressures in an era of high-stakes accountability and improved student achievement outcomes, similar to those Karen was facing. Hoppey and McLeskey (2013) found that the principal’s role is a key force in leading change and desired outcomes. When Karen worked to operationalize a vision of student success, she changed the culture of the school, and her role was a key force in that process.

**Conclusion**

Karen’s efforts appeared to be intentional, strategic, and evidenced through her actions and perceptions. They were strategic as she conducted needs assessments and established ways to address identified needs. Yet, as she carefully implemented changes, Karen understood change would take time. Therefore, she was able to reinforce her vision over time, and perhaps, most importantly, she was given the time to do this as she became a stable force in the school. As she operationalized her vision of student, Karen wanted her school to be a place where students wanted to be. She believed school was not a place focused on what you do to students but what you do for students. Through her vision, everything else followed.

The First Year on Tenure-Track: A Latina’s Reflections

Jafeth E. Sanchez,

University of Nevada, Reno

Hawaii International Conference on Education

January 2016
Abstract

Recruitment and retention of faculty of color continue to be areas of concern for leaders among high education institutions. In particular, the need to have faculty of color on campuses remains critical to mirror rapidly changing student demographics and reap the many educational benefits to diversity. This paper presents a Latina’s personal narrative of her experience during the first year in a tenure-track position at a public university in the Western United States. The author concludes that creative hiring processes, attention to a sense of belonging, and balance within the role may impact efforts to increase recruitment and retention.
The First Year on Tenure-Track: A Latina’s Reflections

Recruitment and retention of faculty of color continue to be areas of concern for leaders among higher education institutions. The need to have faculty of color on higher education campuses remains particularly critical amidst the rapidly changing student demographics. This need is more apparent when comparing undergraduate enrollment percentages against faculty percentages in postsecondary institutions. For example, the National Center for Education Statistics (NCES, 2016a), reported a 119% enrollment increase in Hispanic undergraduate students between 2000 and 2014. Yet, of the 1.5 million full-time faculty at degree-granting postsecondary institutions in 2013, only 4% were Hispanic (NCES, 2016b). Even more, among full-time professors, less than 1% were Hispanic females (NCES, 2016b). With this reality in mind, the purpose of this study was to share a personal narrative of my experiences during the first year in a tenure-track position at a public university in the Western United States to help aid efforts related to recruitment and retention of faculty of color.

**Brief Review of Literature**

Undoubtedly, “achieving the aims of a more diverse faculty is not about numbers or quotas, but rather, about changing the culture of the campus to value, embrace and wrestle with the changes that a more diverse faculty brings” (Hughes, 2015, p. 670). Moreover, it is known that faculty of color are critical members of higher education institutions who contribute a number of positive educational benefits. A more diverse faculty, for instance, can effectively impact student recruitment, promote more inclusive practices and a diverse curriculum, and support overall student success (Akombo, 2013; Fries-Britt, Rowan-Kenyon, Perna, Milem, & Howard, 2011; Mayo & Chhuon, 2014; Strayhorn & Johnson, 2014; Subramaniam & Jaeger, 2010). In addition, faculty of color can strengthen the institution (Hughes, 2015), enhance the
institutional climate and culture (Akombo, 2013; Bilimoria & Buch, 2010), and can even help to improve overall impressions of an institution (Subramaniam & Jaeger, 2010). Altogether, Basak (2013) identified fundamental benefits, such as bringing a multicultural understanding to academia, promoting unity, providing an enrichment of academic traditions, and promoting democracy.

Although there are many known benefits; there are also many challenges to faculty diversification. For example, the “normal search process in higher education has been largely unsuccessful at diversifying the faculty” (Mayo & Chhuon, 2014, p. 224). Beyond the search and selection process, researchers have long documented that when faculty of color are hired, they face added pressures or have increased service obligations based on their cultural background. To illustrate, over 20 years ago, Padilla (1994) referred to this as a cultural taxation. Unfortunately, this challenge of added obligations has persisted as evidenced by the more recent work of other researchers (Fries-Britt et al., 2011; Mayo & Chhuon, 2014; Cerecer, Alanis, & Murakami-Ramalho, 2011). As Hughes, Horner, and Ortiz (2012) simply put it, “they are sought out to meet the institution’s needs for diversity despite the need to be an academician and work for tenure” (p. 603).

One common recommendation for combatting such added obligations and other challenges experienced by faculty of color is to provide mentoring opportunities. Lechuga (2014) indicated that, although there is no single comprehensive definition of mentoring, it does play a critical role in the retention and success of faculty members. Zambrana et al. (2015) indicated that mentoring is an issue of equity and that faculty from underrepresented groups, in particular, should have access to the same effective practices as their colleagues. This recommended
practice, however, can be “inconsistent at best, and ineffective or inequitable at worst” (Yun, Baldi, & Sorcinelli, 2016, p. 442).

As the challenges persist and the need for recruitment and retention of faculty of color continues, it must also be recognized that “little has been written from the perspective of faculty candidates from traditionally underrepresented backgrounds” (Hughes et al., 2012, p. 595). As a result, the missing voice from faculty of color may be another reason for the lack of success in recruitment and retention strategies. Moreover, with the world of academia largely comprised of White males (Hughes et al., 2012), the missing voice from women of color is vital. Specifically, it remains critical to better understand how to support Latina faculty (Gonzales, Murakami, & Núñez, 2013; Núñez, Murakami, & Gonzales, 2015) Researchers (Mayo & Chhuon, 2014) asserted that “individual stories can help individual stories can help make visible the tensions and equity of diversity work in higher education.” Thus, in this study, I use my voice and share my personal narrative of my first year as a tenure-track faculty member.

Methodology

In this qualitative study, autoethnography was used as the primary research method. This method brings voice to an experience by way of an intimate, autobiographic account (Hughes et al., 2012). Specifically, a personal narrative was employed, allowing the researcher to take on dual identities of academic and personal self to tell an autobiographical story about a particular experience (Denzin & Lincoln, 2000).

Researcher Background

I am currently an Assistant Professor at the University of Nevada, Reno. My family and I emigrated from Mexico to the United States when I was a young child. I began to grasp the English language after attending kindergarten in rural Nevada where I was raised. Ultimately, I
attended the University of Nevada, Reno (UNR), a mere 90 miles from home. I was fortunate enough to have been selected as a Bill and Melinda Gates Millennium Scholar (GMS), which funded my higher education degrees: bachelor’s, master’s, and doctoral. However, after accepting a graduate research assistant position, I also received financial support through the university during graduate school. I am a first-generation college student from a low-income family background. I attained each of my degrees from UNR without any deferments; this was in large part because the GMS requirements at the time did not allow much deferment time in an effort to prevent attrition among scholars. I always wanted to have a career in education but mostly envisioned myself as a high school teacher, regardless of my desire to earn a terminal degree.

Path to the Tenure-Track Position

While I was working as a graduate research assistant, faculty members were very strategic and transparent with me. In short, I was informed that upon completion of my doctor of philosophy (PhD) degree, they would prepare me to be qualified to pursue a professorship role in academia. Similar to their transparency, I was quick to share that I appreciated their support, would work to meet those qualifications, but would still pursue teaching in the K12 education field upon earning a PhD.

As I made progress toward my PhD and worked as a graduate research assistant, the main focus of my work was to support efforts related to the federal grant, Gaining Early Awareness and Readiness for Undergraduate Programs (GEAR UP). In the final year of my assistantship, the faculty member who was a principal investigator for the GEAR UP grant was working on a new grant application, in which I agreed to be written into the grant as a postdoctoral fellow to support research and evaluation. In all honesty, I was not sure if the grant would be awarded, so I
did not put much thought into the possibility of returning to a higher education institution upon completion of my PhD.

In August 2010, I attained my original goal – to be a high school teacher after earning my PhD. Toward the end of my second year as a high school teacher, that same faculty member contacted me and indicated the grant had been awarded and wanted to know if I was still interested in the postdoctoral position. The option seemed unreal, but I actually did not hesitate at the possibility. I believed it would otherwise be incredibly difficult, if not impossible, to make my way into the same university system from which I had graduated. Thus, just two days later, I submitted my intent to not return to the high school at which I was teaching. However, I did not immediately resign or release myself from the teacher contract because I did not believe it would be an automatic guarantee of the postdoctoral position. Technically, it may have been a guarantee because I had already been written into the grant; however, not long after submitting my application, I was informed that the title/role had been changed to Research Assistant Professor. The change required me to compete in a national search. I did not question my qualifications for the national search because I believed I was academically prepared for the professoriate, but this new process certainly changed my chances of selection. Indeed, I competed and was selected for the position of Research Assistant Professor.

For three years, I conducted research for a GEAR UP grant under the leadership of the faculty member/principal investigator, who also served as an informal mentor. This was, therefore, a grant-funded, non-tenure track position. The role did not include formal course teaching requirements; this role allowed me to begin to establish a research agenda and enhance my research experience. I was also encouraged to join committees to familiarize myself the service process, while gaining an opportunity to know other faculty in the college. In essence, I
tried to view myself as being a tenure-track faculty member, holding myself accountable to similar measures, and my colleagues were intentional in providing those experiences for me.

Perhaps part of the reason I was afforded these types of experiences was because their intent (though I was not fully aware at the time) was for me to be able to transition into a tenure-track line upon someone’s retirement. As I approached my third year as a Research Assistant Professor, a colleague announced retirement plans. I contemplated the idea of leaving my role and transitioning into the tenure-track position. As my colleagues and I inquired into the process, I was informed that a recent policy change no longer allowed for such a transition, but I could compete in a national search for the tenure-track opening. Again, I found myself competing in a national search for a position that was no guarantee. I was selected.

The First Year

On July 1, 2016, I began my first year in the tenure-track position as an Assistant Professor. In reflecting on my trajectory to the position, I began to wonder whether my path was rare. Even more, being familiar with existing research related to faculty of color in tenure-track positions, I felt I had some sense of understanding recruitment and retention of faculty of color. In considering these two areas of exploration, I became increasingly interested in better understanding my own experiences and exploring how this understanding could be used to inform research and practice. I inquired about needing approval from the university’s Institutional Review Board and started taking notes about my experience, reflecting on events, and considering their connections to research and practice.

It is also important to note that I was pregnant with my first child and due July 25, 2015, the same month I began my tenure-track position. Therefore, although I was not required to report to campus until late August, I worked feverishly to (a) plan for my first two graduate
courses (was given a 2-2 course load), (b) finalize necessary areas related to my prior role (grant writing/reporting for GEAR UP and revising manuscripts in progress), (c) draft at least two manuscripts for publication, and (d) learn about appropriate paperwork related to maternity leave. To the best of my ability, I completed the above components and felt confident beginning my tenure-track role.

**Personal Pressures**

At the college’s faculty welcome meeting in late August, my dean introduced me to the faculty as an Assistant Professor (along with other new faculty members). Although I had already been a part of the faculty in my non-tenured role, this announcement helped me realize that I, undeniably, had a greater responsibility and was now a much more integral part of the college. My program coordinator and dean expressed an understanding about my new role as Assistant Professor, as well as being a new mother. On more than one occasion, the dean and other faculty members recalled their personal stories about parenting and working toward tenure, which demonstrated a great deal of empathy. Although they seemed understanding, I ended up not formally using maternity leave; instead, I worked at home when possible and was adamant about fulfilling my responsibilities; I did not want my commitment or ability as an Assistant Professor to be questioned.

**Tenure & Promotion Orientation**

I attended a campus wide, new academic faculty orientation that was primarily focused on tenure and promotion. It was at this orientation that I realized I lacked a lot of information about the process. I learned about university policies related to tenure and promotion but a host of information directed new faculty members to speak with college deans, department chairs, and other administrative faculty in regard to specific expectations by field. There was a panel of
faculty members across the campus who represented the continuum of the tenure and promotion process (i.e., one was under review, one had two years in the tenure-track role, another had just received tenure and a promotion). Each had valuable input to share, and I tried to learn lessons from their experiences. For example, one indicated having managed time by setting a timer and committing that designated block to prepare for class. Another echoed similar efforts, indicating that a class could be taught by planning a 1-hour PowerPoint presentation or by simply writing one word on a white board. My take-away was that I needed to find what worked for me.

Others went into detail about how they tracked their service, as well as what was valuable or useful towards tenure. For instance, one panel member mentioned keeping track of every single contact made with students in an informal advisory or mentoring capacity, while another panel member indicated only recording meetings with formally designated advisees. A third panel member focused on committee work and stated that any work assumed had to have a mutual benefit to self and the organization. The largest take-away was to protect my time and not take on too much service. I sat there thinking about how much service I was doing; I wondered if I was already the faculty member of color whose service could impede the progress toward tenure and promotion.

The final component was focused on research expectations. Again, it was made clear that expectations would vary by college or department. For example, for some faculty members the expectations might include a published book, while a book may not qualify as research for other faculty members. One panel member mentioned having reached the third-year review and being informed that more first-authored publications were needed. Another panel member discussed the process of having articles under review, others in draft, and ideas in progress to maintain a steady flow in research efforts. My colleagues had recommended I work to publish three articles
per year, and hearing that there was so much variation, I made a note to myself to ask my associate dean about specific expectations with my college during my annual evaluation time. I cautiously set my goal to publish three articles in one academic year.

Relationships

My prior role in the college and my work on committees helped me to learn about other faculty members’ research interests and commitments. In working on committees and continuing them into the tenure-track role, I was able to establish a collegial relationship with many faculty members in the college. One member from one of the committees for example, provided support and information about the tenure and promotion process and becoming a parent during that time. Another colleague asked me how my experience was going and commented that this was one of those jobs in which more and more work was required, but it was very rewarding and did not feel like work. In another committee, it was decided that a subgroup should work on some research related committee objectives, and we began collaborating not just within the committee roles but as a research team. On a frequent basis, I also felt comfortable disrupting my informal mentors’ work to share my current successes, challenge, or simply to say hello. Each conversation and other similar ones throughout the year helped me to better understand the sense of community in the college and my position within it.

However, not every experience was positive. For example, it was all too common for me to get comments indicating they (faculty members) thought I was a student or that I looked very young. I did not assign blame to them for their candid comments; somehow, it seemed to push me to want to show them that I should not be confused for a student or that my seemingly-young appearance did not mean I was incapable of effective work. There were also incidents in which I walked through the hallways and smiled at other professors, but I did not get a response; I
assumed they did not know who I was, even though I knew who they were. In another incident, I had spoken up in a professor’s absence and shared a meeting update. After the meeting, a senior faculty member approached my office and suggested I not speak for other professors. I stated that I was not speaking for someone else; rather, I was simply updating the entire group on the information I could share. I mentioned that if there were office politics involved, I was unwilling to take part in such negativity; the faculty member responded that I should also be cautious about my involvement, even when it might seem positive. It made me uneasy, and I contemplated sharing it with my college administrators, but I thought about it over a few days and then vented with my informal mentors. It was suggested I share the experience with my dean or associate dean, but it did not seem worth the potential drama.

At a higher administrative level, I must note that I had various opportunities and met with upper-level administrative leaders across the campus. I understand that upper-level administrative leaders meet many individuals, and I did not expect them to remember each person’s name. Still, each subsequent event at which I shook their hands, I was once again greeted with, “It’s nice to meet you,” I felt unknown. I was also not comfortable enough to inform them that we had already met. I reflected on whether it might make more sense for them to consider greeting faculty members with comments like, “It’s wonderful having you here,” “Thank you for what you do,” or “It’s great to see you.” I imagined that if I had been greeted in this way, I would not have to be reminded each time that they actually did not remember me.

I worked hard to remember others’ names and roles within the college and across campus. Within our college, I took the initiative of introducing (or re-introducing) myself to those around me during college faculty meetings. There were no all-college introductions that took place, so I often took note of names when one faculty member addressed another. I also
often left meetings and ran straight to my office and studied the directory page; I focused on who I had heard speak and matched faces from the meeting to their pictures on the website in order to learn their names. After one meeting, I recall one professor’s introduction. The professor also asked me how my role was going, shared insightful experiences to which I could relate, and said I was welcome to seek help or advice, if needed. The simple introduction was very thoughtful and impactful; I felt supported and encouraged. In every subsequent meeting, I found myself greeting others and being greeted by more faculty members, having more casual and professional conversations, and feeling more comfortable in that setting.

Faculty members within my own program were informal mentors and were amazing, to say the least. They were transparent, showed compassion and genuine care, and it was evident that they worked to protect my role and responsibilities. They were (and continue to be) deeply cognizant of the demands that can be placed on tenure-track individuals, particularly faculty of color. I believe they were very intentional and strategic in supporting my progress and success. In some cases, I learned later that they had protected my time by requesting I not be asked to join a committee or be offered additional responsibilities. I also received frequent reminders to remember to advocate for myself and to be cautious about my involvement in additional service work. At times, I did overhear issues about college politics, but it was clear that there was a deliberate effort to keep me out of them; I was happy to remain neutral.

I was also open and honest about the things I did not know how to do. Some questions I asked were: What types of things do I usually discuss in my first advisement meeting with master’s students? When do I begin chairing doctoral committees, and how many will I do? What flexibility do I have with my course scheduling? Is there a target goal with publications? How much service work does a faculty member typically do in our college? What happens
Annual Evaluation

An additional process that I encountered was the submission of my annual evaluation; it was due January 15, 2016. This would reflect six months of my tenure-track position. My abstract provided a fairly succinct and clear description of my time in the role. It represented my teaching, advising, research, and service, including grants, and I will focus on some of those components here.

I noted that I had worked hard to fully immerse myself into the roles and responsibilities of my position. During the summer of 2015, I was on an overload contract, which allowed me to work on GEAR UP funding, so I documented that these grants were successfully awarded for the 2015-2016 academic year, totaling $458,000. Upon starting my first semester in Fall 2015, I taught two courses (1 master’s, 1 doctoral) and got positive student evaluations. I also indicated I would be teaching two spring courses and three fall courses (the 3-2 course load transition for the upcoming 2016-2017 year). In Spring 2016, I taught a fully online course, which was the first course to use a fully online delivery within our program. In addition to this formalized teaching, other teaching efforts occurred at the local, regional, and national levels through presentation and workshop sessions at conferences, general trainings, and as a guest lecturer. I also advised and mentored students; my transition from the Research Assistant Professor role to the Assistant Professor role, reflected a 175% growth the number of students I advised in 2016. As a committee member, I supported two students to dissertation completion, three through their
proposal, and many other doctoral students who were considered in process, as well as having supported one master’s student to completion, with several other master’s students in process.

I acknowledged being in my tenure-track position for a short time; yet, I was proud to have published one peer-reviewed article and one newsletter article. I also moved two articles from in preparation status to submission, which were under review during the evaluation (and subsequently got accepted with revisions in the summer). I was first author on all of this work. In addition, I was serving on 11 research projects, all helping to expand my research agenda. I also supported program evaluation of academic bootcamp programs for our university’s provost and continued a follow-up evaluation that was set for completion in Spring 2016. In addition, I as a co-editor of a book and served on research teams for several studies related to GEAR UP, leadership, and diversity initiatives.

I documented my service on a number of committees at various levels (i.e., university, college, local community). For example, I noted that I continued the leadership role for a charter school board. I also provided service to GEAR UP in events at the local, regional, and national levels. Specifically, I served on the State Evaluation Team, I also served in the national evaluation consortium. I was a member of a national committee to completely re-design the national indicators and annual performance reporting for GEAR UP. I provided translation services to various stakeholders within and outside our university. In addition, I served as an editorial adviser for a journal and served as a peer-reviewer for a number of journals.

Essentially, I believed these areas demonstrated strategic, thoughtful, and extensive efforts toward teaching, research, and service. I felt confident about my progress, and I was looking forward to seeking feedback in regard to my efforts. On several occasions, I also asked our associate dean some clarifying questions, such as what supportive materials might be needed
as attachments to my evaluation, as well as how much I needed to include from my course evaluations. The associate dean’s office was open and welcoming, and I felt it was okay for me to “pop in” to ask questions.

As a first-year Assistant Professor, I was required to schedule a meeting with my associate dean to discuss my evaluation. I was not sure what the process would entail, but I did not feel any apprehension toward it. In addition, the associate dean was also in the first year of that role, so I approached the meeting as a mutual learning experience, and I recall mentioning that during the meeting.

There were two most striking parts that I noted from my evaluation meeting. The first part was that I received praise about my excellent progress, and it was recognized that I did very well while having had a baby. I felt that my hard work was acknowledged. At the same time, my rating reflected a commendable mark (rather than an excellent mark). I immediately experienced a sense of cognitive dissonance – the words I was hearing indicated excellence but my actual rating did not reflect that. The reasoning was that I was too new to truly demonstrate or receive a rating of excellent. My immediate question (having recalled my orientation training) was, “What do I have to do to get an excellent rating in research? Do I need to publish six articles per year…or…?” The response was that the college average in publications was 2.5 articles. I found the .5 interesting and confusing, and I decided that my mentors’ advice early on about publishing three articles each year was still a strong and valid goal. I did think to myself, “…but in just six months, I published one and have two under review.” My self-consolation was that I would get the two in review accepted and in the following year’s evaluation, I would have three publications.
The second striking part was that there was a cautionary note in regard to my service. It specifically indicated I should “Be cautious about how much service you take on.” It was reassuring to know that my college administrators were taking note of my often-burdensome service work. At the same time, however, I grappled with how the written note could translate into actual practice. I reflected on whether I was the embodiment of a faculty member of color who is too often described in literature reviews as having too many service responsibilities.

The Final Months

As the final months for my first year on my tenure-track contact approached, I was asked to take on further service work, despite the fact that I specifically referenced having received a cautionary note in my evaluation. As a result, I politely declined additional committees, task forces, panel sessions, etc. In January 2016, I started planning my upcoming fall courses because I would be required to teach three graduate courses (Tuesday through Thursday from 4:00-6:45PM). I had not fully processed how my upcoming schedule would impact my professional and family life. However, one day in a hallway conversation with a colleague from a different program/department, the professor mentioned being adamant about protecting family time by declining service responsibilities beyond 5:30PM. I realized my course schedule alone would prevent me from doing something similar, but I started to think more strategically about how scheduling could impact my professional and family life.

I soon inquired with other colleagues about how they used time management, structured their course schedules, and created time for research. Perhaps the most common response was that some courses could use a flipped model, be fully online, or could follow a hybrid format. At this point, I was teaching a traditional course and an online course, so I began to consider the idea of the hybrid model. I strategically began to draft my three syllabi schedules and considered
ways to rotate some course sessions online. It was evident that at the primary stages of planning and development for online sessions, a lot of work is needed. However, the thought of providing students with some variation to the content delivery and format was appealing. It was also appealing to know that a mutual benefit to this course delivery could take place. I casually shared my ideas with more individuals because I did not know if I needed formal permission from someone to be creative with my schedule. After several points of reaffirmation, I structured what would be strongly beneficial for students’ learning but could also work for me.

During this time of year, I also started getting an influx of documents to review, such as master’s theses, dissertation proposals, or dissertations for defense. There were at least two meetings each month related to a master’s or dissertation defense. As I was busy reading student work, I was also busy working to submit my own presentation proposals that would likely happen during my off-contract time during the summer session. Specifically, each month from February through May 2016, I worked on presentation proposals (1-2 per month) and also attended a professional conference (1-2 per month).

Additionally, I was asked to join a university-district collaboration effort to completely revise our college program, syllabi, and course sequence that required monthly (sometimes weekly) meetings; I also served on three separate dean or other upper-level administration meetings in which I was invited to share some perspectives related to my first year or my diverse background. Furthermore, during the second semester, I was required to finalize and submit programs of study for my new master’s degree advisees. I was also engaged in grant management activities. Specifically, I wrote the renewal for the GEAR UP grant for the following award year and closed existing grants. Lastly, I attended end-of-year closing events.
Consequently, as I entered the final month (May 2016) of my nine-month contract, I realized that I had no tangible, drafted research manuscripts. I soon set my eyes on my “off contract” days of summer. My reality was that summer would be critical for finalizing classes, conducting conference presentations, but most importantly, working on what everyone around me kept reminding me was the essential part of my role – publications.

**Discussion**

As Mayo and Chhuon (2014) indicated, “While we encourage *all* [original emphasis] higher education institutions to consider the benefits of a racially diverse faculty…being situated at research-intensive universities has unique implications” (p. 233). These authors added that research-intensive universities often set the tone for policy and practice. Thus, the discussion that follows includes three areas to consider from my personal narrative that could inform policy and practice related to recruitment and retention of diverse faculty.

**Use Creative Hiring Processes**

Traditional hiring practices, advertisement, and recruitment efforts must change to attract faculty of color. Researchers (Bilimoria & Buch, 2010; Hughes, 2015; Mayo & Chhuon, 2014) have noted that informal lines of communication, non-traditional organizations for recruitment, postdoctoral positions, consideration of hiring one’s own graduates, and diversity within search committees are all strategies that can support creative hiring processes. In my case, although I did not immediately envision myself in higher education, personal recruitment efforts and attempts at creative hiring processes, paved my way to the professoriate. Similar to other experiences, this required a few individuals who believed in my potential and advocates who understood the difficulties with traditional hiring (Mayo & Chhuon, 2014).
As a Latina female, it is not uncommon for individuals from underrepresented backgrounds to want to stay geographically close to family (Johnson, 2008; Williams & Luo, 2010), and I was no different. I stayed within 90 miles from the rural town in which I was raised. In seeking my PhD, however, I did not know that institutions typically do not hire their own graduates (Basak, 2013). Consequently, my personal desire to be close to home was in conflict with institutional hiring practices. With more creative hiring processes, faculty of color may be able to better navigate these two seemingly opposing aspects.

Enhance a Sense of Belonging

There is extensive research related to first-generation, low-income students of color at the K12 and postsecondary levels indicating that their sense of belonging is critical to educational success (Jehangir, 2009; Tinto, 2007). For me, this need for a sense of belonging extended to my professional environment. Altogether, the creative hiring efforts, the relationship experiences, and the many questions I asked and conversations I had with others were critical components to my sense of belonging.

From the most simplistic level of working to know colleagues’ names to a more complicated level of wishing upper-level administrators greeted me in a more welcoming manner – all appeared to impact my sense of belonging. The greatest impact on my sense of belonging, however, came from my informal mentors. Their offices were “safe havens” where I could comfortably seek advice, ask any question, and feel in the presence of friends. Above all, I did not feel alone because of my informal mentors; rather, I felt welcomed, supported, and cared for because of them.
Provide Balance

With an understanding of the literature, my experiences related to the additional responsibilities that faculty of color tend to have (Cerecer et al., 2011; Fries-Britt et al., 2011; Hughes, et al., 2012; Mayo & Chhuon, 2014; Padilla, 1994). However, an individual’s self-awareness and reflections may help the individual to seek balance within the role. For me, balance came from learning to manage my coursework scheduling, course preparation, and grading. In addition, balance came from seeking input to better understand what kind of flexibility and decision-making was possible or appropriate. It also came from a constant self-analysis in which I considered whether I was seeking (or being offered) too much service work that inhibited my time for research. It was a constant balance in processing and deciding whether I could decline a particular additional service component. Clearly, I declined some added service work, and some I did not. In order to build relationships and enhance my sense of belonging, additional service components were often critical. However, too many responsibilities could be detrimental toward tenure and promotion (Hughes et al., 2012). Therefore, what must be recognized is that, oftentimes, this need for balance strongly conflicts with the need for a sense of belonging.

Conclusion

Recruitment and retention of faculty of color is unquestionable. Yet, the “result of decades of effort to increase faculty diversity, particularly when it comes to underrepresented minorities, has been disappointing” (Roy, 2013, para. 5); more needs to be done. As has been noted, targeted hires can be used to bolster recruitment initiatives (Mayo & Chhuon, 2014). In my experience, the opportunity to first serve as a Research Assistant Professor, introduced me to unfamiliar systems and how to navigate them as a faculty member. This trajectory also helped
me to begin to build a research agenda; this is certainly paramount in a tenure-track role at a research-intensive institution. Also, some form of mentoring, even if informal (as in my situation), can still help faculty of color understand expectations, be able to seek questions/advice, and build relationships. Of course, mentoring must occur in a manner that does not undermine capabilities but helps to build on the strengths of faculty of color. Furthermore, these trusting relationships can help faculty of color gain a sense of belonging and purpose on that campus. Still, their purpose on campus needs to be well-understood and protected in order to foster balance within the role. It was all too often in my experience that the rhetoric and the reality of expectations did not match, especially in consideration of service work. Consequently, faculty of color must cautiously self-advocate, but the surrounding faculty and the existing institutional policies and practices must be used to further support recruitment and retention efforts.

Cooperative-based settings prepare students for intellectual and social awareness, career readiness and intellectual and social development to become better contributors and facilitators (Stephan, W. G., & Vogt, W. P., 2004) in a multinational team. By sharing accountability in learning, and providing feedback that is necessary in establishing a shared identity as members of an institution and an organization, students are able to promote the social support needed to improve participation, to personalize the educational experience, to increase collaborative achievement (Gillies, 2007) and to improve the quality of team-based learning.

Cooperative learning is an instructional procedure of small groups for individuals to work together to maximize their own learning, as well as each other’s. (Johnson, 1991). If properly implemented, cooperative learning leads to greater learning and superior development of communication and teamwork skills (Buch, 2012) in which individuals have the capacity to conceptualize their cognitive advantages in transitioning from academe to employment.

In cooperative teams, individuals can engage in discussions in which they construct and extend conceptual understanding of what is being learned, and develop shared mental models of
complex phenomena. Through the use of cooperative learning, individuals will be prepared to perform better in multicultural teams, and participate in strengthening their interpersonal and professional communication styles.
Title: Using Number Talks to Transform Mathematics Classrooms and Develop Mathematical Thinkers

Author: Ruth Parker, Ph.D.

USING NUMBER TALKS TO TRANSFORM MATHEMATICS CLASSROOMS AND DEVELOP MATHEMATICAL THINKERS

Ruth Parker, CEO, Mathematics Education Collaborative (MEC) and co-developer of Number Talks

In the early 1990s, having observed the fragility of students’ thinking about and with numbers for more than two decades, my colleague Kathy Richardson and I commiserated that there must be a better way to teach arithmetic. Past and current practices have simply never produced large numbers of students with number sense, nor have they produced many students who can work flexibly and efficiently with numbers.

In our search for solutions to this decades old problem, we began asking the teachers we were working with at the time to try to see what students would do naturally to solve arithmetic problems if we didn’t first tell them the rules to follow. As these teachers began to listen carefully to students and how they thought about problems, the idea of daily Number Talks was born; a 10- to 15-minute routine where students mentally solve computation problems in their own ways, defend their ways of thinking and consider approaches used by their peers.

Since then, I have had the opportunity to introduce Number Talks to thousands of students and teachers across the K-20 continuum, and to parents, administrators and business leaders throughout the country. I have conducted Number Talks with students, teachers and parents in diverse communities and have watched and listened as teachers have taken Number Talks back to their own classrooms at all levels from elementary schools through universities. Teachers and students love Number Talks. And it is also clear that they want and need additional support as they work to change their practice in profound ways using Number Talks as their own ‘sites for learning’. In response to this need, Cathy Humphreys and I co-wrote the book Making Number Talks Matter (Stenhouse, 2015), a guide to Number Talks for mathematics teachers across the educational continuum.

After nearly three decades of working with parents, teachers, administrators and business and community leaders, it is crystal clear to me, and to external evaluators who have studied this work, that when these important stake-holders experience Number Talks as learners, then in overwhelming numbers they support the practice, and they want to see it implemented in schools. Many business and community leaders have expressed that in addition to an increased understanding of mathematics, Number Talks help instill in learners several other dispositions deemed vital to the workplace of today. They need workers who are curious, who can think outside the box and who believe in themselves as problem solvers; workers who have a disposition to persevere until problems are solved; and, workers who can work productively with others, express ideas clearly, and use sound mathematical arguments to present ideas and to critique the reasoning of others. Many business leaders have expressed during our meetings that they want to hire locally, and yet they can’t find workers with these necessary skills and dispositions.
**Number Talks** are gaining national and even international attention as more teachers implement them in classrooms, noting the impact on themselves and their students’ mathematics learning. This growing attention was on display during an on-line book study on *Making Number Talks Matter* (Humphreys and Parker, 2015) facilitated this past school-year by Teacher Laureates at the Teaching Channel. Over 700 elementary through high school teachers and coaches from many countries participated in the 11-week book study. During the study it was common to hear teachers throughout the U.S. and abroad comment that they were learning a great deal of mathematics alongside their students.

**WHAT IS GAINED BY INSTITUTIONALIZING NUMBER TALKS?**

Daily Number Talks are by far the most efficacious way I know of developing student agency in mathematics; of deepening mathematics content knowledge for teachers and students alike; and of developing productive mathematical dispositions in virtually all students. Number Talks serve to deepen student and teacher understanding of arithmetic, and they make a strong contribution to developing number sense. In a very short period of time (just weeks), when Number Talks are practiced frequently, students and teachers come to know that mathematics makes sense and that they can make sense of it in their own ways. Teachers and students alike develop a genuine curiosity towards and a desire to understand how others are thinking. This one profound (yet simple) 15-minute daily practice can shift the entire culture of a mathematics classroom – away from one where students learn math primarily as rules and recipes to be memorized; and towards one where understanding mathematics is expected and where reasoning, sense-making, and mathematical discourse are the norm. Number Talks bring the Mathematical Practices to life in classrooms at all levels.

In summary, some of the important outcomes of this fifteen-minute daily routine include the following:

- Teachers and students gain a much deeper understanding of the operations of addition, subtraction, multiplication and division of rational numbers, place value, and the arithmetic properties – all mathematical relationships that undergird the study of mathematics at every level;

- Students come to know that mathematics makes sense and develop a disposition to persevere until things make sense when confronted with mathematical problems and situations;

- Mathematics classrooms become communities of learners where students trust each other and their teacher, and where everyone is eager to learn from each other;

- Students, teachers, administrators and parents, alike, learn through Number Talks that people approach mathematical problems in different ways, and that this is a good thing. They come to know that when various perspectives are shared, everyone involved learns the mathematics more deeply. They learn to genuinely care about hearing from others and
value frequent opportunities to compare various ideas and ways of thinking about problems.

- Virtually all students become comfortable bringing their ‘voice’ to mathematical discussions during *Number Talks*, and this tendency is often carried into their other subjects as well. One essential aspect of *Number Talks* done well, is that students are put completely in control of deciding if and when to bring their own voice to the public space. A totally safe environment, where they know they will never be put on the spot, allows all students to engage in learning, and *Number Talks* provide time for everyone to think and to ‘rehearse’ or ‘subvocalize’ an idea as they get ready to share it publically.

- Students and teachers leave *Number Talks* curious and wanting to know more. They observe their own growth and that of their peers as they come to enjoy challenging themselves and being challenged during *Number Talks*. They come to understand that important mathematical ideas are never fully mastered in that they continue to deepen in complexity over time. Teachers and students together develop a curiosity that leads to new questions, and a disposition to pursue finding out, and thus, *Number Talks* also spark many worthwhile mathematical investigations around how numbers work.

Phil Daro, one of three principle authors of the Common Core State Standards in Mathematics, directly addresses the importance of *Number Talks* when he talks about mental computation, saying, “You can’t really do mental math without doing algebra. This is algebraic reasoning in its purest form” (NCSM/TM presentations 2010 and 2014).

Daro again addresses the importance of *Number Talks* when he writes, “Inside every number calculation are buried the seeds of algebra. This wonderful new book shows how to use *Number Talks* to grow those seeds and meet the challenges of the Common Core. Cathy and Ruth have given us a wise and practical book on how *Number Talks* can help solve some of the most pressing problem facing schools” (Humphreys and Parker, 2016).

“... *Number Talks* can help solve some of the most pressing problems facing schools.” I agree. The impact of *Number Talks* on student and teacher learning continues to be studied and documented. There is clear evidence for the efficacy of the practice; evidence compelling enough that virtually everyone currently involved in mathematics education should want to become more knowledgeable about the practice. MEC is now working to design a leadership plan to help take *Number Talks* to scale while holding true to essential components of the practice.

If you would like to further explore partnering with MEC as part of our upcoming leadership efforts, please contact me via email at mec@mec-math.org.

{yuj6, yunm}@wit.edu

Abstract
There are about 20.2 million students attending American colleges and universities in fall 2015 and we expected the
number will increase annually. To facilitate the decision making for the students and families, the school normally
considers to offer opening events. However, there are a few issues at opening events: (1) campus tour is a human
resource intensive task; (2) event scheduling and location switch are difficult for prospective students and families;
(3) the mutual communication channel is not easy to access. In this paper, we identify a few research questions and
propose a system to address these questions. The WOW (Wentworth Opening Wizard) is an innovative integrated
system, which not only provides mid-scale navigation on campus by using NFC and Wi-Fi techniques, but it also
allows the students and families to schedule interested events with navigation support when using it.

Keywords - School Opening Week, Campus-wide Navigation, NFC, Wi-Fi.

1. INTRODUCTION
According to the National Center for Education Statistics (NCES), there are about 20.2 million students attending
American colleges and universities in fall 2015 and the number has increased 4.9 million since fall 2000 [1]. To
facilitate the decision making, the colleges and universities normally offer a few opening events to help prospective
students and families understand the school, including the school’s vision, resources, courses, financial support, the
characteristics of the departments, campus settings, etc. However, the communication was mainly single direction from
the school to the students and their family. Even worse, the schools normally have limited budgets and resources to
support all prospective students, such as campus tours, and the students have difficulties to explore all interested events
on unfamiliar campus. There are many challenges in current settings of opening events, but we would like to think of
them as opportunities to apply new technologies to solve parts of them.

Firstly, a campus tour is one of the most time-consuming event, but it is an important factor for the students and
families to choose a school. Although Global Positioning System (GPS) navigation system has become popular and
convenient in outdoor environment, it is not easy to provide such a service easily at an indoor environment, such as
rooms in a building or a connection between buildings.

Secondly, there are many interesting events happening at the opening day and the students are easy to miss some of
them without noticing it. Although a school brochure can provide a detailed event schedule, the students and families
can feel annoyed and lost, especially they need to switch locations for different events. Scheduling selected events and
understanding what’s happening on campus has become a challenge.

Thirdly, it is difficult for the schools to service all prospective students, and the students and families also encounter a
difficulty to ask questions and get an instant feedback to facilitate decision making. Even though the schools want to
provide follow up support, traditional sign up sheet approach can’t provide data analysis.

In this paper, we propose to have an integrated platform, WOW (Wentworth Opening Wizard), to address above issues.
As shown in Figure 1, the WOW is an Android 6.0 mobile application developed by using Android Studio 2.1 and it
provides mid-scale, campus-wide navigation service by using NFC (Near Field Communication) and Wi-Fi
technologies. In addition, the system also provides event tracking and support for mutual communication between the school staffs and the students. In the following of the paper, we will introduce the current status of the development and discuss the future direction of this project.

![Figure 1: The WOW mobile application. (Left) Main dashboard page; (Right) A navigation drawer provides an easy-to-access options.](image)

**II. NFC NAVIGATION**

Although a traditional GPS-based navigation system has shown a successful usage in some fields, such as driving and outdoor navigation, it doesn't help prospective students and families or someone unfamiliar with the area to explore the campus and get to their desired destination. Based on the observations, we found that there is a need to have a more reliable way to access directions, especially when GPS systems are inaccurate or inaccessible. NFC is a new short-range wireless connectivity standard that uses magnetic field induction to enable communication between electronic devices in a close proximity [2]. This technology is currently used for many different services, such as Google Wallet, Apple Pay, and Nintendo Amiibo.

NFC tags allow the users to accurately determine their location on campus by touching their NFC phone or tablet to an NFC tag, which is normally preprogrammed. This action will then enter the locations data into the application. The location data can then be used to provide directions, reminders, and location specific information (such as building names, room numbers, hours of operation, etc.). Our previous work has demonstrated that it is feasible to use NFC tag to provide mid-scale navigation [3]. We extend our work to the WOW system and provide campus-wide navigation. As shown in Figure 2, by tapping NFC tags placed all around the campus, the users can get the current location in details. If that user registered some opening event through the Event Calendar feature, a path information to the desired destination from current location can be provided.
Figure 2: WOW NFC Navigation. (Left) A screen for tapping on NFC tag to know current location. (Right) A search result on the map to support indoor navigation.

III. WI-FI NAVIGATION

Although NFC tags are relatively cheap and have very flexible placement options, NFC navigation system still requires initial deployment cost and efforts [3]. However, Wi-Fi access points (AP) are already available on most campuses and every smartphone or tablet has Wi-Fi access [4]. By using existing Wi-Fi signal strengths, the system can provide a dynamic location and direction information.

Wi-Fi APs on a campus also have unique media access control (MAC) addresses, which allows devices to differentiate between the routers, especially since some campuses may have a number of routers in close proximity to one another. Our Wi-Fi navigation module collects the signal strengths from these APs in order to determine a user’s location. As shown in Figure 3, we verified our idea on the third floor of Wentworth Hall at the Wentworth Institute of Technology in Boston. Each room has a Wi-Fi AP and we collected a few received signal strength indicator (RSSI) inside and outside of a room. After mapping those RSSIs to the room numbers and Wi-Fi MAC addresses, the WOW Wi-Fi navigation can provide an accurate location information. Figure 3 shows the output of current Wi-Fi navigation module.

IV. CONCLUSION AND FUTURE WORK

The school opening events have provided an opportunity for the students and families to know the school. However, existing opening events system has many challenges and these challenges offer an opportunity to find solutions with state-of-the-art technologies.

In this paper, we have identified three issues at opening events: (1) campus tour is a time consuming and human resource intensive task; (2) event scheduling and location switch are difficult for prospective students and families; and (3) the communication channel was mainly single direction from the school to the students and families, and the school cannot collect and analyze data to support future opening events.
Based on these observations, we designed and implemented a new Android mobile application, WOW (Wentworth Opening Wizard), to address above issues. The WOW system uses state-of-the-art techniques, NFC and Wi-Fi indoor positioning, to provide mid-scale navigation, which is helpful for some school opening events, such as campus tours, location switches for an event, etc. In addition, it also provides event scheduling for the students to plan events in advance. Figure 1, 2 and 3 have shown the status of current development.

Although the current development has demonstrated a promising direction for school opening events, we are considering to explore following research directions to enhance the service.

A. Back-end data analysis server

While the WOW system provides services to the students, the students and families can also provide their public information comments (text or voice) to help the school prepare for the next year. We are considering to setup a server by using Node.js to provide data analysis with statistic open-source software. Based on the analysis, the school can have an idea of the geographic information, students’ academic background and preferred events or activities for the opening events.

B. Speech-based routing support

The WOW NFC and Wi-Fi navigation services can only provide text-based navigation at current stage. To provide a better usage, we are working on creating a GPS-like speech navigation feature that can guide the prospective students and families naturally. Integrated with Events Calendar feature, we believe the system can provide a CLICK and GO scenario.
C. User study with prospective students and families

We are working with the school administrative office to include 2016 opening events into the WOW system. As long as we have the details of all planned opening events, we will start to invite users to test the features, including NFC navigation, Wi-Fi navigation, events scheduling, etc. The post-interviews are also considered to get qualitative feedbacks to improve current system.

Implementing Non-Cognitive Development
Through Dynamic Experiential Learning Techniques

Joan Banel M.Ed.
Patrick Austin Freeland M.S.

Northwest Indian College
Bellingham, WA
Abstract

Outcome-Based Education often focuses on cognitive skill development. While Indigenized educational approaches seek to promote individual ethics “attentively, respectfully, and responsibly,” often times there still exists the axiology of education as a product; this is especially true in postsecondary education. The Northwest Indian College TRiO Student Support Services (NWIC TRiO-SSS) program is designed to serve first-generation, low-income, and students with disabilities, by utilizing non-cognitive developmental interventions to establish a “sense of belonging,” ameliorate historical educational trauma, and also identify and adapt to multiple learning styles and modalities. Based on methodologies developed for the NWIC TRiO-SSS Non-Cognitive Development strategy, education is framed as neither a product, nor discipline, and instead viewed as a reconfiguration of neural pathways. Students’ educational trauma, PTSD, depressive disorders, and others can be ameliorated concurrent with cognitive development and coursework through: individualized coaching/advocacy, writing mentorship, motivational interviewing, reconfiguring self-construal, and mindfulness.
There exist many systemic failures and inherent sociocultural biases within the institutions of American education. After years of mandated core competencies, standardized test requirements, and normative expectations associated with education, curricular benchmarks often create a barrier for student advancement, rather than serving as a gained asset. The usual Student Will Be Able To (SWBAT) institutional outcomes often do not take into account the holistic needs of the learner. The tactic of asking for the need and the want develops agency for the student. The considerations of student experience and positioning academia in context of functional knowledge disassembles the barriers and rearranges challenges into attainable, and pragmatic, goals. This adaptive approach to learning enables a student to move a little further away from the margin toward the collective definition of success, while also serving as a criticism of the academic institution as a whole to ensure that only the most optimal, and beneficent, methods are utilized in engaging students within academia.

