These strips are copies of the actual data recorded by Meselson and Stahl. Students will need to analyze the results and determine if it matches the possible outcome of their model. If it does not they will need to change their model so that its results meet the data shown on the third chart strip. By this point students should have developed the semiconservative model of DNA replication.

Participants: Seven high school biology students were interviewed after participating in a modeling based activity focused on the Meselson-Stahl experiment. The students were from a rural school in the Midwest of the United States and had been taught using a newly designed Modeling Instruction™ course in biology. The students’ had taken part in the Meselson-Stahl modeling activity [X weeks] prior to the interviews.

Study Design: The students were asked to talk aloud as they solved a biology problem based on DNA replication. The problem designed for the talk aloud it listed below:

1. A single E. coli has a DNA strand that looks like this:

When one new strand is being made a mutation occurs at one point. This caused a bacteria with a mismatched base pair it its sequence, resulting in a G-G pair. (see the figure below).
During replication phase of one single E. coli a nucleotide substitution occurred on one strand of its DNA.

E. coli that have the point mutation are resistant to penicillin.

For the next two generations produced from this bacteria,
- Draw circles to show how many bacteria will be produced.
- Place a star in each of the bacteria that will contain the mutation.
- Place an R in each of the bacteria that are resistant to penicillin
- Under each offspring bacteria draw the DNA sequence that it contains.
- Show which first generation bacteria produced each second-generation bacteria by connecting them with arrows.

The audio of the videos was transcribed then linked back to the videos. A coding scheme will be developed to analysis the talk aloud using grounded theory (Glaser & Strauss, 1967). The coding will be checked via inter-rater reliability.

**Analysis and Results:** The findings will be discussed at the presentation. Examples of the students’ responses will be shown as well as how those responses were coded using the developed coding scheme.

**Conclusions and Ramifications:** During the presentation we will discuss our findings and how they impact on suggested changes to the modeling based curricula.

**Limitations:** This is a pilot study and has a limited number of students. Plus, there are only treatment students and no comparison group of students. Finally, there was only one problem used. The final study will contain a comparison group as well as a minimum of two problems to solve during the talk aloud.

SIGHT LINE ANALYSIS OF WORKERS TAKING INSTRUMENT EXAMINATIONS FOR GENERAL APTITUDE TEST BATTERY

Seiko Taki, and Takamitsu Kiyosawa

Abstract

The General Aptitude Test Battery (GATB) is widely used as a method for evaluating cognitive ability with regard to employment selection in Japan. Moreover, results of the GATB have been used to allocate staff to departments ranging from clerical to assembly ones. However, at actual manufacturing and assembly sites, workers receive mixed evaluations of ‘slow work’ and ‘fast work’ from the site administrators even though they all have high GATB scores for their job.

This study measured ocular movements of employees taking instrument examinations for the General Aptitude Test Battery used by businesses when recruiting or reassigning personnel, in order to determine the relationship between work capacity and ocular movements in performing simple tasks.

Four types of equipment tests are performed in the GATB, using two types of equipment, the manual test board and the fingertip dexterity test board. These tests measure the "dexterity of hands and arms" (M-values) and the "dexterity of fingertips" (F-values). The dexterity of hands and arms is defined as the capacity to move hands, arms, and wrists in a skillful manner, e.g., capacity to move hands and arms skillfully as intended, lift objects, or quickly and accurately switch hands holding an object, while maintaining specified positional relationships. The dexterity of fingertips, on the other hand, is a capacity to handle small items skillfully, by quickly and accurately moving fingers. Higher scores indicate higher capacity for both measures. In this study, the participants were 10 males with the age of 20 to 24 years old. The differences between highly capable workers and less capable workers were identified by analyzing sight lines of workers.

The results of the study are expected to prove useful for businesses in conducting their work training. We need to consider implementation of this test in other business settings and investigation into whether similar results can be obtained under different experimental conditions to be important avenues for future research.

Keywords: sight line analysis, General Aptitude Test Battery

1. Introduction

While it is difficult to convey an expert’s skills to a beginner, if information about line-of-sight is shared, the beginner is able to actually perceive the expert’s point of view, which may result in effective support for learning skills that are difficult to express in words. It is proposed that beginners should be taught the expert attributes using the ACT model (Adaptive Control of Thought) [1].

This research focuses on the eye movements of high and low scorers in the General Aptitude Test Battery (GATB). It attempts to clarify the indices related to productivity improvement by analyzing the lines of sight of the high scorers.
2. Experiment and method of analysis

2.1 The General Aptitude Test Battery [2]

The General Aptitude Test Battery (GATB) is a test approved by the Ministry of Health, Labour and Welfare that measures professional aptitude via attributes such as manual and finger dexterity. This research uses two kinds of GATB boards (the manual operations test board on the right hand side of Figure 1 and the finger dexterity test board on the right hand side).

In the case of the test using the manual operations test board, Experiment 1 involved the action of holding the pole (peg) with both hands and inserting it in the designated hole (“inserting test”). Experiment 2 involved the action of turning the pole upside down using the dominant hand (“turning upside down test”).

In the case of the test using the finger dexterity test board, Experiment 3 involved the action of holding the rivet and washer at chest height, joining the rivet and washer together and inserting them (“joining together/combination test”). Experiment 4 involved the action of separating the already combined rivet and washer, returning the rivet to the designated hole, and moving the washer to the designated location (“separating test”).

2.2. Experiment method

The examinees, ten males aged 20-24 years (A-I below), carried out the tests using the two kinds of GATB boards as shown in Figure 1. Eyeball movement at the time of the test was measured using an eye movement measurement device. The marking of examinees and test guidance followed the GATB (required operations) guidance compiled by the Ministry of Health, Labour and Welfare [2].

2.3 Analysis method

In this study, we measure and analyze the duration of time spent looking at a point and the movement time of the sight line for sight line analysis. Figure 2 shows the three gaze points and three sight line movements from Experiment 3.