There exists a need for a pedagogy which caters to the distinct individualized needs of marginalized learners; individuals whose differences set them apart from the mainstream student demographic, and render them unable to benefit from homogenized learning outcomes. These learners do not have the luxury of agency, or time, to benefit from a pre-set learning outcome. Instead, these are individuals who have developed their own distinct needs for an education that fits their individual needs from their learning institution. These needs, however, may not reflect the outcomes intended by the institution, and when amalgamated into overall student statistics can appear as failures. The inability to progress due to either failure - or outright rejection - of regimented competency measures, implies that a student’s needs are not met. This leads to social trauma as these individuals may disappear from classes and student spaces and become even
more separated and disconnected from institutions of learning. To exacerbate the disconnect, students dropped from their classes risk damaging their GPA and/or academic record, or worse they may end up owing large amounts of student debt and are even more severed from the academic pipeline. When a student’s needs are met, and considerations are situated holistically, the student develops self-efficacy - connection to their education - which leads to persistence, higher grades (or other institutional outcomes and/or benchmarks), graduation, and eventually practical application of knowledge leading to an increase in a student’s quality of life. The impetus is to create a tactical pedagogy: to meet these individuals where they are at, to literally ask: “What do you want?” and “What do you need?”

Marginalized students are often placed into classes for which they may not be prepared. Students who struggle with remedial math and English requirements may also feel isolated in an academic institution, especially students who are non-traditional, first-generation, low-income, and/or may have a disability. Therefore, it’s imperative that academic advisors and student support staff understand and acknowledge students’ needs and wants and employ tactical pedagogy. Academic advising has undergone a series of revisions throughout modern education to increase effectiveness (Poole 2013), and just as any sort of critical theory in pedagogy, a whole host of styles and methods have taken stage: holistic advising, intrusive advising, eAdvising, prescriptive advising, and countless other forms. While there have been several studies analyzing advising methodologies (Poole 2013), there is a common theme which emerges: students no longer require mere assistance in choosing an academic pathway, they require assistance with making healthy life choices.

The specific method employed is fairly straightforward: (1) a student engages with an instructor/advisor/facilitator, (2) through multiple forms of needs-assessment and student/coach
interaction, a set of objective-based goals are developed, (3) specific academic and/or life needs are met using an "experiential learning" approach, and (4) successes and failures are utilized to improve the method across scale and discipline. The work of the instructor, the advisor, and/or the facilitator is to assist with defining the need, the want, and to situate the functional knowledge within context of place, culture, and environment. The needs/wants will be different for every individual learner, and necessarily so. This paper does not seek to analyze, categorize, and criticize each form of instruction and advising, rather this will serve as a foundation to explicate the current method of Coach Advocacy at the Northwest Indian College TRiO Student Support Services program (NWIC TRiO-SSS), and further detail the specific activities which employ non-cognitive development methods to overcome potential trauma associated with education. This paper seeks to emphasize tactical pedagogy as a means for a student to develop specific knowledge and skills to accomplish explicit objectives and overcome inherent fears/trauma associated with education. Furthermore, this paper will not discuss specific summative outcomes of the methods employed as we have adopted a Community-based Participatory Research (CBPR) process for assessing, analyzing, and disseminating results; meaning, until we have not only consent, but also data-ownership and buy-in from our students, and their community, this paper will simply highlight the specific methods developed utilizing prior research and evidence of effectiveness.

Position

Education, as a strictly intellectual concept is often positioned as a discipline, a method, and/or an outcome (Walton 1963; Wittrock 1986; Acharya 2003). We frame education specifically as neurological development; the literal reconfiguration of neural pathways leading
to change in consciousness and associated behavior. Traditional pedagogies, particularly those utilized in math and language can require a hegemony which could be oppressive, even traumatic, for students who are situated outside of the typical American educational system (Perry 2006). Therefore, through positioning both education and trauma as forms of stress, an "educator" must take into consideration a student's specific associations with not only course subjects and classroom spaces, but also environmental factors which may contribute to harmful stress. This can be accomplished by first identifying the specific cognitive functions that a student is expected to learn, and then identifying non-cognitive methods to incorporate those functions into the student's experience holistically.

By focusing on the specific required function, rather than broad subject, there exists potential for redress of trauma associated with the institutions of learning. The NWIC TRiO-SSS Coach Advocates utilizes several methods to associate positive feelings with academic outcomes ranging a whole host of academic applications including writing, completing assignments, attendance, applying for financial aid, etc. Coach Advocate staff seeks to cultivate a sense of belonging among all first-year students using these principles and collaboratively develop non-cognitive life skills in areas such as Sense of Place. Furthermore, Instructors incorporate into lessons, the knowledge of cultural values which support a student’s ability to communicate in diverse situations, listen deeply, think critically, and organize and articulate ideas. Within the framework of Tactical Pedagogy, Coach Advocates use a concept akin to military tactics as a way to take stock of their weaponry and identify objectives. Strategies are developed to adapt and overcome - to win the battle against what a student identifies as the “enemy” of their success- and break down barriers that prevent the student from reaching their idea of success. Coach Advocates then use the tools of experiential learning and non-cognitive association and
skill-building to further equip a student with skill-sets necessary to effectively communicate and lead in diverse situations. By enabling a student’s access to “intelligence,” allowing a student to anticipate further challenges, also increases their signaling capacity; receiving and expressing information - and most importantly need - both verbally and non-verbally. This also furthers the overall institutional capacity as self-efficacious students can also modify, deploy, and even train other students to use analytical and critical thinking skills to draw and interpret conclusions from multiple perspectives, axioms, and experiences.

Application

Students who are not engaging, attending, producing, graduating are problematic to an educational institution. They bring down retention and graduation rates, which create frustration for administration and faculty alike. Within the TRiO grant there are three identified student characteristic targets-Students with disabilities, low-income students, and first generation students. These are generic labels to help sort out groups of individuals and all of these students have some need or want that is not being met. During the phase of program development it was pre-supposed that students who fit within these categories were experiencing a disconnection education in a way that made their education unattainable. The first effort to clarify the disconnection was to develop a comprehensive script for the first student meeting. This script incorporated the spirit of Motivational Interviewing to engage the student in a collaborative working relationship, Miller, W. R., & Rollnick, S. (2013). Academic Life Coaching is used as a framework for creating a relationship that is a non-hierarchical and provides a foundation for both the student and the coach to explore different areas and be creative in finding individual solutions that work specifically for that student. (Williams, J. A. 2016). Culturally sensitive
questions were incorporated due to the majority of students of who were identifying themselves as Native Americans.

The anticipated outcome of the lengthy interview was to develop rapport with the student and then identify goals that students and coaches would work on together throughout the quarter. What we did discover is that students did not have time for a lengthy interview; they had distinct emergent needs that if not met on the fly would result in immediate negative consequences in the form of absenteeism, failure to complete an assignment, or complete the class. There was very little long term goal consideration, let alone the ability to make and keep an appointment for next week. The other focus of development was on the idea of non-cognitive activities to increase overall engagement. The idea was to create activities that increased student sense of connection to their education and to the educational institution. This manifested as a “Backgrounds Matter” campaign that was incorporated as the underlying theme to the program development of the grant. It was determined that individuals have unique backgrounds (their power) they brought to the college (place) and then a relationship developed. Commitment ceremony, personal tours, Student Executive Board (SEB) members telling their backgrounds, incorporating experiential learning to places at where there is no hierarchy and which have their own distinct backgrounds (Lopez Island Camas Research Garden, Geology field trips, Doe Bay, North Dakota and Birch Bay). Open Space Facilitation practice developed the personality of the relationship. This effort was utilized to take away the hierarchy that is found in so many relationships in academia. The imbalance of power in academia of “I have what you will need to be successful on my terms” rather than “What do you need?” to be successful on your terms. Allowing the individual to define success and honoring that design cemented the development of personality. The following
methods are the specific applications of non-cognitive development couple with tactical pedagogy and experiential learning.

Methods

Each of the following methods begins with an invitation for the learner to participate to establish inclusion to increase comfort level with the activity as well as to increase the motivation to learn. (Daffron 2011)

**Method one: Initial Interview with the student.**
Purpose: To create a rapport, identify strengths and identify needs.
Design: Using Motivational Interviewing Techniques, Academic Coaching tools and preference assessment the coaches become familiar with the student’s level of resiliency, their immediate needs, and their challenges to assist them with self-identification of success. Students are initially asked for permission to discuss these things and are advised of the confidentiality that is maintained within the content of their discussion.
Outcome: Students who are able to identify an immediate need that will allow them to remain in school, such as Financial Aid, Childcare, or inability to communicate with an instructor, are immediately armed with the knowledge or support to take the next step. Coaches use accountability actions to ensure students use the tools they develop.
Application: For example: a student who identifies the need for food is advised about SNAP assistance and is walked through the on-line application.

**Method two: Non-cognitive skill building workshop: “Box of Objects”**
Purpose: To develop connection to education and to other students.
Design: The exercise allows students within a group setting of their peers identify from a collection of objects and are asked to verbalize how they feel connected to that object and then share with the group. The facilitator than provides additional examples of connection to strengthen concept of power, place, and relationship. (Deloria & Wildcat 2001).
Outcome: Students are able to identify and verbalize connection as a feeling.
Application: For example: a student who selects a piece of beach glass may describe how they are reminded of being connected to the beach, the water, and family.

**Method three: Non-cognitive skill building workshop: “Learning Styles Activity”**
Purpose: To present the concept of learning styles as a definition of a tool and not as an identity.
Design: Students listen to the facilitator read different scenarios regarding completion of a task. Students group with likeminded individuals after each reading up and they are encouraged to group together with likeminded individuals and discuss how they chose to identify with the particular scenario.
Outcome: Students discover that different tasks may require different learning techniques and learning styles are fluid, flexible, and without a hierarchy of power.
Application: Students are able to consider themselves as not confined to one presumed learning style that they use for every task and are free to utilize the style that meets the task at hand.

Method four: Non-cognitive skill building workshop: “Letter to Self Activity”
Purpose: To use writing as a tool to connect their current self with the future self.
Design: Participants are invited to first join in a humorous group writing exercise of fill-in-the blank scenario exercise to help make a positive association with writing. They are next given a prepared sheet of paper and taken step by step through the process of how to write a letter to their future self. Within the letter the student is asked to identify motivators, support people in their lives, and to write out a phrase of encouragement that has worked for them in the past. The letter is to be read whenever the going gets tough during the quarter. (Our experience with students has been that effort declines immediately after the rush of midterm is over.) Completed letters are collected in individual sealed envelopes that will be made available to them when the student feels the need or the Coach Advocate senses the need.
Outcome: Student identify motivators, support people and positive self-talk
Application: Students are able to plan for the future and utilize a tool that will help increase motivation.

Method five: Non-cognitive skill building workshop: “Bacon and Eggs”
Purpose: To introducing the theme of personal commitment and encourages the concept of understanding and honoring differences in individual preferences.
Design: Participants are asked to listen to a question and then move to the picture that illustrates their response. There is time built in for small group discussion and sharing out to the larger group after each question. Students are reminded that there are no wrong answers and to answer what is true for them. The facilitator then uses analogy and metaphor to debrief and demonstrate the concept of commitment to education and personal preferences.
Outcome: Students witness that they have similarities and differences with their preferences and there is no hierarchy to preference related to commitment, only personal choice.
Application: Students are defining how they will commit to their educational goal.

Method six: Panel Discussion: “Background Matters”
Purpose: To highlight the variety of student backgrounds and their stories of individual success
Design: Pre-selected students are invited to share out in panel discussion style their background, their current educational goals, how they are meeting them, and their future goals. Following the panel discussion, individual students are then invited to be interviewed by the panel students—one on one and using the same format and record these interviews in written and video format. Outcome: First-year students will be asked to volunteer to share aloud and record their essay on video with the understanding that future students will hear their message and self-construe a similar positive mindset change. Videos are made available for viewing. Application: Students are defining how they will commit to their educational goal.

Consideration

Considering that while each student may be different, for practicability some classifications can be utilized. The majority of the student population served and those who have been interviewed to assess their background using the extensive interview and knowledge coaches experience and are grouped into four general classifications:

Type A – Student with strong foundation-done well all her life, has the degree/tutoring-often overlooked because they are overlooked-overly anxious/huge amount of responsibility or worse seen as the model—but not necessarily Dunn and Kruger effect tactical response is to reduce anxiety-develop living in the moment thinking schools and anchoring them to the idea of past success that can be transferred to current success. This may involve breathing techniques, relaxation techniques and positive visualization

Type B – Student with self-driven foundation-student that may or may not have done well in school but this is also the student that misses all of the class—but does all of the work tactical response is…to learn how to take the test. Develop strategies to attend class, review family and cultural responsibilities that prevent the student from attending class. Look at strengths; assess level of self-efficacy and connection to educational goals.
Type C – Remedial Student/Developmental Disability-undiagnosed disabilities, pushed through high school taken same math class 6 times-paid for it 6 times. Etc. Strategies include diagnostics for immediate accommodations such as large print, access to lecture note prior to lecture, sit down with instructor to brainstorm accommodations. Arrange Vocational Rehabilitation counselor to meet with the student and the coach at the college.

Type D – Student rejecting classic education model and are rated as being high risk by faculty, staff and advisors who are in contact with them. These may be students who have enrolled in school to access financial aid as a source of income and will attend class just long enough to receive their distribution are made ineligible because of incurred student debt. Students with undiagnosed learning disability who refuse attempts for support and want to “tough out” their education and ultimately drop out or are forced out by their poor academic performance. Another example from this group is the student athlete who is recruited, eager to play ball, but is not seeking to complete their education. The tactic to engage these students is to assess their true wants, career assessment and align them with appropriate resources such as career guidance, financial counseling, and job finding techniques.

A key advantage to tactical pedagogy is methodological malleability, meaning that through situating a particular knowledge or skillset to not only the student, but also the place, can be accomplished without compromising said knowledge. Furthermore, by situating the knowledge in context to place, a pluralistic approach can be incorporated which does not erode, discount, or degrade a student's prior knowledge. This is an especially pertinent consideration for work with indigenous peoples, or other peoples with particular knowledge held as sacred and/or fused with their entire epistemology (Deloria & Wildcat 2001). English language, for instance, is the result of centuries of colonization, and to fail to take this into consideration when working
with students who may have English as a second language. Instead, English language should be approached, positioned, and instructed as a functional knowledge to reach a specific outcome of the student's choosing, rather than as a hegemony and/or tool of oppression.

It’s also imperative to situate the method to the place, respecting the surrounding community and culture. Place-based education can also utilize functional knowledge, through experiential learning and pragmatic application, to meet specific outcomes. For instance, a student may reject learning trigonometric functions in a classroom, however may understand and apply trigonometry by using an astrolabe to measure the height of a tree or building. The student in this way can see an immediate, and practicable, outcome. This is a double-edged sword however, as often times place-based education can utilized as a crutch to reject particular knowledge due to ethnocentrism and/or xenophobia.

Conclusions

The specific activities developed for inclusion into the NWIC TRiO Student Support Services are based on models which have shown evidence of effectiveness. To assess specifically how effective, and observe the longitudinal impacts of tactical pedagogy and associated experiential learning will require further research, ideally in various places and populations, and a clearer review and understanding of functional knowledge. Furthermore, this method could be a rehash of another, previously tested, form of pedagogy under a different name, once again requiring a more rigorous review of the literature as well as transcultural educational review outside of the western academic paradigm. It may be that tactics employed have a different name
or are not understood or labeled as non-cognitive designed skill building. The goal is to identify and collaboratively review the similar programs and strengthen the results.

Implications for Education are numerous. There are several that have emerged in the short time that the program has been in place. The effect of using tactical pedagogy to promote decisive movements and targeted effort increases efficiency. Students who have lingered for years failing to move forward with their educational goals are rapidly assessed, armed with the correct tactics and graduate. Students who have wallowed in self-doubt and were unable to find the muster to continue are identifying their resiliency and using it to slay heretofore confounding prerequisites and moving into their programs of study after developing self-efficacy. Finally, students with undiagnosed disabilities and who for years questioned their intelligence now work directly with instructors and coaching staff to create accommodations to target their needs and ultimately demonstrate their ability to succeed.

New Social Studies: Use of Inquiry to Engage Learners

Social Studies Education

Poster Session

Move beyond a simple list of who, what, when, and where in your social studies curriculum by enabling students to delve into the how and why—give students the power to guide their learning by answering their own personal questions about topics. Example inquiry lessons and lesson planning strategies for implementing the process will be shared.

Seth Lickteig, Graduate Teaching Assistant

Curriculum and Instruction

Kansas State University

Bluemont Hall 213

1114 Mid-Campus Dr.

Manhattan, KS 66506

supah@k-state.edu
Abstract

Science-based classes have been using inquiry-based instruction for years. Often, these classes are hands-on and encourage students to ask questions, test hypotheses for possible solutions, and finally share results with one another. Historically, social studies classrooms have been the exact opposite: the teacher instructs (usually in lecture form) a long list of events and people which are connected via major themes or ideas with the expectation students will be able to recite and justify the information back. Very rarely were students encouraged to ask questions or challenge the opinions of the instructor. To do well in these classes, all that was asked of students was rote memorization and the ability to justify events with similar perspective to the teacher (or group if working cooperatively). It is no wonder students found these classes drudgingly boring and monotonous.

To best meet the needs of our 21st century students, we need to change the way we approach instruction in the social studies classroom. Modern students no longer need instruction into basic historical facts; these things can be learned by simply "asking Google." Instead, teachers in the social sciences can improve engagement and understanding by borrowing the inquiry process our science colleagues have been using for such a long time. Inquiry-based learning is student-centered. It allows students to question and generate their own answers and perspectives on topics. Teachers are able to move out of textbooks and lecture to become facilitators of the information. Students practice a process which is used in both college and future career fields.

By bringing the inquiry process to the social studies curriculum, students are in control of their learning. Students are given a prompt, usually a controversial question from a topic or era. Students propose answers and develop supporting questions they will need to answer to address
the over-arching theme or question. Next, students find and use sources to support or refute their hypothesis. This step also includes strategies and procedures for organizing and sorting their data. Finally, students share and compare their results with classmates—each student is allowed to develop their own unique understanding of the topic and creatively share it with their peers.

During this poster session, participants will see examples of how the inquiry process is used in a social studies classroom. Examples include how to use the process at a variety of different educational levels: elementary, middle level, high school, and university level classes. Additionally, planning techniques and ideas will be shared giving participants a "starting off" point for modifying and updating existing curriculum to include inquiry-based lessons.

Title: Flashy Fluorescence: An Interdisciplinary Approach to Art and Science

Topic Area of Submission: Cross-disciplinary areas of Education, Art Education, STEM Education, Secondary Education

Presentation Format: Poster Session

Description: Applying both Chemistry and Visual Arts disciplines, students will use “green chemistry” techniques to extract photo-reactive chemicals to produce colorant that will then be used to make interesting art projects with hidden designs.

Paper Authors:
1. Jenna Lech, OCT, Alternative Schools East and Year Round Schools, Toronto District School Board, jenna.lech@tdsb.on.ca
2. Janet Sloan, OCT, Alternative Schools East and Year Round Schools, Toronto District School Board, janet.sloan@tdsb.on.ca

Abstract: Messy, measurable, and memorable are great indicators for learning in the Art... and Chemistry classroom. Chemistry and Visual Arts are not typically seen in tandem; however, these two subjects are related. Chemistry provides the basic elements of design, while Art unifies these aspects which appeal to the aesthetic senses. Through this investigation, students will be able to extract fluorescent pigments in order to use them to create Visual Art pieces that incorporate an additional dimension revealing “hidden” designs through the use of UV or black light. The colorant is sourced from nontoxic plant or general household items. These materials are generally inexpensive, readily available and ensures that this project is friendly to the environment as well as economical to the classroom teacher. Exemplar pieces and lesson plan handouts are available.
Title: *Wii Are Having Fun, Aren't U?* Using a *Wii U* to Engage the High School Math Student

Topic Area of Submission: STEM Education, Other Areas of Education

Presentation Format: Poster Session

Description: Lesson plans and exemplars on employing gaming systems, with an emphasis on the *Wii U*, in a secondary school mathematics class environment.

Author: 1. Jenna Lech, OCT, Alternative Schools East and Year Round Schools, Toronto District School Board, jenna.lech@tdsb.on.ca

Abstract:

Mathematics is everywhere - and this includes video games! The entertainment system developed by *Nintendo*, the *Wii U*, has captured the attention of youth everywhere through a myriad of games. Young adults instantly gravitate to the charming characters and the exciting storylines which sparks students’ interest. The use of video games has been employed at the elementary panel and can also be utilized at the secondary level. Applying mathematical concepts through the use of these games, can lead students to a better understanding in a variety of high school numeracy topics. Further, this gaming console can aid in engaging students through the thrills that this interactive technology has to offer. This presentation will investigate how games, including *Nintendo Land*, *Mario Kart 8* and *Mario Maker*, can relate mathematical concepts to students at the secondary level.
Abstract

This is a study in progress and preliminary data is reported. The study is the beginning of a programmatic research effort. Individuals from US and international universities are recruited as collaborators.

Online instruction has emerged as a significant trend in how instruction is delivered by institutions of higher education. Internationally, distance education courses, are increasingly being offered online. The model is employed by many universities in offering online undergraduate and graduate degrees. Blended courses that integrate online instructional features with face-to-face instruction are also offered in most disciplines as part of campus based curriculum offerings. A critical difference between online instruction and face-to-face instruction is the reliance on visual display designs (design patterns) for the representation and presentation of instructional information. Some of the traditional elements of face-to-face instruction do not generalize to online instruction. An example of such elements includes some aspects of accommodating cultural differences. Institutions of Higher Education (IHEs) in the United States invest heavily in professional development to ensure that faculty accommodate the needs of students from different cultures in face-to-face instruction. However, in online instruction there is little evidence that similar efforts are being made to determine if there are cultural differences that impact the design of online instruction and in turn the performance of online students. Yet, most IHEs in the US are actively recruiting students of diversity and many are targeting online programs globally.

The study represents the early stages of an effort in investigating whether postsecondary online learners vary in their responses to course design and pedagogical features due to the students’ cultural background. The cultural groups, being studied, include Asians, Hispanic/Latinos, Middle Easterners, African Americans, Caucasians, and Native Americans.

The methodology employs three sets of survey items derived from reviews of the research literature. The surveys include 1) online pedagogical features, 2) course design features, and 3) visual design principles. Responses of individual online learners, enrolled in collaborating
institutions, to each item within the three surveys along with demographic information are recorded online.

The specific research goals of this study are as follows:

- To begin with an examination of the basic design and pedagogical features of fully online asynchronous courses and the underlying design principles;
- To explore the need for programmatic research to validate cultural differences relative to pedagogical and design features employed in online instruction features at the post-secondary level;
- To develop research based guidelines for accommodating cultural differences among online learners;
- To stimulate interest among researchers in IHEs internationally in addition to the US in joining this collaborative research effort.

The purpose this study is to inform future research and to attract additional collaborators to participate in a programmatic research effort related to the study of cultural differences in online instruction. The preliminary analysis of a pilot study indicates that there are cultural differences that occur among different cultural groups as measured by responses to selected survey items. To date the sample size of responses in this study from some cultural groups is currently too small for a comparative analysis across cultural groups. The purpose of expanding the number of collaborating IHEs is to increase the size of the data pool and to ensure sufficient size across cultural groups for appropriate analyses.

**Online Instructional Context of Cultural Differences**

The use of visual display technology, as applied in online courses, to present instruction is distinctly different from face-to-face teaching/learning environments. Face-to-face instructional environments provide a natural setting for teaching. Instructors can build the classroom culture that works best for them and their teaching style. Reinforcement of students in face-to-face instruction is more easily achieved and addressing cultural differences among learners becomes a natural part of the instructional process. Instructors in face-to-face instruction also have the advantage of observing student reactions and responding to non-verbal cues. The accommodation of cultural differences among online learners may be more important than in face-to-face instruction. This is especially true in asynchronous online instruction delivered via distance education models where neither the nature nor the impact of cultural differences has been validated at the post-secondary level as has been done in face-to-face instruction. A large body of literature exists on the impact of cultural differences on teaching and learning in face-to-face instruction. The accommodation of cultural differences in face-to-face instruction is a high priority in teacher education in US universities as is multicultural education. Yet, the instructional implications of display designs as employed in online instruction have not been sufficiently researched from the perspective of cultural differences among online learners. There
appears to be the perception that online students are all alike and that the same course features and display designs tend to be effective with all students.

The rationale for this study is that insufficient attention has been given to the impact of cultural differences on how online learners respond to display designs pedagogical features employed in the presentation of online instruction. The visual display is the most common element of online instruction. It is what the learner responds to. Said in another way, the visual display design presented via the monitor is central to how online instruction is presented to the learner in online instruction. The impact of cultural differences on how online learners respond to visual displays has not been validated in asynchronous online instruction.

While the literature addresses the importance of considering the cultural background of students in face-to-face instruction, there is a lack of research on how cultural differences impact the outcomes of online instruction and how to accommodate validated cultural differences. What tends to be the current practice is to assume that all online learners enrolled in a common course are the same in terms of how they respond to visual display designs. This display attribute of online instruction is what distinguishes online instruction from face-to-face instruction. This study focuses on asynchronous online instruction and instruction presented online in hybrid and blended instruction.

There is a body of research outside of education that relates to the rationale for this research. In the world of business, and is called “cultural markers.” When the business world relies on digital displays in marketing, they want those displays to be maximally responsive to the cultural differences of their potential customers. If they are not, then their business plan may fail. If there are cultural markers in business, might there be cultural markers in instruction that contribute to successful learning in the digital world of education?

**Cultural Context of this Research**

A significant unanswered question in online instruction centers on what the probabilities are that culture impacts how online learners respond to display designs and/or the instructional features routinely employed in the development of online courses at the post-secondary level. If it is found that cultural differences do impact learner outcomes, then it may be assumed that differences will vary across cultures. This sets the stage for conducting programmatic interdisciplinary research. The focus in higher education on marketing online courses worldwide, combined with the growing diversity among students in US IHEs make researching cultural differences in online instruction a major need. If cultural differences are found to impact online learner outcomes, accommodations will be needed to address the differences across cultural groups. The accommodations will likely be achieved through modifications in display and instructional designs. As noted in Figure 1, online instruction has changed the instructional environment. There are two distinct instructional environments in addition to varied blended models. Today, the face-to-face environment receives extensive attention at all levels of education to accommodate diversity in educational settings. This is not true in online instructional environments where instruction occurs via display. Knowing how online courses
are designed in different countries and cultures could inform subsequent research. Domestic environments in the U.S. are by no means immune to cultural differences.

Figure 1: Online Learning Environments

It is difficult to estimate the amount of money being spent today by the public and private sectors to design and develop online courses and training programs without attending to the question of whether cultural differences impact online learner outcomes. Yet, if cultural differences are found to exist, the cost of accommodations may be expensive. However, not to create those accommodations may be even more costly from the perspective of learners. On the other hand, such research and accommodations may benefit all online learners. The context of online instruction has clearly been impacted by advanced technologies. It is hard to comprehend the impact that technology has had on education. Progress will continue in educational applications due to the invention of advanced technologies. This progress in technology may minimize the impact of cultural differences relative to the role of visual displays in online instruction. Or, ease the task of achieving accommodations across cultural groups.

The study that we are engaged in represents a preliminary effort to determine if there are cultural differences that impact online learner outcomes. It also represents a step toward engaging others to join in subsequent collaborative research efforts.

The relevancy of this discussion on the context of culture to the proposed research is to emphasize the importance of beginning a research initiative to explore the implications of cultural differences on the design of online instruction. In general, the importance of being responsive to cultural differences in face-to-face teaching is well established. Few would likely argue that it is not equally important in online instruction. Given the rate of growth in online instruction, a case could be made that researching the implications of cultural differences is even more important in online instruction. The research that has been done is very limited and does not study cultural difference from the perspective of design principles related to display, nor does it address the wide array of cultures reflected among the students in post-secondary institutions.
The focus of this research is on design principles and pedagogical features related to how instruction is presented via display. The display is the most common element in the delivery of online instruction. Despite a significant literature base on visual display design that was accrued decades prior to the Internet, there is little evidence that this knowledge base has been significantly addressed in the movement toward online instruction. The delivery mode for online instruction is dramatically different from face-to-face instruction. But, the design focus appears to have been more on the structuring and framing of content than the principles of display design. The goal is to contribute to building the knowledge base on maximizing the effectiveness of instruction delivered online for all learners.

**Literature Perspective**

The challenge experienced by society in accommodating cultural differences varies depending on the context. For example, many neighborhoods and communities are made up of families from different cultures. Over time, the families accommodate their differences in a very natural way. The challenge to society is not in defining culture or identifying advocates for accommodation; the challenge is knowing under what conditions cultural differences might warrant special attention and determining how accommodation can best be achieved. The international literature is filled with examples of how everyone’s quality of life is improved and how the interests of a global society are served when cultural differences are valued. However, little is known about the impact of cultural difference on how online learners respond to instruction delivered via visual display i.e., the monitor. This is particularly true in online instruction where technology plays a critical role in the teaching and learning process. Online instruction exists at all levels of education - especially the post-secondary level - yet educators know very little about the significance of cultural differences within this mode of instruction.

While the lack of research in validating the impact of cultural differences in online instruction is evident, the literature argues that it is important to accommodate cultural differences in all modes of instruction. Barber and Badre (1998) discuss cultural markers as interface design elements and features “that are most prevalent and possibly preferred within a particular cultural group” (p.1). This concept would seem to have application in online instruction. The authors also stress that culturability should be one of the design principles in website design. An international user interface should take cultural markers into consideration for particular international users.

The fact that education and industry have moved at an unprecedented rate to implement online instruction without addressing even the most basic questions that undergird the delivery of instruction via display technology has resulted in a major void in the knowledge base needed to maximize the effectiveness of online instruction. This void becomes even more significant when combined with the lack of research on the impact of cultural differences on learner outcomes.

In describing how cultures are formed and how they impact every corner of society, Hofstede and Hofstede (2005) describe the patterns of thinking, feeling, and potential acting that were learned throughout a persons’ lifetime, as culture – the software of the mind. They go on to
refer to culture as “consisting as the unwritten rule of the social game” (Hofstede & Hofstede, 2005, p.3) and offer a model for extending an examination of culture from studying national and global differences among nations to analyzing organizations for cultural

While the early work of Hofstede and Hofstede occurred prior to the emergence of the Internet as a vehicle for delivering instruction, their work provides a rationale for examining the following question: How do cultural differences impact online instruction for online learners?

Survey Design

The survey was configured into two parts. Part 1 was a modified replication of the study done by Hu (2009). The modified Hu’s (2009) five-point Likert Scale instrument included 31 design features and 32 pedagogy features. Respondents were asked to rate their preferences on a five-point scale, ranging from strongly disagree (0) to strongly agree (5), for each individual feature.

Part 2 was the modified replication of the study by Chiu (2013). There were two elements in Part 2. A Likert Scale using the same design as Hu (2009) employed in Part 1 using the thirty-two items from the design principles researched by Chiu (2013). These statements of design principles were modified to be relevant to the targeted educational age group surveyed. Part 2 also included the normative distribution in Q methodology developed by William Stephenson. The Q methodology provides an approach to exploring correlations between persons’ viewpoints toward an issue or a topic (Brown, 1996). A Q methodology tool developed for the research by Chiu (2013) was used in the presentation of the Q-sort exercise. See Appendix A for list of the pedagogy and course design features items. See Appendix B for a list of the visual display design principles.

Participants

A convenience sample is being employed. The researchers identified a pool of faculty at appropriate post-secondary institutions with a high incidence of diversity among enrolled students. The faculty members were interested in this area of research and experienced in teaching online. Guidelines were provided participating faculty. They were advised not to specifically invite students because of their ethnicity rather they were instructed to invite all students in a class. Faculty at participating post-secondary institutions informed students about the opportunity to participate in completing the survey(s). The assumption was that if enough complete classes participated there would be sufficient number across the targeted cultural groups. However, this approach has not yielded the needed sample size per cultural group. Handouts and content for emails were developed for faculty to share with students. Students were allowed to make their own decision on participation based on the information provided in the handout/email. Demographic data was requested as part of the survey(s), but no personal identifiable information was collected. The IRB and the IRB approval notice from the University of Kansas was provided the participating faculty to be shared with their appropriate institutional research office.
The number of collaborators is now being expanded to increase the number of international IHEs as collaborators. Representatives of attending IHEs will be invited to consider becoming collaborators.

**Variables**

**Dependent variable.** Dependent variable were participants’ responses to each survey item. The ratings for Part 1 and Part 2 Likert Scales ranged from 0 – 5. The ratings for the Q-sort tool in Part 2 ranged from 1 – 7.

**Independent variables.** Independent variables were participants’ personal information, such as age, gender, ethnicity, language, and educational background, as well as participants’ technology using frequency and skills.

**Data Collection and Procedures**

Participants were requested to complete both Part 1 and Part 2 of the online survey. In pilot testing most participants completed the complete survey within 30 minutes. Besides Part 1 and Part 2, the participants were asked to offer their personal information such as age, gender, cultural background, and educational background. The instruments also collected data on their attitudes towards design principles. No responses were personally identifiable.

The customized computer system to record participant responses and to save data automatically in the computer database of the host institution via a network system was developed. All datasets automatically transferred to a database via the secured network. The system only allows investigators to access the database by using their password and user name. At the end of the project, storage partitions that were used to store confidential data will be overwritten using partition-level overwriting tools.

**Data Analysis**

Efforts are underway to expand the number of collaborating institutions of higher educations with specific attention given to the student composition from the currently underrepresented cultural groups. New collaborators are being confirmed. Since this is a progress report in the larger context of a study in progress, we need sufficient sample size per culture group for purpose of statistical analysis. Descriptive statistics such as the mean and standard deviation for each survey item were reported in the Results section of the conference paper in order to determine which items have been rated as highly important or of the highest agreement among participants from different ethnic groups. There is wide variability in the number of responses to surveys across the seven cultural groups. The four ethnic groups (i.e. Caucasian, Hispanic, Asian and Middle Eastern) were used in the analysis as they had the most number of responses recorded (of at least 50 participants or more). For purposes of this progress report we have drawn a sample of 50 responses from the four groups with the largest responses.
As can be seen from the table displayed, there are significant differences in many of the features, especially between Caucasian respondents and their Middle Eastern counterparts. These are only some initial findings that begin to inform us of how we can improve our online instruction with regards to the pedagogy and design features to be included or not included in the future. In the analysis, we found that differences between selected cultural groups were statistically significant. The most significant differences are between Caucasian and Mid-Eastern participants. For example, “allow students to post their work to learn from other students”, mean score for Caucasians is 4.82, for middle eastern is only 3.73. Percent difference is 19.3%.

Figure 2. Cultural Group Agreement for Pedagogy and Course Design Features-Most Important Principles

The four cultural groups collectively indicated the above items as the most important features for Pedagogy and Course Design Features.

**Agreement on Most Important Features**
- 3. allow students to post their work to learn from other students (P)
- 14. provide feedback on student work by using tracking (as used in editing) (D)
- 16. allow students to keep a record of communications with other students (D)
- 18. provide navigation options that are easy to follow (D)

Figure 3. Pedagogy and Course Design Features Differences-Least Important Principles

**Agreement on Least Important Features**
- 24. provide information on how the course fits into their academic program (P)
- 27. provide feedback tailored to performance of individual students (P).
- 33. provide access to versions of lectures for review (D)
- 34. include interactive learning activities (P)
- 40. allow students to maintain electronic records of their work (D).
- 49. provide discussion opportunities among students related to the content (P).
- 60. stimulate critical thinking among all students (P)
- 61. provide a schedule for chat sessions (P)

The four cultural groups collectively indicated the above items as the least important features for Pedagogy and Course Design Features.
The high agreement across cultural groups is a positive. The translation of principles into online instructional features is the challenge. While we are finding differences between cultural groups on features there is agreement on principles. The high level of agreement on the most important visual display design principles is an important observation.

**Figure 5. Cultural Group Agreement for Visual Display Design Principles-Most Important Principles**

- Principles were derived from research and juried by experts
- Principles underlie beliefs and development
- Principles differ from features in that there are rarely precise examples
- No statistically significant differences between cultural groups

### Agreement on Most Important Principles

- 5. Learners need time to process information and to reflect between each segment of learning.
- 11. Simultaneous media presentations should be kept simple.
- 12. 'Chunking' content into short-term memory so that it relates to long-term memory is important in designing online instruction.
- 14. Online navigation should include several modes of access.

**Figure 6. Cultural Group Agreement for Visual Display Design Principles-Least Important Principles**

### Agreement on Least Important Principles

- 3. Design should minimize working memory load and instead utilize the greater capacity of long-term memory.
- 26. Activities should be designed to provide a rich context for learning involving inquiry and revisions of ideas.
- 28. Students should be provided opportunities to understand the connection between the knowledge they are taught and everyday life.

There were some interesting observations from the cultural groups agreement on the least important visual display design principles. Item 28 was somewhat of a surprise instructors tend to be concerned about making instruction relevant to students in their daily lives. They may be
more sophisticated than we give them credit for being in that they are thinking about preparation for subsequent learning.

**Discussion**

The study represents a preliminary step in a proposed programmatic effort to research the impact of cultural differences on online learners. It is driven by the unprecedented growth in the offering of online courses and degrees in post-secondary institutions of higher education. The design of these courses tend to be made generally available to all students enrolled in the same courses without consideration given to the differences that may be represented by their cultural backgrounds. In most post-secondary classes there is likely to be diverse cultures represented by enrolled students. This tends to be true of international students in residence who meet institutional admission requirements as well as those distance education students who have enrolled from their home country. The significance of the question on the impact of cultural differences on online learners is accented by the major investment of fiscal and human resources that institutions of higher education make to insuring that the multicultural needs of their students are met in face-to-face instruction. This is evidenced by the level of professional development offered to faculty, the presence on many campuses of multicultural centers, yet little evidence appears to exist that sufficient attention is being given the needs of online learners from different cultural groups. This emerges as a problem of some magnitude when one examines the extreme difference between online learning environments and face-face-learning environments. This is especially true in asynchronous courses and instruction offered as part of blended course models. There are critical differences between face-to-face teaching and learning and online teaching and learning via a display such as occurs in online instruction.

**Implications**

Implications supporting needed programmatic research on course design and pedagogy features. There is evidence of differences between groups on features as well as a need to increase sample size preferably to 200 per group. There is strong support needed for programmatic research on visual display design principles as well seeing that there is consistent high agreement on both principles of high and low importance. There is a need to create operational examples of design principles and verify the operational example of principles in an instructional context.

63 Pedagogy and Course Design Features

1. provide students access to content in manageable chunks.
2. provide tools for instructors to easily track student work and grades.
3. allow students to post their work to learn from other students.
4. incorporate clear and regular reports on student progress and grades.
5. allow students to monitor their own rate of progress.
6. include activities that involve students in engaging in teamwork to produce products.
7. use interactive activities that promote collaboration among classmates.
8. align assessments with course objectives.
9. provide study guides for exam preparation.
10. provide students understandable course goals and objectives.
11. encourage students to share information about themselves at the beginning of the course.
12. allow all students to work independently at their own pace.
13. include self-correcting quizzes.
14. provide feedback on student work by using tracking (as used in editing).
15. allow students to easily communicate with other students.
16. allow students to keep a record of communications with other students.
17. involve students in reviewing the work of other students online.
18. provide navigation options that are easy to follow.
19. provide tools to allow students to engage in (synchronous) online chats.
20. present clear and understandable performance expectations.
21. provide an explicit orientation to the course structure and requirements.
22. include sufficient and easily understood menus.
23. provide web pages that are designed to be intuitive and immediately understood.
24. provide information on how the course fits into their academic program.
25. allow students to easily access required instructional resources.
26. introduce the instructor(s) personal teaching style and professional expertise at the beginning of the course.
27. provide feedback tailored to performance of individual students.
28. provide students with multiple options for communication.
29. include a glossary of the essential vocabulary for the course.
30. provide students with an understandable information on the grading system.
31. be efficiently accessible anytime and anyplace where connectivity is available.
32. provide a detailed syllabus.
33. provide access to versions of lectures for review.
34. include interactive learning activities.
35. ensure that students know appropriate times to contact the instructor.
36. engage students by using tools e.g., message boards or threaded discussions.
37. encourage students to access additional resources.
38. inform students on how to communicate with the instructor.
39. provide students target dates for monitoring their progress.
40. allow students to maintain electronic records of their work.
41. provide free interpersonal communication tools to students.
42. allow students to review their own work.
43. provide tools to allow students to post media resources online.
44. allow students to easily access their grades on assignments.
45. allow instructor to tailor their responses to individual student work.
46. allow students to easily navigate from the start to the end of assigned tasks.
47. engage students in assignments related to course objectives.
48. allow instructor to inform students of changes in content at the same time.
49. provide discussion opportunities among students related to the content.
50. allow students to introduce themselves to classmates.
51. allow easy access to any part of the course.
52. allow students to customize the interface, e.g., adjusting font size to enhance readability.
53. encourage students to communicate with each other.
54. provide for the use of popular social media tools e.g., Facebook.
55. provide clear explanations for how students access instructional support services.
56. allow students to demonstrate learning through completion of varied activities.
57. be reliable and free from technical problems.
58. provide downloadable audio lectures in a common format e.g., mp3,wmv.
59. allow students to keep a record of communications with the instructor.
60. stimulate critical thinking among all students.
61. provide a schedule for chat sessions.
62. ensure that all web addresses (URLs) are accurate and active.
63. require minimal technical support.
Appendix B

32 Visual Display Design Principles

1. Affective signals for online learners are essential in maximizing e-learning.
2. The time limitation of working memory must be considered in designing visual displays.
3. Design should minimize working memory load and instead utilize the greater capacity of long-term memory.
4. Factors, such as attention, engagement, goal setting, monitoring, and action control, must be addressed in multimedia learning.
5. Learners need time to process information and to reflect between each segment of learning.
6. In viewing or listening to messages, it is more likely to be interpreted correctly when it is expressed more than once and in alternate forms.
7. Visual displays should be designed consistently with other displays the student may perceive at the same time.
8. Requiring the learner to mentally integrate different sources of information interferes with learning.
9. Mediated activities, while teaching common content at the same time, result in more effective learning.
10. Cultural factors impact interactive activities and require that interactions be presented along with background information.
11. Simultaneous media presentations should be kept simple.
12. ‘Chunking’ content in short-term memory so that it relates to long-term memory is important in designing online instruction.
13. The design structure of an activity should include motives, actions, and responses to cultural needs.
14. Online navigation should include several modes of access.
15. Online instruction is most effective when using multiple representations of information.
16. Knowing students' prior knowledge is central to the design of online instruction for struggling learners.
17. Students learn better when the summarization does not include the same wording as the original instruction or contains additional detail.
18. Concurrent narration and animation result in higher performance than content presented through text and animation.
19. Visual and auditory stimuli impact learning, through engagement and a balance between textual, pictorial, and verbal presentations.
20. The interaction among multimedia design features needs to be examined relative to their contribution to cognitive overload.
21. In learning there is interaction between the learner and the instructional environment.
22. In accommodating individual differences through multimedia, emphasis needs to be placed on the mix of instructional modes.
23. Multiple means of engagement are critical to creating conditions that stimulate engagement in learning.
24. Multimedia-designed instruction allows the learner to make connections between verbal and visual presentations.
25. When incorporating displays, the display should look like a pictorial image of what it represents.
26. Activities should be designed to provide a rich context for learning involving inquiry and revisions of ideas.
27. The motivational value of multimedia (both video and audio) needs to be considered in instructional design because they help to reduce fear of failure.
28. Students should be provided opportunities to understand the connection between the knowledge they are taught and everyday life.
29. Instructional developers need to be sensitive to the affective reasoning ability of students when developing online instructional resources.

30. Unnecessary information should be kept to a minimum to avoid cognitive overload.

31. Learning activity occurs through actions oriented toward goals while the goals are becoming routine.

32. Online navigation options should be kept simple.

Abstract:

**Illiteracy is an urgent and growing problem in the United States.** Data from a groundbreaking report (Kirsch, Jungeblut, Jenkins, & Kolstad (2003)) indicated that the US was experiencing a literacy epidemic. In 2013 a report funded by the *US Department of Education* and the *National Institute of Literacy* showed the illiteracy rate in the United States has not changed over the past decade. An estimated 32 million (14%) adults in the U.S. cannot read. Even more startling is the data indicate that 21% of adults in the United States read below a 5th-grade level.

**The trajectory for individuals with low literacy is grim.** In a study by Harlow (2002), commissioned by the *US Department of Justice* demonstrated a strong link between academic failure and delinquency, violence, and crime. This study spurred an onset of media attention and increased awareness about risk factors individuals who are struggling readers face. This link between low literacy rates and crime is substantiated from data presented from a report from Birth to Read (2015). The researchers reported that over 70% of inmates in America's prisons cannot read above a fourth-grade level. These data also linked poverty to low rates of literacy (three out of every four food stamp recipients perform in the lowest literacy levels) and high levels of infant mortality.

**Illiteracy is a generational problem and will only worsen over time.** The levels of language parents utilize in their home directly affect their children. A study by Hart and Risley (1995) found that the average child in a family receiving public assistance hears 153,000 fewer words per week than the average child growing up in an affluent home where the parents are college educated. Being exposed to enriched, robust language is the first step to literacy. A child growing up in poverty without exposure to robust language puts the child further behind all other children in his or her age group.

**Educators have been working hard to improve student literacy for decades.** Policies and mandates alone will not lead to improved instruction in classrooms. Effective programs with aligned implementation strategies are the best way to ensure that all students will have access to best practices in literacy learning. (Duda, Penfold, Wernikoff, & Wilson, 2015). Without ensuring that all students receive the instruction necessary for acquiring literacy, the achievement
gap will continue to widen, and opportunities for participating in a worldwide economy will continue to decline.

**The public schools in Philadelphia, PA, have not been immune to this ongoing challenge.** The Pennsylvania Department of Education (2015) reported that only 40% of 3rd-grade students were reading at or above proficiency, as compared to the statewide average of 70% of students reading at comparable levels. While recognizing the gravity of the situation, the district actively sought answers to this issue. The AIM Integrated Literacy Model offers an innovative solution to this ongoing problem.

**The AIM Integrated Literacy Model offers an innovative solution to this ongoing problem.** From its inception, AIM’s mission has included identifying, designing and delivering effective curriculum and instruction for their students and to disseminating effective practices for all students. Thus, the AIM team began their search for identifying a comprehensive literacy program with documentation of improved student outcomes that would ignite passion for learning for all students. AIM recognized that one program was not sufficient to accomplish their goals nor did “off the shelf programs” necessarily address the continuum of skills and abilities necessary for students to become proficient readers and writers.

As a result, the AIM Team committed to developing a model that was theoretically sound aligned with the standards, rigorous in nature and that attended to differentiation. They recognized the importance of input from their educators but also sought professional development and counsel from nationally known researchers and practitioners in the field. Consequently, the team developed a model that addresses the role of oral language, the foundational skills of reading and writing as well as the higher order skills of constructing and expressing understanding. AIM’s innovative approach to providing effective literacy instruction has resulted in a model that includes both a combination of evidence-based and evidence-informed programs, practices and materials.

**Making it Happen.** This case example highlights two urban schools and the journey of program developers to help teachers implement the AIM ILM with fidelity. An important component of this case example includes the application of Implementation Science to support knowledge translation into actual practice and to build internal implementation capacity of school level educators. A key to sustainability is to have both an effective literacy program and effective implementation methods. Lessons from various stakeholders will be highlighted
including: 1) the process for operationally defining what teachers actually need to do and how to empower them with aligned training and coaching; 2) getting the “right” people in place to support and sustain this new work (school and district level implementation teams, school-based literacy leaders (coaches); and 3) specific tools used for translating research to practice, and practice into complex environments. Data on improved teaching practices, fidelity, educator and parent satisfaction and improved student outcomes will be shared.

Abstract and/or full paper

“We got your six” is a military term for “We have your back” and is both critical in any operation and understood as a vow. With four military bases, one being a combination of two Air Force bases, San Antonio has a booming veteran population and The University of Texas at San Antonio (UTSA) is enrolling a growing number of veterans. These students have a specific set of needs as they seek to transition successfully to the academic environment. Student veterans are often nontraditional students; they have experienced things that others in their age demographics have not and often feel they do not fit in with the usual student populations. In addition to the usual student veteran associations that provide resources for veterans, libraries can construct a neutral place of support for veterans to study, rest, and learn. This poster showcases how the UTSA Libraries were able to create a dedicated physical space and provide targeted support for this specific student demographic. The means by which the UTSA Libraries started this initiative is not cost prohibitive and yielded positive results. The UTSA Libraries accomplished something that any library could duplicate to facilitate a conversation with a growing population of student veterans with specific needs.

Abstract:

Overview

Innovation abounds in education; yet boundaries—of place, position and power—such as those between K-12 teachers and university faculty limit change. As Bryk, Gomez & Grunow (2010) argue, “The field suffers from a lack of purposeful collective action. Instead, actors work with different theories of the same problem, activities are siloed, and local solutions remain local” (p. 4). In order to form a “colleagueship of expertise” focused on solving a specific and shared problem, some educators have been developing a new model to create and sustain change: The Networked Improvement Community (NIC) (Bryk & Gomez, 2008).

NICs are a core element of improvement science that redefine traditional research relationships. In a typical research partnership, only researchers do the “intellectual heavy lifting at the front end of the idea pipeline” (Bryk et al., 2010, p. 2). This work may result in innovation that practitioners then implement; or, may result in research that begets research—but never exits the academy and enters the classroom. Improvement science attempts to break this traditional research structure through a problem-centered approach that joins academic research, clinical practice and community expertise; operates on a much shorter timeline (as short as 90 days); and uses overlapping and repeating research/implementation phases [referred to as Plan, Do, Study, Act (PDSA) cycles] (Bryk et al., 2010). Unlike experimental designs which require accurate replication, in this model, variation is considered data because the ultimate goal is to develop and test creative solutions that can be quickly and affordably implemented in the local context (Bryk & Gomez, 2008; Bryk, et al., 2010; Lewis, 2015).

Over the past two years, the Council for the Accreditation of Educator Preparation (CAEP) launched the Family Engagement Networked Improvement Community (NIC) with seven Educator Preparation Providers (EPP) in Washington, D.C., Georgia, and Illinois. The NIC focuses on improving pre-service teachers’ communication skills in their work with diverse families. These seven EPPs formed a NIC because of both a recognition of the importance of families in children’s education, as well as an acknowledgment that their preparation programs need to improve or enhance their current curriculums in this area. They chose the NIC model in order to develop and test creative solutions that can be quickly and affordably implemented into their teacher preparation classrooms (Bryk & Gomez, 2008; Bryk, Gomez & Grunow, 2010). To address the needs of the spectrum of stakeholders involved in teacher preparation, and specifically family engagement, the NIC includes faculty, candidate teachers, mentor teachers, principals, and parents affiliated with each EPP.
This model of inclusion—multi-site, multi-state, multi-stakeholder—makes the NIC adaptable to the local context and user-centered. Through iterative research pilots, (CAEP) developed a family engagement course to develop and test specific strategies to improve the communication skills of candidate teachers. The goals of the trainings are to emphasize relationship building and proactive, positive engagement and teach candidates to view families as assets and partners with teachers in their child’s education. The result is a free resource for educator preparation provider faculty and their teacher candidates that includes two modules: 1) How to conduct a parent teacher conference and 2) How to conduct a phone conversation.

Methodology

Pilot 1: Phone Call Training
After engaging in iterative research cycles to identify areas of need and potential solutions, a phone call training was developed and piloted from September-December 2015.

The phone call training involved five steps:
1) Pre-assessment mock phone call
2) Pre-training survey
3) EITHER in person OR online phone call training
4) Post-training survey
5) Post-assessment mock phone call

These steps are detailed below.

Pre/post phone call:
Along with Dr. Joan Walker (see below), the NIC is developed a pre-/post-test to assess the phone call training. Candidates will completed a 3-5 minute mock parent phone call prior to attending the in-person training or to completing the online training. Actors were trained to play the part of the mock parent. Candidates were given a scenario with a profile of a mock family (including parent and K-6 student), as well as a prompt for the call. The mock parents were trained to follow a script with certain pre-selected responses to use to respond to the subject.

Pre-/post survey:
Prior to training, candidates completed a short online survey to collect demographic information, as well as variables for comparison on the post-test. In addition, candidates completed a post-training reflection. This reflection asks some of the same questions as the pre-training survey for comparison purposes, as well as open-ended questions to collect qualitative data.

Phone call training:
Candidates participated in either 1) an in-person training or 2) an online training (including video modules and short exercises) on communicating with the families of their (prospective) students focusing on how to make both “success/good news” and “challenge/bad news” phone calls to their students’ parents. The goals of the training were 1) to emphasize relationship building and proactive positive engagement and 2) to teach candidates to view families as assets and partners with teachers in their child’s education.

To develop these trainings, the NIC worked with several national experts on parent communication. First, Dr. Samantha Cohen, the National Director of Training and Support at the Flamboyan Foundation
delivered the in-person training. In her role, Samantha coaches national organizations that are launching family engagement efforts and builds Flamboyan’s strategy for national partnerships.

The online phone call training was developed with Mr. Orin Gutlerner, Director, Match Education and Sposato Graduate School. Prior to his role with Sposato, Mr. Gutlerner spent five years at Harvard University’s Graduate School of Education working to re-shape the Undergraduate Teacher Education Program and acting as a guest lecturer in the Graduate School.

The assessment for these trainings was developed with Dr. Joan Walker, Associate Professor, Pace University. Dr. Walker’s research has led to the development of an innovative online course on parent-teacher interactions.

**Pilot 2: Parent teacher conference online case study**

Simultaneous to implementing the phone call project, the NIC is developed the next project in the cycle—a simulated parent-teacher conference through an online platform. The NIC worked with Pace University professor, Joan Walker, to develop a case-based digital learning environment to develop and assess elementary candidates’ readiness to support Title I families. In spring 2016, the NIC piloted the online case study, which develops candidates’ skills in conducting an initial parent-teacher conference, with their candidates. We chose to focus on parent-teacher conferences as the second project because they are a standard professional practice for all teachers; however, they are rarely addressed in teacher pre-service programs. Martin et al. (2006) found that during a parent-teacher conference, teachers out-talk parents by a ratio of 10 to 1. Building on the learnings from the phone call training, we emphasized 1) relationship building and proactive positive engagement and 2) candidates viewing families as assets and partners with teachers in their child’s education.

The inquiry-based learning environment of the case is constructed on three principles: First, the multimedia platform allows candidate teachers to simulate experiences, such as a parent-teacher conference, to which they do not normally have access in pre-service education. Second, candidates observe both effective and less effective approaches to the common—but rarely observed—professional practice of parent-teacher conferencing. Bandura (1986) found that observational learning that includes both watching an expert perform an action, as well as observing the consequences of those actions is an effective learning mechanism. Finally, we assume that specifically what the candidates observes matters. According to Rittle-Johnson & Star (2009) watching contrasting examples of a more and less successful conference will be more beneficial than observing just a single model.

The above model has been tested and validated by Walker and her findings were published in her award-winning Journal of Teacher Education article. This article won the 2013 Outstanding Journal of Teacher Education (JTE) Article Award from the American Association of Colleges for Teacher Education (AACTE).

**Pilot Results**

The data from the two pilots, including surveys, performance on tasks gauged via rubrics, and focus groups of participating faculty and candidates were analyzed to evaluate the usefulness of the piloted tools. Based on feedback, modifications were made to content and plans were created to maximize next steps. To increase the likelihood that the project will be self-sustaining, we are investing time and
resources in the development and testing of online trainings. At the end of the grant period, these online trainings will be available free of charge for the EPPs. Each participating EPP will have several concrete products they can use with their candidates for ongoing professional development. Online trainings will save the EPPs considerable resources as they will not have to pay for an in-person facilitator or develop their own in-person curriculum. Based on outcomes from the phone call and parent-teacher conference trainings, we will continue with additional PDSA cycles through December 2016.

Learning objectives
The objectives of these modules is to help the candidates understand the importance of communication in improving family engagement. This will be accomplished through providing the principles of effective parent teacher conferences and parent teacher phone calls. The goals of the trainings are to emphasize relationship building and proactive positive engagement and teach candidates to view families as assets and partners with teachers in their child’s education.

Anticipated results
We anticipate this project will lead to greater awareness of the importance of positive relationships and engagement between the educator and the families they teach. In particular, candidates will be better prepared to conduct Parent-Teacher Conferences and Parent-Teacher Phone Calls.

6. **Abstract:**

   **Objectives or purposes**
   Surveys of school administrators reveal hiring quality educators is a critical factor in efficient and effective school operation. "Errors made in the selection process have direct and far reaching consequences for students, administrators, other teachers, and the functioning of the school as a whole" (Ebmeier & Ng, 2005, p. 202). Recent work demonstrating that students assigned to different teachers experience substantial and persistent variation in their achievement growth has further underscored the importance of recruiting high quality teachers (e.g., Aaronson, Barrow, & Sander, 2007; Kane, McCaffrey, Miller, & Staiger, 2013; Kane, Rockoff, & Staiger, 2008; Rivkin, Hanushek, & Kain, 2005). Despite the deleterious consequences to student outcomes of hiring ineffective teachers, there has been little progress to link teacher quality with factors observable at the time of hire (Rockoff, Jacob, Kane, & Staiger, 2011). Responding to both the lack of evidence linking existing screening procedures to student outcomes and the demonstrated need for evidence-based screening processes, this investigation explored the relationship of competencies and beliefs likely to predict a teacher's retention and effectiveness to hiring outcomes.

   A sample of pre-service teachers from 10 educator preparation providers whose student teaching placements took place in an urban district was utilized. First, their preparedness to teach was explored through the perceptions of their supervising teachers, university supervisors, and the pre-service teachers themselves using the INTASC Readiness Survey to measure competencies. Next, the Haberman Pre-Screener, a scenario-based instrument that has been found to be predictive of effectiveness and retention, was utilized to measure beliefs. Then, the relationship between pre-service teachers' preparedness to teach and their hiring outcomes was explored. Finally, pre-service teachers’ approach to the new teacher hiring process was explored qualitatively to provide context for the quantitative analyses.

   **Perspective(s) or theoretical framework**
   A Consortium for Policy Research in Education (CPRE) working paper described the following seven somewhat disturbing trends of the changing teacher workforce: (1) Larger, (2) Grayer, (3) Greener, (4) More Female, (5) More Diverse, (6) Consistent in Academic Ability, and (7) Less Stable (Ingersoll & Merrill, 2012). In 2007-2008, the modal teacher was a first-year educator - a drastic change from 10 years earlier when a seasoned veteran of 15 years represented the modal teacher. The problem is particularly salient in urban, low-performing schools serving high minority and high poverty students where in some cases the teacher dropout rate exceeds the already high student dropout rate (National Commission on Teaching and America’s Future [NCTAF], 2007). NCTAF (2007) further asserted that these districts are therefore twice as likely to have beginning teachers serving their at-risk populations and are continuously rebuilding their staff. Based on data from the National Center for Education Statistics (NCES) and teachers with value-added and growth data, Jacob, Vidyarthi, and Carroll (2012) estimated that approximately 10,000 of "our best" teachers are lost annually across the 50 largest districts in the United States. Further, the authors found that finding a replacement teacher of comparable quality can take up to 11 hires.
The constant filling of vacant teaching positions due to teacher turnover comes at high academic and monetary costs to districts. The estimated cost of teacher attrition is $7.3 billion a year in the United States - $19,013,750 to the urban district serving as this study's setting alone; "even without a price tag on lost teaching quality and student opportunities to learn, the message is clear: high teacher turnover is draining school districts of precious dollars that could be used to improve teaching quality and student learning" (NCTAF, 2007, p. 5). Ronfeldt, Loeb, and Wyckoff (2013) found empirical evidence suggesting substantial negative impact, particularly in schools serving minority and low-performing students, of teacher attrition on student achievement. Teachers who are unprepared are twice as likely to leave by the end of their first year according to NCES data (Ingersoll, 2006). With the high costs and a preponderance of beginning teachers who are less likely to stay in teaching, especially in urban districts, the expectation would be that a great deal of effort would be put into researching and fine tuning teacher selection methods to maximize the positive impact of new teachers. However, research on methods of selecting effective teachers is underdeveloped in proportion to the need.

As suggested by Boyd, Lankford, Loeb, Rockoff, and Wyckoff (2008) and Rockoff et al. (2011) the effectiveness of the teacher workforce and improvement of student learning could be achieved through the use of composited, evidence-based measures. Following this example, the study described in this dissertation utilized a composite of measures not typically used in hiring decisions to explore the relationship of pre-service teachers' preparedness to teach and their hiring outcomes. In other words, the present study explored whether or not the pre-service teachers who may be most likely to be effective and survive in the district were selected to teach in the district.

**Methods, techniques, or modes of inquiry**

The present study explored the following research questions.

1. To what extent are pre-service teachers prepared to teach in the urban district?
2. What is the relationship between pre-service teachers' preparedness to teach and their hiring outcomes?
3. How do pre-service teachers approach the new teacher hiring process?

Taken together, the answers to these questions were intended to provide a clearer picture of which pre-service teachers end up working for the urban district studied and whether or not they are the candidates who may be most likely to be effective and survive in the district.

This study utilized a correlational model, a variant of embedded design, in which qualitative data are embedded within a quantitative design to help enlighten the mechanisms at work in the correlational model (Creswell & Plano, 2007). Corresponding analyses for the first research question included descriptive statistics and comparisons. Following Capraro et al. (2010) a comparison of INTASC Readiness Survey Ratings by informant type was conducted using 95% confidence intervals. Regarding the Haberman Pre-Screener results, a one sample t-test was used to examine the difference between the sample mean and Haberman’s cited mean. Data were further examined for significant differences in INTASC Readiness Survey rater evaluations between pre-service teachers who fell below and above Haberman’s recommended cut-off score (above 32 and without a low score in any of the dimensions) with independent t-tests. Results of these analyses were related to hiring by regressing the measured and latent variables separately on each of the possible hiring outcomes, following Capraro, Capraro, and Helfedt (2010). Following Rockoff et al. (2011), pre-service teachers' hiring outcomes were separately regressed on their total Haberman Pre-Screener score.
Qualitative data, utilizing sequential mixed-method approach (Creswell, 2014) – surveys then interviews with volunteer participants - were included in this investigation to obtain a clearer idea of how the hiring process works from the perspectives of teachers new to the district. As such, these data provided insight into results observed in the above quantitative analyses, allowed for the identification of some of the factors affecting the hiring process not captured by the quantitative analyses, and provided an understanding of the participants’ views and experiences (Gibbs, 1997). Data were analyzed following transcription using Descriptive Coding (Saldana, 2012). After coding, within-case and cross-case analysis methods (Creswell, 1994) and the constant-comparative method (Glaser & Strauss, 1967; Lincoln & Guba, 1985; Thomas, 2011) were employed to identify similarities and differences between the groups. Particular attention was paid to areas where stakeholder perspectives overlapped, contradicted, or were unique.

Data sources, evidence, objects or materials
In the present study, the relationship of the likely effectiveness of pre-service teachers who completed their student teaching placements in the urban district studied to their hiring outcomes was explored. To do so, likely effectiveness of student teachers was ascertained through the collection of information not typically available to districts at hire because these less commonly gathered metrics have not been fully explored and may be more powerful predictors of a teacher candidate's effectiveness than typical hiring metrics.

The INTASC Readiness Survey is a Likert-type instrument that was originally developed by Dr. Elisabeth S. Foster. Survey asks participants to rate student teacher performance on items that are a regular part of their training. The INTASC Readiness Survey consists of 63 items measuring the 10 beginning teacher standards. Examinees were instructed to rate themselves on each item using a five-point Likert-type scale. The internal consistency reliability estimate for the survey in Capraro et al. (2010) was .978. Franklin (2011) reexamined the internal consistency reliability of the subscales; the Cronbach’s alpha coefficients for the subsets were: content pedagogy = .79, developmental appropriateness = .72, differentiated instruction = .71, varied instructional strategies = .81, motivational techniques and learning environment = .91, communication and media use = .83, planning for instruction = .70, formal and informal assessment = .81, reflective practice and professional growth = .73, school and community relationships = .85. Franklin (2011) described the process used to verify the instrument's content validity. Results of an expert panel review confirmed that the instrument demonstrated content validity (Franklin, 2011).

The Haberman Prescreener is one of few validated teacher selection instruments, measures dispositions of teacher candidates not typically captured, and showed promise as one of the multiple measures utilized in Rockoff et al. (2011). The intended purpose of the tool is to provide principals and human resources with information about the likely effectiveness of urban teachers prior to hiring (Haberman 1993, 1995), matching a demonstrated need in the district studied. All of the pre-service teachers in the sample were expected to graduate in May of 2013 and were tracked through their job search. Their hiring outcomes were compared to their performance on both instruments and explored through qualitative interviews. Examining patterns of selected teachers is informative to the field of research on teacher selection and can aid school administrators and district personnel in determining future matches of teachers most likely to succeed in a classroom in the urban district studied.
Results and/or substantiated conclusions or warrants for arguments/point of view
Considerable variation in the preparedness of the sample was observed highlighting the importance of effective hiring practices to distinguish among applicants who may look similar on typical observables. Although the mean total score of participants in the sample was higher than the population mean on the Haberman Prescreener, their likeliness to score low in many of the constructs measured including Organization and Planning, At Risk Students, Survive in Bureaucracy, Fallibility, and Explains Teacher Success questions how successful they would be teaching in the urban district. No significant relationships between teachers’ preparedness to teach, particularly in terms of competencies, and their hiring outcomes were found. This result was anticipated because the qualitative interviews revealed that principals typically screened candidates using brief interviews and did not observe competencies or beliefs similar to those utilized in this study.

Scientific or scholarly significance of the study or work
With the obvious and economically meaningful advantages of having more effective teachers, the expectation would be that a large body of research and reform efforts would be concentrated on improving hiring metrics and processes to identify, attract, select, and retain teaching candidates who are most likely to be effective. "Given this set of circumstances, it is clear that much research is still needed on how high-quality teachers may be identified, recruited, and retained" (Rockoff, 2004). In response to inefficient district screening processes and gaps in teacher selection research, this study utilized prior performance and the Haberman Pre-Screener, both with a growing evidence base in relation to teacher effectiveness and retention, to explore pre-service teacher scores in relation to their hiring outcomes. Thus, present study contributed to the research in these areas by investigating the competencies and beliefs of pre-service teachers, from teacher preparation providers that feed into the urban district studied, in relation to hiring outcomes.

Not only was the present study designed to inform gaps in the literature reviewed, but this study was a step for the district towards evaluating the readiness of PDS pre-service teachers to teach full-time in the district’s classroom. As such, this study provided the district with examples of evidence-based tools to allow for comparisons of pre-service teachers across teacher preparation providers. Analyses of data collected from these instruments provided the district with a better understanding of strengths and weaknesses of pre-service teachers and teacher preparation providers. Hiring outcomes of PDS pre-service teachers were explored quantitatively in relation to these strengths and weakness, as well as qualitatively to inform interpretations of hiring patterns. Overall, the results of this investigation may be used to begin to inform the district’s decisions to: preference optimal match teachers within the hiring process, increase the percentage of optimal match teachers accepting positions, provide a better understanding of the professional development needs of new teachers who completed their student teaching in the district, inform future partnerships with teacher preparation providers, provide more as well as more timely choice to principals and schools, and potentially decrease teacher turnover.

Abstract

Many doctoral candidates fear falling into the “All But Dissertation” (ABD) category once they reach the solitary process of writing the dissertation. A small group of African American doctoral students established a “finish line” cohort in the mid-1990s as a way to support and navigate the bureaucracy of the dissertation process. In 2013, an original Finish Line member invited former classmates and a new cohort of novice researchers to form what is now called the Finish Line. This is a peer run, non-university supported learning community that supports and provides structure for African Americans in various stages of the doctoral process. The Finish Line currently consists of more than seventy-five African American doctoral students from six institutions in the State of Michigan. The learning community secures spaces and establishes schedules to meet educational goals particularly writing the dissertation. Collectively, the group meets twice a year for dinner, welcoming new members, encouraging continuing members, and celebrating recent graduates.

The premise of the Finish Line is based on the psychological perspective of student retention. According to Bean and Eaton (2002), this perspective is based on four psychological processes that lead to academic and social integration. These processes are: positive self-efficacy, handling stress, increasing efficacy, and internal locus of control. Bean and Eaton suggest that these psychological perspectives shape entering students’ perceptions of college and university life. Avolio and Gardner (2005) promote the theory of Authentic Leadership Development (ALD) which focuses on the process of developing leaders and how that process can be measured. The presenters seek to use this proposal for future research to generate fundamental ideas to promote the attainment of doctoral scholarship for Black researchers in higher education.

The goal of this workshop is to cultivate an open dialogue, with higher education professional and graduate students, and to provide insight on supportive practices that can promote achievement to degree completion, specifically for African American students. By using the psychological perspective of Bean and Eaton (2002) and the ALD theory of Avolio and Gardner (2005), the presenters seek to establish a research agenda that is inclusive of all university faculty, staff and students with a specific focus area of identifying methods and practices that increase graduate rates for Black doctorate students.

Sealing The Cracks of The Educational Pipeline: How Advocacy and Collective Responsibility Inspired Latinas’ K-16 Success

Angela Leslie, Ed.D

Sacramento, California 95819
angela.leslie@csus.edu
SEALING THE CRACKS OF THE EDUCATIONAL PIPELINE: HOW ADVOCACY AND COLLECTIVE RESPONSIBILITY INSPIRED LATINAS’ K-16 SUCCESS

Recent research has attended to the gender, race, and socioeconomic obstacles that Latinas face in American education. However, less is known about the experiences of Latinas who are the first in their families to complete a baccalaureate degree. This research differs by offering an examination of influential factors for first generation Latinas in their K-16 success and how their gendered experiences informed their educational success. From their counterstories, the author has shown how advocacy and collective responsibility inspired Latinas to succeed throughout the educational pipeline. This article is an expansion of ideas and stories from my 2012 doctoral dissertation study. Key words: Collective Responsibility, Counterstories, First-generation College Students, Latinas’ Education.

Introduction

A college degree can provide a gateway to better career and life opportunities, particularly for underrepresented females of color. This is particularly relevant for Latinas who are severely underrepresented in American high schools and colleges. Latinas’ college completion rates are 10.3 % in the 2011-2012 academic year, which falls significantly lower than White females at 68.2 % and Black females at 12.2 % (National Center for Educational Statistics, 2013). Despite these obstacles, the intent of this article is to examine how gender influenced Latinas’ schooling experiences and what factors contributed to their successful completion of baccalaureate degrees as first generation college students.
Social Capital Is Key In Latinas’ Success

Existing research shows that family and peer support as a means of social capital is one of the most important and influential factors in determining success for Latinas. (Aguilar, 1996; Cantú, 2012; Castillo & Hill, 2004; Ceja, 2004; Gloria, 1997; Gonzalez, Stoner, & Jovel, 2003; Gonzales, 2012). More specifically, Latina mothers have proved to be instrumental in facilitating their daughters’ educational success (Ceja, 2004; Gándara, 1995; Garcia, 2004; Garza, 1998; Gloria & Castellanos, 2012; Gonzalez, Stoner, & Jovel, 2003). Other studies have concluded that mothers were highly contributory in their verbal encouragement and support for college retention (Ceja, 2004; Garza, 1998; Hernandez, Vargas-Lew, & Martinez, 1994; Wycoff, 1996).

How mentoring others in their community is also instrumental in understanding what inspires Latinas. Gloria and Castellanos (2012) confirmed that Latina first generation students utilized stories of their own experiences to help other Latinas in the college going process. Barajas and Pierce (2001) found that Latinas were able to successfully navigate college by having a positive cultural image through supportive relationships with other Latinas on campus.

Methodology

Exploring how Latinas used their cultural identities to persevere in their educational experiences makes Wing’s (2003) Critical Race Feminism (CRF) an essential theoretical model for this study. CRF provides a theoretical framework useful to examine the complexities and fluid gendered identities of Latinas’ stories and offers women of color a discourse that reflects the multiplicities of distinctive experiences that women of color have. The methodological approach used in this qualitative narrative research
utilizes counterstories as a strategy of inquiry. Critical race counterstories serve as a retelling of dominant narratives that often describe the lives of marginalized people from a deficit perspective (Bernal, 1998; Ladson-Billings, 1998; Solórzano & Yosso, 2001; Yosso, 2006). Counterstories reveal the complexities of individual experiences as well as the group as a whole. These stories provide counter spaces for women of color to add their own influences and understandings to further academic research in this area.

**Latina Participants**

The participants in this study consisted of nine Latinas who were the first in their families to earn baccalaureate degrees. Purposeful convenience sampling was used to ensure that my participants are recent graduates, have attended school (K-16) in the United States, and were the first in their family to graduate from college. All of the participants have graduated within the past five years to reflect more recent experiences through the educational pipeline. The Latina participants are a representative sample of the diversity and demographics of Latinas. Although, all of the participants are graduates of California State University, Sacramento, the students come from different socio-economic backgrounds, generational status, bilingual/monolingual, immigration patterns, and have lived in other states. See Table 1.

**Research Questions**

I used the following four open-ended questions to encourage their educational stories to unfold: What factors contribute to Latinas’ success in school? What obstacles do Latinas’ confront in their K-16 educational experiences? How do gender, race, and class impact their education? How are Latinas’ impacted by their accomplishment of being the first in their families to complete an undergraduate degree?
Results

Contrary to ideals about existing gender roles in Latino culture many of the female participants in this study recounted stories of empowerment passed on by their mothers. This is not to say there were not some gender role expectations present in their households. Most of the participants recounted stories and examples of traditional gender roles in the home, however, these constraints did not deter them. Many participants remarked on how daughters were expected to complete household chores, while their brothers were allowed to play outside. Many of the participants viewed this unequal division of labor in the home as unfair. These extra responsibilities occasionally interfered with their educational goals and expectations. Despite accounts of how Latinas’ parents sometimes enforced traditional gender roles in their families, most participants consciously rejected those ideals and developed more equitable relationships in college and beyond.

They were able to counter these traditional roles through their mothers’ influence and advocacy. Not all of the participants’ parents held onto traditional sex roles; some participants recalled how their mothers were modern and liberal in their ideas of gender roles. Gabriela gives an example of how her mother defied traditional gender role stereotyping:

My mom, for her generation and her age, I would say she’s very open-minded (laughs), a very open-minded Latina! For example, one situation, Nintendo came up, when I was growing up, and my dad’s thinking was that Nintendo was for boys, not for girls, we were all young too, my sisters and I. My mom went over his head and bought the Nintendo for us and said, “They are going to learn!” (laughs) So, the way she approached things like that, my dad tried to put those types of sex roles in our lives, but our mom kind of squashed them (laughs), depending on the situation. (Leslie Shaw, 2012, p. 129)
Furthermore, Lori and Sophia grew into independent, college educated women in an effort to not replicate the obstacles their mothers faced. Lori felt motivated to do better in school and life by watching her single mom struggle to raise children on her own. Lori describes her feelings growing up in a single headed household:

And then the divorce that my mom went through, I saw her struggle and then I think according to her, she told me that I used to tell her that I didn’t want to end up like her, I wanted to do more, and be more, so part of that was I guess going to college and wanting to do more with myself versus struggling with going to work. Because I remember seeing her struggle to get up to go to work and then come home ridiculously tired, then trying to raise kids and manage the house and it’s just such a struggle and I didn’t want to see myself go through that. So I think that was something that also pushed me to do that. (Leslie Shaw, 2012, p. 94)

Sophia faced similar experiences growing up with a single mom and she was motivated to continue her education through her mom’s own life experiences:

I think a lot had to do with my parents getting separated, so she was a single mom, I think she wanted me to not be a single mom, but to be able to provide for myself and not depend on any man or anything like that. (Leslie Shaw, 2012, p. 94)

These findings were consistent with previous research on mothers’ influences on their daughters (Ceja, 2004; Gándara, 1995; Garcia, 2004; Garza, 1998; Gonzalez, Stoner, & Jovel, 2003). Ceja (2004) looked at first generation college-bound Chicana students and found that their mothers’ storytelling was key in developing their college aspirations and stressing the obstacles of their current occupation or economic struggles as a way to motivate their daughters to move beyond their current economic status. Most of my participants’ families worked as migrant farm workers or blue-collar jobs due to their lack of opportunities in education. Despite their own obstacles with education and work, mothers continued to place a high value on schooling for their daughters. Latina mothers emphasized education in an effort to influence their daughters to strive for a better life.
Participants recalled early parental nurturing of their academic success in school throughout the educational pipeline. Participants’ mothers proved that they valued education and consistently pushed the importance of education by making it a priority in their children’s lives in a variety of ways. Gabriela’s mom emphasized the importance of education over everything else, including family:

So, my mom was really big about us completing school and stuff and getting further ahead……she always pushed us to the point where we never went to Mexico in December or visited. We never went on vacations during school time. She was really big about not getting us out of school, and making sure we went to school. (Leslie Shaw, 2012, p. 95)

Gabriela’s mom also stressed the importance of reading at a young age:

Well, I thought it was the norm, until I found out it’s not very common for people to get a library card at five years old (laughs). She used to work her 12-hour shifts, and you know have her long days, but whenever she had a break, she would walk us, we didn’t have a car, we only had one car at the time, she would walk us to the library. That was her free time and a free event for us for the time. (Leslie Shaw, 2012, p. 96)

Kristina’s parents similarly made education a top priority in her and her brother’s lives, providing a structured routine for homework early on. Kristina remembers:

It was never an option to not go to college. When I was little, my parents always sat us down for homework time, like as soon as we got home. Before we could do anything fun, it was like did you get your homework done. Whenever we needed help, they would help us, they really pushed education on us a lot. My parents always pushed me for it. They always wanted me to do better, and just have a life where I wouldn’t have to struggle. (Leslie Shaw, 2012, p. 96)

The idea of going to college as a non-negotiable priority was reinforced in Lori’s household by her mother and grandmother in two different ways. Lori recounts:

I would say a huge motivational factor was my mother. She was really a pusher into you are going to go to college, kind of like I was just destined to do. And then I remember my grandmother taking English classes, when I was probably in high school; she was about 70 years old.
She would walk to the church to take her English classes, and then come home and I would see her practicing, still trying to learn English, so I think that also kept me thinking about how it’s important for grandma to educate herself so it’s important for me to educate myself as well. (Leslie Shaw, 2012, p. 96)

Several of the participants conveyed through their stories that this emphasis towards education made the difference between dropping out of education after high school and continuing on to college. All of the participants mentioned their parents as being main sources of inspiration and motivation to obtain a higher education and more than half of the participants specifically mentioned their mothers as the person who was most influential to them in completing a baccalaureate degree.

Mothers also extended their advocacy in their children’s education. Some participants recounted instances where their mothers advocated for their children in school, further emphasizing the importance of education. Sophia discusses how her mom continually had to go to her school throughout her education when Sophia was placed into ESL (English as a Second Language) classes:

S: My mom put me in preschool for two years instead of one because I didn’t know that much English, my first language was Spanish, so she kept me in there longer. When I got older, when I was in elementary school, they were trying to put me in those (ESL) classes, so my mom went to go talk to them. “No she doesn’t need to be in those classes, because she already knows English really well.” Because it was for kids who just came from Mexico and really didn’t know any English. My friend and my mom’s friend; both of our moms had to go to the school and actually like argue that we don’t need to be in ESL. It kind of was a big issue, you know, because they just automatically put them in there. I was just like so annoyed, because I know English.

A: Did you have any of those experiences in middle school and high school?

S: In high school, they tried to place me in those classes. My mom was like “She doesn’t need to go there, you can test her.” By that time, I knew full-blown English, so it had been awhile. That was an issue, them trying to put us in ESL classes. I didn’t need ESL. (Leslie Shaw, 2012, p. 98)
Some participants recognized the social injustices of tracking and resisted these challenges by advocating for themselves or enlisting the assistance of their mothers to dispute these inequities. Isaura remembers:

I think, ever since middle school, was when my mother talked to my counselors to tell them I want her to get in honors classes. Someone had told her that those classes would help get her children to college. So, right there it already started the changes, because I was in a regular class then I went to an honor class. Then from middle school to high school, that’s what happened, those students already in honors classes, the academic college path, continued on and I was there in honors classes. (Leslie Shaw, 2012, p. 98)

This advocacy was undoubtedly important in setting up Isaura for success in high school and also in preparing her for scholarly work in college.

Mothers also consistently praised their daughters’ academic accomplishments, inspiring daughters to live up to these high expectations. Isaura’s mother repeatedly boasted about Isaura’s educational achievements in middle school and high school, which Isaura found to be highly affirming. Isaura says:

My mom would always tell her friends, oh, she’s doing really good in school and I’m really proud of her, so that motivated me. (Leslie Shaw, 2012, p. 99)

After graduating from college, Isaura recalls how her mother would reveal her pride for her accomplishments when talking to friends or clients:

My mom, who cuts hair now, will be talking to people there and she’s like, “I’m pretty proud of my daughter, she didn’t run away with a boyfriend, she didn’t get pregnant, she got her degree already, she’s working, I am a pretty happy mom.” My mom was really proud of me, I’ll always remember graduation day. It’s awesome, because I’m a girl and the first to graduate. (Leslie Shaw, 2012, p. 99)

Participants revealed that their mothers’ constant verbal support and advocacy influenced their abilities to overcome academic obstacles throughout the educational pipeline.
In college, daughters continued to rely on maternal support to nurture and guide them throughout the college going process. Kristina describes how her mom, provided much needed emotional support to keep her motivated in college:

I wanted to make my parents proud, I think, and I wanted to do better for myself. Constantly having my parents’ support, like I would call my mom sometimes so stressed out and she would be, “I know you will get it done”. It was good having someone to talk to. (Leslie Shaw, 2012, p. 97)

Mothers’ verbal encouragement and emotional support was vital for many participants’ incentive to attend college and graduate. This research complements other studies that show how mothers were highly influential in their daughters’ academic success. Villenas and Moreno (2001) captured these nuances of Latina mother-daughter pedagogies in their study. The researchers describe the delicate balance of mothers’ stories and life experiences used as strategies to combat societal racism and sexism as a way to impart independence, while maintaining ideologies of being good, traditional wives.

**Female Advocacy**

Throughout conversations with the participants, it became clear that the role of female mentors, besides their mothers, were also invaluable. Participants frequently recalled certain teachers, school counselors, or programs that facilitated their educational success. Most of their examples were from their high school experiences, which is important to note, since this appears to be a crucial time in development and identity. Influential teachers and helpful counselors during high school were mentioned most often throughout education, reinforcing their vital role in student’s lives. Furthermore, the majority of these influential mentors, were female and Latina, emphasizing the need for more Latina teachers, counselors and administrators.
Isaura remembers one teacher in elementary school who was responsible for a turning point in her education and future academic goals:

The only thing I can think of is the teachers were motivational. At one point in fourth grade, and I still didn’t know English that well, this teacher told my mom, “You need to put her in English classes because you want her to succeed and you want her to go to college, and be on that track.” I feel like if I didn’t learn English at that early age, then I would have been in regular classes, and wouldn’t have succeeded in honor classes. (Leslie Shaw, 2012, p. 103)

Other participants, Bianca and Isaura specifically mentioned Spanish language teachers who inspired them to perform better in school. Isaura’s teacher motivated her to go to college by sharing personal stories of her own college success. Similarly, Bianca’s Spanish teacher encouraged the girls in class to prioritize education over relationships with boys. Two teachers in particular inspired Lori in high school for different reasons:

There was a math teacher that I had that was really influential in that she wanted me to sign up to go to a different high school that was more technology based and the high school itself was on a college campus. But it was too much pressure and I didn’t want to apply. I didn’t want to leave where I was at and start something new. But she really influenced me in thinking farther outside of where I was at motivating me into seeing I could do more. Someone actually believes that I can do more and be somewhere else, so that did help. Also, my art teacher was really passionate. What she did as an art professor and then she was really awesome, she spoke to us one on one and made you feel, “I know you are here and I know what’s going on with you.” So, that helps too. Having teachers that kind of just cared a little bit, took the time to say, “Oh, how are you doing today” or “Thanks for being in class today”, or just remembering your name, calling you by name made a big impact as well. (Leslie Shaw, 2012, p. 103-104)

As the above stories signify, the role of caring teachers positively impacts students’ lives and educational experiences. The importance of female mentors as sources of inspiration and motivation cannot be overstated in its role in school retention rates. Furthermore, a cycle of female empowerment only leads to further resiliency amongst communities since future generations of females are uplifted and will strive to be successful, which then leads to strong, successful Latinas giving back to their families and communities.
Giving Back To Families And Communities

The idea of supporting their family financially or helping their communities was a common theme that resonated with all of the participants. Some participants earned college degrees to gain earning potential, so they could help their families out financially. Giving back has been established in other research on Latinas’ motivation in education, where researchers found that many Latina women emphasized commitments, not only towards their own peers or families, but also to the community in which they came (Bernal, 2001; Rosas & Hamrick, 2002).

Sometimes, participants gave to their parent’s newfound knowledge regarding social issues that changed parents’ lives in unexpected ways. For example, Bianca became educated on human and labor rights through her college classes, and this information was then passed on to her parents who began to advocate for themselves. Bianca discusses these issues:

But now my father prefers to stay out of the field now. He’s been in it for over 20 years of his life. Now he’s working inside in an egg factory in Delano. My mother is a sorter, a fruit sorter, an almond sorter, so she’s also working in a shed. We still consider each other migrants, but my dad has standards, no more working in the fields, it’s too hot. It’s too much. My mom is still open to anything; however, now she’s working inside, in a little shed. They have AC, conditions have changed a lot. Now, they have AC, they can sit down, they don’t have to worry about dehydration, health concerns, sun protection, and stuff like that. It’s a big change. Through being educated, as we are going to school, and us educating them, it brings about a different view, for them too. (Leslie Shaw, 2012, p. 102)

Through their mutual education on larger social issues, Bianca and her parents were able to improve their quality of life through their collective knowledge.

Other participants became increasingly empowered by their college education and
experiences, influencing their households in various ways. Some participants empathized with their mothers who had to work physically demanding jobs and then come home to complete their domestic roles at home. Alejandra remembers:

Because my mom, I would see my mom working long hours, she has to sleep, she wakes up and has to cook something, and then she has to try and clean as much as she can, and then she has to get ready for work. And then on her days off, what does she have to do, laundry, grocery shopping, and cleaning the entire house, like completely, where is her resting time? (Leslie Shaw, 2012, p. 125)

She recalls being enlightened about the disparity in these gender roles increasingly later in her life, especially after she moves away from home to attend college. Alejandra recalls becoming increasingly incensed over the inequities of household chores in her family, and her defiance slowly started changing her brothers’ behaviors:

Through time, they (brothers) started to change. Like now, when I am there, if I’m in the house, they will pick up their plate. If my mom’s there, and I’m not there, they won’t do it. I told my mom you need to tell them. They know if I am going to clean, I don’t want them around because it’s very uncomfortable to see them just sitting down and me having to clean around them, it just gets me really mad. My brothers and my nephew like, I was always having them do stuff. I asked my nephew if he wants to help wash dishes. He’s barely three years old. And he likes doing it. I told my mom we need to start at a young age, people need to start doing it. Now, my mom tells my brother to do it. (Leslie Shaw, 2012, p. 126)

Alejandra’s advocacy for fairness in her families’ gender roles has had lasting influences on her mother who has separated from Alejandra’s father and her brothers who are now doing more around the house as well as the encouragement to create more equitable relationships for her nephew by expecting him to learn how to perform household chores.