3. Analysis Result and consideration

The scores of the examinees in the tests using the GATB boards are shown in Table 1. Specifically, the Experiment 3 results are shown in this paper.
3.1 Gaze points and sight line movements in Experiment 3

The change in time spent looking at a point time of Examinee A, a high scorer in Experiment 3, is demonstrated in Figure 3. The proportion of time spent looking at a point for each examinee is demonstrated in Figure 4.
All examinees focused the most on the “combination.” However, it was found that Examinee A, who was a high scorer in Experiment 3, did not focus on the “washer” at times. Further, the proportion of time spent looking at the washer was small.

### 3.2 Comparison of average times spent looking at a gaze point

T-tests were carried out in order to determine whether there was a variation in the average looking time of the high scoring Examinee A and the other examinees. The results of that test are shown in Table 2.

The result was that in most combinations a significant difference was observed between the average looking time of Examinee A and the average looking times of the other examinees. In other words, it can be said that there is a difference in the average looking time of Examinee A in comparison with the other examinees.

### 4. Conclusions

This research carried out sight line analysis of workers focusing on simple tasks. Experiment 3 made it clear that all examinees spent longer periods of time looking at the combination, and that the high scorers spent shorter periods of time looking at the washer. In most of the combinations, a statistically significant
difference was obtained between the average looking times of the highest scorer and of the other examinees.

As there is a bias in the examinees’ scores in this research, in the future there is a need to increase the number of examinees and determine whether the same results would be obtained even with other examinees.

Productive Affix Knowledge
and its Relationship With Known Words

Tatsuo ISO
Tokyo Denki University

Kazumi AIZAWA
Tokyo Denki University

Abstract

This study aimed to provide empirical evidence towards clearer understanding of the relationship between second language learners’ vocabulary size and productive affix knowledge. It also aimed to shed light on the organization of affixes in the mental lexicon through comparing test results of more and less frequently used words with affixes. In the first experiment, 270 Japanese learners of English at college level took an online test of productive affix knowledge with 30 affixes and a vocabulary size test. The results showed that vocabulary size correlated with the knowledge of affixes (r = .64), suggesting that having a larger vocabulary was indicative of better command of affixes in production. The second experiment, where an online test of 23 prefixes along with the vocabulary size test were administered to 253 Japanese university learners of English, indicated that the prefixes were stored together with root words when the combined forms were used more frequently. On the contrary, such tendency was not observed in the case of less frequent words, suggesting the organization of affixes differs depending on the frequency of affixed words.

1. Introduction

The learning of vocabulary requires both item learning and system learning. We have to learn meanings, spelling, pronunciation, and other various aspects of each word one by one. At the same time, some facets of vocabulary learning are systematic. When asked to provide an example of system learning in English, many teachers would agree that knowledge of affixes would be one such example. Due to the systematic nature of affixes, knowing affixes is considered to play a pivotal role in vocabulary learning. It is as if affixes are magic wands that transform unknown affixed words into known ones. If a learner knows the word familiar and affixes such as un- and -ity, the unknown word unfamiliarity seems suddenly dissected into word parts such as un + familiar + ity, and the meaning of the otherwise unknown word becomes instantaneously clear. As
Bauer and Nation (1993) state, the knowledge of a root (e.g., *familiar*) and its allowable affixes (e.g., *un-*, *-ity*, and/or *-lize*) help us recognize unfamiliar members of the word family. Empirical evidence has repeatedly shown that the amount of receptive affix knowledge correlates with vocabulary size (Mochizuki & Aizawa, 2000; Noro, 2002; Schmitt & Meara, 1997).

Even though the idea of systematic knowledge of affixes seems rather appealing, there has been a debate as to how affixes are stored in mental lexicon. The issue regarding the affix organization is highly important, as it relates to a question of how affixes should be taught. Are they independent of root words and stand on their own, or are they dependent and stored as parts of the derivative word, in which case, the knowledge of affixes isn’t systematic after all? Surely, answers to such questions would affect how affixes should be dealt with in language teaching. Though there have been several studies examining these issues, the findings are inconclusive (see Morita (2010) for more details).

Further, most of the previous studies have dealt with receptive knowledge of affixes and have neglected an investigation into the productive aspect of it. We all know that knowing is one thing, and being able to use the knowledge is quite another. How capable are learners of English when it comes to using affix knowledge? Do learners construct derived words from affixes and a root each time they use them? Due to lack of empirical evidence, answers to such questions remain elusive. This study, therefore, focuses on productive affix knowledge and aims to investigate if larger vocabulary size relates to better command of productive affix knowledge. Further, this study also attempts to provide information on how affixes are stored in the mental lexicon from the viewpoint of production of affixed words.

2. Literature Review

When learners encounter an unknown word, teachers, who are keen on vocabulary strategies, instruct them to carefully look at the unknown word and try to find a familiar part. If the unknown word is an affixed word, and learners already know the root and the affixes used in the word, such a strategy might be quite useful. Learners only have to combine the meaning of each part and the seemingly unknown word magically becomes a known one. Though the reality may not always be this simple, it is understandable that affix knowledge seems quite appealing to both teachers and learners.

In fact, vocabulary learning strategy surveys show that learners find affix knowledge useful. Through extensive surveys conducted in junior high and high schools, as well as universities in Japan, Schmitt (1997) reveals that just short of 60% of participants consider knowledge of affixes useful when discovering the meaning of an unknown word. Saida (2006) also reports the results of a survey, maintaining the use of affix knowledge is part of Japanese high school learners' vocabulary learning strategies. She further maintains that such a strategy is often used by learners with a vocabulary size of more than 2000 words.
Affix knowledge also benefits reading comprehension. Although unknown words are one of the factors contributing to poor reading comprehension, it is intuitively plausible that affix knowledge facilitates inferencing of word meanings, which, in turn, facilitates reading comprehension to a certain degree. By conducting a reading comprehension test and morphological awareness tests to EFL learners, Zahn and Koda (2013) demonstrated morphological awareness made limited but unique contributions to reading comprehension. Noro (2002) also investigated how morphological knowledge, the knowledge of suffixes to be exact, interacted with reading comprehension. His results show a much higher correlation coefficient with reading comprehension ($r = .66$), compared to .24 in Zahn and Koda (2013). Since the reason for such difference is not the focus of the current study, this paper will refrain from such discussion. It should be noted, however, that the above mentioned studies do not include tests of prefixes. Therefore, how prefix knowledge might play a role in reading comprehension is not yet evident.