**Giving Back To Their Communities**

This sense of advocacy was also reflected in the career choices with all of the participants in this study. The majority of the participants expressed interest in returning home to work in their respective Latino/a communities. The majority of participants
were currently enrolled or applying to graduate school programs to achieve these goals. Additionally, they planned on using their bilingual skills and cultural knowledge to assist Latino/as in their hometowns. Lori felt that helping others succeed in education would be important. Gloria chose a career in law enforcement to help the families of crime victims from her own community. Elizabeth hopes to give back to her community by becoming a bilingual nurse. Additionally, Gabriela, who majored in Deaf Studies/American Sign Language and is trilingual (American Sign Language, English, Spanish), wishes to assist Latino/a hearing impaired children with community resources and education. Isaura graduated with a teaching credential in bilingual/multicultural education. And Alejandra recently graduated with her Master’s degree and hopes to assist other Latino/as as a Vocational Counselor.

**Inspiring Other Family Members’ Education**

Isaura and Bianca mentioned being proud that they could be role models for their younger siblings to follow in their footsteps in achieving a collegiate degree. These findings are consistent with conclusions from a study by Gloria and Constellanos (2012), where first generation Latinas were generous with their time and stories in influencing other Latinas on the path to college. Sometimes these past experiences can prove invaluable in the navigation of institutional tracking and college admission practices. This research reveals how Gabriela was able to inform her mom about tracking practices when she realized her younger sister was unfairly placed in ESL classes. Gabriela discusses her role in helping her sister:

When I was in high school, the same thing was going to happen to my younger sister, she was actually put in second language English, ESL classes. She had been taking English classes since you know, kindergarten, first grade. She can pronounce and write better than I could because she had me to practice with. So,
I told my mom, you need to take her out of those classes, so I was the first one to advocate for my sister, to tell my mom I don’t think she should be there, she’s smarter than that and this is what they did to me when I was there. For me, pushing my mom, she did end up taking my sister out of those classes and putting her in the English class she was supposed to be at. (Leslie Shaw, 2012, p. 101)

Sharing information and resources to help others continued to be a common thread throughout the participants’ counterstories. These findings are aligned with Yosso’s (2005) theories of familial capital where valuable knowledge is passed on to family members, extended family, or communities to increase individual or collective empowerment. These ideas permeated the participants’ stories where Latinas expressed their achievement of a collegiate degree more as a team effort, not an individual accomplishment. They recognized and acknowledged all of the people that supported them throughout the educational pipeline.

DISCUSSION

The counterstories document an intricate web of female support that collectively contributed to Latinas’ academic success. The following diagram highlights the gendered influences that are tied to participants’ identities and shaped them in their academic efficacy throughout the educational pipeline. It also demonstrates the fluidity of collective responsibility. Each participant and the people who influenced them share this cycle of support, a reciprocal relationship, to ultimately uplift the individuals in this study, but also the families, friends, mentors, and communities of the participants. See Figure 1.

I offer an alternative critique on previous research of collective responsibility that can further pedagogy of how collective responsibility can be applied to understand Latinas’ success in college. Existing educational research generally focused on how
teachers and school administrators apply collective responsibility or relational trust within their school communities to increase student achievement (Bryk & Schneider, 2002; Lee & Smith, 1996; Whalen, 2012). Research by Muñoz and Maldonado (2012) on college persistence by undocumented Latina students revealed how their college experiences shaped their ideas of gender in progressive ways and incited questions of traditional gender roles. This study frames how Latinas are able to activate gendered influences and collective responsibility in their communities and in school to ensure that fellow students succeed as well.

One of the most important findings that my work reveals is that more than half of the participants talked about how their mothers in particular were their main sources of inspiration in their education. Previous studies document the importance of Latina mothers’ influences on their daughters’ educational success (Ceja, 2004; Gándara, 1995; Garcia, 2004; Garza, 1998; Gloria & Castellanos, 2012; Gonzalez, Stoner, & Jovel, 2003). Additionally, three other studies by Garza (1998), Hernandez, Vargas-Lew, and Martinez (1994), and Wycoff (1996) contend that the influence of mothers and their encouragement are key factors in fostering success for Latinas in a college setting. Mothers and other females in participants’ lives embody feminist principles by supporting the success of participants while sometimes discrediting traditional gender role expectations.

This study extends the discussion of how culture and family foster educational efficacy (Yosso, 2005) and emphasizes how gender influences Latinas in their educational success. Females’ nurturing and support of others was another vital finding throughout the participants’ counterstories. Looking at participants’ stories that inspired
them throughout the educational pipeline, their mentors are overwhelmingly female and Latina. Participants mentioned female academic advisors, counselors, teachers, professors, and friends who all contributed to the success of Latinas in this study. Same sex role models proved to be an important factor in providing the necessary support for Latinas. Additionally, many of those same mentors were Latinas, demonstrating the need for more Latina role models as counselors, teachers, and professors in the K-16 pipeline.

Latina mothers and mentors advocated for daughters/students on behalf of the participants throughout the educational pipeline. Participants learned how to be change agents from these early childhood experiences. Many participants possessed a sense of collective responsibility and female empowerment, continuing to advocate for their younger female siblings and/or other family members to succeed in college as well. This cycle of advocacy and collective responsibility reveal important unique gendered characteristic that inform how and why Latinas succeeded in the educational pipeline. The idea of females helping females is instrumental in promoting female empowerment and necessary in deconstructing limiting gender role expectations. Additional work needs to be done on the application of collective responsibility and its impact on education. These ideas can bring new gendered perspectives into how and why Latinas complete baccalaureate degrees.

Latinas are influenced by a web of female support that foster their success throughout the educational pipeline to the culmination of their college degrees. Latinas feel a collective responsibility to support family members and peers in their educational pursuits and uplift Latinos from their communities.

1) Title: Decolonizing Higher Education: Master of Social Work based in Indigenous Knowledges

2) Topic: Higher Education

3) Format: Panel Presentation

4) Description: A new program, Master of Social Work based in Indigenous Knowledges, has been developed over the past seven years and the first course began on August 29, 2016. The program is an effort to counter the colonial processes that exist in higher education, and in turn in the field. This presentation will outline the learning stemming from developing and implementing this anti-colonial project that can offer support for other efforts at decolonizing education.

Don Robinson, MSW-IK Implementation Committee, University of Manitoba, inninewconsulting@mymts.net
The Master of Social Work based in Indigenous Knowledges (MSW-IK) program was initially conceptualized over seven years ago. The program was developed over the following seven years by members of the Indigenous Caucus at the University of Manitoba, Faculty of Social Work, and members of the Indigenous community in the City of Winnipeg. The need for the program was and is based on the recognition that much of post-secondary educations failure to adequately address Indigenous realities, aspirations, knowledges, and processes. Over the following seven years the program was developed in detail, including its intent, philosophy, structure, processes, courses, positions, and resourcing. The program was reviewed several committees at the University of Manitoba, and was approved by the Board of Governors and Senate. Funding for the program was provided by the Provincial Government after much discussion. These processes have taught the committee members about how colonial processes continue to exist, how to overcome these and other challenges, and the importance of creating such programs in mainstream education institutions. This presentation will outline the programs development, implementation, learning and challenges as a decolonization project. The panel presentation will demonstrate the need for and benefits of such programs, and offer support for others developing new program aimed at shifting higher education, and in turn society.

6. **ABSTRACT & PAPER:**

   The primary objective of this paper is to consider a theoretical reanalysis of higher education workforce development programs from a capitalist, hegemonic, social reproduction frame and instead as a horizontal, open system of creating organic intellectuals across socially stratified classes. Through a contrastive analysis of preliminary written discourse, images, and context of a STEM higher education pathway program, new outlooks are made visible that may have not been considered before. Beginning with a Marx-Weber-Gramsci perspective the analysis yields familiar vertical hegemonic structures. Then applying Deleuze and Guattari, Foucault and Said concepts of knowledge, power, and rhizomes as well as Gramsci’s intellectuals, a reframing of workforce as intellectuals, as opposed to labor, allows for restrategizing how to meet projected workforce vacancies of highly skilled science personnel due to eminent attrition.

Introduction
One winter day in December 2015 at the coastal research and development (R&D) agency in the United States southwest, this agency and a local four-year, university research institution signed an agreement that solidified the partnership to establish a higher education workforce development program. This career pathways program is an opportunity for veterans and underrepresented community college students to experience science, technology, engineering, math (STEM) design projects in a coastal setting. This program’s overarching goal is to increase the number of veterans and underrepresented community college students, who major in STEM-related subjects and wish to pursue a civil career in science and engineering. Fifteen students were chosen to participate in a paid 8-week summer in-residence engineering workforce development program and be divided into five teams with an assigned engineering graduate student, faculty advisor and a civil service engineer as mentors. Each week, four days were spent at the coastal R&D agency working on design projects, with each Friday in attendance at the local four-year, university research institution for training in an entrepreneurship and innovation course. The aim over time is to create a pool of potential candidates for civil service careers as highly skilled engineers. At first glance, this seems like a traditional industrial workforce development program that satisfy capitalist and social structures. However, this paper analyzes shifts in practice and discourse of the coastal R&D agency that show glimpses of a new direction for refocusing and training, at least in part if not whole. This discourse study makes visible what is unintentionally invisible as a new, pilot program. Additionally, one of the researchers brought first-hand, cultural knowledge to this work as a civil service career scientist.

Structure and Reproduction

For structural theorist Karl Marx, education is a method of social reproduction to maintain hegemonic structures that support economic production. In “Manifesto of the Communist Party”¹, Marx explains that education is both social and industrial reproduction. And in Capital Volume 1, that the division of labor is determined by hand labor and head labor,² and in Capital Volume 3 with large structures formed by class functions with a consensus on values and norms that provide stability.³ For the coastal R&D agency, education is also a means of transmitting skills to next generations, with a service or workforce contract, like Marx’s social contract, on its agreed values and norms. Their civil service training schools include field training camps, civil service training schools and academies. Similar to Antonio Gramsci’s

notion of schools of labor, additional tiers of schools or training exist for leadership and elite like the civil service college for top leadership, and elite training for specialized personnel. All programs instill the traditions of the coastal R&D agency’s culture, chain of command and professionalism in their personnel.

Additionally, just as Max Weber links religion to capitalism, there are characteristics of the agency that are religious-like and integrated into their hegemonic structures. Emile Durkheim would concur that all collectives have a religious element. For example, each civil service branch has its own motto that creates an ideology and cohesion such as: “Non sibi sed patriae” (Not Self, but Country), “This We’ll Defend”, “Aim High, Fly, Fight, Win”, “Semper Fidelis” (Always Faithful). Besides a motto or creed, the agency also has forms of totems that unify their members. Within the agency, examples of totems - “a symbol, a material expression of something else” – are service flags, statues, pins or badges on uniforms. Durkheim would consider these service mottos and totems as methods of bonding in kinship and all forms of social reproduction. Both Weber and Durkheim believe that division of labor creates social solidarity because everyone has a role, and job is a vocation. Also, all forms of labor are considered morally virtuous even if work is defined differently by various religions, and in this case different civil service branches. Also in Weber, division of labor or stratification of work is considered part of God’s plan or of benefit because acquiring new skills is valued. These concepts of social reproduction through class structure, division of labor, religion, totem, and work are applicable and prominent in the coastal R&D agency and all branches of civil service.

A STEM Higher Education, Workforce Development Pathways Program

Currently, in terms of operational structure, the coastal R&D agency must address a growing issue of mass vacancies within highly skilled science personnel. In the next five years, the coastal R&D agency foresees a shortage of as much as 5,000 skilled personnel, which is about 50% of its STEM professionals due to retirement or attrition. This pending personnel loss is already evident at one southwest branch with current STEM openings such as Supervisory Engineer, Structural Civil Engineer, Supervisory Technician, Electronics Engineer, Environmental Transportation Systems Specialist, and Aerospace Engineer; other science related

---

positions include Interdisciplinary Fish and Wildlife Biologist/Cartographer and Psychologist. In light, a primary issue for the civil service agency nationally, and the coastal R&D agency locally, is sustainability and the agency is searching for new ways to increase and stabilize their diminishing workforce, different than they have traditionally done it before.

For example, while inequality exists with labor and intellectual classes still divided in the agency through training and education, the fragile and deteriorating infrastructure is not due to a class struggle against the proletariat, from a Marx point of view. This pending issue is due to an aging population of a scientific skilled workforce. In this new era of shifting social and professional structure of the civil service agency, it is piloting a new strategy of social and professional (re)production, A STEM Higher Education, Workforce Development Pathways Program. The program is different than the civil service agency’s traditional forms of training and educating. First, this program is funding each undergraduate student $4,000-$6,000, dependent on level of education and experience, for their 8-week summer participation, without obligation to serve in the civil service agency. Traditionally, most of those who have been funded by the civil service agency through academic or vocational training must commit to serving for the agency; if a contracted member changes their mind about serving, they must return the equivalent cost of their education and training. But now, the civil service agency seems to be modeling other government education programs like the National Institute of Health (NIH) or the National Science Foundation (NSF) who each have their summer internship components so students can experience the profession and the science field, and so the government agencies can view rising talent as potential future employees of the departments. For the participant, a summer internship is temporary and non-obligatory future employment to the funding organization but a means of academic and career exploration. This “growing your own” is not automatic as most hegemonic structures would already determine class and status.

Second, the workforce development program is seeking to replicate and expand to other locations across the nation if this pilot summer model is a success. To foreshadow this expansion for analysis in this paper, I suggest envisioning that this growth strategy no longer mirrors a centralized hegemonic structure but more decentralized and horizontal as in Deleuze and Guattari’s concept of rhizomes. Hypothetically, for a fraction of the civil service agencies that are relatively near major universities and near a community college population, rhizomes could be spreading. I hesitate to say that the civil service agency is “seeding” the rhizomes because per Deleuze and Guattari, rhizomes have no beginning and end. The agency would just be “watering” what exists – that underrepresented and veteran community college students already going to school – by giving them the opportunity for paid experiential education and training at the coastal R&D agency. Also, this growth is not necessarily a simultaneously, organized and orchestrated expansion even if policy and financing are standardized processes in the agency. On the contrary, what makes each new workforce development rhizome growth variable is the

10 USAJOBS Website https://www.usajobs.gov/

11 NIH Summer Internship Program http://www.niehs.nih.gov/careers/research/summers/

unpredictable multiplicities and assemblages that would differ per location. Each local university, R&D agency, and community colleges would have different types of actors, leaders, cultures, histories, priorities and timelines in play that would make rhizomatic growth variable; and if a workforce development rhizome is not successful in a specific area, then it would just be an asignifying rupture with no death or birth because students could just continue with schooling as before without the R&D summer training. This rhizomatic analysis would show an open system, with multiple entries into the system, as opposed to a traditional, hierarchical closed system that the agency traditionally utilizes to decide whom to include and exclude.

Language and Intellectuals

Aside from structure and reproduction, the themes of language and intellectuals are examined to show contradictions or shifts in agency discourse and representations of the workforce development program. Related to language, I reflect on discourse and knowledge presented by Edward Said in *Orientalism*. He explains that writings and discourse contributes to the political, social and cultural understanding of a group or phenomena. Also, he elaborates that “true knowledge is not political, so political and economic knowledge is not wholly true.” I merge these ideas with Foucault’s claim that knowledge has power and that discourse, or narratives are fragmented, non-linear, and discontinuous. First consider the power of representation of the workforce development participant, especially in terms of Said’s textuality, where texts exist in contexts to include social, ideological frames or meanings. In news articles about this workforce development program, participants are framed as subjects. This subjectivity alludes to hierarchy and hegemony created by the news reporter, agency and local university. Yet, a missing representation or less prominent discourse is the community college stakeholder, who was not part of the “Signed and Sealed” photograph but is a key partner in the workforce development program, with actually several community colleges in the network. Said would link this to distortion and accuracy, if text, discourse or description is either too general or too specific. To make further note, if the workforce development program is not successful and the news articles are the only two archival pieces in the public space, the community college partner over time will likely be rendered invisible in the history of higher education or civil service education and training initiatives.

Also potentially misrepresented and debatable, is the notion of the diverse or nontraditional student (i.e. underrepresented and veteran) as thinker with intellectual capital as opposed to subaltern or lower, manual labor class. A common narrative exists about minorities and veterans as subaltern, outsider, unstable, poor or homeless. But a counter narrative exists as well of minority and veteran as valued. For example, in program meetings and outreach events

---

19 Said. *Orientalism*, 16.
for this workforce development program, all those at the table consistently regarded the social, cultural and intellectual capital brought by diverse students and that the diversity of students is necessary for out-of-the-box thinking and new solutions to problem solving; diverse and creative thinkers are in demand for the civil service agency. However, until preliminary analysis of inaugural participants engaged in the pilot program is completed, it is yet to be seen if this discourse is rhetoric or truly embodied by the students, partners, staff and stakeholders of the workforce development.

Another point of reflection is the program logo, see Figure 1 to the right. From a Marx-Weber-Gramsci hegemonic lens, the lightbulb atop the anchor, may be interpreted as intellectuals – represented by the lightbulb as mental, knowledgeable, brain – superseding and controlling the laborers, symbolized by the anchor as physical and closer to the ground. Yet, the creators and approvers of the logo, saw the two – lightbulb and anchor – purposefully linked as unity and integration of mind and body, a whole person or the intellectual with skills, and the laborer who can think.

Something else brushed upon by one of the news articles is the ethnographic research component of the program and operations. The project creator and lead says, "A very important component of this program is that we’re looking at this as an opportunity to help the Navy create a sustainable STEM pipeline. Using an ethnographic approach, we will investigate the factors affecting veteran and minority students’ participation and academic success in STEM, with the goal of identifying and reinforcing practices that support their success." 20

Without looking any deeper into what this actually is or means, a significant characteristic of the program is lost by readers and/or non-researchers. But this is particularly important perspective of participants as intellectuals and relevant to Gramsci’s organic intellectuals 21. First to elaborate on the educational ethnography component of the workforce development program, the research’s conceptual framework and methodology draws on educator, anthropologist, ethnographer, discourse and sociolinguistics expert, Judith Green’s et. al. work. 22 Key principles of this epistemology and method that the articles stress are:

- The methodologies of ethnographic research emphasize the importance of understanding the learning and decision-making processes from the perspectives of the study participants.

20 Logan. “All Hands on Deck.” The UC Santa Barbara Current.

• This approach provides transparency and supports the ethnographic principle of **learning with, rather than about** the participants as they develop a frame for seeing, understanding, and knowing their world.

• Based on a **cyclical process** of interpretation, application, revision, and dissemination of disciplinary work in action, the goal is to observe, record and analyze participant experiences.

• An ethnographic orientation provides students with a **guiding “map”** for interpreting their daily experiences in order to critically reflect on their capabilities, identify resources needed for advancement, and develop strategies to support their learning.

The purpose of this interactional ethnography concept and method is to make visible how, why, and what participants think and perceive of their educational experience in the program and of the system of education and schooling. With this mental training and exercise, the workforce development program participants are not viewed singularly as laborers but intellectuals.

Expanding on Gramsci’s intellectuals, and paralleling the workforce development program’s view of the participants, everyone has knowledge, intellect and mental capacity. Typically society decides who intellectuals are as a class and education reinforces those social structures. But for Gramsci, “non-intellectuals do not exist.” And interestingly the civil service agency is consciously focusing on populations that have not necessarily been their primary population base in terms of intellectual leaders – and supporting them in becoming intellectuals and leaders, via career exploration, mentorship and training. This strategy would seem counter to Gramsci’s explanation of organic intellectuals only coming from within a class or group, and not across a class or group. Yet, the civil service agency is also cognizant of *esprit de corps*, the community, comradery and connection veterans usually have for others that are military members or veterans. The conscious choice of the civil service agency to recruit military veterans supports the development of the organic intellectual science cadre with those who are familiar with government culture and environment. An inherent esprit de corps creates ease in forming a cohesive workplace. So in some ways creating intellectuals across classes i.e. minority and veterans, usually seen as labor, into the skilled science intellectuals of the agency is defying the social stratification that Weber and Gramsci view for stability and order. Also for Gramsci, the purpose for creating organic intellectuals is to reduce the reliance on intellectuals from other classes in order to challenge existing hegemonic order. This is not the case with the workforce development program; the agency is inviting those outside of normal recruitment classes to become scientific intellectuals for the agency. Additionally this seems counter to typically analysis of social class structure where physical labor is separated from mental or intellectual skill. In terms of team, Gramsci’s teams would like “a capitalist entrepreneur alongside the industrial technician, the specialist in political economy, the organizer of a new culture, of a new

---

legal system etc.”26 What is yet to be analyzed in the workforce development program is how students were integrated or how they integrated themselves – either hierarchically or rhizomatically – with the actors in their designated project teams that include a civil service engineer mentor and graduate engineering mentor.

Conclusion

A STEM Higher Education, Workforce Development Pathways Program is a new initiative and partnership between a coastal research and development (R&D) agency in the United States southwest, a local four-year, university research institution and local community colleges to support underrepresented and veteran community college students with an 8-week paid summer experiential workforce development program to learn about STEM design, environments, and careers in the civil service. Initially this program can easily be viewed in a hegemonic social reproduction of the workforce needed for the agency. However, with a shift in recruitment strategy, method of training and support, discourse on participant subjects, and added ethnographic educational research component, this workforce development program is worth reexamining as horizontal, open system of creating organic intellectuals across socially stratified classes. While this is a limited analysis as a theoretical reconceptualization paper, further study may be made through an educational ethnographic analysis of the inaugural cohort groups’ participation in this summer immersion. Additionally, the potential for the workforce development program to grow to other locations can determine in time the outcome of this new education and career pathway initiative. This rethinking of STEM higher education workforce development is especially relevant to eminent attrition of highly skilled science personnel and vital to reimagining how to meet personnel needs in the next five years and beyond.

Presentation Format: Paper Session

Description. This paper describes a collaborative research project designed to support classroom teachers in including physical activity breaks/movement and healthy behaviors into their K-8 classrooms. Classroom teachers from three schools were asked to set goals related to including healthy behaviors in their classrooms and then to reflect on their progress two times over the course of an academic year. Grounded in the theoretical framework of self-efficacy, teachers’ goals were primarily focused on including physical activity/movement in the classroom, teaching health knowledge, modeling healthy behaviors and eating healthy at school. Teachers had some success in meeting their goals; although reporting was inconsistent. Come prepared to share your own successes and challenges related to teaching healthy behaviors in classroom settings.
Introduction

This study, grounded in self-efficacy theory (e.g., Bandura, 1997), sought to investigate the role of goal setting in classroom teacher behaviors related to creating healthy and active schools. Classroom teachers had professional development opportunities centered on creating healthy and active schools and participated in *Fitness for Life* Wellness Week activities (e.g., Corbin, LeMasurier, Lambdin, & Greiner, 2010) across one school year.

Goal Setting

Goal setting has long been used (e.g., Mace, 1935) in many different settings to improve outcomes. Goal setting theory is founded on Ryan’s (1970) idea that goals affect action. A goal is the intention of an action, such as attaining a higher test score. Creating a specific, difficult goal has led to increased productivity in word processors typing more words per minute (Latham & Yuki, 1976), loggers cutting more trees (Latham & Yuki, 1975), athletes improving sports performance (Kyllo, & Landers, 1995), and improved teacher and student performance (e.g., Grant & Stronge, 2013).

Academic goal setting has been used for teachers to set goals for students’ academic achievement. Academic goal setting (teachers’ goals for students) has been connected to students’ initial cognitive entry prerequisites and mastery learning practices, both of which have shown increased levels of student academic performance. Authors found that goals setting in teacher evaluation led to teacher collegiality, reflection and a collaborative atmosphere in the evaluation process (McBride & Miller, 2005). In a study of student goal setting, Hancock (2005) had students either set an absolute goal for physical activity performed in physical education classes or a relative goal based on their
goals for teaching healthy behaviors

pretest score or no goal. Hancock reported that students in both goal setting groups (absolute and relative) were significantly more active (e.g., 7,176 and 7,393 respectively vs. 5,353 steps/day) than the control group across several days. In the current study, classroom teachers set goals for themselves related to implementing healthy behaviors and healthy behavior knowledge in their classrooms and across the school setting and subsequently reported on whether or not the goals were met.

Bandura’s (1997) Social Cognitive Theory postulates that the major determinants of teacher choices are their judgements related to self-efficacy. This suggests that their confidence related to teaching about healthy behaviors and exhibiting healthy behaviors with their students is related to their self-efficacy (or situation specific confidence) in these areas. Individuals with high self-efficacy often set more ambitious goals. More efficacious individuals also tend to be more committed to their goals. Further, higher levels of self-efficacy can also translate into people responding more positively to all types of feedback from others which may lead to better goal achievement (e.g., Locke & Latham, 1990). Self-efficacy provides a foundation for goal setting. The role of self-efficacy in goal setting is assumed (as it was not measured in the current study).

While there have been many studies supporting the important role of goal setting in improving human performance and educational outcomes, we were unable to find any studies that addressed classroom teachers’ goal setting related to integrating healthy knowledge and behaviors into their classrooms. Thus, the purpose of this study was to investigate classroom teachers’ use of goal setting related to teaching healthy behaviors and promoting participation in healthy behaviors in their classrooms and across the school setting. Specifically, what types of personal goals related to teaching/exhibiting
Goals for Teaching Healthy Behaviors

Healthy behaviors did teachers set and how successful were they in meeting their goals for teaching/exhibiting healthy behaviors?

Method

Setting

This study was part of a larger three-year intervention that focused on changing the culture of three schools to be healthier and more active. The intervention included other programmatic components (beyond goal setting in classrooms,) such as new before school physical activity programming and additional healthy lunch and snack options.

Classroom teachers had been focusing on SMART goals (specific, measureable, attainable, realistic, and timely) for their classrooms with administrators. Teachers had professional development on a regular basis (approximately four times at each school) across the school year during staff meetings on implementing healthy behaviors in the classroom and were provided with grade level textbooks for the Fitness for Life curriculum model (Corbin et al., 2010).

Before Wellness Weeks one and three (of the four Wellness Weeks), teachers were asked to set, up to three SMART Goals, for their upcoming Wellness Week on a reporting sheet. After Wellness Weeks one and three, teachers at the three schools were also asked to self-report on their wellness week activities performed and if her/his specific goals were met on a post- Wellness Week reflection sheet. Pre/post Wellness Week forms were turned into a Fitness for Life mailbox at the schools by teachers using their assigned numbers and forms were collected by members of the research team.

Participants
The teacher participants in this healthy behavior goal setting study were from three rural K-8 schools in the Southwestern USA; school 1 (19 teachers) school 2 (18 teachers) and school 3 (23 teachers). The 60 teachers (51 female) had between four and 37 years of teaching experience ($M=18.42$, $SD=9.37$). The majority of teachers reported their ethnic background as Caucasian or did not report it. Teachers taught all subjects ($n=45$), or math/social studies ($n=4$), science ($n=2$), reading/language arts ($n=6$), physical education ($n=1$) or special education ($n=2$).

**Instruments**

**Wellness Week Goal Setting Sheet.** Teachers were asked to set goals for incorporating healthy behavior knowledge and activities into their classrooms on a Wellness Week Goal Setting data collection sheet that was submitted to a dedicated mailbox for Wellness Week number one in the fall and Wellness Week number three in the spring.

**Wellness Week Self-Report Sheet.** Teachers also reported on the number and type of activities taught in their classroom during Wellness Weeks one and three over the school year.

**Results**

**Teacher Goals**

Teachers reported up to three goals for the wellness weeks; although teachers were inconsistent in their reporting. Classroom teachers’ goals were categorized into the following areas: (a) teaching a daily physical activity break, (b) taking kids walking, (c) teaching healthy behavior knowledge, (d) modeling healthy behaviors in the classroom.
and with students around the school campus, and (e) teachers and students eating healthier in the cafeteria.

For Wellness Week number one, the most frequent first goal was teaching a physical activity break (91.9%), followed by the second most frequent goal of teaching healthy behavior knowledge (73%) and finally the third most frequent goal of teachers and students eating healthier in the cafeteria (100%). Similarly, for the third Wellness Week, the most frequent first goal was teaching a physical activity break (66.7%), followed by the second most frequent goal again of teaching healthy behavior knowledge (46%) with no third goals listed. Interestingly, the goal of taking kids walking only appeared twice and it is alarming that modeling healthy behaviors in the classroom was only indicated as a goal by one teacher.

**Wellness Week Activities**

**Physical Activity Breaks.** During Wellness Week one, teachers reported they included 1-5 physical activity breaks \((M=3.5\ SD=1.6\text{ for physical activity only})\). They also reported physical activity breaks tied to academics \(M=2.2, SD=1.9\text{ (e.g., skip counting with jumping jacks)})\).

The third Wellness Week results were analogous with 1-5 activity breaks reported. There was an average of 3.4 physical activity breaks done for activity purposes alone and an average of 2.6 activity breaks tied to academics.

**Wellness Week Activities.** Forty-one percent of the teachers indicated they met their first goal; while 36.4% met their first two goals, and 9.1% met all three goals; with 13.6% of teachers not reporting any goals met. For Wellness Week three, teachers also
reported meeting one goal (35.7%) and meeting both goals (53.6%) with 0.7% of teachers reported no goals met and no third goals reported.

**Discussion**

Goal setting is one strategy that may help classroom teachers increase the integration of healthy behaviors and healthy behavior knowledge into their classes. Other studies in education settings have shown that teacher goals can improve teacher performance and student outcomes (e.g., Grant & Stronge, 2013) as well as lead to other positive outcomes such as teacher reflection and collaborative efforts (McBride & Miller, 2005).

In the present study, teachers were able to create their own personal goals. These goals are thought to be mediated by their self-efficacy related to teaching healthy behavior content and promoting healthy behaviors in schools (Locke & Latham, 2002).

The results of this study are encouraging, suggesting that classroom teachers were willing to integrate healthy behavior content and experiences into their classrooms and that goal setting may support teacher driven healthy behavior changes in classrooms and across schools as one part of transforming schools to healthy and active places for children and youth.

**Conclusion**

Teachers were successful in setting one or more goals in up to five different areas related to teaching about and practicing healthy behaviors in their classrooms (i.e., daily physical activity breaks, taking students walking, teaching healthy behavior knowledge, and modeling healthy behaviors in the classroom and on campus, and teachers and students eating healthier in the cafeteria). Teachers mostly (46-100%) reported meeting
their goals related to daily physical activity breaks, teaching healthy behavior knowledge and teachers/students eating healthier in the cafeteria. Classroom teachers taught between one and five physical activity breaks during the Wellness Weeks (usually 2-3). Goal setting has been shown to improve teachers’ self-efficacy and help individuals be more committed to their goals (Locke & Latham, 1990). In the current study, goal setting led to teachers having numerous goals and some success in achieving their goals related to teaching about healthy behaviors and participating in healthy behaviors in their classrooms and at school.

6. Abstract.
   This study seeks to address the question: What are the experiences of counselor education students engaged in a service learning project in the class-Child and Adolescent Development in the Department of Counseling? This qualitative study presents the research in two dimensions: 1) examination of data collection comprised of counselor education student experiences and reflections derived from description and analysis; 2) counselor education students enrolled in a class produced a written report reflecting on the pre-experience and post experience beliefs of low income students. Students were asked to reflect on the negative and positive aspects of the service learning experience, what they learned about themselves and the low income children, and the urban environment.

An Investigation into the Experiences of Immigrant Teachers Serving in Bilingual Education Classrooms in the United States: What Can We Learn from Their Experiences?

Dr. Patsy J. Robles-Goodwin, Professor of Education
School of Education, Texas Wesleyan University, 1201 Wesleyan Street, Fort Worth, TX 76105
817.531.4963; problesgoodwin@txwes.edu

Description

The purpose of the study was to investigate the experiences of Spanish-speaking teachers recruited from other countries to work as bilingual education teachers in the US. They are often sought out to meet the needs of schools districts needing Spanish-speaking teachers to serve a growing student population of linguistically and culturally diverse students who often struggle to meet state standards.

Abstract

This research presents the findings from an ongoing qualitative research study that investigates the experiences of teachers migrating from Latin America and Spain, to Texas, U.S.A. Teachers are being recruited in their country of origin to serve students in bilingual education programs because there is a critical shortage of bilingual teachers due to rapid changes in the demographic composition of the school population. School districts have responded to the bilingual teacher critical shortage in innovative ways, one of which is recruiting teachers from Spanish-speaking countries. The purpose of the study was to investigate the experiences of this group of teachers to understand and the types of professional development immigrant teachers in bilingual education programs need, especially for fostering an effective acculturation process and retaining them in the classroom in this country. This process is important because bilingual teachers from Latin America and Spain are often recruited to meet the needs of schools districts needing Spanish--speaking teachers to serve a growing student population of linguistically and culturally diverse students who often struggle to meet state standards. A successful cultural, professional, and social integration of these teachers will ultimately impact the schools, students, and communities they serve. Some findings of the study include: cultural shock of a new way of life in the United States; family alienation in that the former family support, especially for child care, is nonexistent in the United States; surviving on the new higher pay scale in the US. Even though teachers earn more in the US as opposed to their native countries, it is often not enough to survive after all the new costs of living in the US are accounted for in the monthly expenses. However, the most impactful areas for the teachers coming to the US is the vastly different educational systems and teacher expectations, especially in the area of English language proficiency and student evaluations and outcomes. The teachers report not fully understanding the “best practices” for non-native students, as well as for all students in general such as differentiation. They also report having the need for a mentor during their induction year to learn about the school culture and expectations. The findings of this study can be helpful for many affected school personnel—school administrators, teachers, and community. More research in this area is needed to fully understand the unique perspectives of the teachers and to support them on their journey of professional educator in the US.
Undergraduate Research: Not Just for Research Universities

Abstract
This study examines the impact of undergraduate research participation on student outcomes drawing on 324 senior students who completed the 2015 administration of National Survey of Student Engagement and their enrollment data. The results indicate that students who have participated in undergraduate research reported higher-level of engagement, were more satisfied with their entire educational experiences, and reported higher gains than their peers who have not done undergraduate research. In addition, participation in undergraduate research improves student one-year retention, good academic standing, and graduation rates.

Undergraduate Research: Not Just for Research Universities

Purpose of the Study

Undergraduate research (UR) as a high-impact practice (Kuh, 2008) is increasingly gaining attention from the higher education community. The benefits of participation in undergraduate research have been well recognized (Malachowski, Osborn, Karukstis, & Ambos, 2015). Engagement in UR with faculty members not only provides opportunities for increased involvement in college activities and the development of personal and professional skills, but also allows students to directly experience the inquiry process by participating in defining and solving real problems (Kinkead, 2003). It also allows students to put knowledge and theory that have been learned in the classroom into practice. Research shows that participation in a research project as an undergraduate student is associated with a host of desirable student outcomes, such as persistence, degree completion, and career inspiration (Gilmore, Vieyra, & Timmerman, 2015; Pascarella & Terenzini, 2005). Lopatto (2009) asserts there are four benefits of engaging in UR: skills acquisition, personal development, professional development, and professional advancement, particularly for underrepresented students (Kuh, 2008; Lopatto, 2006, 2009; O'Donnell, Botelho, & Brown, 2015). Other studies have also indicated that participating in undergraduate research strengthens inquiry skills (Alexander, Foertsch, Daffinrud, & Tapia, 2000; Bauer & Bennett, 2003; Kardash, 2000; Lopatto, 2006, 2009; NSSE, 2007; Seymour et al., 2004), and improves interpersonal communication and language skills, critical thinking, and reflective judgment (Bauer, 2001).

Despite well documented positive impacts of UR on student outcomes, “its practice is still far from universal” (Malachowski et al., 2015, p. 1). The literature on undergraduate research is not extensive, “especially in the area of student outcomes” (Kuh, 2008, p. 32). Other than persistence and graduation, student outcomes related to student learning have not been well established (Kuh, 2008). As a result, a significant gap in the literature exists, especially regarding undergraduate research at small teaching colleges as opposed to larger research universities. Due to the different mission and vision of a research university and a teaching college, it is assumed that students at research universities may be advantaged and more likely engage in UR experiences than their peers who attend teaching-focused colleges (Hu, Kuh, Gayles, 2007; Marwick, 2012). In addition, the impacts of UR have not been widely examined among senior students (Gardner et al., 1998). Through years of studying at the institution, senior students may provide valuable feedback on students’ academic and campus experiences to a variety of stakeholders in the campus community leading to actionable knowledge that can improve college teaching, student assessment activities, program self-study, campus planning, as well as relevant decision making (Franke, Ruiz, Sharkness, DeAngelo, & Pryor, 2010).

Situated in a comprehensive public four-year state teaching college that serves a largely underrepresented, first-generation student population, and drawing on National Survey of Student Engagement (NSSE) 2015 senior students’ data and institutional data, this study aims at addressing three research questions:

1. Are there any differences in seniors’ engagement indicators, overall satisfaction, and perceived gains if senior students have participated in undergraduate research relative to their peers who have not participated in undergraduate research?
2. How does participation in undergraduate research relate to seniors’ perceived gains and satisfaction?
3. To what extent does participation in undergraduate research make a difference in senior students’ one-year retention, academic standing, and graduation rates?

It is our hope that answers to these questions not only shed light on the benefits of participation in UR on student outcomes, but also contribute to the knowledge base of undergraduate research in teaching-focused institutions. This study inspires leaders and administrators in teaching-focused institutions to revisit their programs and courses and rethink how teaching institutions can include more opportunities for undergraduate research. In addition, it also encourages faculty at teaching colleges to include research opportunities or components in the curriculum.

**Theoretical Framework**

Several conceptual frameworks were employed to guide design of this study and interpretation of the results. Astin’s (1984, 1999) student involvement theory and Kuh’s (2003) engagement perspective assert that the more a student is involved/engaged in the educational experience, the more he/she could gain intellectually and socially. These perspectives also suggest that student involvement/engagement is positively associated with desired student outcomes, such as retention, cognitive learning, and perceived gains in practical, personal, and social development. Following this line of thinking, we hypothesize that if students participate in UR, they will have more opportunities to work with faculty and their peers, these opportunities in turn promote higher-levels of engagement, overall satisfaction, and perceived gains.

Astin (1999) also proposed a model depicting how academic programs, student-faculty interaction, student peer groups, and other variables impact students’ college experience. Over time, these theories have fostered development of recommended practices. Chickering and Gamson (1987) propose seven broad principles for good practice in undergraduate education, which have extensively influenced research and teaching practices in higher education. Kuh (2008) advocates that participation in high-impact practices, including undergraduate research, could be “life changing” for students. Therefore, we hypothesize that if students participate in undergraduate research, they will have more opportunities to interact with faculty and peers and engage more deeply in their educational experiences, both of which will lead to increased positive learning outcomes and perceived gains.

Studies support the effectiveness of high-impact practices on student outcomes, including service-learning and undergraduate research (Lopatto, 2006, 2009; Kardash, 2000; Kuh, 2008; O’Donnell et al., 2015; Pascarella & Terenzini, 2005). The undergraduate research opportunities benefit all students, and particularly underrepresented students (Lopatto, 2006, 2009; Kuh, 2008). However, the literature on undergraduate research is not extensive, especially in regards to teaching-focused institutions. It is often assumed that research universities may provide more opportunities to engage undergraduate students in research projects and university faculty may have more funding to support undergraduate research. As a result, students at research universities may be advantaged and more likely engage in undergraduate research experiences than their peers who attend teaching-focused colleges (Hu, Kuh, Gayles, 2007; Marwick, 2012). Although it might be held true, this assumption and the benefits of participation in UR on student outcomes has not been closely examined in the context of teaching college. Therefore, it is imperative that researchers and scholars in the higher education community deepen our understanding of students’ UR experiences at teaching institutions.
Methods

Context of the Study

This study is situated in a comprehensive four-year public state teaching college with a deep commitment to fostering educational opportunity and enriching educational experiences for a largely underrepresented, first-generation student population. As a highly diverse campus, 77% of the students are female, 56% are an ethnic/racial minority, and above 60% are first-generation college going students. The campus has a large portion of low-income, Pell-eligible students (74% in fall 2015).

To meet the needs of such a diverse student population, the Institution starts with providing supportive services and inclusive practices that open doors for a diverse and largely under-served student population (such as bridge programs, stretch courses that combine remediation with college level work, and peer course assistants). This opportunity, in turn, creates a path to educational enrichment – the personal and professional growth shaped by learning experiences that challenge and inspire students to achieve their potentials. The Institution offers a wide range of student support initiatives to assist all students academically, as well as to enrich and enhance their general experiences on campus, especially for those underserved first-generation, ethnic minority, and low-income students.

Data Sources and Participants

Two types of data served as the data sources of this study: senior data from the 2015 administration of NSSE and institutional enrollment data. NSSE data were retrieved from the NSSE institutional interface specifically designated for the Institution. NSSE administered its survey to first-year and senior-year students in the Institution through a specific online survey link directly sent to eligible students enrolled in spring 2015. The 2015 NSSE data allowed us to explore all interested variables of student experiences with undergraduate research, overall satisfaction, and perceived gains. In addition, NSSE data included student ID, through which we linked NSSE data to student enrollment data. To do so, our data analyst in the Office of Institutional Research accessed and downloaded NSSE data and matched data with student enrollment data using student ID. After matching, the data were de-identified so that no individual student record was identifiable in the dataset.

Participants in this study were senior-year students who completed the 2015 NSSE. Among the 1154 eligible seniors, a total of 374 students returned their responses, which leads to a response rate of 32.4% and a sampling error of 4.2% (NSSE, 2016). The response rate was relatively acceptable, which was higher than the average response rate of Far West Public (21%, Far West Public is the default comparison group for this Institution) and NSSE 2015 (25%), and similar to that of the Carnegie Class institutions (33%). The final sample included 324 senior students who completed NSSE the undergraduate research question item and other targeted questions of this study. Of these students, the majority were female (76%), first-generation (67%), non-minority (57%), non-traditional (75%), and part-time (63%; see Table 1). The sample of this group of NSSE seniors is similar to the campus senior population enrolled in spring 2015 in terms of gender, ethnicity, first-generation status, age, low-income status, and enrollment status (see Table 1). Therefore, it warrants the generalizability of the results to the campus senior population.

**Measurement and Variables**

The 2015 National Survey of Student Engagement main survey was utilized to measure three variables of this study, which were seniors’ participation in undergraduate research, overall satisfaction, and perceived gains. First, regarding UR, unlike most questions on the NSSE survey, the undergraduate research question was not limited to the current school year. Therefore, seniors’ responses include participation from prior years. NSSE asked students about their participation in undergraduate research with one item, “which of the following have you done or plan to do before your graduate?” The item was followed by four possible responses – 1: “have not decided”, 2: “do not plan to do”, 3: “plan to do”, and 4: “done or in progress”. Based on students’ responses, we recoded the number of 1, 2, 3, and 4 into a dichotomous measure, accordingly, as 1 for “done or in progress”, meaning students have participated in undergraduate research, and 0 for “have not decided, do not plan to do, or plan to do”, indicating students have not participated in any UR activities.

Second, student engagement indicators (EI) were estimated by 10 indicators. These indicators were measured by 47 questions, which asked students indicating how often they have done the related activities. One question reads, for example, “during the current school year, about how often have you done the following?” and then provided a list of activities such as “combined ideas from different courses when completing assignments.” NSSE 2015 designated each question with four response options (e.g., never, sometimes, often, and very often). In order to facilitate comparisons over time, as well as between groups of students within or between institutions (NSSE, 2015), engagement indicators were expressed on a 60-point scale. Student responses of “Never”, “Sometimes”, “Often”, and “Very often” were recoded with values of 0, 20, 40, or 60. Thus an engagement indicator score of zero means that the student chose the lowest response option for every item in that item, while a score of 60 means that the student chose the highest response to that item. Then, the recoded values for each component item on each EI were averaged and weighted at the student-level scores for gender, full-time and part-time, first-year and senior students, and were expressed on a 60-point scale. The 10 Engagement Indicator scale scores were pre-calculated directly derived from the NSSE dataset created for the Institution. Each engagement indicator score and the score on each component items ranges from 0 to 60. The higher scores mean higher-level engagement (NSSE, 2015).
Third, student perceived gains were measured by and generated from 10 items asking student self-reported gains in personal, practical, and general education competency areas as a result of their undergraduate education. The question asks “how much has your experience at this institution contributed to your knowledge, skills, and personal development in the following areas?” and then lists areas such as writing clearly and effectively, speaking clearly and effectively, or thinking critically and analytically. Students were asked to indicate the gains on a four-point scale with four response options, which were: 1 “very little,” 2 “quite a bit,” 3 “some,” and 4 “very much.” Similar to the calculation of EI, based on the SPSS syntax provided by NSSE (NSSE, 2014b), each of the ten items were recoded with values of 0, 20, 40, or 60. Therefore, perceived gains score and the score on each component items ranged from 0 to 60. The higher scores mean more perceived gains.