So far, knowledge of affixes has been shown to be helpful in a receptive manner. That is, knowing affixes can facilitate decoding of unknown affixed words. Such knowledge would facilitate better inferencing of word meanings. Then, how about the actual learning of words? Does knowing more affixes help learners learn new words? After all, knowledge of affixes is considered as a means to make vocabulary learning systematic. Words can be turned into related, yet separate words by adding allowable affixes. To put it differently, mastering affixes, which are limited in numbers, and applying the affix knowledge could turn one word into a number of different ones. Therefore, at least theoretically, knowing more affixes should have a strong relationship with vocabulary size.

Mochizuki and Aizawa (2000) investigated the acquisition order of affixes, where they administered a receptive affix knowledge test. In this test, the participants were asked to choose the correct meanings of 13 prefixes, given three pseudo words with a common prefix, as well as parts of speech of 16 pseudo words with suffixes. The participants’ test results moderately correlated with their vocabulary size at $r = .58, .54, .65$ for prefixes, suffixes, and affixes, respectively. Similar results have been reported in Noro (2002) with $r = .69$ for suffixes.

Schmitt and Meara’s (1997) study is, as far as the current authors know, the sole study that investigated such relationship by looking into not only receptive knowledge of suffixes, but also productive knowledge. The observed correlations in their study are weaker than those of the aforementioned studies with the coefficient values being .41 for receptive suffix knowledge. However, their study is valuable for, among other things, reporting correlations between productive affix knowledge and vocabulary size ($r = .37$).

Upon reviewing the studies that show the relationship between affix knowledge and vocabulary size, it seems reasonably safe to conclude that receptive affix knowledge and vocabulary size are moderately interconnected. What is not clear, however, is how having a large vocabulary affects the production of affixed words.
Another question that needs to be focused is the organization of affixes in the mental lexicon. Are affixes stored dependently on root words as if affixes and root words are single units? Or are affixes stored independently and called upon when needed? If an anecdotal assumption that teaching of affixes exponentially expands learners’ vocabulary size is to be true, it could also be true that learners are able to use the knowledge of affixes to recognize and produce morphologically complex unknown words. Even so, it is not clear if such words stay as they are or are decomposed into word parts and waiting to be called on in the mental lexicon.

In a study that uses a timed lexical decision task, Morita (2010) provides evidence Japanese learners seem to process words with suffixes in two ways. In his study, words with suffix such as -er, -ly, and -ment are shown to be processed as if they are stored in a decomposed manner by learners with larger vocabulary size (approximately 6000 words, in average), whereas suffixes like -ation, -ity, and -ive are processed as part of a given word. What his study shows is the state of affix organization in the mental lexicon is mixed.

However, Morita’s (2010) study deals with limited number of suffixes and does not provide evidentiary support for prefixes. Also, more studies that investigate from various angles, such as productive use of affix knowledge, or the organization of affixes in the mental lexicon are needed for us to have better insights.

This study, therefore, attempts to provide further empirical evidence towards a clearer picture of how affixes are stored as well as the interrelationship between vocabulary size and the knowledge of affixes.

3. The Study

3.1 Research Questions

Based on the literature review, the current study focused on the following two research questions.

RQ 1: Is the accuracy rate of affixed word production related to the size of English learners’ vocabulary?

RQ 2: How are the affixes and the root words organized in language learners’ mental lexicon?

3.2 Experiment 1

The first experiment focused on the first research question by analyzing the possible relationship between receptive vocabulary size and productive affix knowledge of English. It is important to note here that productive affix knowledge is defined as the knowledge that enables learners to actively recognize a correct combination of an affix and a root word when given an L1 counterpart. This process is similar to a situation where a learner is uncertain of the correct affix-root combination and ponders which affix should be used with a given word.
To gain broader insights into the relationship between the vocabulary size and the affix knowledge, it was decided to include both prefixes and suffixes in this experiment.

3.2.1 Participants

The participants in the first experiment were 270 college level English learners majoring in engineering. Most of them were receiving a 90-minute reading-focused lesson once a week when they participated in the experiment. Their estimated vocabulary size ranged from 2600 to 6533 words with average being 4856.30 words (S.D. = 888.19) based on our original vocabulary size test which will be shown in the materials section. The participants have never been systematically taught how affixes work in English, although they were aware that certain words consisted of affixes and a root word.

3.2.2 Materials

Two independent online tests were administered in the experiment. A productive affix knowledge test was developed for the purpose of this study. For each target that consists of three root words, the participants were asked to choose a common affix from a list of eight affixes (see Figure 1 for an example question).

A total of 30 affixes to be tested were selected from Bauer and Nation (1993) with frequency in high school and junior high school text books in mind. The 15 prefixes and as many suffixes were non-, un-, dis-, re-, ex-, in-, pre-, semi-, en-, mis-, anti-, sub-, fore-, inter-, and post- for prefixes, and -(e)n, -ize, -ism, -ish, -ous, -ation, -ity, -ness, -al, -ant, -ment, -ist, -y, -ly, and -ful for suffixes. Two questions were constructed for each affix, and a total of 60 questions were included in the test.
Another test administered in the experiment was an online vocabulary size test with 120 questions in a multiple-choice format. The target words were randomly chosen from *JACET 8000*, each of which was displayed with four Japanese word choices. The participants were asked to choose the correct Japanese counterpart for each target word within 10 seconds (see Figure 2). All the target words which appeared in the vocabulary size test are found in the Appendix.

Both of the tests were set up and administered on the Internet, and the data were collected and stored on a secure server for minimum contamination and complications.

### 3.2.3 Results

After confirming that the productive affix knowledge test was highly reliable (60 items; $\alpha = .90$), the data were analyzed in terms of correlations with vocabulary size. All of the 270 participants completed the two online tests.

Table 1 shows the results of the productive affix knowledge test and the correlation coefficients for prefix section, suffix section, and two sections combined. Overall, slightly above 50% of the test items were answered correctly. As expected, the mean score of suffix section was

higher than that of prefixes, indicating that words with suffixes are more easily produced.

As can be seen in Table 1, medium-strength correlations were found between vocabulary size and prefix, suffix, and affix knowledge.

3.2.4 Discussion

The results of the first experiment showed a moderate correlation between affix knowledge and learners’ vocabulary size. That is, having larger vocabulary is an indication of having a better command of affixed words, and vice versa. On closer inspection of the target items used in the vocabulary size test showed that just under 6% of the words had prefixes and 18% had suffixes, both of which appeared in the affix knowledge test. Though this might have had an effect on the difference in mean scores between the prefix and suffix sections, it did not seem to affect the correlational analyses due to the fact that almost identical coefficient values were found.

The observed correlation coefficient values in this experiment were very similar to those of previous studies, even though the affix knowledge focused in this experiment was of a productive nature. Taken together, the evidence seems to suggest that being able to recognize and produce affixed words relates moderately to knowing more words.

3.3 Experiment 2

In the first experiment, it was found that the knowledge of prefixes and suffixes both correlated with vocabulary size in an identical manner. In the second experiment, it was decided to shift our foci to prefixes and how they are stored in learners’ mental lexicon, as the shift would allow us to gain clearer picture of the affix organization due to the fact that prefixes are often used to change a given word’s meaning more drastically than suffixes, which could cause learners to store two closely-related words as separate entries. If that is the case, the knowledge of affixes can be viewed as being stored dependently, or as part of a root word.

3.3.1 Participants

The participants in the second experiment were 253 Japanese learners of English majoring in engineering. They were quite similar to those in the first experiment in terms of English learning history and the range of proficiency; however, none of them participated in the first experiment. The same vocabulary size test described in the first experiment was administered, and the range of vocabulary size was from 1666 to 6666 words with average being 4891.44 (S.D. = 864.95). The participants were deemed to have limited prefix knowledge, judged from the similar test results of vocabulary size observed in the first experiments.
3.3.2 Material

To gain further insight into the relationship between vocabulary size and prefixes as well as the organization of prefixes, a new test of productive prefix knowledge was developed. In this test, the participants were shown a root word and its Japanese meaning followed by a Japanese translation of a target prefixed word. Then, the participants were instructed to choose a correctly prefixed English word from a list of four choices, as shown in Figure 3.

The definition of “productive” was being able to choose the correct English word based on a Japanese translation, as it mimics the process of uncertain, if not unknown, prefixed word production.

There were 23 prefixes tested, which were found in levels three to six of Bauer and Nation’s (1993) list of affixes: non-, un-, in-, ante-, anti-, arch-, bi-, circum-, counter-, en-, ex-, fore-, hyper-, inter-, mid-, mis-, neo-, post-, pro-, semi-, sub-, pre-, and re-.

For each prefix, two higher frequency words and two lower ones were chosen from Corpus of Contemporary American English. This was a necessary procedure, as making a frequency-based comparison would shed light on how prefixes are stored. To be more precise, it was important to be able to determine whether correct answers were due to the familiarity to the prefixed words themselves or having both semantic and morphological knowledge of a given prefix. If higher frequency words and lower ones are answered with similar success rates, there is a strong indication that prefixes are stored independent of root words, as it would mean that learners are able to put a prefix and a root word together as needed. For this purpose, each prefix was tested on four occasions, making the number of the target items 92.

3.3.3 Results

Table 2 shows the mean scores and standard deviations as well as the correlation coefficient values for total and word frequency groups. The result of the productive prefix test was found to be
reliable enough (92 items; \( \alpha = .83 \)). The test results show that the mean score for higher frequency words were slightly higher than that of lower frequency words, and as it turned out, statistically so as well: \( t(496.48) = 9.94, p < .001, r = .41 \).

Through the correlational analysis, it was found that the result of the productive prefix test correlated with vocabulary size with medium strength \( (r = .61) \), with the higher frequency words yielding a marginally better result than the lower frequency counterparts.

### 3.3.4 Discussion

In the second experiment, which focused on prefixes, the results of the correlational analysis supported those of the first experiment and previous studies: Having larger vocabulary would suggest being able to determine correct combinations of prefixes and root words more successfully. Although a significant difference was observed in the mean scores by frequency groups, the difference in correlation coefficient values remained marginal, which would suggest that the effect of knowing more words is not very strong, even though there is an interrelationship between vocabulary size and the productive prefix knowledge.

In terms of the second research question, which deals with how prefixes are stored in the mental lexicon, the observed difference in mean scores based on frequency is meaningful. As mentioned above, if prefixes are stored separately from root words, learners should be able to produce prefixed words for as long as they know the meanings of both components. In the case of the second experiment, the participants were given the meaning of each root word. Therefore, if the participants had enough knowledge of each prefix, they were supposed to be able to choose the correct answers irrespective of the frequency. The results of the second experiment showed otherwise. What is indicated by the results are two possibilities. One such possibility, and probably a simpler one, is that prefixes are stored with root words and such combinations are differentiated from the root words in mental lexicon. This would easily explain the significantly higher mean scores of higher frequency words. As they have better chances to be already learned or seen in various media by learners, they could have already been remembered as single units. Unfortunately, this does not explain how participants in the experiment correctly answered about 30% of the lower frequency words in average.

Another possibility is that frequent prefixed words are remembered as a whole, and yet learners recognize and analyze common constituents used in those words so that they are able to build hypotheses to be tested on unknown words. This way, depending on how successful the hypothesis building is, learners are able to produce unknown combinations of prefixes and root words, which could be the case in the second experiment. This possibility also seems to be more reasonable in light of cognitive resources that are limited. That is, not having to construct an already known prefixed word each time and being able to do so when an unknown word is called for seems to be more economical as well as intuitively plausible. Although the current data is not indicative enough to make such a claim, this possibility is worth investigating in future research.