Fourth, overall student satisfaction about their entire educational experience was measured by two NSSE items: “how would you evaluate your entire educational experience at this institution?” and “if you could start over again, would you go to the same institution that you are attending?” both of had four response options (e.g., poor, fair, good, and excellent; or definitely no, probably no, probably yes, and definitely yes). Following NSSE recommended SPSS syntax (NSSE, 2014b), we recoded the aforementioned four options with values of 0, 20, 40, or 60, and expressed them on a 60-point scale. We also calculated overall satisfaction score averaging the scores on the two items, which ranged from 0 to 60. The higher score means higher-level satisfaction.

Outside of the NSSE survey, retention, academic standing, and graduation rates were examined using institutional research data. Student one-year retention was measured by fall to fall retention and were coded as 0 if a student was not retained, and 1 if they were retained. Academic standing was measured by student letter grade. If a student earned a letter grade of A, B, or C for the semester, he/she was coded as 1 for being on good academic standing, and otherwise the student was coded as 0 for not being on good academic standing. Graduation was measured by college graduation status, and was coded in a similar pattern as one-year retention.

**Data Analysis**

The quantitative method was adopted, with several analytic approaches, to address the three research questions of this study. First, the General Linear Model (GLM) was performed to address the first research question by comparing means and standard deviations of engagement indicators, perceived gains, and satisfaction by UR participation status. A univariate analysis of variance was conducted on perceived gains because only one composite perceived gains score was involved in this study (Stevens, 2002). Additionally, a multivariate analysis of variance was performed on overall satisfaction and its two composite items: evaluation of entire educational experiences and whether a student goes to the same institution he/she is now attending if he/she started over again. The reason of employing GLM rather than other procedures is because GLM allows the inclusion of sample weight when calculating means and standard deviations of the targeted variables due to the complexity and weighting of NSSE data (Chen et al., 2009; NSSE, 2014a).

Two conditions presented in NSSE data, which require that weight must be taken into account when analyzing data. One condition that triggers weighting is when the proportion of respondents within a particular demographic variable (e.g., gender, full-time/par-time, adult students) differs substantially from their population percentages, and the other condition is when students within the subgroups differ substantially in the variables of interest (e.g., full-time and
part-time students show different patterns of engagement). For each participating institution, two sets of weights were pre-computed separately for first-year and senior students using gender and enrollment status information taken from submitted population files and were included in the files released to the institution (NSSE, 2016). In this study, weights for gender and full-time/part-time status for first-year and senior students were used for calculating means and standard deviations of engagement indicators, perceived gains, and satisfaction.

Second, to address the second research question of this study, the Point-Biserial correlational analysis was performed to examine the relationships between participation in undergraduate research and overall perceived gains and its 10 composite items, and overall satisfaction and its two composite items. Due to the categorical nature of UR participation variable and continuous nature of perceived gains and satisfaction, the Point-Biserial correlations were chosen to examine the relationship between participation in UR and perceived gains, and participation in UR and satisfaction.

Lastly, due to the categorical nature of one-year retention (retained, not retained), academic standing (on good academic standing, not on good academic standing), and graduation (graduated, not graduated), as well as UR participation (participated, not participated), chi-square tests were utilized to address the third research question, examining the proportional differences between students who have and have not participated in undergraduate research because of its applicable for independence and homogeneity (Franke, Ho, & Christie, 2012). In this study, we compared the proportional differences in one-year retention, academic standing, and graduation between students who have and have not participated in undergraduate research.

**Limitation**

This study has its limitations in several ways. First, although the sample of this study was demographically representative of senior enrollment of this Institution, the small sample size of students who have participated in UR limits the generalizability of this study. Second, participation in undergraduate research was measured by one single item. This item can only indicates the participation status. Future studies need to develop more reliable measurement to ensure measuring the whole picture of undergraduate research. Third, this study only focuses on one institution. Cross-similar sister institutional examination of student engagement in undergraduate research is necessary. And lastly, this study relies on self-reported measures of undergraduate research, overall satisfaction, and perceived gains. Future studies may collect data from other sources and/or collect more qualitative data to triangulate with quantitative measures.

**Results**

The data analyses lead to several salient findings. Overall, senior students at the Institution participated in undergraduate research at a relatively lower rate; about 12% of seniors (38 out of 324) have participated in undergraduate research by the time of responding NSSE. However, if senior students have done or in progress of undergraduate research, the positive impacts were evident from this study.

First, for those senior students who have participated in undergraduate research, their engagement, satisfaction, and self-reported gains were statistically higher than their peers who have not participated in undergraduate research (see Table 2). As shown in Table 2, regarding engagement indicators, senior students who have participated in undergraduate research reported significantly higher scores on engagement indicators of reflective and integrative learning ($M =$
48.56 vs. 42.45), quantitative reasoning ($M = 35.74$ vs. 28.12), collaborative learning ($M = 39.56$ vs. 29.12), and student-faculty interaction ($M = 29.64$ vs. 19.09), than their peers who have not participated in UR, $p < .01$, $p < .05$, $p < .01$, and $p < .01$, respectively. For senior students who have participated in undergraduate research, their evaluation of their entire educational experience ($M = 52.49$ vs. 44.94), assertion that they would go to the same institution if they could do so again ($M = 52.40$ vs. 45.31), overall satisfaction ($M = 52.44$ vs. 45.13), and self-reported gains ($M = 44.87$ vs. 36.40) were statistically significant higher than their peers who have not participated in undergraduate research, $p < .01$, $p < .05$, $p < .01$, or $p < .05$, respectively.

$^a$ Weighted Least Squares Regression - Weighted by Gender, FT/PT weight for FY, SR within an institution; $^b$: ns means not significant.

Second, correlational analysis indicated that participation in undergraduate research was significantly associated with perceived gains and satisfaction (see Table 3). Participation in undergraduate research was found significantly associated with a variety of the perceived gains items in practical, personal and social development, including “thinking critically and analytically”, “analyzing numerical and statistical information”, “acquiring job- or work-related knowledge and skills”, “working effectively with others”, “developing or clarifying a personal code of values and ethics”, “solving complex real-world problems”, and total score of perceived gains (see Table 3). Correlation coefficients between UR participation and perceived gains...
ranged from 0.119 to 0.189, indicating a small effect size. Similarly, participation in undergraduate research was also found significantly correlated with evaluation of entire educational experience, assertion that they would go to the same institution attending now if start over again, as well as overall satisfaction, \( p < .01 \), \( < .05 \), and \( p < .01 \), respectively.

Third, results from chi-square tests revealed that students who have participated in undergraduate research performed better on student success metrics such as one-year retention, academic standing, and graduation when compared to peers who have not participated in UR (see Table 4). Senior students who have participated in undergraduate research were being retained at a higher rate than that of their peers who have not participated in UR (92.1% vs 85.3%), and more of them were in good academic standing (97.4% vs 94.4%). However, the proportional differences were not significant, \( \chi^2(1) = 1.29, p > .05 \) and \( \chi^2(1) = 0.59, p > .05 \), respectively (see Table 4). In terms of graduation rate, students who have participated in undergraduate research graduated at a significantly higher rate than that of their peers who have not participated in UR (73.7% vs 39.5%), \( \chi^2(1) = 15.94, p < .01 \).

</tr>
</tbody>
</table>

Note: a. Due to the small sample size (less than 5), the results should be interpreted with caution.

**Discussion and Conclusion**
The current study revealed the positive associations between participation in undergraduate research and student engagement, overall satisfaction, and perceived gains in practical, personal and social development. Students who have participated in UR reported significantly higher-level engagement in “reflective and integrative learning”, “quantitative reasoning”, “collaborative learning”, and “student-faculty interaction” relative to their peers who have not participated in any undergraduate research activities. Students participated in UR also indicated higher-level satisfaction and perceived gains. The findings not only were consistent with prior studies, showing the benefits of undergraduate research on student outcomes (Kardash, 2000; Kuh, 2008; Lopatto, 2006, 2009), but also confirmed the assumptions of Astin’s (1984, 1999) student involvement theory and Kuh’s (2003) engagement perspective, and supported our hypothesis. If students participate in undergraduate research, they will have more opportunities to interact with faculty and peers and engage more deeply in their educational experiences, both of which will lead to increased positive learning outcomes and perceived gains.

Undergraduate research as one of the high-impact practices that has been well-recognized and widely adopted by research universities, especially since the National Leadership Council for Liberal Education and America’s Promise (LEAP) identified the effectiveness of high-impact practices in the Association of American Colleges and Universities (AAC&U)’s 2007 report (other high-impact practices include first-year seminars and experiences, learning communities, undergraduate research, service learning, internships, community-based learning/service learning, and senior capstone courses and experiences). According to National Survey of Student Engagement (NSSE, 2007), these high-impact practices, including UR, are marked by several traits that effective educational practices share, which involve demanding students devote considerable time and effort, requiring meaningful interactions with faculty and peers, encouraging collaboration with diverse others, facilitating learning outside of the classroom and challenging students to develop critical thinking, and providing frequent and substantive feedback (NSSE, 2007). As a result, the positive impact of participating in these high-impact practices could be life-changing (Kuh, 2008). Therefore, institutions should create opportunities for research and encourage all students, especially underrepresented students, to actively participate in at least two HIPs over the course of their undergraduate experience—one during the first year and one later in the context of their major (Kuh, 2008; NSSE, 2007).

The findings of this current study are encouraging regarding the positive impacts of UR on student engagement, overall satisfaction, and perceived gains in teaching-focused institutions. The positive impacts of UR on student outcomes are significant, however prior to this study there was little research that had been done to examine the relationship of UR on outcomes at teaching colleges. This study deepens our understanding by providing empirical evidence. The findings of this study indicated that UR participation significantly correlated with a variety of perceived gains and evaluation of entire educational experiences, and overall satisfaction. In addition, students who have participated in UR also have higher one-year retention and good academic standing rates, as well as significantly higher graduation rates than their peers who have not participated in UR. Therefore, we assert that providing additional opportunities for undergraduate students to engage in research projects with faculty members will benefit students and promote student success metrics regardless of institution classification. Undergraduate research is not just for research universities, and teaching institutions must think creatively about how to build greater in-class and extracurricular opportunities for students to access this high-impact practice.
Significance of the Study

This study contributes to the knowledge base of higher education by exploring the impacts of undergraduate research on student outcomes in the context of teaching institution, which has not been closely examined yet in the field of higher education. The results are encouraging, indicating that students who have participated in UR are more satisfied with entire educational experiences and reported significantly higher gains than their peers who have not done undergraduate research. In addition, participation in UR also improves other student success metrics, such as one-year retention, good academic standing, and graduation rates. This study deepens our understanding of impacts of undergraduate research on student outcomes beyond the context of research universities. It also inspires other sister teaching institutions that undergraduate research is not just for research universities. Given the positive impacts of undergraduate research, however, since only a small proportion of seniors have participated in undergraduate research activities, the administrators need to invest more to encourage faculty to include students in their research projects and be creative about how to do so when scholarly expectations or facilities may be limited. It might be fundamental to incorporate research components at the course level to give students access to research.

Does Financial Aid Matter? An Examination of Pell Grants and Underrepresented Students’ Performance

Abstract

This study examines the impact of financial aid on underrepresented students’ performance drawing on institutional data from 3549 students enrolled at a comprehensive four-year state college. The results of this study are encouraging that Pell Grants matter for persistence, especially for underrepresented first-generation and SSS eligible students. It is also hold true that Pell Grants significantly increased student one-year retention regardless their race and ethnicity.

Does Financial Aid Matter?
An Examination of Pell Grants and Underrepresented Students’ Performance

Purpose of the Study

Underrepresented students in higher education are those who come from low-income, first-generation, or ethnic and racial minority backgrounds (Green, 2006). These students have been historically underserved in post-secondary education and may encounter more difficulties than their peers in persistence, retention, and graduation (Carter, 2006; Kuh et al., 2006; Pyne & Means, 2013; Smedley, Myers, & Harrell, 1993). However, research has shown that institutional efforts such as student support services including financial aid may enhance underrepresented students’ persistence in college, regardless of the obstacles they face (Beck, Cresiski, Scinta, Thanki, & Shi, 2016; Hurtado, Carter, & Spuler, 1996).

The Pell Grant program is the largest need-based financial assistance provided by the U.S. federal government available to postsecondary students across the United States. The number of students receiving Pell Grants increased from 3.7 million in 1994-95 to 5.3 million in 2004-05, and to 8.2 million in 2014-15 (The College Board, 2015). With the introduction of the Guaranteed Student Loan program and the Pell Grant, along with other merit-based grant, state grant, and institutional scholarships, there is evidence of an increase in college access, choice, and affordability (Long, 2008). As observed by Coria and Hoffman (2016), studies have consistently supported the positive relationship between the availability of financial aid and college attendance (De La Rosa, 2006; Long & Riley, 2007; Wei & Horn, 2002).

However, the impacts of financial aid on retention and attainment have not been as extensively investigated as on attendance ((DesJardins et al., 2002; Kerkviet & Nowell, 2005), and associations between financial aid and persistence seem unclear compared to associations between financial aid and access to higher education (Coria & Hoffman, 2016). As the largest source of need-based federal financial aid available to low-income students in the United States, The Pell Grant, created in 1972, has been the focus of such examination. However, the results of impacts of Pell grant on student persistence was also inconclusive due to the difficulty to establish the cause impact relationship of Pell Grant on persistence (Long, 2008).

Some studies demonstrated a weak, statistically significant relationship between financial aid and persistence (Bettinger, 2004; Ishitani & DesJardins, 2003; Wei & Horn, 2002). Studies suggest that the relationship between financial aid and persistence are generally positive (e.g., Herzog, 2005; St. John, 1998; St. John, Kirshstein, & Noell, 1991; Terkla, 1985). Some studies indicated the positive effect of aid may not last beyond the first term of attendance (Herzog, 2005), and may also depend on family income and types of aid (Chen, 2008). Still a noticeable number of studies have indicated that financial aid is no longer adequate to promote persistence (e.g., St. John & Starkey, 1995; St. John, 1998; DesJardins, Ahlburg, & McCall, 2000), especially in public institutions. Using institutional data, Herzog (2005) suggests that students from middle income families with greater levels of unmet need face increased departure risk, while academically well-prepared first-year students with unmet need are more likely to transfer to other institutions. Therefore, it might be possible that future studies disaggregate financial aid based on student demographics to closely investigate financial aid and student success metrics, which could warrant a solid proclamation of such a relationship.
Drawing on data from 3549 college students enrolled in a comprehensive four-year state college, this study examines the impacts of Pell grants on underrepresented students. Two research questions guided this study:

1. Does financial aid matter for students’ performance?
2. Do Pell Grant recipients performed better than their non-Pell recipient peers based on first-generation status, SSS eligibility, race and ethnicity?

Methods

Context of the Study

This study is situated in a comprehensive four-year public institution with a deep commitment to fostering educational opportunity and enriching educational experiences for a largely underrepresented, first generation student population. The institution had a student enrollment of more than 3500 and was classified by the Carnegie Foundation for the Advancement of Teaching as a Baccalaureate College with Diverse Fields. As a highly diverse campus, 77 percent of the student body in this institution is female, 56 percent is an ethnic/racial minority, and above 60 percent are first-generation college going students. The campus has a large portion of the students (74% in fall 2014) who are eligible for the Student Support Services (SSS) program, which is designated for helping disadvantaged low-income, first-generation students, and students with disabilities successfully complete their postsecondary education.

To meet the need of such a diverse student population, the Institution starts with providing opportunities for underrepresented students, as well as all students – the supportive services and inclusive practices that open doors to a diverse and largely underserved student population. This opportunity, in turn, creates a path to educational enrichment – the personal and professional growth shaped by learning experiences that challenge and inspire students to achieve their potentials.

Data Source and Participants

Data of this study were drawn from the institutional data of 3549 undergraduate students who enrolled in fall 2014 in a comprehensive four-year public institution in southwest of USA. We select fall 2014 enrollment data because the data sources provide us a better understanding of enrollment pattern of one cohort in the whole academic year.

Participants of this study were 3549 students. Table 1 presented the demographics of these participants. A large of proportion of the students enrolled in fall 2014 were female (76.5%), ethnic minority (53.4%), part-time (66.2%), first-generation students (61.6%), and students who are eligible for the Student Support Services (SSS, 73.7%). This Institution represents a very diverse campus, like other intuitions which serve a diverse population of students. It is our hope that through this case we will provide empirical evidence of how student support services make a difference in student success for the higher education community.

### Data Analysis

One of the exploratory variables of this study was the Pell recipient status measured by whether a student received Pell Grants or not. If a student received Pell in the academic year of 2013-2014, he/she was coded as 1, otherwise 0. We disaggregated the data by student demographic information, including first-generation status and SSS eligibility. These two variables were categorical in nature and were coded as 1 if any, otherwise as 0. In addition, the variable of race/ethnicity was grouped into four racial and ethnic groups, which are White, Hispanic, African American or Black, and Asian.

Outcome variables in this study consisted of students’ one-year retention and academic standing. One-term and one-year retention were measured by whether a student was retained in the following term or academic year. If a student received an average GPA above 2.0 on a 4 point scale for the courses taken during that semester, which means the student received a letter grade of A, B, or C, he/she was categorized as on good academic standing; otherwise, he/she was not on good academic standing. These outcome variables are categorical in nature, and thus were coded as 1 if any, otherwise 0.

Chi-square test was used to address the research questions of this study, which can be applied for testing goodness of fit, independence, and homogeneity (Franke, Ho, & Christie, 2012). Due to the nature of the categorical dependent variables (one-year retention and academic standing) involved in this study, chi-square tests were performed to examine the proportional differences in one-year retention and academic standing based on Pell recipient status, first-generation and Pell grants recipient status, and ethnicity.

### Results

The data analyses lead to encouraging findings. Overall, students who received Pell Grants performed significantly better than their peers who did not receive Pell Grants. First, the results of this study indicated that students who received Pell Grants had a significantly higher proportion of one-year retention than their non-Pell recipient peers, $\chi^2(1) = 19.03$, $p < .01$ (see Table 2). Pell received students were retained at a higher rate than that of their non-Pell received peers (52.0% vs. 40.6%).

Second, when we disaggregated the data by first-generation status, SSS eligibility, and race/ethnicity, the results revealed these underrepresented students performed better if they received Pell Grants. Regarding first-generation status, if first-generation students received Pell
Grants, they were retained at a significantly higher rate in terms of one-year retention than their peer counterparts (47.4% vs. 40.0%), $\chi^2(1) = 15.51, p < .01$ (see Table 2).

</tbody>
</table>

Statistical test
$\chi^2(1) = 7.75, p < .01$
$\chi^2(1) = 0.39, p > .05$

In terms of SSS eligibility, the results also revealed that students who are eligible for SSS program if they received Pell Grants, their one-year retention was also significantly higher than
their peers who did not receive Pell Grants (52.0% vs 42.2%), $\chi^2(1) = 13.39$, $p < .01$ (see Table 2).

Similarly, Pell Grants significantly increased student one-year retention regardless of their race and ethnicity (see Table 2). Students who received Pell Grants were retained at a higher rate than their peer counterparts who did not receive Pell Grants, $ps < .05$ for White (53.6% vs. 41.8%), Hispanic (56.5% vs. 41.5%), and Asian students (59.5% vs. 37.2%), and $p < .05$ for Black or African American students (43.3% vs. 30.9%), respectively.

Third, interestingly, Pell Grants were not significantly associated with good academic standing regardless of first-generation status, SSS eligibility, and race and ethnicity. The reason deserves further investigation.

**Conclusion**

This study indicated that if a student received Pell Grants, she/he is more likely to be retained next year than their peers who did not receive Pell Grants, which is consistent with previous empirical studies in terms of the impact of the financial aid on student retention (Bean & Metzner, 1985; Bettinger, 2004; Braxton et al., 2004). The results also held true for first-generation and Pell received students. If a first-generation student receives Pell grants, she/he is more likely to be retained next year than their peer counterparts. In addition, the results suggested that Pell Grants increased students’ one-year retention regardless their race and ethnicity. This study deepens our understanding of the connection between Pell Grants and student performance for underrepresented students by providing empirical evidence to the knowledge base of higher education. The findings of this study are encouraging that Pell Grants matters for persistence, especially for underrepresented students. It also calls for campus attention about how to provide a holistic student support services system to enhance student success beyond retention. This study focused on Pell Grants only. Future studies may closely examine the association of financial aid and student performance by breaking down financial aid by unmet need status, unmet need amount, and type of aids.

Abstract

The authors report on a three-year project focusing on the development and implementation of a self-directed, regional, professional development structure for approximately 50 regional K-12, community college, and university faculty in English language arts (ELA) and mathematics. Focusing on the goals of decreasing the proportion of high school graduates placing into developmental courses and increasing the proportion of college students satisfactorily completing college-level ELA and mathematics courses, project participants address high school to college transition difficulties in both ELA and math. A professional learning project was established to target the complex and persistent problems of students’ high school to college transition. Professional learning through inquiry helped us to examine our practices in relation to the problem. This regional collaborative professional development project consisting of ELA and math faculty from Eastern Washington University, Community Colleges of Spokane, Spokane Public Schools, and area rural districts shows common problems of practice across sectors and content areas. The three main problems of practice identified are 1) independent learning, 2) critical reading and writing skills, and 3) critical thinking and problem solving skills. An important aspect of inquiry learning is in sharing results of our work, both internally and externally, which allows for collective learning about the problem and its possible solutions (Morris & Hiebert, 2011; Palmisano, 2013).
Introduction

Approximately 50 mathematics and English language arts (ELA) and math faculty members from Eastern Washington University, Community Colleges of Spokane, Spokane Public Schools, and area rural school districts began working on a three-year collaborative professional development project titled “Successful Transitions to College: Collaboration for Alignment to the Common Core State Standards” (STC) in the fall of 2014. This project strengthens the K-16 alignment of ELA and mathematics curriculum and instruction across the schools and colleges, facilitates K-12 and higher education faculty members fully implementing Washington state’s adoption of Common Core State Standards (CCSS), and ensures a smoother transition from high school to college for the region’s low-income students.

STC is a professional network allowing sustained cross-sector collaboration as regional educational leaders identify curricular and instructional alignment issues. Through providing time and resources for faculty members to develop, research, test, and apply solutions to shared problems of practice across institution, collaborative inquiry occurs through a generative process and builds instructors’ capacity to closely examine their own teaching practices. The inquiry process provides space and tools to imagine and implement potential solutions to improve student success and to gather and analyze evidence of each strategy’s efficacy (Morris & Hiebert, 2011). Informed by scholarship promoting changes to teaching practices across sectors in order to more effectively support students in the transition from high school to college (Conley, 2011), this approach is shaped by research on best practices in the development of both professional learning communities (Darling-Hammond, et al., 2009) and networked improvement communities (Bryk, Gomez, & Grunow, 2011).
Sustained inquiry learning requires the development of an inquiry stance—that instructors identify problems, realize and question their assumptions, and examine their own roles in solving the problem (Nelson, Slavit, & Deuel, 2012). STC has high but achievable high school to college transition goals for both ELA and mathematics:

- lower rates of student placement into developmental courses;
- higher student pass-rates in college-level classes; and
- the collaborative faculty development of a repository of instructional resources.

All participants attended three workshops in years one and two of the project, and content specific cross-sector cohorts met and worked between the large meetings. This same structure will continue in year three as cohorts are researching, designing, and iteratively implementing and revising specific curricular resources for use across sectors.

**Methods**

Collaborative inquiry across institutions requires consistent planning, flexibility, and adaptation. Designers and facilitators assisted in creating conditions and support for collaborative, systematic, and ongoing inquiry. Two main strands of research—professional learning communities and adult cognitive motivational learning theories—were employed to support faculty in their ongoing work. Research and methods found in the literature connected to professional learning communities grounded and informed our constructivist and collaborative approach to our work (Annenberg, 2004; Wenger 1998). In this approach, collaborators work together to 1) define a problem of practice; 2) reach agreement on goals; 3) generate solutions; and 4) systematically test and gather evidence on the efficacy of these solution. Instructors who work in different educational systems require assistance to build relationships, understand each other’s challenges and constraints, and find common areas to target. Research in adult learning
theories (Brookfield, 1988; Trivette, et al, 2009) and cognitive motivational theories
(Csikszentmihalyi, 1997) were used to create optimal conditions for educators to share expertise
and collaborate in ways that are highly productive. Through these theoretical lenses, project
leaders work to provide resources and structure to support the process; create protocols for
collective guided inquiry; find, distribute, and facilitate discussion of applicable research; and
structure meetings to help groups understand the process of inquiry.

Prior to the initial gathering of all participants, project leaders worked to understand
values, build collaboration, and develop understanding and ownership of the problems by
creating a website where they posted readings and discussion prompts. The readings included
articles on equity, on problems of transferring knowledge, and on teacher learning through
inquiry. In an online discussion of these articles, participants explored the readings before the
first meeting. This helped them to build relationships, which led to the creation of professional
learning ELA and math cohorts composed of regional high school, college, and university
faculty. At the outset of the project, content specific cohorts were developed intentionally to
include teachers from both rural and urban low-income school districts, four-year university
faculty, and two-year community college faculty. Initially, participants took part in a
collaborative protocol process focusing on evidence-based skills and content to examine the
alignment of their existing classroom practices to CCSS. Each instructor was expected to follow
through on an iterative process designed to build shared understandings of problems, generate
approaches designed to produce better results, and assess and reflect on the results (Palmisano,
2013). The inquiry process required participants to share responsibility for the high school to
college transition problems. An important part of the process, from beginning to end, is for
participants to reflectively and reflexively share their experiences, processes, and the results. In
year one, project leadership facilitated two specific opportunities to reach these ends: examination of standards and classroom observations.

**Examination of Standards**

Prior to choosing a problem of practice, project participants examined and discussed the CCSS in Mathematics and the CCSS in ELA/Literacy. In particular, they deliberated over the Standards for Mathematical Practices and the ELA portraits of college-ready students in order to create descriptions of characteristics they sought to develop in their students. Then, they identified problems of practice that affect students’ development of these ideal characteristics. Each ELA or mathematics cross-sector cohort of instructors involved in the STC project was asked to choose a *problem of practice* regarding teaching and learning that negatively affects students’ likelihood of placing into college-level classes in composition or mathematics and/or successfully completing college-level courses in English composition or mathematics within the first two years after completing high school.

**Classroom Observations**

After identifying problems of practice, project leadership designed a specific observation protocol—the “Student Experience Visit”—to visit each other’s classrooms and to determine shared issues on which to focus. Approaching these classroom visits from the student perspective helped participants avoid feeling judged on their teaching and, instead, opened conversation about the inherent challenges students face within every classroom. Teachers observed and described evidence of students’ understanding of learning objectives and expectations, as well as identified opportunities for students to gain the necessary skills to meet those objectives and expectations. The observation protocol asked participants to identify the skills and demands students face in each environment. Observations included noting how the
skills expected of students in the classroom environment they observed differed from
expectations in their own classroom environment—high school instructors visited two-year and
four-year classrooms, two-year faculty visited high school classrooms and four-year classrooms,
and so on. Through the observation protocol processes, each of the cohorts continued to narrow
to a particular focus, derived from a common problem of practice.

Results

Discussion among ELA and mathematics instructors, based on the examination of standards
and classroom observations, led to the realization that the desirable attributes and practices for
success in learning mathematics mirror the portraits in college-ready ELA students. Based on
these early discussions, a key idea arose—ELA and math cohorts identified similarly themed
cross-content problems of practice:

- Independent learning
- Critical reading and writing skills
- Critical thinking and problem solving skills

What follows is the data, in these three themed problems of practice categories, based on STC
instructor participation in the examination of standards, classroom observations, and facilitated
discussions.

Independent Learning

It was a common expectation, across sectors and content areas, that students would
independently apply concepts covered in classwork. Problems of practice identified by two math
cohorts and one ELA cohort focus specifically on independent learning:

- Algebra A Cohort—How can we observe and measure students using resources other
  than the teacher (without a prompt)?
• Algebra B Cohort—Creating a classroom environment that promotes independent learning and perseverance.

• ELA D Cohort—Develop students’ abilities to independently discover and apply applicable processes when they encounter literacy situations in various classes.

These three cohorts recognized that instructors managed issues related to students’ independence: motivation, preparedness, curiosity, and reflective questioning.

One classroom observation revealed that an instructor communicated the need for independent learning through his pedagogical actions. In certain instances, the instructor would only give guiding questions and partial answers help to students after they had made some progress on the problem on their own. He would lead them with a question or a thoughtful comment and continue to emphasize independent learning instead of showing a student how to do a problem. Another observer noted an interaction between a student and instructor focused on the value of independent learning. The student was expressing that he was ashamed and disappointed that he spent multiple hours trying to solve and understand only a few homework assignment problems. The instructor’s response was to smile and encourage the student to be proud of the work completed and in persevering through the struggle to understanding. This conversation took place in class and highlighted the emphasis on independent learning in this course.

**Critical Reading and Writing Skills**

Another common problem of practice theme identified by both ELA and math participant instructors was the need for students to read and write critically:
• Calculus A Cohort—Students need to improve their ability to read for content and think critically about what they read. Many students are not reading the text. Students who are reading are not fully comprehending.

• ELA B Cohort—Students struggle to provide an objective summary of academic texts. There is an emphasis in these identified problems of practice of students’ approaches to a variety of literacy situations, which includes both reading and writing. While there is an explicit focus on critical reading skills, writing activities like objectively summarizing, are closely connected to reading. The composing process inherently requires the ability to critically read one’s own writing. This relationship between critical reading and critical writing relates directly to results found by cohorts. Much of the concern of STC participants focused on student preparedness to effectively connect the reading of texts to their own production of texts.

Critical Thinking and Problem Solving Skills

Critical thinking and problem solving was third theme that appeared through STC participants’ examination of standards, classroom observations, and facilitated discussions. It’s important to note that instructors saw this theme as directly related to the both other identified themes— independent learning and critical reading and writing skills. Specific problems of practice focused on critical thinking and problem solving skills included the following:

• Geometry Cohort—Students don’t understand formulas well; therefore, they have a harder time applying them and applying them to novel situations. Instruction focuses too much on plug and chug, and not enough on making sense of the formulas students are using.

• ELA Cohort A—Students are challenged to both discern the relevant aspects of source material used by authors and to effectively integrate that material as authors themselves.
• ELA Cohort C—Student do not use text as a means to increase their experience/expertise. Instructors, again across sectors and content areas, showed interest in helping students to think critically about a problem or task before applying a process, procedure, or formula. They consistently asked students to reflect on processes and revise approaches through continual reflection and justification of responses. A common approach to addressing these problems of practice was discussion and group work in both ELA and math classrooms. One instructor noted, “I expect my students to self-assess and ask questions. I expect students to be able to answer questions in class, make connections to prior knowledge, and explain their thinking…On most days there is structured group work and collaborative learning. Another participant explained, “I observed students eager and interested in participating in the problem solving…I saw students using good reasoning, communicating well, and persevering in problem solving.” Instructors observed practices—asking critical thinking questions, asking students to collaborate, and engaging students in whole class discussions—to facilitate critical thinking and problem solving. These practices were valued in all classrooms, regardless of sector or content area. All instructors expected students to work on challenging problems, engage effectively at every stage of the problem solving process, strive to make sense of the concepts they were learning, and clearly describe their thinking.

Discussion

The problems of practice identified by participating STC instructors, based on their varied classroom experiences, suggest that students’ independence, critical reading and writing skills, and critical thinking and problem solving skills are of concern across sectors and content areas that lead to ongoing and shared challenges for instructors and their students in the transition from high school to college in both ELA and math. Examining the standards together
and observing each other’s classrooms encouraged instructors to question their assumptions about students’ experiences in other sectors. These experiences provided participants space to support a deeper collaboration and a clearer understanding of the range of systems, from high school to college, that students must navigate. Instructors targeted difficult, but shared, aspects of teaching and learning that helped them see student experiences in a variety of classroom settings, while initiating a process to become cross-sector partners in search of solutions (Coomes, Alvin, & Olson, in publication).

Students must, when they enter college, learn to engage with the academic discourse community, an entity with which first-year students traditionally have had little in-depth experience (Lea & Street, 2006). The shift in the CCSS to focus on the “[r]eading, writing, and speaking grounded in evidence from texts, both literary and informational,” can be understood as an effort to address this transitional challenge before students enter college (Agriss, Reid, & Young, 2016). Findings from the STC participants suggest that students struggle to effectively participate in the academic discourse community which focuses on independent learning, critical reading and writing, and critical thinking and problem solving. We argue that these problems of practice are related, and that our participants’ identification of these key problems of practice is mirrored in the CCSS themselves, and that successful implementation of those standards will require a focus on independence, reading, writing, and critical thinking in both ELA and Math. A focus on literacy across disciplines and sectors has the potential to improve student success in reading and writing, and also in the content areas themselves.

Scholarship on the implementation of the Common Core suggests that the CCSS seek to specifically address students’ critical thinking ability as key to the successful transition to college. David Conley (2011) argues that, in order to truly meet the standards of the Common
Core, and ensure that students are in fact ready for college, educators must “move classroom
teaching away from a focus on worksheets, drill-and-memorize activities” towards a pedagogy
that promotes active student engagement, through the cultivation of key “cognitive strategies” (p.
16). While pedagogies such as direct instruction may be more effective in improving short term
test scores, the teaching and learning of the cognitive strategies that constitute independence,
critical reading and writing, and critical thinking and problem solving is best accomplished with
a constructivist approach, which holds that learning can only truly occur via a process of
interaction with others and internalization of knowledge within the individual student (Hillocks,
1999). Language use and communication in the classroom is key to learning the kind of
cognitive strategies that are essential to the successful transition to college.

In other words, one way to make the kind of epistemological and pedagogical shift that
Conley suggests is to engage students in learning through discursive activity in both math and
ELA, across the K-16 continuum. Fortunately, both the math and ELA CCSS encourage a
discourse-based approach to teaching and learning. In ELA, the CCSS pushes literacy pedagogy
away from a direct instruction approach through a focus on the learning of writing as a process
and the learning of reading as an individual, contextualized experience (Calkins, Ehrenworth, &
Lehman, 2012). Additionally, the teaching and learning of math through discursive practice
(often termed “math talk”) is supported by the CCSS Standards of Mathematical Practice, as well
as by examples within the current literature on the effective teaching and learning of math
(Wagganer, 2015; Anderson, Chapin, & O’ Connor, 2011; Stein, Engle, Smith, & Hughes,
2008).

The themes of the problems of practice identified by our participants suggest that
teachers and administrators across the K-16 continuum are concerned about the relationship
between student ability to use language and think critically and readiness for the independence required to successfully transition from high school to college. Thankfully, the CCSS are designed to directly address these problems of practice, and ideally those students graduating high school will be better prepared to enter college as a result.

**Conclusion**

The STC project attempts to address issues that high school students face in their transition to college ELA and mathematics classes. While developing a culture of professional learning that asked participants to adopt inquiry stances about teaching and learning, this project created both large and small cross-sector and cross-disciplinary communities of practice where instructors engaged in inquiry-based learning to identify problems of practice. A key outcome of work done by the cross-sector, cross-disciplinary group was the realization that students in both disciplines face similarly themed problems of practice—Independence, critical reading and writing skills, and critical thinking and problem solving skills. These three main problems of practice, and the fact that all educational levels agreed on them, indicated the need for a more deliberate scaling of classroom intervention tools to help students build confidence and content competence.

In order to design effective pedagogical tools for the classroom, cohort groups needed to further narrow their focus within a particular problem of practice. As a next step, project leaders designed a protocol titled *Guidelines for Specifying a Problem of Practice and Defining Scope of Work*. This next protocol assists cohorts in transitioning from a problem of practice to planning an intervention. Currently, STC participants are engaging in the systematic study of selected research-based curriculum materials related to the identified problems of practice. They are working collaboratively in their cross-sector cohorts to gain a shared understanding of the
expectations for students’ performance as they transition from high school to college ELA and math. Research-based course activities and assignments are being jointly designed and implemented, and participants are collecting data and collaborating to review samples of students’ work from all sectors.

Faculty from high schools, community colleges, and the university are working to better understand the expectations placed on students in all sectors. Collaboration on this work will inform participants of differing expectations among sectors, facilitate identification of gaps in the curriculum within and among sectors, and allow faculty to work together across sectors to better assist students in successfully transitioning from high to college.

Title of Proposal:
Beyond Show & Tell: Active Learning in the Library Classroom

Topic Areas:
Libraries and Learning Commons, Higher Education, Pedagogy, Active Learning

Presentation Format:
Poster

Summary:
Engaging students with varying levels of research experience in a single class session can be a challenge for an academic librarian. This presentation will examine strategies for developing active learning research exercises at the postgraduate level.

Abstract:
Graduate and doctoral students are expected to conduct exhaustive literature reviews, yet many of them lack basic research skills. However, a traditional lecture-based library session can leave research savvy students bored and disengaged. This presentation will examine the use of problem based learning activities to engage students with varying ranges of research experience. Through a series of search challenges, the students were invited to work together and share their solutions. The active learning approach gave students the opportunity to teach each other while refining the skills they already have.

Abstract

This paper is based on the most current information we have about the human brain during the process of reading. Through the advances of fMRI, PET, and EEG brain imaging, neuroscientists have begun to learn about how the brain processes new information, and transfers the new learning from short term to long-term memory. This new information regarding how the brain learns to read can help teachers to create effective, research-based lessons and activities. Traditionally, teachers have learned by trial and error which instructional methods meet the needs of their students. Current brain research can be used as a guideline when creating a preliminary brain-based reading instructional framework. Two key ideas from neuroscience pertaining to reading instruction were consistently found in the literature: 1) the brain attends to novelty, movement, intensity and contrast and 2) neural connections are built through the repetition of skills. Effective brain-based instruction requires different strategies for individuals based on such variables as prior learning, experience, and a select set of cognitive neuroscience principles.

Key Words: Reading, brain-based research, neuroscience, imaging, cognitive science, reading strategies, struggling readers, teaching ring, dyslexia, reading research.
Introduction

The ability to read well is a prerequisite skill that every student needs to succeed in school and every adult needs to be successful in their everyday life. Dehaene (2006), a leading cognitive scientist maintains, “Neuroscience today sheds indispensable light on how a reader’s brain works and what makes it more or less receptive to different teaching methods” (p, 326). The question of how to best teach students to read has been the source of heated debate for over 100 years amongst educators. Unfortunately, not all students learn to read easily, in fact, many struggle to acquire the skills to become fluent readers throughout the course of their years in school. For some students, their lack of reading expertise is due to emotional issues, which result in a lack of concentration and focus during reading instruction. Many students come from home environments that do not support the development of phonemic awareness and pre-reading skills due to constraints of time or lack of parental educational backgrounds. Finally, there are dyslexic students who receive intensive reading instruction in small groups or on a one-to-one basis who continue to struggle with becoming skilled readers.

Regardless of which instructional method is used, most educators agree that learning to read is a multi-step process. Learning to read can be compared to learning to play a musical instrument. We learn to read at increasingly higher levels of skill development or achievement with training and practice. To decode or sound out words is just a first step in the acquisition of reading proficiency. After obtaining a familiarity with the letter-sound relationships in reading, students must then learn to use this process
at an automatic level, to read with fluency. Sprenger (2013) suggests that “reading is a complete cognitive process that has five essential components built on brain development and experience” (p. 75). Reading experts have identified the five major categories of skills which are developed and used as children or adults learn to become skilled readers as: 1) phonemic awareness, 2) phonics instruction, 3) vocabulary, 4) fluency, and 5) comprehension.

Two key ideas from neuroscience pertaining to learning and reading instruction were consistently found: 1) the brain’s need for novelty, and 2) the repetition of skills builds and strengthens neurons, multisensory instruction is effective. Refer to Appendix C for a table of reading strategies supported by our current understanding of neuroscience.

**The Brain’s Need for Novelty**

The Reticular Activating System (RAS) is a structure of the brain that performs the first screening of all sensory input before it enters the brain is especially responsive to novelty. Understanding that novel or different instructional activities will be allowed through the RAS allowing your students to attend and receive these activities has important implications for teachers. Changes in the classroom, activities and strategies will catch the RAS’s need for novelty. Willis (2010) recommends that teachers use this information about the brain to inform their teaching by incorporating novelty into their daily instructional activities.
Neuroscientists believe that concrete vivid images are an important way to convey learning. According to Jensen (2008) the brain has an attentional bias for high contrast and novelty and 90 percent of the brain’s sensory input is from visual sources. (p. 56). What does that mean for reading teachers? Teachers should incorporate project-based assignments, computers, videos, books, cameras, art supplies, visual aids, posters, word walls, and graphic organizers into their reading and literature lessons.

**The Repetition of Skills Builds and Strengths Neuron**

Learning involves the activation of thousands of neurons, which make connections in order to make networks of neurons. As reading skills are practiced, neurons send dendrites to other neurons, creating denser neural connections and possibly increasing myelination. The repetition of correctly performed skills building dendrites has implications for all the components of reading. Regular practice of skills will improve phonemic awareness skills, phonics skills, vocabulary development, fluency, and comprehension by changing the architecture of your students’ brains.

**Review of the Literature**

Reading is a relatively recent cultural creation, and the alphabet itself is thirty-eight hundred years old. When viewed through a neuroscience lens, reading is the development of the brain making connections between thousands of neurons through the process of rehearsal. Neuroscientists have identified the regions of the brain devoted to hearing, vision, speech, as well as the recognition of faces and places. Situated between
the regions of the brain, which enable us to recognize faces and the portion, which we use to recognize places, is an area termed the visual word form. Deheane (2009) explains “an amazing recent discovery shows that there is a specific cortical area for written words, much like the primary auditory area or the motor cortex that exist in all our brains” (p. 51). Deheane (2009) and others have labeled the left occipito-temporal area of the brain the visual word form area or the “brain's letterbox” (p. 62). See Appendix A for a visual representation of the brain’s word form area.

Neuroscientists believe that reading involves the integration of two systems, our ability to speak with that of recognizing objects and faces. According to Dehaene (2009), “Learning to read involves connecting two sets of brain regions that are already present in infancy; the object recognition system and the language circuit” (p. 195). Dehaene and his colleagues at the Cognitive Neuroimaging Unit in Saclay France are studying how the brain processes the written word by using fMRI technology. Dehaene (2009) proposes that when a student reads a word, activation begins in the occipital or visual processing portion of the brain followed by neural activity in the left occipital temporal region (Brain's Letter-Box) that extracts the visual word form. Neuroscientists believe that as we learn to read, after numerous times of sounding out a word, the brain stores the word in the visual word form area in the form of a picture.

Deheane hypothesizes that reading hijacks portions of the brain, which were genetically hard-wired for visual recognition. To survive primates needed to have instantaneous face and place recognition to avoid danger and promote survival and that
this would account for evolutionary and genetic programming of these highly
developed recognition skills.

**Phonics**

Sousa (2010) asserts that, “Teachers have taught for centuries without knowing
much, if anything, about how the brain works” (p. 2). Recent brain research supports an
explicit phonetic approach to teaching decoding. Sally Shaywitz, a neuroscientist and
professor of pediatrics at Yale University School of Medicine, has studied the brain
mechanisms involved in the reading process using magnetic resonance imaging
technology. Shaywitz (1999) reported that reading is not a naturally developed skill as is
learning to use oral language. Shaywitz (1999) explains, “We know that whereas
speaking is natural, reading is not. Children do not automatically read. They have to
learn how to do it” (p. 26). The brain research of Shaywitz and her colleagues support a
phonics based instructional method to teach decoding. Shaywitz (1999) explains,
“Although phonics is more important for some children than for others, all children can
benefit from being taught directly how to break up spoken words into small units and
how letters represent sounds” (p. 29).

Furthermore, Shaywitz (1999) contends that, “...if we can give poor readers a
sound foundation so that they know and can decode a group of words, they will have the
phonologic skills to sound out words they’ve never seen before and will be encouraged to
read” (p. 29). For many students, whose home environment supports literacy the
decoding process can be accomplished with even poorly developed phonics programs.
For students, whose homes do not support the development of literacy, the method of beginning reading instruction is of critical importance.

Adams (1990) conducted a metanalysis of over six hundred reading studies. Two major outcomes of the Adams’ report were: (1) explicitly taught phonics resulted in improved reading achievement, and (2) phonics instruction needed to be taught within the context a balanced program which included text that contained words reflecting what the students were learning in their phonics lessons. From studying the literature regarding reading Adams (1990) concluded, “Collectively these studies suggest, with impressive consistency, that programs including systematic instruction on letter-to-sound correspondences lead to higher achievement in both word recognition and spelling, at least in the early grades and especially for slower or economically disadvantaged students” (p. 31).

**Phonics: Implicit Versus Explicit Phonetic Methodology**

Phonics is commonly defined as instruction in the relationship between letters and their sounds. The phonetic method of instruction has been used to describe a wide range of techniques, although it is comprised of two main approaches: (1) the synthetic or explicit method, and (2) the analytic or implicit method. Explicit phonics methods teach the letter-sound correspondences in isolation and insist that students blend the individual sounds to pronounce whole words. For example, students learn that the written or visual stimulus “b” to make the “buh” sound or oral response. Almost instinctually, teachers often use the techniques of the explicit approach to fill in the implicit instructional gap
for their students in the decoding process. Anderson et al. (1985) describe what happens in explicit phonics, “In explicit phonics instruction, the sounds associated with letters are identified in isolation and then “blended” together to form words” (p. 39).

Most reading educators today agree that some phonics instruction, which teaches students to decode or sound out words, is an essential ingredient in reading instruction. Anderson et al. outlined the explicit phonics methodology as the following: A critical step in explicit phonics instruction is blending the isolated sounds of letters to produce words. To help children blend the sounds in the word sit, for example, a teacher may begin by pointing to each letter and asking the children to say the separate sounds, /s/ /i/ /t/. Next the teacher may model blending by extending the sounds /ssiit/ and then collapsing the sounds together to yield sit. Blending may seem simple to an adult who already knows how to read, but in fact it is a difficult step for many children. (p. 39)

In implicit or analytical phonics instruction, the sounds associated with the letters are never pronounced in isolation. During an implicit phonics lesson, for example, the teacher would write a list of word of the board such as “Sand, soft, and slip,” and ask the children, “what do all these words have in common?” After the students, have identified the initial consonant “s” the teacher would then tell the students that the letter “s” stands for the sound that you hear at the beginning of these words. Anderson et al. stated, “A problem with implicit phonics is that it places stress on an ability called phonemic segmentation. This is the ability to identify separate speech sounds in spoken words” (p. 40). Not all children are able to hear the sounds, separate, and duplicate the sounds
without direct modeling and practice. The problem with implicit phonics is that it expects students to be able to perform what has never been formally taught.

**Vocabulary**

Hart and Risley (2003) in their gold standard research study found that somewhere between eighty-six and ninety-eight percent of children’s recorded vocabularies matched that of their parents. They also found that by the age of three, children living in professional families had a recorded vocabulary size of 1,116 words whereas children in working class families’ vocabulary size was 749 words. This difference in the vocabulary of children entering school puts children of working families in a catch-up position as they began to learn to read. However, enriched early childhood programs can help students increase their vocabulary, lessening the existing gap in vocabulary. The importance of building vocabulary and background knowledge in disadvantaged youth is critically important, as a well-developed vocabulary is key to strong fluency and comprehension skills. Skilled teachers can expand their students’ vocabularies by building background knowledge, reading rich literature out loud to their class and inspiring their students to love reading and become avid independent readers.

Deheane (2009) reminds us that, “Although decoding is essential for beginning readers, vocabulary enrichment is equally important. A child must learn the morphology of English (prefixes, suffixes, and roots of words particularly when he comes from an underprivileged background or a family where English is a second language” (p. 328).
Beck & McKeown (1985) suggest that literate people have a vocabulary consisting of three tiers. Tier 1 words are made up of sight words, nouns, verbs, adjectives such as book, girl, baby. Tier 2 words are the high-frequency words that we find in a variety of domains and these words play a major role in the vocabulary of mature language. Examples of Tier 2 words include coincidence, masterpiece, industrious, and benevolent. Tier 3 words are low frequency words that are domain specific and used during instruction in that content area. Beck advises that teachers concentrate on teaching Tier 2 words to achieve the best vocabulary benefit.

Fluency

Let’s turn our attention to reading fluency and look at some of the brain-compatible strategies that improve fluency. According to Willis (2008), “Fluent readers can decode, recognize, and comprehend the meaning of text at the same time, so their networks fire effectively and efficiently” (p. 47). Using the gradual release of responsibility model, to promote reading fluency is an accepted methodology among reading experts. In step one of this model, the teacher models reading a passage with fluency. During this time, students hear the correct pronunciation and expression for this passage. In step two, students choral read the passage with the teacher. Step three follows when students choral reading without the teacher. Finally, during step four, students read along independently after practicing the passage.
Reading Comprehension

When students have mastered the alphabetic principle, and can masterfully decode words, and read with fluency, their working memory is freed up for the task of comprehending the text. Students with strong knowledge about the world and a wide range of things bring to the reading process prior knowledge. Educational researchers maintain, “To have strong language comprehension skills, children must know about the world in which they live, and must have elaborate background knowledge that is relevant to what they are trying to understand. This knowledge is more sophisticated than mere facts or word definitions—it is a reference base for personal experiences, scripts, and schemas that help those children understand how the world works” (SEDL, 2009).

Reading teachers know that activities that activate and build prior knowledge will ultimately improve vocabulary and reading comprehension. When teachers model comprehension strategies, they show students how to break down the text to extract meaning. Visualizing, predicting, active questioning, making text connections, reading anticipation guides, story maps, creating and completing graphic organizers are just a sample of the numerous effective comprehension strategies.

Conclusion

Learning to read is not a linear endeavor because the cognitive elements r components of reading support and reinforce each other. As letters are sounded out into words, the meaning of these words comes into play. The importance of a well-developed vocabulary supports the development of decoding, fluency, and comprehension skills.
Neuroscientists from the Education Endowment Foundation in London, England propose that “fluent reading should be understood as the product of multiple contributing reading subskills.” Through the advances of fMRI, PET, and EEG brain imaging, neuroscientists have begun to understand how the brain processes new information, transfers the new learning from short term to long-term memory, and retrieves that learning at a future time. Teachers can use this information to create effective, research-based lessons, activities, and assessments. Traditionally, teachers have learned by trial and error which reading methods met the needs of their students.

Current brain research can be used as a guideline when creating a preliminary brain-based reading instructional framework. Two of the key ideas from neuroscience pertaining to reading instruction are: 1) the brain’s need for novelty, and 2) the repetition of skills builds and strengthens neurons and their connections. Interestingly varied activities appeal to the brain’s interest in novel stimuli. Focused practice over time of key reading skills builds dendrites, increases the density of neural connections, and strengthens neural myelinization which allows students to become fluent readers with a deep understanding of text. The ability to read well aids students when reading in the content which ultimately adds to background knowledge and vocabulary development the sciences and social sciences. Most importantly, the ability to read well often results in the desire to read independently which reinforces the reading components. Good readers very often become avid readers with a passion for reading that lasts a lifetime.
Brain-based teaching is based on the premise that effective instruction requires the selection of strategies based on our students’ prior knowledge and the principles of novelty and skill practice. Knowing the cognitive science principles that our brains require novelty and that skill practice facilitates the growth of dendrites will contribute to our instructional effectiveness and consequently to increased student learning for struggling readers as well as all learners in general.

Appendix A

The visual word form area (VWFA)

- A **reproducible** site of activation during **reading in all cultures** (e.g. Bolger, Perletti & Schneider, 2005)

- Always located at the **same coordinates** in the left lateral occipito-temporal sulcus

- Whose lesion can cause **pure alexia**, an acquired selective disability in reading (e.g. Dejerine, 1892; Gaillard et al., 2006)

- Which activates to **known scripts** more than to other categories of visual stimuli (e.g. Boker et al., 2007)

- A high-level **visual area**, **invariant for location and case** in word identification (e.g. Dehaene et al., 2001; Cohen et al., 2002)

- An automated system, capable of activating even to **subliminal stimuli** (e.g. Dehaene et al., 2001, 2004)
Appendix B

Brain Compatible Lesson Plan Outline

1. Content/Instructional Objective(s):
2. Assessment: How will you know students have learned the content?
   a. Have students present their learning to others
   b. Encourage students to write about what they’ve learned (Journal, essay, news article, report, song, poem)
   c. Have students demonstrate learning with a project (Mural, video, newsletter, commercial)
   d. Quiz students (verbally and/or in writing)
3. Motivational strategies to gain and maintain attention: How will you capture your students’ attention. Examples: novelty, humor, relevance?
4. Activities on Day 1:
   Select two Brain-Compatible Strategies from the list below:

- Brainstorming/Discussion
- Drawing/Artwork
- Games
- Graphic organizers/Semantic maps/Word Webs
- Manipulatives/Experiments/Labs
- Metaphor/Analogy/Simile
- Mnemonic Devices
- Projects (posters, etc.)
- Music/Rhythm/Rhyme/Rap/Movement
- Reciprocal Teaching/Cooperative Learning
- Role-playing/Drama
- Storytelling
- Technology/Student created PowerPoint Presentations
- Visualized/Guided Imagery
- Writing/ Journals/Essays/Research Papers/Poems/Rap

Black Women’s and Girls’ Return to Joy: Addressing Trauma and Healing

Dr. Dannielle Joy Davis, Saint Louis University
Dr. Cassandra Chaney, Louisiana State University
Dr. Denise Davis-Maye, Auburn University at Montgomery
Dr. Donna Culbreth, National Girls and Women of Color Council

Abstract

The concept of thriving amidst trauma receives minimal attention when addressing negative life experiences of Black women and girls. This work examines strategies employed and recommended by Black women and girls that prompt thriving amidst traumatic circumstances as they navigate the intersecting identities of race, gender, and class. Radio broadcasts from the National Girls and Women of Color Council serve as data for the topic. Findings reveal the strength of Black women and girls in dealing with trauma, holding the potential to move beyond coping with circumstances, towards potential thriving in education and beyond.

PROJECT OVERVIEW

The Mathematics Education Collaborative (MEC), Washington State Educational Service Districts (ESDs), mathematics faculty at Western Washington University (WWU), and the State of Washington Office of Superintendent of Public Instruction (OSPI) partnered to develop a next generation of mathematics teacher leaders who now work with their schools, districts and regions to support implementation of the Common Core State Standards for Mathematics (CCSSM) and the Standards for Mathematical Practice (SMP). The overall project vision was to build the capacity of each ESD to support the implementation efforts of the CCSSM in districts and schools across Washington State.

This 2½-year project developed new teacher leaders who first learned mathematics together in carefully designed rich learning environments and then were given time to transform their mathematics classrooms as the foundation for the new leadership roles they have now taken on. Project evaluation data indicates deeply and dramatically transformed classrooms across grades 4 – 14 and corresponding data suggests that students thrive in these classrooms based on SBAC scores, no matter how the SBAC data is disaggregated.

PROJECT ELEMENTS

The Content Workshops

The project provided high-quality professional learning on unifying themes centered on the Common Core State Standards for grades 4-14 future mathematics teacher leaders statewide. The MEC MSP (Mathematics and Science Partnership) developed a series of workshops and Presenters’ Guides, and prepared leadership teams of 4-6 teachers from each ESD region to offer the workshops in their geographic regions. A second generation of workshops, facilitated by these leadership teams, is now being rolled out to grades 4-14 teachers across Washington.

The summer and school year mathematics workshops referenced in the project elements that follow are content-based workshops that align fully with the content and the Mathematical Practices of the Common Core State Standards. Each 4-day workshop engages teachers and administrators as mathematics learners in an environment where the Standards for Mathematical Practice permeate everything. Workshop topics include the following:

- Year One – Ratio and Proportional Reasoning as a Unifying Theme of the CCSS;
- Year Two – Rational Numbers as a Unifying Theme;
- Year Three – Expressions and Equations as a Unifying Theme.
Future Teacher Leaders – Regional Math Support Team teachers (RMSTs)
Each ESD chose 4-6 grade 4-10 teachers who showed leadership potential. Mathematics Instructors from Spokane Falls Community College and the Northwest Indian College were also prepared as future teacher leaders. These future teacher leaders (RMSTs) attended a 4-day CCSSM-focused mathematics content workshop at least once each year as a participant learner, and an optional second time watching through the eyes of a facilitator. These RMSTs also apprenticed with their Regional Math Coordinators in each workshop. A delayed leadership model was enacted. They worked to deeply enact the workshop content and pedagogies in their own classrooms and they participated in on-line Professional Learning Communities (PLCs) with the MEC leadership team as they did so. A full year ahead of the anticipated timeline, many of these new teacher leaders began co-facilitating the MEC workshops within their districts and/or regions.

Regional Math Coordinators (RMCs)
Each ESD in Washington has a Regional Math Coordinator (RMC). RMCs provide professional development and support to mathematics educators in each region and collaborate with each other statewide. All Washington RMCs attended the content-based workshops. The role of the RMC was to provide mentorship for the RMSTs on their leadership team. RMCs connected personally with their RMSTs as they worked to implement the CCSSM and the Standards for Mathematical Practice in their classrooms. RMC participation helped to strengthen their own understanding of what it takes to implement the CCSSM in classrooms, and helped prepare them to shepherd schools and districts in their transition towards the CCSSM.

Web-based school year follow-up for RMSTs – Webinars
All RMSTs and RMCs convened monthly during the school year as a virtual learning community through a series of webinars lead by MEC. Topics addressed included:
- Building numeracy through Number Talks;
- Examining the SMP through the lens of a classroom video;
- Enacting our Theory of Action with a lens toward provoking productive cognitive dissonance;
- Providing skills practice in mathematically engaging and important contexts;
- Performance assessment;
- Working with parents.

Studio Days
Each pilot site hosted two elementary and two middle school “studio days” each year. “Studio days” were also hosted in higher education classrooms at Spokane Falls Community College and the Northwest Indian College. RMCs, teacher leaders, participating teachers, school administrator(s), and other invited guests from that school/district/college/community followed a lesson observation protocol, observed classroom teaching, and used the observation to learn how to ensure high cognitive demand for all students in mathematics lessons and teaching pedagogies.
TEACHER DATA

Note from MEC: The Reformed Teacher Observation Protocol (RTOP), a standardized means for assessing lesson design, content and classroom culture was used to measure changes in classroom practice. The RTOP was administered in spring of Year 1 prior to the start-up of the MEC MSP work. It was administered again in spring of Year 2 and in spring of Year 3.

RTOP means showed impressive annual gains over baseline each year. In fact, the mean RTOP score among 3-year RMSTs nearly doubled from Y1 to Y3 (46.18 vs. 86.82)… The Y3 mean score for RMSTs increased by nearly 41 points as compared with Y1 (86.82 vs. 46.18). One-way repeated measures of analysis of variance revealed this difference to be significant at p < .001

Note from MEC: The RTOP contains 25 items, each on a scale of 0 to 4.
STUDENT DATA

NOTE FROM MEC: This Smarter Balanced Assessment student data is from spring of 2015, just two years into the intervention. The participant group consists of students of MEC MSP teacher participants, now new teacher leaders. The data are from students of the 30 teacher participants who teach in 29 different school districts throughout the State.

The findings revealed strong SBA performance by students in participating classrooms and offered a robust conclusion to the project. Meaningful to administrators and others is the percent of students who met the standard. Differences were impressive: overall, 60% of participant students met state standards compared with 38% of their comparison counterparts.

Note from MEC: In the disaggregated data that follows, we see both success and sites for further growth and study. Remembering that this data represents students who had only one or two years at most in transformed classrooms, we are left wondering what is possible were students to have multiple years in such classrooms. Clearly an income achievement gap still exists, as well as gaps between different ethnic groups. There is much work left to be done on those fronts. Yet we are encouraged by the significant progress demonstrated across nearly all demographic groups.

Title of Submission:

Older Students and the Community College Experience

Topic Area:

Adult Education

Presentation Format:

Paper Session

Description:

Research on older community college students (age 40 and above) is scant or, in some topic areas, non-existent. Using the theoretical framework of the Lifespan Development Model, this research uncovers the behaviors, attitudes and needs of older students at community colleges. The research uses the Community College Survey of Student Engagement (CCSSE, 2015). However, findings to date have been disappointing as correlations expected to be strong have been very weak at best.

Abstract

Older Students and the Community College Experience

Research on older students at community colleges is scant and in many topic areas, non-existent. We propose several novel research lines to better understand 1) the special behaviors, attitudes, and needs of older students and 2) the differences between older students and typical community college students, age 25 or younger, who typically comprise 70% of the student population.

As a theoretical framework, we chose the Lifespan Development Model as originally articulated by Baltes (1987). In this framework, persons are viewed as transforming their environment while the environment is concurrently transforming them (Goulet & Baltes, 1970). The main advantage of this framework is that it enables an examination of a much wider range of circumstances than other models. Although it is most frequently used in the study of intellectual abilities (Erber, 2010), it also supports examination of complex situations involving the cognitive, biological, and social abilities of individuals over time. This framework allows for the possibility of a much richer analysis of the older student’s experience at community college than is typically found in the community college literature.

The dataset to be used for the initial investigations is the Community College Survey of Student Engagement (CCSSE, 2015) public use data set. The Community College Survey of Student Engagement is an assessment tool that provides information on student engagement, a key indicator of learning and, therefore, of the quality of community colleges. The survey is comprised of items that assess institutional practices and student behaviors that are highly correlated with student learning and student retention.

Over 100,000 students completed this survey of which 6.0% were age 40-49, and 3.5% were age 50 and above. The survey contains basic demographic information about the survey participants. In addition, the CCSSE specifically asks about Internet use, level of class contribution, willingness to help fellow students, propensity to discuss course material with instructors outside of class, opinions about online instruction, and what students feel they have gained from attending classes. We would
predict significant, telling differences between the under-25 and over-40 age groups.

Possible outcomes from this research would include better tailored instructional offerings to older and non-traditional students. Also, suggestions might arise about improvements in the community college physical environment such as highly-visible signage, age-considerate furniture (such as chairs with arms), and more convenient and shorter distances between the locations older students frequent. A long-term benefit of this research is a better match to older students’ goals which would result in an environment that can enhance learning, development, and student success.

The research approach described here connects community college research to the much richer tradition of research on aging and gerontology. This approach should result in more constructive and beneficial findings than have previously been seen.

To date, research findings have been disappointing. Anticipated correlations between variables expected to be strong for older students, such as informally tutoring other students and sharing discussions outside of class, are very weak (Pearson’s r = 0.13 at best). However, we are continuing to investigate other data sources and may have better results in time for the conference in January, 2017.

Abstract

This study tested the relationships between student psycho-social variables in the classroom context and the subscale reliability of the Likert-style Project for Educational Research That Scales (PERTS) survey instrument; widely used in testing mindset interventions at the classroom level. Correlations and exploratory factor analyses were performed using pre-existing data from a medium-sized, rural school district, in a large southwestern state of the U.S. including a sample of 2,908 students, in grades 3 through 8, at three elementary schools and two middles schools. Regression analyses revealed the independent variable, student belonging, showed the largest effect in explaining changes in the dependent variable, student self-efficacy mean scores. The PERTS survey demonstrated internal reliability on three of the four scales above pre-determined indices of .80 with the exception of the individual mindset scale showing Cronbach’s alpha below .80. A history of mindset theory and practical applications for the classroom are provided.

Keywords: Psycho-social factors, classroom context, PERTS scale, elementary and middle schools

1. Introduction

Mindset theory interventions involve the act of supporting students in taking autonomous action that aligns with their values and goals; such that they choose to engage and put effort into developing successful academic behaviors. This study seeks to provide the classroom teacher with additional insights into context variables contributing to student autonomy in the classroom. This study empirically tested the relationships between psychosocial variables purported to comprise an academic mindset. When classroom teachers have reliable data collection instruments and understand the factors related to student choice to engage, teachers can design classroom routines, structures, and systems that support student autonomous choice to engage the learning process.

Successful learning results in new skills that increases one’s ability to act successfully in the world. An individual must choose to engage new experiences that challenge one’s existing knowledge structures in order to develop meaningful learning that can transfer to new situations. Similarly, mindset theory builds on the theory of mind, or how one makes sense of the world (Hanson, 2015). However, learning requires personal effort and an openness to make corrections and changes in how one views his world (Novak, 2002). A growth mindset has been described as the belief that one can grow and learn through his own efforts (Blackwell, Trzesniewski, & Dweck, 2007).

Growth mindset is also a belief about one’s power over her world. A person’s sense of autonomy and control develops from experiencing a supportive social environment leading to positive experiences of individual development. Autonomy differs from independent action in that autonomous action involves an alignment with the values embedded in the actions undertaken. An autonomous person takes initiative, feels an intrinsic sense of control, and feels the tasks performed have relevance to him. A sense of belonging and social identity with supportive others is inherent in the process of reciprocal sense making. In contrast, independence is acting without help, support, or resources from others (Chirkov,
1.1 Purpose Statement

This paper proposes to test the relationship between psycho-social variables found in the literature under the description of academic mindsets in the classroom. Understanding classroom context in relationship to developing student engagement is a necessary part of successful teaching. Historically assessment measures in schools have largely focused on cognitive variables demonstrating learning outcomes of students and school effectiveness. Current research seeks to develop valid conclusions drawn from reliable data collection in the area of psycho-social variables shown to support student learning, such as individual mindset, sense of belonging in the classroom, task relevance, and self-efficacy (Bandura, 2001; Deci & Ryan, 1994; Dweck, 1986; Paunesku, Romero, Yeager, Walton & Dweck, 2014).

These variables have been operationalized on the Project for Educational Research That Scales (PERTS) survey instrument (PERTS, 2015a). Research suggests that students with high academic mindsets engage academic behaviors such as attending class, homework completion, organizing work, and studying leading to improved learning outcomes (para. 5). The PERTS research team’s mission statement and purpose for designing the PERTS scale is “to improve the equity of learning outcomes by bridging the gap between cutting-edge research and implementation practices…” (PERTS, 2015b, para. 2).

1.2 Problem Statement

Rachel Marie Herter, PERTS Lab, Dept. of Psychology at Stanford University, in a personal communication (February 7, 2016) explained the current version of the PERTS scale gives data at the classroom level, places students into different category bins, and is not useful for comparing students between surveys. For teachers who use the PERTS instrument, provided free on the PERTS website, an understanding of the relationships between the underlying constructs, purported to be quantified in the PERTS scale, is important for an accurate interpretation of the scale results, for drawing valid conclusions, and for determining classroom specific interventions. Therefore, further study of the relationships between the factors of the PERTS instrument and subscale reliabilities is warranted.

1.3 Research Questions

The overarching research questions for this study included:

Is there a relationship between the individual factors included on the Project for Educational Research That Scales (PERTS) survey instrument?

Are the scale reliability indices of the PERTS instrument within predetermined acceptable parameters?

A history of the development of the mindset theory and implications from the results of this study will be provided as a primer to develop understanding of how academic mindset theory fits into teaching practices. Practical interventions for supporting student learning and a summary and conclusion of the results will also be provided, discussing the importance of understanding the use of psycho-social factors in the social context of the
classroom. Psycho-social factors are reported to provide additional paths to help students develop personal agency to engage in academic behaviors resulting in learning and growth (Farrington, Roderick, Allensworth, Nagaoka, Seneca-Keyes, Johnson & Beechum, 2012). Following are a list of definitions of terms used on the PERTS scale and in this paper.

1.4 Definitions

Individual mindset. (Items 1-3 reversed scored) has been described as “the way in which children interpret human behavior and their beliefs about the stability of human traits;” their views affect students’ attitudes and beliefs about their ability to perform, also referred to as self-efficacy on classroom tasks (Heyman & Dweck, 1998, p. 391; 2002 & 2008).

Belonging. (Items 4-7) Goodenow and Grady (1993) in Ma (2003) defined sense of belonging as “the extent to which students feel personally accepted, respected, included, and supported in the school social environment” (p. 340).

Task relevance. (Items 8-11) “A student’s sense that the subject matter he or she is studying is interesting and holds value. Value can be variously defined as the importance of doing well on a task (attainment value); gaining enjoyment by doing a task (intrinsic value); or serving a useful purpose or meeting an end goal that is important by completing a task (utility value)” (Eccles et al., 1983 in Farrington et al., 2012, p. 10).

Self-efficacy. (Items 12-15) “A mechanism of personal agency, the belief about one’s ability to exercise control over other events that affect their lives.” Self-efficacy beliefs affect thought patterns and influence one’s choice of goals and commitment to them (Bandura, 1989, p. 1175). Self-efficacy is an expectancy theory. A student with high self-efficacy for a certain task, would expect to be able to accomplish that task within the given context. Self-efficacy beliefs are comprised of two components: first is a belief that a specific behavior will produce an outcome, and secondly, the belief in one’s personal efficacy to produce that behavior in the present context and in future situations (Goddard, 2002).

2. Literature Review

A variety of models have been developed to explain how people learn, including: Watson (1924), Skinner (1953, 1954), and Pavlov’s (1927) work in behaviorism; Piaget's (1952) theory of cognitive development using the clinical interview process; Vygotsky’s (1978) cognitive sociocultural learning model and zone of proximal development; and Bandura’s (2001) social cognitive theory. Dweck's (1986) development of the concept of individual personality theories of fixed and growth mindset was deeply rooted in the framework and history of social cognitive theory. This present study tests a Likert-style instrument purported to quantity variables found in the theory of academic mindsets; adding to the individual mindset learning theory by collecting data at the group/classroom level (Farrington, et al., 2012).

Researchers and philosophers alike have developed theories of the mind. For example, Kant (1787/1999) declared the individual’s mind constructed one’s view of reality; the beginning of the constructivist viewpoint. Hegel (1807/1967) considered individual thought to be influenced by one’s social group in a reciprocal exchange of meaning creation. Marx (1867)
described the influence of one’s context on the creation of the individual’s thought.

Theorists in the field of education, such as Dewey (1938/1997), and Vygotsky (1962), later advanced the idea that the social environment and the individual influenced each other in a reciprocal process of learning. This distinction becomes a foundation for understanding Bandura's (2001) social cognitive theory and its triadic model of reciprocal influence of; human cognition, one's environment, and the influence of social modeling on the behavior of the learner. Bandura explained, "...human functioning is rooted in social systems" (p. 15).

Organizational learning theories, resulting from research such as the Hawthorne experiments, described the reciprocal influence of the individual and organization. Variables influencing organizational learning include leader openness to change, faculty openness to change, work locus of control, goal alignment, and collective efficacy (Hanson, Ruff & Bangert, 2016). Collective efficacy has been tested and shown to explain improved organizational outcomes (Tarter & Hoy, 2004). Results of organizational learning research are integral in developing teachers’ understanding of how to support student learning in the classroom (Senge, 1990 & 2000; Hoy, Tarter & Kottkamp, 1991; Collinson & Cook, 2007).

Similarly, researchers described unconscious processes that influenced learning. These processes were considered the result of differences in one’s culture of origin; such as Western individualistic and Eastern collectivist viewpoints. The philosopher, René Descartes (1633/1999) described a distinction between the mind and the body setting the foundation for the dualistic worldview that influences Western thought to this day. The dualistic view resulted in the scientific method and in a symptomatic approach to treating illnesses.

However, this isn’t the only way to view the world. Current organizational learning theories describe an organic model as opposed to a reductionist, or mechanistic, model. The organic model is a holistic approach and can be shown to influence a cultures’ approach to medicine, research, and system organization (Hanson, 2015). Following is a discussion on the progression of learning theories’ psycho-social variables set in a framework of an integrated approach to systems.

2.1 Psycho-social Influences on Learning

2.1.1 Conscious and Unconscious Processes Influencing Learning

Some researchers are suggesting new models for thinking about the brain and new models for describing how we learn. These newer models usually include learning as socially constructed and dependent on both implicit and explicit processes of knowing. This distinction becomes a foundation for understanding Bandura’s (2001) social cognitive theory and its triadic model of reciprocal influence including: the human cognition, one’s environment, influence of social modeling on the behavior of the learner.

2.1.2 Historical Roots of Fixed and Growth Mindset

Growth and fixed mindset concepts compare favorably to the nature versus nurture debate popularized in Francis Galton’s works (1874, 1889). Current discussions revolve around
whether we are born with our abilities and traits; that is, to ask whether one’s traits, such as intelligence, cannot be changed or if one can develop the brain’s abilities over time through applying effort and with appropriate social support and resources. Many researchers consider that both nature and nurture contribute to the development of an individual’s skills and the resulting success of individuals (Hanson, 2015).

2.1.3 Behaviorism

Bandura’s experiments were among the first to report the powerful influence of nurture, or social influence, on individual learning. Prior to Bandura’s research, educational models of learning focused largely on Behaviorism. Pavlov’s experiments with stimulus response procedures to develop salivation in dogs is well known and supports the teaching models of many educational curriculum and classroom management models. Stimulus response theory suggested humans learned through a series of rewards and punishments, without reference to cognitive choice or the influence of one’s social group. The Behaviorist experiments were performed using animals, not humans. Some researchers felt studying cognition was not possible because the mind could not be seen; so they focused on researching observable behaviors.

2.1.4 Social Cognitive Theory

The social cognitive theory was developed from the results of a collection of experiments by Bandura. In his famous bobo doll experiment, he saw a child acting aggressively toward a doll after the child had observed an adult inadvertently model that behavior. Bandura developed the conclusion that imitation is a powerful social influence on individual learning (Bandura, Ross, Ross & Webb, 2013).

2.2 Mindset Theory

Carol Dweck researched and developed her model of growth and fixed mindset at Stanford University where Bandura also worked while developed the social cognitive theory. Dweck’s development of the concept of mindset is deeply rooted in the framework and history of social cognitive theory. Researchers continue to explore the concept of mindset and have expanded the concept to new models at the group level. The organizational learning models attempt to capture variables inherent in the influence of one’s social group and context. The group level mindset models are consistent with social cognitive theory explaining the reciprocal influences of the group on the development of individuals’ beliefs, choices, and behaviors. Figure 1 shows factors on three levels of mindset scales; individual, group/classroom, and school.
Figure 1. Model comparing and contrasting variables on three levels of mindset surveys

The above figure shows the categories of variable items included on the individual mindset survey, PERTS survey, and What’s My School Mindset Survey (WMSM). The Likert-style surveys are used to quantify participant self-reports of their perceptions of psycho-social variables, found in the literature, and reported to improve student engagement in the learning process.

2.2.1 Academic Mindset

Researchers described academic mindsets as ways students think of themselves that make them want to learn (Farrington et al., 2012, p. 9). The concept of academic mindset adds to the individual mindset construct. Along with an individual mindset belief, the academic mindset concept includes a student's belief that he belongs, feelings of relevance for the tasks required of him, and a belief that he can perform the tasks (self-efficacy) required of him in the classroom. Students with higher academic mindsets demonstrate greater levels academic behaviors such as study, attendance, and homework completion (PERTS, 2015a, para. 5).

Academic mindsets are associated with behaviors that have large effects on student learning. Mindset as a psycho-social construct compares favorably with self-efficacy
described as “…a mechanism of personal agency, the belief about one’s ability to exercise control over other events that affect their lives” (Bandura, 1989, p. 1175). While mindset and self-efficacy are similar in their influence on personal agency, they differ in that mindset is a belief about the malleability of one’s traits, whereas self-efficacy is a belief in one’s abilities to perform a task. One’s mindset has an indirect influence on the successful academic outcomes through the influence it has on developing one’s self-efficacy beliefs (Hanson, 2015).

2.2.2 School Mindset Culture

Mindset researchers have added variables to the individual mindset construct to create a group/classroom level construct of academic mindset. For the organizational level, researchers have developed the What’s My School Mindset? Survey (Mindset Works, 2015) to capture and quantify faculty perceptions of a school growth mindset culture. Research studies show interventions at the individual level show less potential for improving outcomes than those done at the group level (Hanson, Ruff & Bangert, 2016). For example, Osterman (2000) found variables, that can be influenced by administrators and faculty and that are within the school context and instructional methods, shown to develop academic mindsets in students (Blackwell et al., 2007). The Project for Education Research that Scales (PERTS) performs studies on the impact of mindset interventions on classroom outcomes using the PERTS scale (PERTS, 2015a). The next section provides examples of how teachers can influence the classroom context to support student academic mindsets.

2.2.3 Systems Thinking

A leader’s behavior influences an overall perception of how the organization will perform (Bohn, 2002, p. 76). One way to improve an organization, is to promote self-organizing behaviors in the participants. Viewing the classroom as a system, teachers can support the development of individual roles and team skills that enable the system to self-organize by creating common expected norms of behavior. This means students are contributing to improvements and structures that are meaningful to them. An instructor’s use of modeling, such as pacing and leading, requires a bird’s eye view of the classroom and a systems thinking perspective (Senge, 2000).

2.3 PERTS Factors

A review of the literature in the areas of mindset, meaningful learning, theories of mind, and psycho-social factors contributing to student engagement revealed a common element of autonomous action within a social context. Student autonomy develops when students feel; a sense of belonging and social identity with supportive others in the classroom; that they are an inherent part of the process of reciprocal sense making; classroom goals are aligned with their personal goals and values; there are opportunities to take initiative; and their personal values are embedded into the tasks required providing a feeling of personal and life relevance (Hanson, in press).

2.3.1 Self-efficacy
Self-efficacy develops from positive feedback in social relationships and opportunities to practice skills together. Four variables contribute to the development of self-efficacy: mastering a task, observing others successfully performing the task, being told by valued others that he can be successful, and developing one’s ability to manage her own stress states (Versland, 2009). Balancing the roles between integration (system role) and autonomy (individual role) is a key variable for developing a flexible focus that allows students to shift from one perspective to another that best fits the context at the moment and promotes autonomous functioning.

Goal alignment is a key factor in developing individual self-efficacy and group collective efficacy. The teacher can develop a classroom level social identity among the students by modeling and encouraging students to: acknowledge one another and agree on common goals and means. Differences may remain as long as a common vision is achieved. What you agree on and how to come to agreement is different from classroom to classroom (Hanson, in press).

Modeling by the classroom teacher influences the classroom system and indirectly the individual students. Modeling has been shown to be an effective way to build positive classroom culture and promote student self-efficacy (Bandura, 2001, Dweck, 2010, Hanson, 2015). An example of a teacher modeling is called pacing and leading. The teacher observes the classroom behaviors and where there is a departure from the expectations, the teacher first identifies with the students’ current focus through movement and supportive comments. Next, inviting the students to participate in the desired activity includes an opportunity for autonomous action to engage in personally relevant activities.

A teacher can embed multiple opportunities for students to master the tasks required while providing sufficient psycho-social support through positive feedback and specific tasks for improvement. Allow the students to practice the behavior over many trials until they master the behavior on their own. Where necessary, model and provide explicit instruction on how to manage one’s own stress responses.

2.3.2 Sense of belonging

In Maslow’s (1943) hierarchy of needs theory, belonging is considered a basic human need. Schwarz (1990) included sense of belonging as part of security in his model of motivational types of values. Teachers can develop a sense of belonging for students in the classroom by providing opportunities for team collaboration and identifying each student’s role in the group. Be explicit and clear. Match the students’ strengths and personal role identities with the team roles. Allow students to give feedback on their experiences in the group and then respond to their suggestions. Ensure the group activity develops positive interaction with others. Sense of belonging has been connected with developing positive relationships (Deci & Ryan, 1994). Use double loop learning strategies (Argyris & Schön, 1978).

Teacher must ensure to provide equitable and just classroom systems and processes. When the leader’s formal (position) is integrated with the informal (relational) position one develops a sense of “…moral authority on their subordinates by establishing synchrony in
their words and actions; the rest of the structure and processes of the organization also get aligned for it, thus creating a robust and transparent culture” (Sidik, 2013, slide # 25).

2.3.3 Relevance

A next step in the process of developing academic mindsets in students is to provide real world educational opportunities for students and connect these to students’ prior learning. Develop task relevance by providing a purpose for the activities that the students can understand. Connect with students to develop an understanding of their personal interests and align the classroom tasks to these values. Provide real world educational opportunities for students to develop a sense of life relevance.

2.3.4 Individual Mindset

Developing a growth mindset classroom culture and providing supportive classroom contexts with an understanding of the importance of praising effort rather than traits will contribute to student growth mindsets (Farrington et al., 2012). Well-being increases when an individual’s mindset matches the organization’s mindset (Delaney, Dweck, Murphy, Chatman & Kray, 2015). However, research suggests the individual’s mindset has little correlation with the group level mindset culture in schools. Organizational values and norms can differ from individual norms, yet, individuals can agree to participate in the overall activities of the group.

3. Methods

This study used a quantitative research design and existing data from a mid-size, rural school district in a large southwestern state. The school district collected data on the schools’ cultures and climate for use in setting Local Control and Accountability Planning (LCAP) goals.

3.1 Data Sources and Participants

The school district collected LCAP survey data during the month of April, 2016, using a variety of Likert-style surveys delivered to students, grades 3 through 8, (n=2,908; 84% response rate) in the classroom at three elementary schools and two middle schools; faculty participants included teachers, grades TK-8, (n=224), other certificated personnel (n=9), and administrators (n=11).

3.2 Instrumentation

Instruments used by the district for LCAP data collection included a brief demographic questionnaire plus 15-items of the Project for Educational Research the Scales (PERTS) survey instrument includes four scales; individual mindset (3 items), sense of belonging in the classroom (4 items), task relevance (4 items), and self-efficacy on classroom tasks (4 items). Respondents self-reported their agreement with scale items by providing ratings on a Likert-style scale ranging from 1= Strongly Disagree, 2 = Disagree, 3 = Somewhat Disagree, 4 = Somewhat Agree, 5 = Agree, to 6 = Strongly Agree.

No reliability data was available for the scales (Rachel Marie Herter at PERTS lab, Inc., February 8, 2016). However, this study empirically tested the scale reliabilities using the
predetermined indicator of Cronbach’s alpha > .80 as an acceptable level for internal reliability of a widely used scale (Nunnally, 1978). Loewenthal (2004) takes into account the number of items on the scale and the construct validity and suggests the alpha coefficient as low as 0.6 could be acceptable, however, Cronbach’s score this low are usually considered acceptable in pilot studies and are often the result of few items on the scale.

A variety of studies have been performed and reported in the literature demonstrating concept validity of the operationalized constructs on the PERTS scale (Farrington et al., 2012). The scale has strong face validity being currently used in large scale studies. The Appendix provides the PERTS scale items.

3.3 Analyses

The data collected in this study was evaluated for normality, skewness, and kurtosis using quantitative analytical software SPSS, 22 (IBM, 2013). The mean value of students’ perceptions on their level of individual mindset, sense of belonging in the classroom, task relevance, and self-efficacy were calculated and correlation analysis was performed between the scales. The following range of indices, as average arithmetic means in three categories, is provided to create a low, medium and high range as a method to interpret the data:

Low = 1.00 - 2.67; Moderate = 2.68 < x < 4.35; High = 4.36 - 6.0.

An exploratory factor analysis investigated the psychometric properties of the four scales including reliability statistics and other information on validity testing. The determination of model fitness was developed from factor loadings, validity, reliability and normality. These values were used to determine whether the scales were valid for measuring the level of psycho-social variables in educational settings in the population under study.

4. Results

4.1 Data Analysis

Data analyses included statistical tests using SPSS, Version 23 statistical software (IBM, 2015) to determine if the data fit a normal distribution and was considered reasonable for parametric analyses. All items tested were within acceptable limits ± 2 (Trochim & Donnelly, 2006; Field, 2000 & 2009; Gravetter & Wallnau, 2014).

4.1.1 Correlations

A bivariate correlation analysis was performed and significant relationships were found. However, results for the Bartlett’s Test of Sphericity was found to be significant indicating that the items, although correlated, were not correlated so highly as to produce an identity matrix preventing the factor analysis from successfully reducing the data into interpretable factors. This was consistent based upon their item descriptions and the theory. An exploratory factor analysis was performed using SPSS, maximum likelihood extraction and oblique rotation methods.

4.1.2 Exploratory Factor Analysis

Four scales were revealed as predicted with internal scale reliability ratings above preset indices of .80 with the exception of the individual mindset scale at .772. The EFA yielded
a four-factor solution using maximum likelihood extraction and Varimax rotation method. Each of the four scales consisted of at least three items, exhibited factor loadings < .80 and > .30 and had items that were minimally cross-loaded with items in other factors (Brown, 2009; Field, 2009; Gravetter & Wallnau, 2014). Discriminant validity between scales was shown by items loading together above .3 on the factor and no cross-loadings, with the exception of items number 8, 9, and 4; however, the difference between correlations exceeded .2. Stevens (2002) suggests that item loadings should differ by at least .200 to be interpreted as not cross-loaded with other factors. Table 1 shows results of the EFA on PERTS factors.

4.1.3 Cross-tabs

Statistical analysis was performed to explore the interdependence of the demographic data variables and to identify statistically significant differences ($p < .05$). One-way ANOVA analysis was used to compare the category means and determine any significant differences between groups that may affect the ability to generalize the results. Significant variations in the sample data were noted between the following categories:

Building levels. The PERTS mean for the elementary classrooms ($n=70$) was 4.6502 ($SD = .26516$) was significantly higher than for the middle schools ($n=50$) was 4.4650 ($SD=.32376$), ($F_{(1,118)}= 11.819, p=.001$). This is consistent with Blackwell et al., (2007) and Hanson, Bangert & Ruff (2016) in their research on school transition and boundary crossings effects from elementary to middle and high schools. Table 2 shows the mean, standard deviation, and sample size for elementary and middle school levels.

</tbody>
</table>

Note. ** $p = .001$, $eta^2 = .014*$, $F_{(1, 118)} = 11.819$.

Ethnic classification (self-selected by student respondents). The student self-efficacy (SE) mean scores revealed significant differences between ethnic classifications using a one-way ANOVA ($F_{(9, 2,898)} = 3.030, p =.001$).

Gender classification showed a negative relationship with student belonging and task relevance. A positive relationship existed between ethnicity and gender. Gender had no significant effect on the regression outcome and was removed from the analysis. Table 3 shows the correlations between classifications and scales of the PERTS survey instrument.

4.1.4 Regression on Self-efficacy

Significant positive relationships were found between variables of the PERTS scales as well as with gender and ethnicity. Statistically significant correlations were evaluated further using regression analysis with dependent and independent variables identified consistent with the nomological net from the theory. The independent variables (IV) of belonging, task relevance, and individual mindset, along with ethnicity (described earlier) were entered simultaneously into the regression analysis using self-efficacy as the dependent variable consistent with the literature (Bandura, 2001).

The results from the multiple regression analysis revealed the IVs explained a significant proportion ($R^2 = .276$) of the variance in self-efficacy scores ($F(3, 2,904) = 370.47, p < .001$). The strongest predictor was student belonging ($\beta = .335$), followed by task relevance ($\beta = .222$), individual mindset ($\beta = .157$), and ethnicity showing a negative effect ($\beta = -.038$). Table 4 shows $\beta$ and $p$ values for the independent variables on SE. Table 3. Regression of PERTS subscale means on self-efficacy, including Beta, Standardized Beta, and significance values.

4.1.5 Discriminant Validity
A one-way ANOVA comparing the school means was run to determine the ability of the PERTS data results to discriminate between groups at the school level. Table 4 shows the mean, standard deviation, and sample size for elementary and middle school levels.

5. **Summary and Conclusion**

The results of this study have important implications for facilitating student learning as well as increasing teacher effectiveness. The results of the EFA yielded a multi-dimensional, four scale construct of academic mindset as operationalized on the PERTS instrument. The four scales met the criteria for convergent validity with item loadings above .30 for each factor and divergent validity with more than .20 difference in loadings between item loadings of other factors.