4. General Discussion

The two experiments in this study both showed that productive affix knowledge and vocabulary size correlated with medium strength. Although similar tendencies were reported in previous studies, most of them were concerned with receptive knowledge of affixes. Taken together, the evidence seems to show that the command of affixes, irrespective of productive or receptive, has a connection to learners’ vocabulary size. What was unique in this study was the cross-modal nature of the vocabulary knowledge. That is, the vocabulary size estimated in this study was receptive and the observed affix knowledge was productive. What this means is that the current study presented evidence that being able to recognize more words could mean being able to produce affixed words, albeit with a condition of passive production, or producing by choosing.

Further, the similar correlations between both receptive and productive affix knowledge and vocabulary size suggest that being able to recognize the meaning of affixed words enables learners to use such knowledge productively as well. Since there were no direct comparisons between receptive and productive affix knowledge made in the current studies, it remains as a mere speculation. Moreover, as the current study measured the productive affix knowledge in a passive manner, results could prove dissimilar in studies with active production of affixes, where participants are asked to write or say affixed words when cued with L1 words.

Another issue to consider is the items in the vocabulary size test. As briefly mentioned in the discussion section of the first experiment, there were words with affixes in the test. Although the number of such words was rather limited and thus, so would the effect to the dataset, even the slightest possibility should be eliminated in future studies, where learners’ vocabulary size is measured by a test that incorporates a word list closely based on the notion of word families.

As for the organization of affixes in the mental lexicon, the evidence found in the current study seems to show support for the mixed state of dependent and independent organization of affixes. It is interesting to point out again that the participants in the current study have not undergone any systematic teaching of affixes prior, though the teaching of their meanings and the possibilities of applications to other words could have been taught sporadically. If this is the case,
how should affixes be taught in language classes? Is the mixed state of affix organization due to the lack of systematic instruction? How would the explicit teaching of affixes affect the organization of affixes in the mental lexicon? Unfortunately, the current study alone does not provide strong enough evidence to answer such questions. Future studies, therefore, should be encouraged to draw on the findings of the current study and incorporate factors such as word frequencies as well as the effect of explicit teaching to yield more fruitful findings.

The Effectiveness of Variation Theory in Learning Combinatorics

Secondary Education

Paper Session

This study investigated the learning of students in combinatorics through the use of teaching materials designed with the consideration of variation theory. A pretest-training-posttest design was used to compare the transfer performance of the experimental group with control groups who underwent traditional teaching approach. Participates in either the experimental or the two control groups significantly improved their transfer performances; yet, the experimental group made the greatest overall improvement.

The Effectiveness of Variation Theory in Learning Combinatorics

Yick Doi Pei

Abstract

Combinatorics is viewed as the pillar of elementary probability (English, 2005); however, combinatorics is one of the mathematics topics that students find it difficult (Tarlow-Hellman, 2007). Theoretical reasons support the use of concrete materials which may improve student learning in basic combinatorial notations (Abramovich & Pieper, 1996). An experiment in this study tested the effectiveness of the use of course materials designed according to the variation theory to promote students’ combinatorics reasoning. This study involved a pretest-training-posttest design, comparing participates’ transfer performance, which was the improvement between pretest and posttest. The transfer performance of the experimental group was compared with two control groups (one with similar ability and the other with higher ability) who underwent the traditional teaching approach. Participates in either the experimental or the two control groups significantly improved their transfer performances. The experimental group made the greatest improvement. Significant surges in transfer performance by the experimental group, as contrasted to the control group with similar ability, in the areas combination operation, arrangement operation, and distribution model were also found. Results suggest that teaching combinatorics with the inclusion of the variation theory help students learn more effectively.

Keyword: combinatorics, variation theory, mathematics instruction, transfer performance
Abstract

The purpose of this classroom inquiry was to implement a daily routine of physical activity for high school students with Autism Spectrum Disorder (ASD) as a pedagogical strategy for the management and regulation of anxiety in high-functioning autistic youth (HFA). It was of interest to observe if increased movement could positively affect anxiety and enhance both behaviors and learning outcomes for these students. The classroom teacher within this inquiry implemented formal strategies to learn of HFA students’ experiences within this regulation program. Regulation with these students was primarily concerned with behavior and the ability to self-control impulses, cease unwelcomed behaviors, and move towards more acceptable behaviors (autism.net, 2015).

Most of this teacher’s students with High Functioning Autism (HFA) struggle to fit in or to know the appropriate thing to say (or not say) at the appropriate time. They describe feeling out being of control, disorganized, feeling weird or not quite right. Reciprocal socialization is difficult. These students have grown used to sitting out on the periphery of most social and organizational activities because of their exceptionalities. They struggle daily with anxiety that manifests itself through a host of problems that they encounter during the day.

As a result of unmanaged anxiety, students with ASD may exhibit increased agitation, display lack of communication, or engage in refusal behaviors. Non-compliance with activities such as attending class, completing class work, or adhering to class routines with peers are apparent when youth with ASD are in an unregulated state or, more specifically, lack the ability to control their own behavior and behave properly even when they do not feel like it. Self-regulation is described as “…the ability to monitor and control our own behavior, emotions, or thoughts, altering them in accordance with the demands of the situation.” www.education.com/reference/article/self-regulation-development-skill/

Experts in the field of autism noted that one of the hallmark features of autism is anxiety and three common behaviors include impaired social interaction, repetitive behaviors, and difficulties with
communication (Bilimoria (2014); Temple Grandin (2006). The literature reflects the positive affects between exercise and behavior and there have been several studies to support the initiative of combining academics and movement opportunities (Cameron (2011); Hilton, Cumpata, Klohr, Gaetke, Artner, Johnson, and Dobbs (2014); Kalyn, Paslawski, Wilson, Kikcio, & MacPhedran (2007).

The process and findings of this inquiry were reported as part of this teacher’s Graduate Studies course work class surrounding innovations in practice and pedagogical strategies within classrooms.