5.1 **Research Question #1**

The first research question of this study, “Is there a relationship between the individual factors included on the Project for Educational Research That Scales (PERTS) survey instrument?” was answered by correlation and regression analysis. All three IV scale factors significantly correlated with the dependent variable self-efficacy. Regression of the IV’s on the DV revealed sense of belonging had the greatest effect to explain variations in the self-efficacy mean. Together the three independent factors explained a small but significant effect ($R^2=.276$) of the overall variation in SE mean scores.

ANOVA tests on the a variety of data categories revealed significant differences between PERTS scale factor mean scores by building levels, and cultural identification. Teachers can use this information to recognize differences exist in student perceptions of the psychosocial supports they receive in the classroom at the middle school level compared to the elementary level. Students identifying as White and Asian self-scored significantly higher on the scale of self-efficacy for classroom tasks than other subcategories of students’ culture. Teachers can expect that classroom scores may improve when students perceive they are receiving
psychosocial supports leading to improved sense of belonging, task relevance, self-efficacy, and individual mindset.

5.2 Research Question #2

The study results answered question #2 revealing only three of the four PERTS sub-scales had internal reliability above the predetermined indices. The individual mindset scale was below .80 and is considered potentially unreliable for a scale that is widely used and may not provide consistently accurate measurements of the students’ self-reports of their perceptions of this construct.

5.3 Conclusion

The use of the PERTS non-cognitive survey instrument provides data to make valid decisions and to provide growth markers toward meeting annual goals to improve school and classroom cultures. The PERTS survey operationalizes student non-cognitive factors and can be used as a boundary object providing evidence of teachers’ strategies to support student psychosocial needs, shown necessary to persist in school to graduation. School leaders can use data collected from the PERTS scale to develop goals for positive school cultures that support student transitions between school levels (Hanson, Ruff & Bangert, 2016), recognizing the variable effects of non-cognitive factors on differing student demographics, and to support at-risk student populations.

5.4 Implications

Teachers may use the results of this study to identify student perceptions of their classroom environment. Having reliable survey data may provide useful information for developing new classroom interventions and for indicating areas of needed professional development. Teachers would benefit from research-based evidence that challenges their assumptions, provides sound reasons for developing new practices as a key element to good outcomes. A valid scale quantifying psychosocial factors could be used to engage faculty in productive discussions about their students’ perceptions of psychosocial supports in the classroom leading to choice to engage in academic behaviors. Following are specific suggestions for building classroom academic mindset cultures in schools.

5.4.1 Teacher Influence - on the classroom system is indirect through modeling and holding students accountable for clear expectations and rules

5.4.2 Developing Teams - allows students to develop social identities increasing a sense of belonging and promotes autonomous functioning reducing the number of decisions that must go through the teacher.

5.4.3 Aligning student individual identities with classroom roles by integrating personal interests with integrated social action increases classroom task relevance.

5.4.4 Develop social experiences of support for effort without focusing on immediate success. Teachers can provide positive feedback and frame failed learning attempts as necessary practice to develop successful outcomes over time. Providing social persuasion that the student can succeed develops individual growth mindset in students (Bandura, 1994; Claro & Dweck, 2016).
5.5 Recommendations for Further Research

Future studies might include qualitative interviews of students to develop a rich, thick, understanding of their experiences in the classroom and how they perceive the scale constructs of the PERTS survey instrument. Further exploration of the individual mindset construct is warranted as the scale does not provide internal reliability, according to the preset indices used in this study. Reliable scales are necessary to make valid conclusions from the data provided. According to the results of a calculation performed, provided by Nunnally (1978), an additional four operationalized items are necessary in order to raise the individual mindset survey scale, included on the PERTS scale, to the desired reliability indices of Cronbach’s alpha score > .80 (p. 244).

Acknowledgement

A recognition and appreciation is extended to Dr. Arthur Bangert, associate professor, Montana State University, Bozeman, for his role in reviewing the statistical results and presentation providing in the methods section of this paper.

Abstract
This quantitative pilot-study empirically tested the factor structure and reliability of the newly developed Graphical Inventory of Ethical Leadership (GIEL) scale, a Likert-style scale for quantifying key concepts related to ethical leadership. Correlations and principal components analyses were performed using pre-existing data as self-reports from a sample including 103 graduate students in an administrator preparation program at a private university located in a large southwestern state of the U.S. Regression analyses revealed the factor, transformational leadership explained a significant amount of the variation in the ethical leadership scale mean score. The GIEL survey demonstrated internal reliability of the four scales above the pre-determined indices of Cronbach’s alpha >.60 considered acceptable for scales in a pilot study. Potential uses of the GIEL include; as a baseline for setting and monitoring professional development goals, as evidence for recommending certification in administrator preparation programs, and as part of a 360-degree evaluation process.

Keywords: Ethical leadership, Survey validation, Administrator effectiveness

1. Introduction
The concept of virtue and integrity, as embodied in one’s values and ethics, can be traced to Aristotle (1947). Virtue has been described as the foundation from which springs “the good life” and integrity as the foundation to ethical leadership. Ethics and integrity suggest a coordination between one’s beliefs and actions, a wholeness and consistency that exemplifies moral behavior (Lawton & Páez, 2014, p. 641).

1.1 Influence of the Administrator on the Organization
Administrators, executives, and managers have positions of authority that wield considerable power and influence over the areas of distribution of resources and decision-making (Weber, 1947). Formal and informal authority over decisions and resource
distribution contributes to the development of power in the leaders’ position and influence over others. However, leaders often experience negative influences from within themselves, as well as from others, while serving in their executive roles. Lord Emerich Edward Dahlberg Acton (2016) wrote an astute, and often quoted, description of the influence of authority on one’s value base,

Power tends to corrupt and absolute power corrupts absolutely. Great men are almost always bad men, even when they exercise influence and not authority; still more when you superadd the tendency of the certainty of corruption by authority (para. 15).

The abuse of power has long been viewed as a human trait, or behavioral tendency, throughout mankind’s history and has been widely documented in many historical texts including the founding documents related to the history of the Colonies, the United States government, and the Bible. Included in the Federalist Papers is the statement,

In framing a government which is to be administered by men over men, the great difficulty lies in this: you must first enable the government to control the governed; and in the next place oblige it to control itself (Publius, 2016, para. 2).

Instead of ruling over others, Matthew 7:12 states, "In everything, therefore, treat people the same way you want them to treat you, for this is the Law and the Prophets."

1.2 Description of the GIEL

A variety of psychometric tools are currently available to measure attributes of leaders and constructs operationalized as factors of ethical leadership. The GIEL scale was designed in response to calls in the literature for improving the scale items and measurement method of ethical leadership in the workplace. The GIEL also responds to the call in the literature for using observed frequencies of behaviors as the measure, as opposed to followers’ self-perceptions of leader’s traits or characteristics (Lawton and Páez, 2014; Yukl, Mahsud, Hassan & Prussia, 2013).

Capturing the leader’s context is critical in developing an understanding of existing perceptual differences between the leader, followers, stakeholders, and supervisors. Administrators, managers, and the leader’s supervisors and reports complete the scale to provide a 360-degree contextual view of the leader’s ethical behaviors. This contrasts with other scales in the literature that quantify only followers’ self-perceptions of the leader. New methods for measurement and training, such as the use of technology and micro-learning strategies must be developed and implemented to address the changing needs of the upcoming generation of organizational leaders, referred to in the literature as the millennials (Loose & Marcos, 2015; Loose & Marcos, 2016; Marcos & Loose, 2014).

The GIEL captures participants’ self-reports on 35 items related to seven key variables of an effective leader including; professional development, personal development, justice and fairness, communication, ethical decision-making, transformational leadership, and role model. A primary purpose of the 3D GIEL is to assist administrators in developing goals
for growth and as a planning tool for practicing administrators, and for use in 360 evaluations. The GIEL survey results may be used as an artifact to demonstrate progress of managers in industry, as well as educational leaders in schools, toward understanding the competencies demonstrated by ethical leadership behaviors.

1.3 Use of the Scholarship for Teaching and Learning (SoTL) Design

Discussions held by the educational leadership master’s department team evolved from the need to provide a means for students in the administrator preparation programs to examine ethical and moral aspects of school leadership, as required in Standard 5 of the California Commission on Teacher Credentialing California Professional Standards for Educational Leaders (CPSEL). The development of the GIEL and testing of the construct validity has been explored through the use of a Scholarship for Teaching and Learning Design (SoTL) design described as follows:

The Scholarship of Teaching and Learning (SoTL) uses discovery, reflection, and evidence-based methods to research effective teaching and student learning. These findings are peer reviewed and publicly disseminated in an ongoing cycle of systematic inquiry into classroom practices. This work benefits students and colleagues and is a source of personal renewal (CSU, 2015, para. 1).

Students use the GIEL, develop goals, create tasks, and reflect and inquire at their work sites on their ethical practices. Anonymous and confidential data from the students’ surveys were used to empirically test the reliability of the GIEL and identify the factor structure.

1.3.1 California Professional Standards for Educational Leaders (CPSEL)

In the mid 1990’s, the Interstate School Leaders Licensure Consortium (ISLLC), composed of a variety of national stakeholder groups, was assembled and charged with the task of designing the first set of national standards for educational leaders. In 2001, California adopted the standards and formally adopted the first set of California Professional Standards for Educational Leaders (CPSEL). In 2004, the CPSEL were adopted as part of the standards-based program for the Administrative Services Clear Credential. In February 2014, a revised set of CPSEL were approved by the Commission. After reviewing the original CPSEL, research studies, professional literature, examples of national, state and district standards for administrators, as well as the newly adopted content and performance expectations for preliminary administrator certification, the CPSEL Update Panel drafted the updated set of CPSEL. Figure 1 shows the model of CPSEL Standards: core expectations for administrators.
Standard 5: Ethics and Integrity was conceptualized as the base from which the administrator’s behaviors, choices, and decisions are influenced.

1.3.2 CPSEL Standard 5: Ethics and Integrity

California Professional Standard for Educational Leaders states, “Education leaders make decisions, model, and behave in ways that demonstrate professionalism, ethics, integrity, justice, and equity and hold staff to the same standard” (CTCC, 2014, p. 9). Efforts to ensure an educational leader evidences the standard’s expectations requires the candidates continuous reflection on her personal standards and values, a commitment to continuous professional and personal growth, and a plan to execute strategies to improve. The CCTC Standard 5 describes behaviors of ethical leaders including:

- the use relevant evidence and available research to make fair and ethical decisions to guide personal and collective actions in the school,
- using their professional influence to support a trusting school climate resulting from mutual respect and honest communication. Equity and justice in operations and decisions related to staff and students provide a model for others’ actions (CCTC, 2014, p. 9-10).

1.4 Purpose Statement

This paper proposes to test the factor structure, reliability, and construct validity of the new GIEL scale quantifying administrator/manager behaviors as found in the literature under the description of ethical leadership (Brown, Treviño & Harrison, 2005, in Lawton and Páez, 2014, p. 641). Understanding the ethical leadership concept in context is necessary to developing transformational leaders who can contribute to successful organizational
outcomes. Historically, assessment measures in the area of ethical leadership have largely focused on traits, or characteristics, of the leader as followers’ perception quantified on a scale. This current research seeks to provide evidence that the GIEL scale, which uses leaders’ behaviors and self-reports from a variety of sources, is a reliable instrument for collecting data from which valid conclusions can be drawn in the area of leaders/manager’s ethical leadership behaviors.

1.5 Problem Statement

The GIEL instrument is currently used by administrator candidates in the educational leadership program at a private university in a large southwestern state of the United States. Students complete the survey about their behaviors and receive 360-degree feedback, then develop personal and professional goals for their program term. The students retake the survey at the end of the program and use their progress as an artifact to evidence growth in ethical leadership behaviors, as required under CPSEL 5: ethics and integrity.

The GIEL instrument had not undergone empirical testing to provide evidence in support of its purported factors and reliable data results. Not understanding the underlying factors purported to be quantified on the GIEL instrument may lead to misinterpretation of a candidate’s skills and to faulty conclusions about his or her progress. For those using the CPSELS to understand and evaluate a candidate’s growth and competencies in meeting CCTC standards valid measurement tools are necessary to accurately judge progress. Candidates may not fully understand the expectations of the Standards without clear constructs on reliable scales to determine a measurable level of attainment or expectations. Therefore an instrument for quantifying administrator behaviors as factors of Standard 5: Ethics and Integrity is warranted. Similarly, executives and managers in industry would benefit from a reliable scale to quantify the construct of ethical leadership in the workplace.

1.6 Research Questions

The overarching research questions for this study included:

Is there a relationship between the individual factors included on the Graphical Inventory of Ethical Leadership (GIEL) survey instrument?

Are the scale reliability indices of the GIEL instrument within predetermined acceptable parameters?

A history of the development of the ethical leadership theory and implications from the results of this study will be provided as a primer for educational leadership departments and industry administrators to develop an understanding of how ethical leadership theory fits into transformational leadership practices in schools and industry. Practical interventions for supporting student learning and a summary and conclusion of the results will also be provided, discussing the importance of understanding the use of ethical leadership factors in the social context of the workplace. Following are a list of definitions of terms used on the GIEL scale and in this paper.
1.7 Definition of Terms

360-degree evaluation process: The GIEL process includes feedback to the administrator or manager, usually anonymous and confidential, from his or her peers, supervisors, and reports for the purpose of developing goals for professional development, accountability, and providing data-based evidence to begin dialogues for addressing concerns.

Professional development: Professional learning to be up-to-date with education research, literature, best practices, and trends to strengthen ability to lead. (Kearney, 2015, p. 32).

Personal development: Examine personal assumptions, values, and beliefs to address student’s various academic, linguistic, cultural, social-emotional, physical, and economic assets and needs and promote equitable practices and access appropriate resources. This includes sustaining personal motivation, commitment, energy, and health by balancing professional and personal responsibilities. (Kearney, 2015, p. 32).

Justice and fairness: Identify personal and institutional biases and remove barriers that derive from economic, social-emotional, racial, linguistic, cultural, physical, gender-based, or other sources of educational disadvantage or discrimination. (Kearney, 2015, p. 34).

Effective Communication: Communicate expectations and support for professional behavior that reflects ethics, integrity, justice, and equity. (Kearney, 2015, p. 36)

Ethical Decision-Making: Consider and evaluate the potential moral and legal consequences of decisions. This includes the review of multiple measures of data and research on effective teaching and learning, leadership, management practices, equity, and other pertinent areas to inform decision-making. This also pertains to the leader’s identification of personal and institutional biases and their efforts to remove barriers that derive from economic, social-emotional, racial, linguistic, cultural, physical, gender-based, or other sources of educational disadvantage or discrimination (Kearney, 2015, p. 34).

Ethical Leadership: was described as consisting of “…the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers, through two-way communication, reinforcement, and decision-making” (Brown, Treviño & Harrison, 2005, in Lawton and Páez, 2014, p. 641).

Transformational leadership: Use a variety of strategies to lead others in safely examining personal assumptions and respectfully challenge beliefs that negatively affect improving teaching and learning for all students. (Kearney, 2015, p. 36)

Role model: Encourage and inspire others to higher levels of performance, commitment, and motivation by modeling transparent and accountable behavior (Kearney, 2015, p. 36).

Organizational Citizenship Behavior: Behavior that contributes indirectly to the organization through the maintenance of the organization’s social system. (LePine, Hanson, Borman, & Motowidlo, 2000; Motowidlo, Borman, & Schmit, 1997; Motowidlo & Schmit, 1999; Organ & Ryan, 1995).
**Rater Bias**: “Rater errors are errors in judgment that occur in a systematic manner when an individual observes and evaluates another. Personal perceptions and biases may influence how we evaluate an individual’s performance. What makes these errors so difficult to correct is that the observer is usually unaware that she or he is making them” (Trustees of Dartmouth College, 2016, para. 1).

### 2. Literature Review

Ethical leadership has been widely researched and discussed in peer-reviewed literature. A school leader’s personal values and ethics have been shown to influence a leader’s decisions and actions, to directly impact a school faculty’s perceptions, and to positively influence the school culture, a significant variable influencing individual choices for behaviors that contribute to the improvement of organizations. The leader’s followers make judgments about a leader’s attributes based upon the leader’s behaviors (Brown, Treviño & Harrison, 2005, p. 120; Lawton & Páez, 2014; Reed, Vidaver-Cohen & Colwell 2011; Tarter & Hoy 2004; Marzano, Waters, & McNulty, 2005; Sergiovanni, 2009; Yukl et al., 2013).

#### 2.1 Construct Validity of Ethical Leadership

Ethical leadership has been quantified, explored, and reported in the literature as both a unidimensional and multidimensional construct. Lawton and Páez suggested a model of three overlapping circles for their research study framework of ethical leadership. The three factors in their model included leadership practices, purposes, and virtues. Researchers are currently exploring meta-theories of organizational purpose based upon virtue theory including recognition of the common good and ethical leadership (p. 645). Ethical leadership has been show to explain outcomes such as trust, organizational citizenship behavior, and employee effectiveness (Kalshoven, Den Hartog & De Hoogh, 2011). This is consistent with Tarter and Hoy (2004) in their enabling school structures influenced by the ethical behaviors of the administrator. The ELS factor of interpersonal support compared favorably with the concept of OCB as well (Reed et al., 2011).

#### 2.2 Scales for Measuring Ethical Leadership Constructs

This section provides a discussion comparing and contrasting a variety of ethical leadership constructs operationalized on scales found in the literature. The scales discussed include: the Ethical Leadership Scale (ELS), Ethical Leadership at Work Scale (ELW), Executive Servant Leadership (ESLAS) Factor Scale, Ethical Leadership Questionnaire (ELQ), and a three dimensional framework for understanding and designing research on ethical leadership. A map of the constructs is provided and the items, dimensions, scales used, unit of data collection, and concepts used in correlational studies are provided. Figure 2 shows the map of comparable and contrasting concepts with ethical leadership constructs.
Lawton and Páez (2014) developed and suggested a framework for research on ethical leadership including three dimensions: virtues, purposes, and practice. Their research described the importance of considering the context in which the leader practices leadership ethics and behaviors. They suggested the appropriateness of values and roles differ under different contexts and the leader must be aware of these culture and norms of the followers. Their focus on activities of the leader is consistent with the decision to operationalize the constructs on the 3D GIEL as leadership behaviors rather than traits. The move away from a trait-based perspective of values and ethics reflects the broadening perspective that recognizes the influence of cultural, political, and social norms as unique in each context (p. 645). This framework provided by Lawton and Páez is consistent with the Hofstede and GLOBE Models (Global Leadership and Organizational Behavior Effectiveness) exploring culturally dependent views of effective leadership (Shi & Wang, 2011).

Brown et al. (2005) developed and validated the Ethical Leadership Scale (ELS). This 10-item unidimensional scale operationalizes six constructs: consideration behaviors, honesty, trust in leader, interactional fairness, socialized charisma (related to transformational leadership, role model, high standards, and cognitive moral development), and abusive supervision. The scale is completed by the followers of the subject leader. Brown used the framework of social learning theory (Bandura, 1986), to conceptualize a leader as a role...
model whose ethical conduct influences the same behaviors in his or her followers (p. 119).

Kalshoven et al. (2011) developed their Ethical Leadership at Work Scale (ELW) as a multidimensional construct including seven dimensions: fairness, integrity, ethical guidance, people orientation, power sharing, role clarification, and concern for sustainability. Subjects are employees or followers and self-reports of their perceptions are captured on Likert-style scale of 1 = strongly disagree to 5 = strongly agree. Correlation studies with the ELW revealed positive relationships with employee trust in their leader, job and leader satisfaction, organizational and team commitment, employee effectiveness, and organizational citizenship behaviors. Negative correlation was found with employee cynicism.

Reed et al. (2011) provided a description of their validated instrument and empirical studies for the Executive Servant Leadership (ESLAS) Scale including five dimensions of the sub-factor ESL: interpersonal support, building community, altruism, egalitarianism, and moral integrity. The scale was provided to adult learners and alumni from a university. The participants are asked to rate their level of agreement on items describing the top executive in their institution on a 4-point Likert-style scale from 1 = strongly disagree to 4 = strongly agree. Reed et al. framed their scale on the theory of trust as a foundation of ethical leadership. Trust supports a cohesive integration of activities, cooperation, and perception of stability. This concept is consistent with the Open Systems theory of collective efficacy and consistent with Bandura’s (1986, 2001) of trust as a necessary antecedent to collective efficacy.

Yukl, Mahsud, Hassan and Prussia (2013) reviewed several of the previously listed scales and developed a 15-item unidimensional scale titled the Ethical Leadership Questionnaire (ELQ) from a review of several of the existing ethical leadership scales. They found that some leadership scales included constructs that were not “inherently ethical, and …can be used for unethical purposes” (p. 40). Therefore they omitted constructs related to leader’s behaviors of wider social issues such as sustainability. The ELQ also excluded items related to personality traits, cognitive skills, a leader’s openness to new information, and connecting ethical leadership constructs with unit outcomes suggesting these constructs can be used either ethically or unethically. For example, some unethical leadership behaviors are described in a previous section of this paper include cheating or misrepresenting student results on accountability reports that may appear to improve unit performance in the short run.

The authors of the ELQ explained that excluding items related to these three constructs avoids confounding the results that overlap with other constructs in ethical leadership scales. The correlation and regression study revealed these confounding variables accounted for 52% of the EL construct. The domain of ELQ includes a leader’s values and behaviors reflecting the construct of integrity between espoused values and actual values in use: setting clear standards, holding others accountable, fair distribution of rewards, and transparency.

2.3 Framework for Understanding the Measurement of Ethical Leadership

The nomological net in the literature on ethics, integrity, and values as aspects of ethical
leadership provided the following frameworks with which to view and interpret the topic including; social exchange theory, social learning theory, and open systems organizational learning theory. Though an individual’s values were shown to have an indirect effect on one’s personal choice of behaviors and outcomes, research on the relationships between ethical leadership, social exchange theory, and employee commitment revealed the administrator's direct interaction effects on employee outcomes such as OCB, trust, collective efficacy, and school outcomes (Tarter & Hoy, 2004; Hansen, Bradley, Brown, Jackson & Dunford, 2013).

Further, the CCTC Standards, CPSEL 5: Ethics and Integrity provides the recommendation that principals reflect on their values, use of ethical behaviors, and demonstrate organizational citizenship behaviors to influence their school culture.

2.3.1 Variables of Ethical Leadership

The variables quantified in the GIEL scale have been shown to compare favorably with those in the literature that were malleable to administrator influence and related to improved school outcomes. School administrators can benefit from understanding the complex variables of the administrator’s ethical leadership on the organization through the use of a GIEL tool that provides research-based data for reflection and planning (Dweck, 2010; Kearney, 2007; Hansen et al., 2013; Lawton & Páez, 2014). Operationalized items on the GIEL scale included seven factors found in the CPSEL Standard 5 and in the research literature on measurement of ethical leadership.

The GIEL uses ethical leadership behaviors as the operationalized constructs for rating compared to the attitudinal dispositions of candidates. Though prior scales required by administrator candidates included self-rating of dispositions, research suggested that trait-based assessment have inherent biases and implicitly suggest a permanence, or fixedness, as enduring characteristics that works against a belief in growth through effort (Dweck, 1986; Hanson, 2015). This is of significant importance to agencies conducting program evaluation and accreditation of university programs under the auspices of the National Council for Teacher of Teacher Education (NCATE), the Council for the Accreditation of Educator Preparation (CAEP), and the California Commission on Teacher Credentialing (CCTC).

2.3.2 Outcomes of Ethical Leadership

Outcomes noted in the literature from the leaders’ use of ethical behaviors included employee commitment to the leader, openness to share work related problems, perceptions of effective leaders by the followers, accomplishing ethical organizational goals, development of new ethical leaders, collective efficacy, and organizational citizenship behaviors. Results of the use of ethical behaviors include professional growth and support for transformations of one’s workplace or school culture leading to improved organizational outcomes (Sadeghifar, Ashrafnejad, Mousavi, Nasiri, Vasokolaei, Zadeh, et al., 2014; Tarter & Hoy, 2004; Tschannen-Moran, 2003).

2.3.3 Differences between GIEL and Previous Scales
The GIEL scale includes a variety of features that differ and are considered an improvement from previous ethical leadership measurement scales. Because the GIEL collects ratings from participants about frequency of observed leader behaviors from a variety of raters including; the leader, followers, supervisors, and other stakeholders, the leader has a means of data to develop an understanding of the context in which he works. A comparison and contrast of self and others’ perceptions provides a data-based source for beginning useful dialogues for understanding differences in values and beliefs.

The recommended use of the GIEL includes pre and post ratings allowing for a means to reflect, set goals, and subsequently assess progress toward one’s ethical leadership goals. This contributes to a cycle of continuous improvement, provides quantified and research-based data as artifacts evidencing attainment of expectations and competencies set as standards for ethical leaders (Brown, et al., 2005; Collinson & Cook, 2007; Kalshoven et al., 2010; Lawton & Páez, 2014; Marzano et al., 2005; Reed et al., 2011; Sergiovanni, 2009).

3. Methods

This quantitative pilot-study empirically tested the factor structure and reliability of the newly developed Likert-style Graphical Inventory of Ethical Leadership (GIEL) scale, for quantifying key concepts related to ethical leadership. Correlations and exploratory factor analyses were performed using pre-existing data as self-reports from a sample including 103 graduate students in an administrator preparation program at a private university located in a large southwestern state of the U.S.

3.1 Data Sources and Participants

The Likert-style GIEL survey instrument was provided online at www.gisasolutions.org to administrator candidates and to other participants in 360-degree evaluations; for the purpose of developing goals and strategies for growth to meet the expectations of Standard 5: Ethics and Integrity of the CPSEL. Responses (n=103) were collected during the fall semester of the 2016/2017 school year. Respondents were graduate students in an administrator preparation program at a private university located in a large southwestern state of the U.S. The data used in the calculations for this pilot study was scrubbed of all identifying participant information and was held anonymous and confidential. Data will be destroyed after completion of the study.

3.2 Instrumentation

The survey items on the GIEL scale represent constructs of effective school leadership behaviors drawn from an extensive review of the literature on the measurement and identification of ethical leadership qualities. The scale items were reviewed by a panel of experts, including 12 active and retired public school administrators, 6 male and 6 female, with an average of 23 years’ experience in the field. Six of the expert panel reviewers had earned doctorates and six had attained the master’s degree level. The demographics for race included self-reports of four Hispanic/Latino, seven Caucasian, and one Filipino. The panel reviewed the 35 items for relevance, clarity, and comprehensiveness related to their effectiveness to communicate the qualities of ethical leadership behaviors to the survey
participants and breadth and comprehensiveness of the concept.

The 35-items purport to operationalize seven factors (5 items each); professional development, personal development, justice and fairness, communication, ethical decision-making, transformational leadership, and role model. Respondents reported frequencies of observed administrator behaviors by providing ratings for survey items on a Likert-style scale ranging from 0=behavior not evidenced; 1=behavior occasionally evidenced; 2=behavior occurs frequently.

3.3 Indices used for analyzing the Data

This pilot study empirically tested the scale reliabilities using the predetermined indicator of Cronbach’s alpha >.60 as an acceptable level for internal reliability of a scale in a pilot study; taking into account the number of items on the scale and the construct validity (Loewenthal, 2004). A variety of studies have been performed, and reported in the literature, demonstrating validity of the operationalized constructs on the GIEL scale (CCTC, 2014). The scale has strong face validity being currently used in the administrator preparation program with administrator candidates. This study exceeded the preset indices of 100 surveys as a minimum number considered acceptable for a pilot study with 103 responses. The preset indices for the ratio of number of survey respondents to survey items will be approximately 5:1 (Tabachnick & Fidell, 2001).

Issues related to normality of the data is not considered relevant when the sample size is sufficiently large (>30 or 40) and an assumption of normality would not preclude the use of parametric procedures (Ghasemi and Zahediasl, 2012, p. 487). For this study acceptable indices for skewness will be considered between ±2 and Kurtosis between ±7 (Hair, Black, Babin & Anderson, 2010; Bryne, 1998). Normality of the data would be reviewed visually, residuals checked for less than 20%, and anti-image correlations >.5 (Fabrigar, Wegener, MacCallum & Strahan, 1999; Tabachnick & Fidell, 2001).

4. Results

Data analyses included statistical tests using SPSS, Version 23 statistical software (IBM, 2015) to determine if the data fit a normal distribution and was considered reasonable for parametric analyses. All survey items were negatively skewed and this is considered normal respondent bias for self-report surveys using psycho-social factors (Trochim & Donnelly, 2006; Field, 2000 & 2009; Gravetter & Wallnau, 2014). A review of the residuals revealed < 20% of the items had residuals > .50 (14%) therefore the next step in the analysis was to evaluate the significance of the Chi-squared calculation. The indices for rejecting the null of good fit was $p < .001$. The Approximate Chi-square=152.087, $df=101$, $p<.001$. Therefore the null was rejected and the data considered sufficiently correlated and further analyses could proceed (Mulaik, James, Van Alstine, Bennett, Lind & Stilwell, 1989; Field, 2000 & 2009).

4.1 Correlations

A bivariate correlation analysis was performed and significant relationships were found. However, results for the Bartlett’s Test of Sphericity was found to be significant indicating
that the items, although correlated, were not correlated so highly as to produce an identity matrix preventing the factor analysis from successfully reducing the data into interpretable factors. This was consistent based upon their item descriptions and the theory. An exploratory factor analysis was performed using SPSS, maximum likelihood extraction and oblique rotation methods. Various EFA extraction methods were tried and yielded multiple pattern loadings and many factors (approximately 10) though most with too few items to be considered true factors. Indices for good factors included frequencies of item loadings per factor (≥ 3), magnitude of loadings on the factor (≥ .32), and low frequencies and low value loadings of the item on each of the other factors (minimal cross-loadings for a simple factor structure) (Gravetter & Wallnau, 2014; Field, 2000 & 2009; Brown, T. A., 2009; Albright & Park, 2009).

4.2 Principal Components Analysis

Therefore the most parsimonious results were found forcing three factors using principal components analysis and direct oblimin rotation in an effort to retain the maximum amount of original variance while keeping the number of variables to a minimum (Conway & Huffcutt, 2003). A review of the grouping of items descriptions and a comparison with the literature, revealed common themes among the factors and the factors were named.

Internal scale reliability ratings were above preset indices of .60 for pilot studies of measurement scales (Loewenthal, 2004). Each of the three scales consisted of at least three items, exhibited factor loadings < .80 and > .30 and had items that were minimally cross-loaded with items in other factors (Brown, T. A., 2009; Field, 2009; Gravetter & Wallnau, 2014). Discriminant validity between scales was shown by items loading together above .3 on the factor and no cross-loadings. Table 1 shows the results of the PCA.

4.3 Three Factor Model

4.3.1 Justice and Equitable Decision-making (JED)

The first factor to emerge was a combination of mostly Justice & Fairness and Decision-making variables. The factor was comprised of items 4, 5, 11, 12, 15, 18, 19, 23 & 31 and contributed 26% of the total variance explained by the three factor model. The items comprising this factor all related to ethical behaviors of supportive (12), truthful (11), communicative (19), open (5), understanding (15), interpersonal (19), and fair (4). Two items included wording related to decision-making (18 & 23). A review of the items warranted a combined name of JED. Cronbah’s alpha was .850 showing good reliability.

4.3.2 Communication & Modeling (CM)

The second factor combined mostly from two varialbes of Role Modeling and Communication capturing items 16, 20, 26, 33, 34 & 35 and contributed to 10.4% of the total variance. The items included in this factor related to interpersonal skills of communication (16), listening (34), positive and likeable (34 & 35), modeling (33). One

Percent of Variance: 25.746, 10.336, 9.159
Eigenvalue: 5.407, 2.171, 1.923
Cronbach alpha: .850, .717, .816
item from Transformational Leader was also loaded on this factor, ”creates a sense we are all a team” (26). A name was given combining the major variables that combined. Cronbach’s alpha was .772 and could be improved although it is considered acceptable in a pilot study.

4.3.3 Personal and Professional Development (PPD)

The third factor was also a combination of two variables, Personal and Professional Development including items 1 & 2, and 7-10 and contributed approximately 9.2% of total variance explained by the three-factor model. The items were related to developing as an individual (7-10) and professional (1 & 2). Cronbach’s alpha reliability was .816.

4.4 Cross-tabs

Statistical analysis was not performed to explore the interdependence of the demographic data variables and to identify statistically significant differences (p < .05) as demographic information was not collected.

4.5 Multi-collinearity

Bartlett’s Test of Sphericity determinant was p < .0001. Bartlett’s tests the hypothesis that the correlation matrix of the data is an identity matrix. The Bartlett’s test revealed issues could result in interpretation of the factors due to multicollinearity. Further analysis showed regression correlations between two factors within the normal limits of .32 to .80 (Cohen & Cohen, 2002). Collinearity statistics tolerance should be > 0.1 (or VIF < 10) for all variables (Field, 2009). Results of regression on the IVs to test the assumption of collinearity indicated that multicollinearity was not a concern (GIEL Factors Mean Scores, Tolerance = .87, VIF = 1.12). Therefore the factors could be considered unique items with individual contributions to the overall concept of ethical leadership.

Figure 3 shows a model of the three-factor result of the principal component analysis

4.6 Multiple Regression Analysis

A multiple regression analysis using JED as the independent variable (IV) and CM and PPD as the dependent variable provided insight into the relationship between the variables. The results revealed the IVs explained a significant proportion ($R^2 = .263$) of the variance in Justice and Equitable Decision-making ($F_{(2, 102)} = 17.870, p < .001$). The strongest predictor was personal and professional development ($\beta = .365$), followed by communication and modeling ($\beta = .303$). Table 3 shows $\beta$ and p values for the independent variables on JED.

Figure 3 Proposed three-factor model of the Graphical Inventory of Ethical Leadership (GIEL)
5. Discussion of the Results

A brief discussion follows explaining the theoretical support of the three factor model and why separate factors might combine as one to represent key behaviors of ethical leaders.

5.1 Justice and Equitable Decision-making

A review of Figure 2 - Map of comparable and contrasting concepts with ethical leadership constructs reveals the literature supports the combining of ethical values with decision-making. Kohlberg’s (1958) Theory of the Stages of Moral Development as well as Rest’s Four Stages Component Model (1999) establish a relationship between the concepts of justice and equitable decision-making. For example, Rest identified four psychological components of contributed to moral maturity. These included, moral sensitivity, moral judgment moral motivation, and moral character. He implies that an awareness and sensitivity of values, such as justice and equity, are a precursor to putting moral judgement into action through ethical or equitable decision-making. Schwartz (1992), an eminent social researcher wrote, “Values are criteria rather than qualities inherent in objects” (p. 1). That is, individuals use a hierarchy of beliefs, or ordering of important beliefs, when evaluating self or others, for making choices, and for setting goals.

5.2 Communication and Modeling

Theorists in the field of education, such as Dewey (1938/1997), and Vygotsky (1962), advanced the idea that the social environment and the individual influenced each other in a reciprocal process of learning. Bandura's (2001) social cognitive theory described a triadic model of learning including human cognition, one's environment, and the influence of social modeling on the behavior of the learner. Bandura explained, "...human functioning is rooted in social systems" (p. 15). Communication and modeling fall under a common theme of interpersonal skills related to relationship, feedback, and social influence.

5.3 Personal and Professional Development

Personal development is closely aligned with professional development when the concept of autonomous learning is considered. Personal choice to engage new experiences that challenge one’s prior learning is fundamental to professional development. Hanson (in press) wrote,

A person’s sense of autonomy and control develops from experiencing a supportive social environment leading to positive experiences of individual development. Autonomy differs from independent action in that autonomous action involves an alignment with the values embedded in the actions undertaken. An autonomous person takes initiative, feels an intrinsic sense of control, and feels the tasks performed have relevance to him.

5.4 Items Removed from the Analysis

Eleven of the 35 items on the scale were removed from the analysis for the following reasons: Items 14, 17, 32 & 24 showed kurtosis exceeding ±7 and were removed. Eight items (13, 21, 22, 24, 27, 29 & 30) that crossloaded were double-barreled containing the
word “and.” Double-barreled items suggest that the loadings are not stable and could vary depending upon the weight the rater gives to either part of the sentence. For example item 24 reads, “Incorporates the use of data and research when formulating decisions.” The rater might focus on the use of data and consider research not part of the observed behaviors of the leader. Therefore this might load with decision making. However, if the rater focused on the research part of the item and did not observe the leader using data in decision making the item might load with professional development. Items 3, 6, 25 & 28 included wording related to “professional readings…outside of work…shared leadership…and shared vision…” These items cross-loaded on two factors.

6. Summary and Conclusion

This paper provided a discussion of the GIEL scale developed by the master’s department of educational leadership program at the subject university through the use of a SoTL research design.

6.1 Research Question #1

The first research question of this study, “Is there a relationship between the individual factors included on the GIEL survey instrument?” was answered by correlation and regression analysis. All three scale factors significantly correlated though not so highly they were considered multi-collinear.

6.2 Research Question #2

The study results answered question #2, “Are the scale reliability indices of the GIEL instrument within predetermined acceptable parameters?” Only all three of the GIEL scales had internal reliability above the predetermined indices of >.6 for a pilot study. The scales can be considered reliable and to provide consistently accurate measurements of the participants’ ratings of observed administrator ethical behaviors.

6.3 Conclusion

The use of the GIEL survey instrument provides data to make valid decisions and to provide growth markers toward meeting Standard 5: Ethics and Integrity and may be used to improve a leader’s understanding of the construct of ethical leadership and for setting growth goals. The GIEL survey operationalizes ethical leadership behaviors and can be used as a data source providing evidence of administrator, follower, supervisors, and stakeholder’s perceptions of their leader in this area. When leaders develop their ethical behaviors their followers perceived increased procedural justice, develop trust, leading to improved OCB and collective efficacy. Improved cultures lead to improved organizational outcomes and employee well-being (Hanson, Ruff & Bangert, 2016).

6.4 Limitations

Human-subject survey research may contribute to reporter bias resulting in a more positive self-report rating (Hoskin, 2012). The subsequent effect could provide a left-hand skew to the data which was seen in this study. Onsite observations were not performed to confirm the validity of faculty and administrator self-reports regarding their perceptions of
a growth school mindset culture in their school context. This study had a limited pool of participants that include mostly rural areas in a large northwestern state. The results may not generalize to larger more diverse populations.

6.5 Implications

Implications of the review performed in this paper suggest principals can compare their overall results from a pre assessment to the post assessment to determine growth on CPSEL Standard 5: Ethics and Integrity. If the administrator’s growth plan was developed from sound data and reflection, then growth is more likely to occur. Additionally, a valid and reliable scale can provide research-based evidence of competencies on the CPSEL Standard 5 that support university recommendations for clearing administrator credentials in CASC programs. Further, data provided by the GIEL will provide opportunities for beginning dialogues with administrators, their faculty, school board members, and stakeholders regarding their perceptions of the administrator’s behavior on the culture in their school. There are many implications for using research-based data from scales such as the GIEL Scale for quantifying administrator ethics and integrity behaviors. Survey research is just a beginning to finding realistic ways to implement growth in a candidate or practicing school administrator (Netemeyer, Bearden & Sharma, 2003).

Administrators in schools and industry can provide the research-based evidence from the GIEL scale for developing a growth plan, reassess to determine growth, and for demonstrating competencies in ethical leadership behavior standards of expectations for the accountability agencies. Principals can work to develop the three factors of ethical leadership such as being a role model, developing two-way communication channels, considering the effect on others when making decisions, participating in personal development activities, facilitating a shared vision using transformational leadership, participating in targeted professional development, and promoting justice and fairness that leads to organizational citizenship behaviors and positive employee outcomes in schools (Hoy, Tarter & Kottkamp, 1991; Kearney, 2007; Sanders & Sheldon, 2009; Sadeghifar et al., 2014).

School districts can use the GIEL instrument and the logic and theory underlying the development of the instrument to plan professional development for administrators in their districts. University administrator preparation programs may include the GIEL instrument in their candidate screening process, for developing coursework, and provide the GIEL to candidates for personal reflection. Other potential uses of the GIEL graphic organizer include; a measure for school district administrator hiring/screening processes and as part of a 360-degree survey tool.

6.6 Recommendations for Further Research

Recommendations include testing the instrument on a stratified random samples from diverse school contexts and populations to determine measurement reliability and generalizability. Another useful area for research would be to compare ethical leadership constructs with constructs from validated instruments such as the Transformational Leadership Scale, Ethical Leadership at Work (ELW) scale, Executive Servant Leadership
(ESL) scale (Kalshoven et al., 2011; Reed et al., 2011), Organizational Citizenship Behavior Questionnaire (Spector, Bauer, & Fox, 2010), Collective Efficacy Scale (Goddard, 2002), and What’s My School Mindset? Scale (Mindset Works, Inc., 2015) among others. Further corrections to the items can be made based upon; the feedback from the expert panel review; correcting all double-barreled items; and adding more items to the CM factor to raise the reliability of this factor.

6. **ABSTRACT:**
The Maker Movement, with a focus on playful experimentation, offers a hands-on approach to science, technology, and engineering, and could offer an answer to student disengagement with STEM. While traditional science classes and the narrow representation of scientists can be alienating, Maker activities offer multiple entry points and modes of engagement, especially for historically underrepresented populations. This paper attempts to address the sparse education or curriculum research on how multimodal Maker activities incorporate students’ interests and funds of knowledge, and what these practices look like. Additionally, we explore how diverse literacies including Making, reading scientific texts, writing poetry, and creating audiobooks support scientific practices (e.g. observation, problem-solving, creating new knowledge) for Latino middle school students participating in a Maker Literacies afterschool program.

   In this analysis we applied Cultural Historical Activity Theory (CHAT) to examine scientific practices during program activities within social and cultural contexts. CHAT frames how people learn, act, and negotiate meaning with others, emphasizing the centrality of culture in human activity. Currently in its third adaptation, activity triangle diagrams outline system components and relationships including norms, participant roles, and social relationships. In our research, we examine the interplay of students, tools, and rules. Tools are both physical, such as
microprocessors and light emitting diodes, and conceptual, such as the engineering design process. In this first iteration, we considered adolescent participants, undergraduate facilitators, graduate researchers, and staff as socio-cultural actors in the activity system of the afterschool program.

Over the course of the 2015-2016 academic year, we observed eight Latino students in sixth and seventh grades. In the Maker Literacies program, they learned about circuits, read about young innovators, wrote poetry about place, and created a miniature light up city on display at a local Maker faire. We explored how students engaged in multimodal approaches to learning (e.g. poetry, Making, reading text, creating audiobooks) to assess their gains in reading as measured by the Qualitative Reading Inventory (QRI).

We employed an ethnographic perspective to explore the everyday life of pre-adolescent participants. Sessions were selectively audio or video recorded. Data also include pre and post test scores of the QRI, a neighborhood tour and exit interview, as well as student designs and poetry. Tracing dialogue and multimodal practices across time, through images, audio and video records, uncovered what literacy processes mean in relation to scientific exploration and discovery.

We selected and transcribed video footage then constructed representations of sessions and learning, with transcripts to depict micro-level communication and event maps to illustrate larger-scale activity development. Next a preliminary coding scheme was created to examine scientific practices, and refined through group discussion. To support inter-rater reliability, two researchers separately used the revised coding scheme and discussed discrepancies to reach consensus in the case of disagreement.

Our results reveal that poetry sessions encouraged student socio-emotional growth, leadership development, and confidence in their reading abilities that enhanced understanding in Maker sessions and informed scientific practices. The multimodal practices allowed for alternative but complementary roles in relation to “scientist”, such as writer, storyteller, reader or teacher. There were different points of entry which allowed students diverse ways to connect with conceptual and physical STEM materials and tools. Additionally, average reading ability as measured by the QRI score, increased by two grade levels. These preliminary results show an opportunity to expand research of multimodal literacies with STEM curriculum in order to be inclusive of diverse forms of learning and diverse student populations.
Professors’ Concerns about Introducing Online Conversation Practice into College English Courses

Junko Handa
Meiji University

yoshie_sakamoto@cyber-u.ac.jp

Japanese English education at college level needs to improve learners’ communication skills. For that purpose, lecturers can utilize current technologies to support them, in such a way as online conversation practice using Skype. However, introducing online conversation practice with outside instructors living abroad into college courses seems to have issues or concerns. Thus, we conducted a survey to find out faculty members’ concerns. We will present the results and suggest possible solutions for course designs.