Presentation Format: Poster Session

Description:
Transfer students are a population of students with unique challenges that has historically been overlooked. However, with recent mandates to improve graduation rates schools across the nation are implementing initiatives to improve the transfer process and to promote transfer student success. Of great importance
to this effort is implementing programs and policies that encourage community colleges and four-year institutions to partner together to improve transfer outcomes. As such, the Kaʻieʻie Pathway Program was developed as a partnership between the University of Hawaiʻi at Manoa and five UH community college campuses within the system. This poster session will provide an overview of some of the unique challenges (i.e. psychological stress) that transfer students experience as well as highlight the Kaʻieʻie Program.
Title: Experiential learning during counsellor education: The primacy of practica

Topic: Counsellor Education

Format: Paper

Description: Counsellor education programs contain course work in several foundational knowledge areas, often with an emphasis of the practice of professional skills. This paper will elucidate these areas with a focus on the critical learning that arises during the practicum interval for counsellor education trainees.

Authors: Stephanie L Martin, PhD, PRDPsych  
Associate Professor (Counselling Psychology) and Graduate Chair  
Educational Psychology & Special Education  
University of Saskatchewan  
E-mail: Stephanie.Martin@usask.ca

Abstract: Counsellor education programs contain course work in several foundational knowledge areas, often with an emphasis of the practice of professional skills within each domain. Completing a practicum in school, health, or community based organizations is also a critical component of counsellor education, but the goals and experience of this training interval are not well understood by those in positions peripheral to this student experience. This presentation will 1) elucidate how foundational the graduate practicum is to counsellor education; 2) describe how graduate practica facilitates the professional identity development of new career counsellors; and 3) suggest ways others more peripheral to this learning interval (i.e., administrators, managers, colleagues from other professional disciplines) can offer support and encouragement to those learning to become counsellors.
Title: Digital storytelling: An effective anti-violence education-as-intervention method?

Abstract: Research in the anti-violence area suggests the primacy of early intervention, particularly education, to interrupt patterns of intimate partner violence in early dating relationships, yet there is a paucity of information on how this is best accomplished. Young women who have experienced dating violence often hesitate to reach out for support for fear that their experiences will not be heard, respected, or appropriately responded to by friends, family and the organizations tasked with helping them and holding perpetrators accountable. Hence, being abused in an intimate relationship is often a private, isolating experience, with grave consequences for personal (i.e., mental health, educational attainment) and relational well-being and quality of life. Even more concerning is that exposure to one incident of abuse often leads to a cycle where young women repeatedly seek out relationships that include abuse. This paper highlights the application of digital storytelling as education-as-intervention for young women exposed to dating violence. Digital storytelling emerged as an aspect of human rights-based education, serving as a way of raising awareness and critical consciousness towards social justice (Lambert, 2013). Digital storytelling uses multimedia to tell stories (Marshall & Rossman, 2016) and has potential to connect those who are isolated and educate broadly about the importance of healthy relationships.
The paper is about reasons why we need to change dramatically our traditional approach of teaching Introductory Economics. Numerous evidences suggest that the current method of teaching with emphasis on technique has failed in two very important aspects. First of all, students at all levels show the lack of understanding of Economics. Secondly, Economics profession seems to have very little influence on the social media, parliament, courts. In general, we have failed in disseminating the essential, powerful truths of our discipline. If students do not learn the fundamental concepts of Economics and have no idea how to apply these concepts to the real world problems it is time to change our current approach to teaching Introductory Economics.

The traditional method that still dominates the field of Economics does the emphasis on technique. As you flip through the pages of the classic textbooks written by G.Mankiv, P.Krugman, R.Lipsey, M.Parkin you will see graphs or mathematical formulas practically on every page. At the end of such a course the students learn how to calculate equilibrium prices and quantities, different types of elasticities and multipliers, how to draw indifference curves. But they have no idea how to apply any of the concepts to real world problems.

The Economic Way of Thinking as an alternative to the traditional method of teaching Introductory Economics concentrates on a few elementary concepts that students could usually figure out for themselves. These concepts will help them think
more coherently about the wide range of social and economic problems they face in the real world. The teaching of a concept must take place in the context of a problem. We emphasize the two-steps approach. In step one we identify a problem. In step two we say: “Here is how economists think about the problem. We need to employ such and such concepts”.

One of the most fundamental concepts that many of us want our beginning students to master is the cost-benefit principle. Perhaps, only few who teach Introductory Economics would disagree that the cost-benefit principle is the pillar of Microeconomics. But, surprisingly, the classic textbooks do not discuss this fundamental concept at all. As far as my teaching experience goes, the only textbook that dedicates the whole chapter to the cost-benefit principle is Frank/ Bernanke’s “Principle of Microeconomics”. I have been using this textbook for many years and I really appreciated the way how this concept was presented to the students.

Due to my personal persuasion about the value of the cost-benefit principle to the beginning economics students I have made a genuine contribution to the methodology of teaching it. I was able to design a general algorithm of how to apply the cost-benefit principle to the problem of optimal allocation of resources. Typically, I use this algorithm in two chapters of my Introductory Economics course – “Basics of the Cost – Benefit principle” and “Demand : The Benefit Side of the Market”. Let me invite you to my Introductory Economics class and share with you that stuff.

First of all, students are introduced to the general idea behind the algorithm. It consists of the following steps:

**Step 1.** Pick up RANDOMLY any allocation A.

**Step 2.** Look forward to another allocation B reallocating your resources just a little bit.

**Step 3.** Standing on allocation A ask yourself a question: ”Should I move from A to B? “

To answer the question you have to compare two things: Additional Benefits from “Moving from A to B” with Additional Costs of “Moving from A to B”.

**Step 4.** Let us assume that the Additional Benefits from “Moving from A to B” is bigger than Additional Costs of “Moving from A to B”. In this case the cost – benefit principle advises you to move from A to B.

Now you are standing on allocation B and you look forward to another allocation C reallocating your resources in the same direction as you did in step 2.
Step 5. Standing on allocation B ask yourself a question:

"Should I move from B to C?"

To answer the question you have to compare two things: Additional Benefits from "Moving from B to C" with Additional Costs of "Moving from B to C".

Step 6. Let us assume that the Additional Benefits from "Moving from B to C" is bigger than Additional Costs of "Moving from B to C". In this case the cost–benefit principle advises you to move from B to C.

And so on..... If moving from allocation X to allocation Y you find out that Additional Benefits from "Moving from X to Y" is less than Additional Costs of "Moving from A to B". Then you have arrived at the optimal allocation which is X.

Let us demonstrate how this algorithm works solving the following two problems:

Problem 1

Assume you can either work as an Economics tutor on campus for $16 per hour or work in your own business making university t-shirts. Your working day is 8 hours. You must decide how much time each day to spend on each activity. Use the information in the table below to determine how you will allocate your time between two activities if you earn $5 for each t-shirt.

Table 1: Productivity in making t-shirts

<table>
<thead>
<tr>
<th>Hours per day</th>
<th>Quantity of t-shirts</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>11</td>
</tr>
<tr>
<td>3</td>
<td>15</td>
</tr>
<tr>
<td>4</td>
<td>18</td>
</tr>
<tr>
<td>5</td>
<td>21</td>
</tr>
<tr>
<td>6</td>
<td>23</td>
</tr>
<tr>
<td>7</td>
<td>25</td>
</tr>
<tr>
<td>8</td>
<td>26</td>
</tr>
</tbody>
</table>

Source: own data

Table 1 above presents information about number of t-shirts your business make in different time. For example, if you work 4 hours doing your business you will make 18 t-shirts.

Now we are going to apply the general algorithm specified above to this specific problem:
Step 1. Pick up RANDOMLY any allocation A:

Assume that initially you are thinking to work \textbf{1 hour} making t-shirts and the rest of your time – \textbf{7 hours} dedicate to tutoring.

Thus, \textbf{allocation A : [1 hour making t-shirts, 7 hours tutoring]}

Step 2. Look forward to another allocation B reallocating your resources just a little bit:

Now, you want to reallocate 1 hour from “tutoring” to “making t-shirts”

Thus, \textbf{allocation B : [2 hours making t-shirts, 6 hours tutoring]}

Step 3. Standing on allocation A you ask yourself a question:

"Should I move from A to B?" To answer the question you have to compare two things: Additional Benefits from “Moving from A to B” with Additional Costs of “Moving from A to B”. Additional Benefits from “Moving from A to B” are associated with extra (additional) hour you spend at your business which will bring you an Additional Revenue. Therefore, Additional Benefits from “Moving from A to B” = Total Revenue you generate from making t-shirts for 2 hours – Total Revenue you generate from making t-shirts for 1 hour = $11 \times 5 – 6 \times 5 = 55 – 30 = 25. That extra (additional) hour spent on making t-shirts will bring you extra $25 in total revenue. But when you reallocate one hour from “tutoring” to “making t-shirts” you lose also your revenue associated with that move. Therefore, Additional Costs of “Moving from A to B” are associated with the Loss of your Revenue as a tutor - $16.

Step 4. As we see, Additional Benefits from “Moving from A to B” = $25 are bigger than Additional Costs of “Moving from A to B” = $16. Thus, the cost – benefit principle advises you to move from A to B.

Now you are standing on allocation B [2 hours making t-shirts, 6 hours tutoring] and you are looking at allocation C [3 hours making t-shirts, 5 hours tutoring]

Step 5. You are asking yourself a question: "Should I move from B to C?"

To answer the question you have to compare two things:

Additional Benefits from “Moving from B to C” with Additional Costs of “Moving from B to C”. Additional Benefits from “Moving from B to C” are associated extra (additional) hour you spend at your business which will bring you an Additional Revenue. Therefore, Additional Benefits from “Moving from B to C” = Total Revenue you generate from making t-shirts for 3 hours – Total Revenue you
generate from making t-shirts for 2 hours = 15*$5 – 11*$5 = $75 - $55 = $20. That extra (additional) hour spent on making t-shirts will bring you extra $20 in total revenue. But when you reallocate one hour from “tutoring” to “making t-shirts” you lose also your revenue associated with that move. Therefore, Additional Costs of “Moving from A to B” are associated with the Loss of your Revenue as a tutor - $16.

**Step 6.** As we see, Additional Benefits from “Moving from B to C” = $20 are bigger than Additional Costs of “Moving from B to C” = $16. Thus, the cost – benefit principle advises you to move from B to C.

Now you are standing on allocation C [3 hours making t-shirts, 5 hours tutoring] and you are looking at allocation D [4 hours making t-shirts, 4 hours tutoring]

**Step 7.** You are asking yourself a question: “Should I move from C to D?”

To answer the question you have to compare two things:

Additional Benefits from “Moving from C to D” with Additional Costs of “Moving from C to D”. Additional Benefits from “Moving from C to D” are associated extra (additional) hour you spend at your business which will bring you an Additional Revenue. Therefore, Additional Benefits from “Moving from C to D” = Total Revenue you generate from making t-shirts for 4 hours – Total Revenue you generate from making t-shirts for 3 hours = 18*$5 – 15*$5 = $90 - $75 = $15. That extra (additional) hour spent on making t-shirts will bring you extra $15 in total revenue. But when you reallocate one hour from “tutoring” to “making t-shirts” you lose also your revenue associated with that move. Therefore, Additional Costs of “Moving from A to B” are associated with the Loss of your Revenue as a tutor - $16.

**Step 8.** As we see, Additional Benefits from “Moving from C to D” = $15 are less than Additional Costs of “Moving from C to D” = $16. Thus, the cost – benefit principle does not advise you to move from C to D.

Therefore, the optimal allocation is C [3 hours making t-shirts, 5 hours tutoring]. If you spend 3 hours making t-shirts and 5 hours helping students to grasp the essence of the cost – benefit principle you will maximize your total revenue.