1. Background

In Japan, English language education has recently more focused on communication skills, because Ministry of Education, Culture, Sports, Science and Technology (MEXT) has aimed to cultivate global human resources (2011). One of the key abilities required for becoming “global human resources” is communication abilities with people who use different languages and have different cultural backgrounds. According to MEXT’s policy, English education in Japanese schools has shifted into practical skills more and more.

In general, language learners are now able to use many kinds of ways to acquire
their target languages. Since the Internet was developed, learners have been more easily able to access extensive contents related to the target languages. For example, they can read news articles, watch video clips of news programs, and use language learning sites, etc. Those contents can include videos as well as sounds. Moreover, the recent technology allows language learners to communicate with others using social media or other tools synchronously or asynchronously. You can communicate with others, even with native speakers of your target language, without leaving your country.

Many Japanese English learners, however, have few opportunities to practice to speak English both in their daily lives and in their classrooms. Although they may have experience of being taught English by native speakers of English in school, it seemed that they did not have sufficient opportunities to practice speaking English with the native speakers. Certainly, it is beneficial to provide them with as many opportunities as possible to practice English in an effective way such as online one-to-one lessons with foreign instructors.

As such attempts to provide Japanese college students with opportunities to practice speaking English, the Institute for Service Innovation Studies of Meiji University conducted several studies in the past. In 2012, the research group conducted an online English conversation practice program with the assistance of the instructors who work in the English conversation school in the Philippines for two months. It consisted of one-to-one lessons using online communication application Skype. It was a non-credit program for students who voluntarily participate. After finishing the program, all the participants (41) answered the questionnaire. The results showed that 97.6% students were satisfied with the online conversation practice lessons with the instructors who stayed in the Philippines (51.2 % students were very satisfied and 46.3% were satisfied). Some of them wrote free comments about the one-to-one lessons. One of the comments said, “I spoke a lot during the lessons because they were one-to-one lessons. I gained confidence and I am not afraid of speaking English anymore” (Sakamoto, Handa, Shishido, & Sakai, 2014).

Moreover, the same research group examined the college students’ English learning experience, and 806 students answered the questionnaire. The study showed that 78% of the students had an experience of practicing speaking English in school. 63% had some experience of practicing English with foreign instructors in school, while 67% of the students had little experience of one-to-one English speaking practice (Sakamoto & Handa, 2016). Thus, one-to-one practice may be the type of learning that Japanese learners of English lack. If so, using one-to-one practice in credited college courses need to be considered.
2. **Purpose of This Study**

The past studies showed that Japanese students have rarely had online one-to-one English practice opportunities with native speakers of English or foreign instructors in school. Those one-to-one lessons may be worth including in college English courses. However, if those types of lessons are included, Japanese instructors need to collaborate with outside instructors such as Filipino instructors. Therefore, the purpose of this study was to find Japanese instructors’ concerns regarding providing online conversation lessons which involve the collaboration with the instructors in the Philippines.

3. **Research Methods**

The subjects of this study were professors working in Japanese colleges or universities. Nine of them were professors who teach English and nine of them were professors who teach other subjects. Eight of them had opportunities to develop English curricula, while 10 of them did not have opportunities to develop them.

The data were collected in an online questionnaire form by using mailing lists for professors working in Japanese colleges or universities. This questionnaire was available online from September to October in 2015. 18 professors answered the survey.

The questionnaire consisted of 14 questions. Two questions were about demographics. One question was the professors’ willingness of using English online communication practice, collaborating with Filipino instructors. Three questions were about how to collaborate with Filipino instructors when they instruct students together, such as what kinds of jobs the Japanese professors want Filipino instructors to do. Six questions were about the Japanese professors’ concerns when they use this type of course at college or university. Regarding the 12 questions noted above, 4-Likart scales (4.Agree, 3.Somewhat Agree, 2.Somewhat Disagree, 1.Disagree) were used, and the other two questions were free comments.

4. **Results**

The results were shown in Table 1. The average score for willingness of including this type of online conversation practice was over 3. The Japanese professors were positive about such practice. There were differences between the professors teaching English and the professors teaching other subjects in terms of collaborative teaching
work. It seemed that the professors teaching English would like to ask the Filipino instructors to have practice sessions rather than to teach together. Both the English language professors and the non-English language professors had concern about collaboration.

The free comments included the following points. The comments for Question 4 showed that some of the Japanese professors felt positive about the introduction of the online oral communication program because it would lead to the increase in students’ opportunities to use English. Some other professors represented their beliefs in the effectiveness of such a program. The comments for Question 14 included the following concerns: (1) concerns about Filipino instructors (e.g. “Students may feel negative about Filipino instructors; they may prefer native speakers of English as instructors,” and “Filipino instructors may have different levels of teaching skills or knowledge”), (2) concerns about collaboration and course design (e.g. “I am not sure how to design the course and how to collaborate with Filipino instructors to teach together”), (3) concerns about arrangements regarding learning environments (e.g. “I am not sure how to deal with defects or problems about PCs in the classroom and network”), and (4) concerns about miscellaneous issues (e.g. “Japanese instructors, especially part-time instructors, may lose their teaching positions,” and “I am not sure whether university could accept this type of course or not”). These comments seemed to be reflected in the scores of the other questions.

5. Discussions and Possible Solutions

In order to introduce the online English practice program into college courses, it is necessary to deal with the four categories of the professors’ concerns: (1) concerns about Filipino instructors, (2) concerns about collaboration and course design, (3) concerns about arrangements regarding learning environments, and (4) concerns about miscellaneous issues.

First of all, there may be some ways to deal with concerns about Filipino instructors. When Japanese professors choose a company providing online English conversation service, the information on instructors’ educational backgrounds or training in the company should be important. Furthermore, professors should take trial lessons to see how eagerly the Filipino instructors teach, how well they answer questions, or how friendly they are. In terms of the assumptions of students’ concerns about Filipino instructors, data show that Japanese learners are relatively unconcerned about the
nationality of instructors. As described above, students were reported to be highly satisfied with and have positive impressions about the Filipino instructors (Sakamoto, Handa, Shishido, & Sakai, 2014).

Next, their concerns about collaboration and course design may be the most difficult part. It can also be related to the cost issues. The course design and how to collaborate to teach should be examined for future studies. However, it can be said that the best way to find problems in advance is to implement a trial course after finishing the course design.

In fact, several studies conducted as trial programs helped the members of our research group find problems. These findings are thought to be beneficial to solve some concerns, especially concerns about arrangements regarding learning environments. For example, even though Skype program was downloaded and installed into the computers in the university’s computer rooms in advance, the computers always changed to the default settings after being shut down. Thus, we found USBs in which Skype had already been installed convenient.

Then, it may be helpful for professors to prepare student’s Skype accounts. Actually in the past trial program, the students often forgot their own passwords and took considerable time to start Skype. In addition, professors need to let the Filipino instructors know the students’ Skype IDs in advance to start lessons.

Teaching how to use Skype is also necessary, because students may not be accustomed to how to use Skype. Although the Filipino instructors wrote messages to the students, some of them did not know how to check the message box on Skype.

Setting rules are crucial in case troubles happen. For example, students were easily in a panic when the lesson was interrupted because of networking problems. In addition, absence rules should be decided in advance. Not only students but also instructors could absent from classes (Sakamoto, Handa, Shishido, Sakai, & Aratame, 2016).

This study showed the professors’ concerns about employing online English conversation practice for credited courses and possible solutions or hints to deal with the concerns. Specifically, it is necessary for future studies to find an effective way to design a course and collaborate with outside instructors.

This is a fairly limited and small case study. Thus, the results may not be generalized. However, as one of the case, the results may be useful to deal with professors’ concerns and to implement online English practice programs.

Single-sex or co-ed secondary school classrooms versus achievement in chemistry and mathematics: A case of Kisii County, Kenya

Everlyne Okero and Enock Obuba & Penina Kamina, Ph.D.
Kisii University, Kenya & SUNY Oneonta, New York

Introduction

In majority of Kenyan public secondary schools, boys are taught separately from girls, unlike co-ed schools seen in its primary and in its higher education. Co-ed at secondary school level is debatable in all extents. It is unclear if opting for co-ed produces an all round developed graduate, say, in all spheres of life i.e. socio-emotional or not.

Does single-sex schools promote better attitudes, values, etc, toward life and career preparedness or stereotypes? (Kangethe, Karuti & Nyamanga, 2014) Does the single-sex type of school impact academic achievement at the end of secondary education or higher education in the future? (Nagengast, Marsh, & Hau, 2013). Are both boys and girls equitably instructed in single-sex schools? Do single-sex schools provide for better gender adaptations? Despite the debates, performances in standardized test in co-ed differ from single-sex schools.

Girls generally do poorly especially in STEAM subjects. For example, Table 1 shows mean score performance in Chemistry in the Kenya Certificate of Secondary Examinations (KCSE).

### Table 1: KCSE Chemistry 2010-2013

</tbody>
</table>

Consistently for the four years from 2010 to 2013 the girls mean scores of 17.56%, 22.80%, 25.95% and 23.08% were lower than the boys despite the increase in mean score with time.

Several studies favor co-ed schooling for many reasons, one being improved academic achievement for girls. In Kenya, overall boys’ performances in math were better and the girls improved in segregated co-ed schools (Bosire, Mondoh & Barmao, 2008). Could segregated co-ed schools environment improve performance in STEAM examinations for girls?

Research Question

Chemistry, physics, biology and mathematics are the STEAM courses offered for examination at the end of secondary school in Kenya by the Kenya National
Examinations Council (KNEC). Mathematics is a compulsory subject but chemistry, physics and biology are electives. Majority of students opt for chemistry since they think it an easier subject to do well on high-stake exam. This paper looks at how the nature of some STEAM classrooms categorized by gender influence girls’ learning achievement and performance in high-stake examinations within Kenyan secondary schools. Is single-sex school, co-ed school or co-ed school with separate sex classrooms better for girls’ performance? Aside from passing or failing Chemistry and/or mathematics, what are the implications of these learning contexts?

**Method**

Three different secondary schools from Kisii County were selected using stratified sampling.  
A: Segregated co-ed  
B: All-girls  
C: Regular co-ed  

All schools were assumed to be equal at the beginning of the four years i.e. the entering behavior at Form 1 were the same. Secondly, that there were no particular influences on achievement from different school environs. Third, that individual learner differences were minimal and finally that students’ transfer from one school type to the other were of no consequence.

Data analysis of KCSE in both mathematics and chemistry were done. Data from KNEC examination scores from 2012 until 2014 were analyzed both descriptively and inferentially using ANOVA followed by a Post-Hoc Test analysis.

**Results**

Table 2 shows mean scores of 428 participants from 2012-2014, where 251 students where from single-sex school (school B), 71 students from a co-ed school with joint girls and boys classes (school c) and 106 students from a co-ed school with separate single sex-classes (school A).

Similar results noted with the schools performance with KCSE Chemistry were seen with KCSE Mathematics

**Conclusion**

In this paper we report preliminary findings on girls performance in both Chemistry and Mathematics. Results indicate that in chemistry and mathematics, girls in the co-ed, gender-categorized classroom performed statistically significantly better than the girls in the joint co-ed classroom and those in single-sex classes.

We are collecting more data for both qualitative and quantitative analysis. Mixed methods to be used to determine if there is a relationship between achievement and gender-type of the class. We will be looking at data from 2012-2016 with more STEAM disciplines using Two-Way ANOVA as well as considering all-boys school. This will enable us to make recommendations for policy changes regarding school types effect on girls’ performance in STEAM courses. The qualitative data regarding instruction in different
school types and perceptions would also help explain the statistics.

Implication of findings will be forthcoming once the newly collected data are triangulated. Hopefully the larger data set would confirm the current beginning results that indicate that girls in the co-ed, gender-categorized classroom perform statistically significantly better than the girls in the joint co-ed classroom and those in single-sex classes.

PRESENTATION FORMAT: Student Paper in Panel Session

DESCRIPTION: The SFUSD Thurgood Marshall High “October 11, 2002 Incident” holds a place in U.S. public school history. It’s the second largest law enforcement response (127 officers) on the southeast side of town for a “non-weapon” school fight. Why are police are in public schools when years ago they weren’t? Reviewing the incident’s San Francisco Chronicle’s and San Francisco Bayview’s two-year press coverage may offer clues to why the public supports police in our public schools.
ABSTRACT

The San Francisco Unified School District’s Thurgood Marshall High School “October 11, 2002 Incident” holds a place in U.S. public school history. It is the second largest law enforcement response (127 officers) to a K-12 facility, for a “non-weapon” school fight. Since the incident at Thurgood Marshall, the school has had more than 7 different principals and the replacement of all school personnel but three original site staff from 2002. With the entire Thurgood Marshall community of educators displaced, all the while maintaining ongoing police presence, how have students attending the school been able to attain the academic heights that the student body once had and coveted: more enrolled graduates into UCs/CSUs than the nationally-renowned Lowell High School and a verified $998,000 in Senior Scholarships the year before the incident? Why are police are in public schools, today, when years ago they were not? Using a document analysis of the San Francisco Chronicle’s and the San Francisco Bayview’s press coverage of the Thurgood Marshall’s 10/11/2002 Incident over a two-year period from October 12, 2002 until September 30, 2004, may offer clues to why the public supports police in our public schools.

Regular and assigned police presence in public schools in the U.S. has increased 38% from 1997 to 2007. At the time of the TMAHS Incident, the San Francisco Unified School District (SFUSD) has had a contractual relationship, via a Memorandum of Understanding (MOU) with the San Francisco Police Department (SFPD) for more than a decade, and paid the SFPD a $10,000 stipend for managing the Incident. Hence, the discontinuation of the program proves to be unlikely as the investment by SFUSD is an ongoing one. However, within the community’s recommendations for an updated MOU, there was a call for youth input and culturally relevant training for SROs working directly with youth at schools and in communities of color (Lee, 2004; OCC, 2003). Furthermore, the SFUSD’s Board of Education has implemented its own restorative justice and practice policies (based in part on the Incident) that support youth monitoring and policing themselves with the support of adult allies in the classroom and at their school sites, which is a more empowering way to grow and exist.
Defense of Practice: Teacher Leaders and Administrators’ Articulation of Continuous Improvement to Increase Students’ Mathematical Thinking

Abstract

This study describes the effects of a partnership between an urban district and a math instructional leadership program; the partnership seeks to build schools’ problem-solving capacity and a continuous improvement culture for student learning. District math leaders integrate a peer coaching system, which gives educators a common language and a common ground for identifying, collecting, and analyzing students’ mathematical thinking. To understand the leaders’ problem solving process, we examine “Defense of Practice” presentations by teacher leaders and site and district administrators. A defense is a process to articulate leaders’ specific decisions and the reasons why they make them; through this process, math instructional leaders develop their self-regulation skills. Results are analyzed using the self-regulation phases and subprocesses from Zimmerman and Campillo (2003). Through an examination of the defenses, we offer recommendations for using a systems thinking approach to increase schools’ problem-solving capacity in math education.
Defense of Practice: Teacher Leaders’ and Administrators’ Articulation of Continuous Improvement to Increase Students’ Mathematical Thinking

In the United States, students are underperforming in mathematics as demonstrated by low performance on assessments of skills, procedures, applications, and critical thinking (Trends in International Mathematics and Science Study [TIMMS], 2011; Organisation for Economic Co-operation and Development [OECD], 2013). Internationally, the United States ranked eleventh of fifty-seven countries in fourth grade math and ninth of fifty-six countries in eighth grade math in the 2011 Trends in International Mathematics and Science Study (TIMMS). While TIMMS assesses traditional mathematics content, the Programme for International Student Assessment (PISA), another international assessment of mathematics, examines students’ application of knowledge to real-world problems. The United States ranked twenty-seven out of thirty-four Organisation for Economic Co-operation and Development (OECD) countries and performed below OECD average in mathematics in 2012 (OECD, 2013).

Improving math education to increase student achievement is a complex problem with multiple elements and relations in the system, which are likely interdependent (Funke, 1985 as cited in Fisher, Greiff, & Funke, 2012). Educators at the local, state, and federal levels have different approaches and plans for addressing this issue. Some argue for more money to fund programs, others focus on hiring the best personnel, and still others want laws and policies to hold educators accountable for reaching the goal of improving math education for all students (Fowler, 2009).

Educational policies of the past two decades have centered on external accountability for teachers, schools, and districts. In 2002, No Child Left Behind (NCLB) required states to yearly assess students in math and reading in grades three through eight and once in high school, report
the results by subgroups, and ensure “highly qualified” teachers were evenly distributed between poor and wealthier schools (Klein, 2015). In 2009, the Race to the Top grants favored states that permitted the use of student test scores in teacher evaluations, and many districts revamped their evaluations of schools and teachers by utilizing state data systems, aggressively implementing school turnaround strategies, and adopting common standards (The White House Office of the Press Secretary, 2009). Now with the Every Student Succeeds Act (ESSA), fully implemented in 2017-2018, states can pick their short- and long-term goals around standards proficiency, English-language learners, and graduation rates and are required to submit accountability plans to the Department of Education. States must continue to assess elementary and secondary school students in math and reading, but they can choose their own rigorous academic standards and standardized tests, i.e. SBAC, PARCC, or state-created exams (Klein, 2016).

The federal government, states, and districts provide guidelines and requirements in an attempt to hold educators responsible for student learning and increasing math achievement. These external accountability systems are “a complex arrangement of policies, created by actors and interests outside of schools, who are in position to reward and punish schools, aimed at impacting practices inside schools, and requiring reporting to diverse external audiences” (Knapp & Feldman, 2012, p. 667). These measures aim to affect professional accountability in schools by defining what effective instruction and high student achievement looks like and thus, bringing everyone to a consensus. However, the implications of accountability include standardization, control from authorities, external auditing, focus on political goals, and compliance with administrators’ or politicians’ decisions (Solbrekke & Englund, 2011). External accountability “demands can be experienced as onerous, punitive, intrusive, and de-skilling,” negatively affecting teacher practice while also increasing the inequities between schools (Knapp &
Feldman, 2012, p. 668). Although external standards-based accountability measures are meant to improve teacher practice and student achievement, accountability systems may be having the opposite effect. Therefore, external accountability measures alone are not the solution to the complex problem facing math education in the United States.

Although district and school leaders are held accountable to external measures, such as standardized tests and evaluations, many are focusing their attention on internal accountability and taking a public learning stance to make instructional practices and outcomes transparent (Knapp & Feldman, 2012). Carnoy, Elmore, and Sisken (2003) describe three tiers of internal accountability: “the individual’s sense of responsibility; parents’, teachers’, administrators’, and students’ collective sense of expectations; and the organizational rules, incentives, and implementation mechanisms that constitute the formal accountability system in schools” (p. 4). Thus, accountability lies within schools’ relationships among students, teachers, and administrators because “the logic of internal school accountability typically assumes that those who work closest to teaching and learning interactions are in the best position to judge each others’ work” (Knapp & Feldman, 2012, p. 673). The school culture and interactions between stakeholders are critical. Instead of solely focusing on external accountability, leaders work towards professional responsibility by building trust, engaging in internal evaluations, thinking proactively, and having more autonomy but yet still feel a moral obligation to students and peers (Solbrekke & Englund, 2011). The commitment is not through formal certification and accreditation but peer obligation (Gonzalez, 2012).

However, Hult and Edstrom (2016) cautions educators about internal accountability: it is challenging to observe teacher and student actions taken and their results, which make reporting and accounting difficult. One teacher in the study by Hult and Edstrom (2016) commented, “Our
own reflexive evaluations that we do after every lesson or teaching segment, they are hard to show [in external evaluations]. That knowledge stays with us, as our experience instead.” Others supported reflection and dialogue as critical ways to improve teaching and learning and emphasized that teachers needed more time with colleagues to engage in these reflective discussions. One option is a written self-reflection, but teachers worried about the additional effort to document without dialoguing with peers (Hult & Edstrom, 2016).

As with any complex education problem, there are no quick solutions. Pink (2009) states the “carrots and sticks” approach may work for mechanical tasks, but a different approach is needed for problems that require ingenuity and commitment (as cited in Fullan, 2016). Therefore, leaders are charged with strengthening a school’s internal accountability system “by bolstering collective expectations and installing a mechanism for exposing practice to scrutiny – while at the same time aligning practice with external expectations” (Knapp & Feldman, 2012, p. 686). Although developing internal capacity and accountability from within are recommended, literature provides few suggested processes or structures to facilitate such accountability.

The purpose of our research project is to describe how K-12 math instructional leaders, including district and site administrators and teacher leaders, engage in problem solving, using an internal accountability process called the “Defense of Practice.” Specifically, we want to explore the instructional leaders’ ability to use data, identify a root cause of a problem, and solve a complex problem. Because we value engaging in this problem solving process routinely, we chose to analyze our data using social cognitive theory, specifically focusing on the “process by which learners personally activate and sustain cognitions, affects, and behaviors that are systematically oriented toward the attainment of learning goals” (Schunk & Zimmerman, 2008, p. vii).
Theoretical framework

Social Cognitive Theory

Perhaps best known for developing social cognitive theory is psychologist Albert Bandura, who was among the first to consider an individual’s self-beliefs in addition to behaviors and environmental factors. By 1986, Bandura designed a model of triadic reciprocity: “behavior, cognition and other personal factors, and environmental influences all operate as interacting determinants that influence each other bi-directionally” (Bandura, 1989, p. 2). Reciprocity and self-efficacy, or “beliefs about one’s capabilities to learn or perform behaviors at designated levels,” were two key concepts of Bandura’s social cognitive theory (Zimmerman, 2001, p. 126). Learners with high self-efficacy take action and continue to improve their understanding, but leaders with low self-efficacy do not take productive steps to further their learning. Learners with low self-efficacy do not think highly of their capabilities to successfully perform the task and, thus, are not proactive. While Bandura’s social cognitive theory offered a more complete model of learning than previous behaviorist theories, other social cognitive theorists, such as Zimmerman and Pintrich, argued that there were more influential factors, including motivation and self-regulation.

Self-regulation

There are many theoretical perspectives of self-regulation, but all emphasize several critical elements: learners are proactive and exert control on their learning processes and environments; learners actively develop their skills and strategies; and motivation is important (Schunk, 2005). Gitomer and Glaser (1987) see self-regulation as roughly equivalent to metacognitive awareness or metacognition (as cited in Schunk, 2012). Engaging in metacognition, learners monitor, direct, and regulate actions toward goals (Paris & Paris, 2001).
According to Bandura (1986), self-regulation processes include self-observation, self-judgment, and self-reaction through which learners need to closely watch their own behavior (observation), compare and evaluate their behavior to the standard and/or goal (judgment), and respond to the comparison and feedback provided (reaction). Zimmerman (1998) supported Bandura’s (1986) model of triadic reciprocity: personal, behavioral, and environmental factors, and he saw these interacting in a cyclical process that changes and needs to be self-monitored. Zimmerman and Campillo’s (2003) self-regulation cycle phases in Figure 1 include: forethought, performance, and self-reflection.

Figure 1

Phases and subprocesses of self-regulation

In the forethought phase, the learner determines a goal of a behavior within a set time period. Setting a goal is critical because later the learner will self-evaluate his or her learning and performance from this standard. During this phase, the learner also creates a strategic plan to identify specific strategies, behaviors, or thoughts that will be used during the performance phase. While goal setting and planning, the learner considers self-motivation beliefs, including self-efficacy, outcome expectations, intrinsic interest/value, and goal orientation. The learner asks, “Can I do it?” and “Why is this important?” In the performance phase, the learner is engaging in self-generated actions and self-observation. While performing, the learner is self-
monitoring as he or she is meta-cognitively aware of the quality of his or her competency and skill levels. Throughout this phase, the learner asks, “Do I think I have performed a flawless process thus far or have I made any mistakes?” In the self-reflection phase, the learner self-judges his or her learning and self-reacts to the performance. The learner self-evaluates based on his or her goal for performance and notes perceived causes of success or failure. The learner also reflects on his or her satisfaction with the performance (Cleary, Callan, & Zimmerman, 2012).

Methods

Context

The Math Leadership Corps (MLC) is a collaborative partnership between a university School of Education, private funders, and school districts. MLC works with districts to strengthen their leadership and internal problem solving capacity in math education. District math leaders, including teacher leaders and administrators, integrate a peer coaching system, which gives educators a common language and a common ground for identifying, collecting, and analyzing students’ mathematical thinking. Teacher leaders and administrators create a culture of continuous improvement and shared leadership, which allows them to build and implement a coherent math program that promotes student learning and results in high levels of student equity, access, and success. Teacher leaders continually utilize coaching and student data to improve practice and attain the vision where all students have the mathematical reasoning and procedural skills to design creative solutions to complex problems.

The K-12 math instructional leaders present semi-annual “Defense of Practice” presentations, during which each leader articulates his or her specific decisions and the rationale for those decisions. Each participant has ten minutes to defend. These presentations are an
opportunity for participants to move from collaboration to internal accountability for their district’s shared vision. The defenses provide opportunities to maintain quality instruction.

MLC describes a defense as the process in which math instructional leaders articulate their specific decisions and the reasons why they make them. The purpose is to analyze the intentional decisions necessary for all math instructional leaders within a K-12 district to become self-regulating learners who seek continuous improvement. Leaders analyze progress toward goals, build colleagues’ will and skill for increasing student self-regulation and achievement in math, and continuously develop as instructional leaders to influence student learning.

**Sample**

In 2015-2016, MLC partnered with two urban K-12 school districts, District A and B, to begin two years of intervention followed by one-year sustainability. District A serves 3,876 students, 85% underrepresented minorities, 45.1% qualify for free and reduced lunch, and 8.7% English Language Learners. District B serves 3,415 students, 45.7% underrepresented minorities, 11.5% qualify for free and reduced lunch, and 5.7% English Language Learners. This study analyzed K-12 math leaders’ defenses from May 2016. The eighteen participants included two district administrators, seven site administrators, and nine teacher leaders in Figure 2. In District A, one district administrator, four site administrators, one elementary teacher leader, and four secondary teacher leaders presented their defenses; two co-principals presented together for a total of nine District A defenses. In District B, one district administrator, three site administrators, two elementary teacher leaders, and two secondary teacher leaders defended.

Design

The purpose of our research project was to describe how K-12 math instructional leaders engage in problem solving, using an internal accountability process called the “Defense of Practice.” Specifically, we want to explore the instructional leaders’ ability to use data, identify a root cause of a problem, and solve a complex problem. The research question is: How do math instructional leaders solve complex math education problems related to student learning? Because the study concentrated on describing the math education instructional leaders’ problem solving process, a qualitative design was used.

Data Generation

We collected the math instructional leaders’ defense PowerPoint presentation slides. Document analysis was used to learn about the leaders’ problem-solving capacity and self-regulation skills. Audiotapes and notes from the defense sessions were not available to analyze but are recommended in future studies. The MLC director and colleagues created a recommended structure for the defenses, including state a goal that elicits teacher and/or student actions during rigorous mathematics and aligns to the school site focus, provide rationale for actions and evidence of student engagement and achievement over time, articulate next steps based on data, and provide a self-reflection on the process of continuous improvement and how feedback has supported students and teacher learning.

Prior to beginning the study, the Institutional Review Board at Loyola Marymount University approved the study procedures. The MLC director collaborated with the participating district leadership to schedule the defense presentations. MLC faculty members, who support the secondary teacher leaders, analyzed the presentation slides from the district administrators, site administrators, and teacher leaders.
Data Analysis

Data analysis began after the defenses were completed. Participants emailed their presentations to the MLC director for document analysis. Prior to the document analysis, a guide was created to capture the participants’ information (school, grade level, instructional leader title) and specific issues aligned with the research question and theoretical framework (ability to use data, ability to identify root cause of a problem, ability to solve complex problems, metacognitive ability, and ability to self-regulate), evidence, preliminary analysis, counterevidence, and summary. For the first coding round, a MLC faculty member used closed coding with predetermined codes aligned with problem solving. After examining all defenses of practice, the researcher reviewed her notes and began to group some of the evidence together. The researcher reviewed the data a second time with the lens of self-regulation from social cognitive theory. The process of coding and developing categories helped to make sense of the data and thus the participants’ problem solving capacity and self-regulation skills.

Findings

The purpose of this study was to understand how instructional leaders solve math education problems. Through the data analysis process, three critical themes emerged: data use when goal setting and evaluating, planning for action, and motivation to defend and improve practice.

Data use when goal-setting and evaluating

All 17 defenses included two or more presentation slides with data. Types of data included student observations, photos of students and teachers, assessment data, coaching conversations, and student and teacher surveys. Although participants drew conclusions from the data presented, it was often unclear how data was used to set goals, create action plans, and
evaluate if objectives were met.

In the forethought phase, it is important to state a goal or expectation against which performance can be compared in the self-reflection phase (Cleary, Callan, & Zimmerman, 2012). Of the district and site administrator defenses, seven out of the eight defenses included a vision statement. The two district administrator defenses began with the vision while the five site administrators’ visions were towards the end of the slides. Following the vision statement, three site administrators and two district administrators provided student data, but an evaluation to a standard was not presented to understand performance so far. Thus, most of the visions appear to be future objectives for the following year and rely on the collaboration of multiple stakeholders. Three out of five site visions begin with “we” or “community,” emphasizing administrators and teacher leaders working together towards the vision.

As for the teacher leaders, all District A teacher leader defenses and three District B defenses included a goal. Goals were written from the perspective of students, teachers, and teacher leaders, and the quality of the goals varied from specific to general. A teacher leader from District B explained this specific process goal for a teacher:

By May 2016, 87% of students will be able to use addition and subtraction within 20 to solve word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using objects, drawings, and equations with a symbol for the unknown number to represent the problem, at the level of proficient or above, as shown on a teacher created assessment with formatted math problems and as scored by a teacher created rubric.

Other teacher leaders stated general instruction goals, including “making sense of problems” or “create goals for active practice.” Some teacher leaders provided coaching goals. A teacher
leader from District B stated a specific goal: “Asking better questions in order to get the teacher to do the thinking and get the teacher to stay on task (redirect conversation).”

All of the goals were learning oriented, but none provided clear outcome expectations for students, teachers, or the teacher leader and only one included a brief explanation of why the goal was important. The teacher reflected, “I feel that the consistency will make the students more comfortable with all aspects of solving word problems.” One teacher leader and one site administrator gathered survey data on teacher voice, asking if the program or their coach was helpful, and the teachers expressed positive experiences with their on-site coach, which might be influencing their instruction. However, the survey data was not directly tied to the teachers’ instruction, and the teachers’ values and intrinsic interests in achieving the goals were unclear.

Without beginning with a solid goal in the forethought phase, it was challenging to understand the participants’ self-reflection. All participants included student and/or teacher data in their defenses, but analysis was vague. One District A teacher leader simply stated, “[S]tudents saw growth”; he then showed achievement data from three assessments in Figure 3. However, there was no timeline or description of a progression for the assessments. It seems that this was a final analysis and used for evaluation as opposed to monitoring throughout and making instructional changes during the performance phase.
None of the participants compared their data to a standard or benchmark, which made it difficult to determine whether the participants had met their goal. Without this critical step in the self-reflection phase, it is also challenging to attribute success or failure, understand reactions to the results, and inform cyclical adaptations.

**Planning for action**

Another critical component of the forethought phase is creating a strategic plan prior to action in the performance phase. As recommended by MLC faculty, all District B site administrators offered “small” and “long” steps, detailing specific meetings, infrastructure for collaboration, or supports, to work towards the vision. These action steps were stated at the end of the defense, so performance data had not been gathered or evaluated yet. In District A, two out of three site administrator defenses stated focus areas, i.e. culture of trust and collective responsibility, and what on-site collaboration looked like during spring 2016. For example, one defense explained:

How we create a culture of trust:

- MLC program is viewed as a platform for coaching, rather than evaluation.
Productive and supportive communities are created and sustained by ensuring that teachers and coaches have materials and resources necessary to implement the program, as well as ample prep time for planning and coaching sessions.

The principal and coach work closely and communicate frequently about program goals.

The principal, coach, and teachers have worked together and agreed upon goals, a focus MP and NCTM, and observation/data collection sheets.

These site administrators also articulated short- and long-term steps for the following school year. Metrics for evaluating efficacy were not included in the defenses.

Three out of five District A teacher leaders and all District B teacher leaders provided their coaching cycle or actions. Two District B teacher leaders provided a visualization of their coaching in Figure 4 to demonstrate how planning, lesson observations, and debriefs relate to one another.

Figure 4
Coaching cycle

While this cycle was not tied directly to a goal, it provides details about the general support a teacher gets from a teacher leader to meet his or her goal. One District B teacher leader provided
an initial plan that focused on a specific coaching goal and, as evidence of the teacher leader’s self-monitoring, an updated plan and self-reflection.

Without a clear plan of the actions or success criteria for the performance phase, it is not easy to observe the impact of the teacher leaders and administrators on teacher and student learning. Because only the presentation slides were analyzed, the participants may have articulated their plans but not included them in the submitted materials. Lack of a plan may be due to limited time for planning, misunderstanding of the goal, a non-complex goal that does not require a plan, or pressure for a quick fix within the classroom. Future research may study why participants did not articulate and/or strategically plan for performance.

**Motivation to defend and improve practice**

Motivation elements include mood, self-efficacy, success expectancy, satisfaction/affect, intrinsic interest/value, and causal attribution (Cleary, Callan, & Zimmerman, 2012). In District A, two site administrator defenses stated their visions and next steps with research-support. It is assumed they are interested in the similar outcomes or value the researchers’ approaches, therefore, motivating the site administrators to take action. One of these administrators hopes to “co-teach at least one unit…to be truly immersed in the program,” showing she values the program and is fully invested. In District B, site administrators seemed satisfied with their current direction. One administrator stated things were “improved” and “clarified” for the next school year, and he hoped to “continue to optimize coaching.” Another site administrator shared positive feedback from her teachers about the program and provided support. It was challenging to find articulation of the motivation elements in the district administrator defenses. Their self-reflection about progress thus far was absent.
Two teacher leaders expressed motivation to continue improving their practice and noted specific steps they could take to do so. A District B teacher leader reflected on the strengths, missed opportunities, and next steps for the following year. She expressed satisfaction with her coaching relationship and talked about a recent positive shift:

Currently, I have a really good relationship with my partner coach. We both enjoy conversations about different strategies and how we can use them in our classroom. Over the past few months and even over the past few weeks, my partner teacher has really increased his willingness to try out different things in his classroom and have a positive reflection as to how his students are responding.

After listening to audio of her coaching conversations, she highlighted questions that engaged the teacher in dialogue about student learning, so she plans to use similar questions in the future. She attributed challenges to lack of time, stating, “Since timing was a big issue this year, I am hoping that next year, my partner teacher and I can set a more structured time to meet on a weekly basis.” Causal attribution and self-satisfaction/affect are highly predictive of motivation and persistence (Cleary, Callan, & Zimmerman, 2012).

One District A teacher leader shared that she knew she needed to move outside of her comfort zone, which was initially explaining instructional practices to her teachers. Her coaching practice shifted to making data driven decisions (closed questions), asking open-ended questions, and now focusing on hypothetical student centered questions. As a symbol of her own growth and success, her presentation included a small plant growing over time.

Overall, the presentations included limited evidence of participants’ motivation to engage in this form of internal accountability. This may be because the researchers analyzed only the presentation slides, not the transcripts, or participants had a short time to defend.
Discussion

Leaders are responsible for building a school’s internal accountability system around collective expectations and a method to scrutinize instructional practice (Knapp & Feldman, 2012). The defense is a process to engage educators in collaborating around instructional solutions and providing feedback to each other.

The findings of this study highlight the importance of collecting, analyzing, and using data for a purpose. Just as it is unacceptable to explain instructional or leadership actions without evidence to support one’s claims, an abundance of random data on students, teachers, or a site culture is not appropriate either. Reviewing presentations from District A and B, one might conclude that sufficient data was provided, but the participants’ articulation of their metacognition was missing. The researcher is left wondering how data-based decisions were made, what were the solution options, and why the chosen solution worked. Leaders need to collect data to adequately monitor the success or failure of a clear plan of action in order to determine if the solution is maximizing student learning. Data, specific to math education, should be collected throughout performance and over time to evaluate the solution (Cleary, Callan, & Zimmerman, 2012). Careful articulation of a need in math education, how success is defined, solution options, and the implementation and monitoring of a chosen solution allow for leaders to understand others’ solution discovery process and provide feedback to those defending.

Internal accountability systems rely on a collective effort, transparent plans and data, and dialogue about successes and challenges. All administrators’ presentations explained their school structures that allowed time for teachers, teacher leaders, and administrators to converse, sharing analyzed data, working together to plan lessons, and engaging in activities around a
common vision for student learning in mathematics. However, the metrics for efficacy were unclear. A few teacher leaders shared teachers’ compliments about their coaching and support. Yet few defenses expressed the importance of these collaborations and how interactions between participants led to improved solutions. Without these connections, solutions and individuals appear isolated instead of part of a systematic solution for math education created by a collaborative problem solving team.

**Limitations**

Because the data collection was limited to presentation slides, there were some limitations to the study. Bandura’s (1986) model emphasizes environmental and reciprocal relationships, but collaboration and context are not represented in the current presentation format. Parts of the self-regulation cycle, especially some of the motivation components, may have been verbalized but audio recordings were not obtained. Participant or observer notes would have provided context and more information about the participants’ problem solving process. Also, the presentation slides appear to be created by one person, but in actuality, they were co-created between a teacher and teacher leader or teacher leader and administrator. Data collection and analysis will be altered for the next study.

**Conclusion**

To support participants in data use and collaboration when problem solving, the Math Leadership Corps (MLC) has shifted its approach to a systems engineering and collaborative solution discovery process of defining a desired outcome, searching for solution plans, and taking actions that will maximize success in math teaching and learning. Systems engineering applies systems thinking to build and sustain complex systems, such as math teaching and learning. Systems thinking emphasizes relationships between people, processes, and systems
within the larger system (Senge, 2006); it brings together individuals’ values and learning with group learning to solve complex problems. This way of thinking breaks the traditional view that individual leaders provide solutions. When faced with a complex problem, collaborative problem solving is needed to utilize the collective intelligence of the group (Heifetz & Laurie, 1997). Using each other as resources and learning together will result in better solutions.

Therefore, the MLC partners with school districts who are interested in driving policy change within their district and beyond. MLC advocates on behalf of the school district’s policy on student equity, access, and success in mathematics, by working together, through a systems engineering design process, to create an internal accountability system for student learning in mathematics. The systems approach strengthens problem solving and leadership capacity for system accountability, not individual accountability. Looking ahead, defenses will be presented by partners that collaborate and interact frequently to solve complex problems. After these presentations, participants will do a systems check to analyze how well people, processes, and systems within the larger system are operating. By creating a strong internal accountability, the school district can focus their policy efforts on student learning in mathematics, defined as equity, access, and success.

Abstract

K through 12 Education has changed dramatically. The explosion of technological advancements require savvy educators, and the development of current educational leaders. Many companies which produce curriculum materials are motivated by profit margin. Emerging educational leaders must carefully examine data and professional development needs prior to making commitments.

The purpose of this research is to examine the analysis of curriculum materials through the lens of future educational leaders in a graduate education program. The candidates analyzed attributes of nine middle school curricula for effective teaching and learning strategies. The research is designed to examine the vision set forth by these emerging educational leaders. A qualitative approach will be used to compare teaching approaches; categorize methods and examine the most effective methods of engaging students. Outcomes will initiate a deep discussion concluding that the most effective strategies to engage students in learning are measured with valid, reliable, assessment tools. The success of product design is based upon the ability to understand student learning, bypass personal obstacles, which distract the learning process, and effectively assess results. This paper will determine the optimum strategies to engage student learning, perpetuate success and provide a framework for emerging educational leaders to evoke sound academic decisions.
How students problem solve after completing a DNA replication modeling activity – a pilot study

**Topic:** STEM Education

**Paper Presentation**

**Abstract:** The Next Generation Science Standards (NGSS)) has stipulated an increase in the use of scientific models and modeling in biology classes. The goal of this research is to discover how students problem solve about DNA replication after a DNA replication modeling activity. Students solved a DNA replication activity out loud and the findings of how they think through the problem will be discussed.

How students problem solve after completing a DNA replication modeling activity – a pilot study (in progress)

**Introduction:**
As more countries are stressing the use of more authentic classroom experiences that focus on science models and modeling, it falls on teachers to develop these type of activities since few exist, especially in the area of biology. However, it has been shown in studies that teachers do not have a solid understanding of science models and modeling (Moritz & Kruger, 2016; Ware, Malone, Irving, & Mollohan, 2016). Both of these studies, one set in Germany and one in the United States, determined that teachers mostly understood models to be copies or physical models. Teachers rarely use models in the classroom nor evaluated them against other models, tested, modified or used them in a predictive sense. Thus, teacher understanding hampers the development of true modeling activities if their understanding is limited.

To alleviate limited understanding, there have been some science model-based and modeling curriculum units that have been developed for classroom use (Dukerich, 2015; Jackson, Dukerich, & Hestenes, 2008; Malone, Schuchardt, & Schunn, 2015; Passmore and Stewart, 2002; Posthuma-Adams, 2014; Schuchardt, & Schunn, 2016. However, many of these are in areas other than biology. In addition, the studies usually focus on student content gains between treatment and comparison groups (Hestenes, Wells, & Swackhamer, 1992; Malone, Schuchardt, & Schunn, 2015; Schuchardt, & Schunn, 2016), understanding of scientific models (Passmore and Stewart, 2002) or gains in scientific reasoning (Coletta, Phillips, & Steinert, 2007). There are not many studies that focus on the benefits of model based and modeling focused activities on students’ problem solving abilities in biology. This pilot study is an attempt to fill this gap.

**Research Question:** How do students solve replication problems after a modeling based activity focused on DNA replication?

**Meselson-Stahl Classroom Modeling Activity:** Prior to the Meselson-Stahl activity the students had completed an activity that allowed them to come to the consensus that daughter cells had identical copies of chromosomes. At the start of the modeling activity students are asked how they think the DNA replicates. After the students have time to develop different ideas about how DNA might replicate the instructor introduces them to the historical figures of Meselson and Stahl and explains that they had puzzled over that same question. The students are then introduced to the experiment developed by Meselson and Stahl. They are told that the experiment developed insured that cells replicated their DNA in a condition that only allowed the cells access to heavy isotopes. Therefore, they created cells with “heavy” DNA. The students are then introduced to the second phase of the experiment when Meselson and Stahl took the cells with the heavy DNA and allowed them to replicate.
in a condition where they only had normal or “light” isotopes available during the replication process.

The instructor then explains to the students that they will be using chenille sticks and pony beads to model this experiment and determine how DNA replicates. Each pair of students gets a DNA strand (chenille stick with “heavy” isotopes represented by blue pony beads) – see figure 1.

At this point the instructor can ask the students what would happen if they put heavy and light isotope strands in a solution. The majority realize it will produce a density gradient. If necessary due to the background of the students’ density gradients can be explored. Next, the students are asked to predict and justify what banding pattern they would expect to see if the heavy isotope labeled DNA they initially have was centrifuged and a density gradient was developed. The students write down their predictions and then the instructor passes out to each group the lab result strips (see figure 2).

The next step in the modeling activity is to allow the students to replicate their “heavy” DNA using the normal or light isotope/pony beads. The student groups are given a few minutes to reach consensus about how they believe the DNA might replicate. They are given two chenille stick strands and light beads represented by a different color (see figure 3). The students replicate the DNA per their consensus model. The students use a mixture of replication methods with usually dispersive, conservative or semi-conservative being represented. See figure 4 to see a semi-conservative replication, figure 5 for conservative replication and figure 6 for dispersive replication results.

After the replication the students are asked to predict where the bands would be located if a density gradient experiment were run. Finally the second strip is handed
out to the students to compare with their model’s results (see Figure 7). The instructor at this points can tell the students that the lab sent them the results of their first replication and hands out copy of Meselson-Stahl’s chart 2 strip to each group. At this point most students predictions match the chart strip in Figure 5. If their model results do not match the actual results of the density gradient the student have to reinvent their model of DNA replication and attempt the experiment again.

Once the group’s model predictions matches the data as shown on strip 2 the group can move onto the next or second replication. During the second replication the students will end up with four replicated strands of DNA. The students again predict what the density gradient would look like based on their modeling results. Then the instructor can give them the lab results or Strip 3 (see Figure 8).