**Problem 2**

To earn extra money in the summer, you grow tomatoes and sell them at the farmers’ market for 30 cents per kilogram. By adding compost to your garden, you can increase your yield. If compost costs $1 per kilogram and your goal is to make as much money as possible, how many kilograms of compost will you add?
Table 2: Tomatoes yield with respect to compost

<table>
<thead>
<tr>
<th>Kilograms of compost</th>
<th>Kilograms of tomatoes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>100.0</td>
</tr>
<tr>
<td>1</td>
<td>120.0</td>
</tr>
<tr>
<td>2</td>
<td>125.0</td>
</tr>
<tr>
<td>3</td>
<td>128.0</td>
</tr>
<tr>
<td>4</td>
<td>130.0</td>
</tr>
<tr>
<td>5</td>
<td>131.0</td>
</tr>
<tr>
<td>6</td>
<td>131.5</td>
</tr>
</tbody>
</table>

The table above presents information about the relationship between the amount of compost added to tomatoes’ field and the corresponding yield.

Let us apply the general algorithm to this specific problem:

Step 1. Pick up RANDOMLY any allocation A:

Assume that typically you do not add any compost and now you are thinking to add the 1st kilogram.

Thus, allocation A: [1 kg of compost]

Step 2. Look forward to another allocation B reallocating your resources just a little bit- you want to add one more kg of compost.

Thus, allocation B: [2 kg of compost]

Step 3. Standing on allocation A you ask yourself a question:

"Should I move from A to B?" To answer the question you have to compare two things: Additional Benefits from "Moving from A to B" with Additional Costs of "Moving from A to B". Additional Benefits from "Moving from A to B" are associated with extra (additional) yield of tomatoes due to extra kg of compost. Selling that extra yield of tomatoes on the market will bring you an Additional Revenue. Therefore, Additional Benefits from "Moving from A to B" = Total Revenue you generate from adding 2 kg of compost – Total Revenue you generate from adding 1 kg of compost:

$$120 \times 0.30 – 100 \times 0.30 = 6.00.$$  

The 2nd additional kg of compost will bring you extra $6 in total revenue. But the extra kg of compost will cost you $1.00.

Step 4. As we see, Additional Benefits from "Moving from A to B" = $6 are bigger than Additional Costs of "Moving from A to B" = $1.00. Thus, the cost – benefit principle advises you to move from A to B.
Now you are standing on allocation B [2 kg of compost] and you are looking at allocation C [3 kg of compost]

**Step 5.** You are asking yourself a question: "Should I move from B to C?"

To answer the question you have to compare two things:

Additional Benefits from "Moving from B to C" with Additional Costs of "Moving from B to C". Additional Benefits from "Moving from B to C" are associated with extra yield of tomatoes due to extra kg of compost. Selling that extra yield of tomatoes on the market will bring you an Additional Revenue. Therefore, Additional Benefits from "Moving from B to C" = Total Revenue you generate from adding 3 kg of compost – Total Revenue you generate from adding 2 kg of compost:

\[
125\times0.30 - 120\times0.30 = 1.50
\]

The 3nd additional kg of compost will bring you extra $1.50 in total revenue. But the extra kg of compost will cost you $1.00.

**Step 6.** As we see, Additional Benefits from "Moving from B to C" = $1.50 are bigger than Additional Costs of "Moving from B to C" = $1.00. Thus, the cost – benefit principle advises you to move from B to C.

Now you are standing on allocation C [3 kg of compost] and you are looking at allocation D [4 kg of compost]

**Step 7.** You are asking yourself a question: "Should I move from C to D?"

To answer the question you have to compare two things:

Additional Benefits from "Moving from C to D" with Additional Costs of "Moving from C to D". Additional Benefits from "Moving from C to D" are associated with extra yield of tomatoes due to extra kg of compost. Selling that extra yield of tomatoes on the market will bring you an Additional Revenue. Therefore, Additional Benefits from "Moving from C to D" = Total Revenue you generate from adding 4 kg of compost – Total Revenue you generate from adding 3 kg of compost:

\[
128\times0.30 - 125\times0.30 = 0.90
\]

**Step 8.** As we see, Additional Benefits from "Moving from C to D" = $0.90 are less than Additional Costs of "Moving from C to D" = $1.00. Thus, the cost – benefit principle does not advise you to move from C to D.

Therefore, the optimal allocation is C [3 kg of compost]. If you add 3 kilograms of compost you will maximize your total revenue.
Although two problems above are artificially created and the algorithm to solve them can’t be applied directly to real – life issues of optimal allocation of resources but students, nevertheless, will greatly benefit from solving them. They will get used to look at the real world problems through the glasses of "opportunity costs and the cost-benefit principle". This is the major benefit they should expect from studying and learning the principles of Introductory Economics. It is my deep persuasion that our role as economic educators is to help beginning students to form their economic way of thinking. As John Maynard Keynes said in his famous General Theory of Employment, Interest and Money: “The theory of economics does not furnish a body of settled conclusions immediately applicable to policy. It is a method, rather than a doctrine. An apparatus of the mind, a technique of thinking, which helps its possessors to draw correct conclusions."
Title: A Participant Oriented Process for Developing National Educational Materials in the 21st Century

Author:
Sherrill Rutherford, BScPT, MCIScPT, EdD
SRPT Education Consultants

Author Address:
608 Bruce Avenue
Nanaimo, BC, Canada
V9R 3Y7

Author e-mail:
srutherford@telus.net

Topic Area of Submission: Health Education

Presentation Format: Paper Presentation

Abstract:
Background: The educational materials for specialized training courses offered by a national health professional association required revising and updating to become current, evidence informed, and user friendly.

Methods: This project was laid out in 3 main Stages. The first Stage had two components - a Stakeholders’ Survey of instructors and learners across the country to seek guidance for the redevelopment of the educational materials, as well as a review and update of the curriculum. Stage two of the project also had two components - coordinating small Focus Groups with instructors and learners to discuss the revised education materials using the feedback from the Stakeholders’ Survey as a jumping off point for the discussions, and a comprehensive literature review that gathered current research. The final Stage of the project was the development of the overall conceptualization of the revised educational materials including the delivery formats, contents, and supplemental educational materials. This conceptualization evolved from the input received from the Survey and the Focus Groups, underpinned by the updated curriculum and the literature review.

Results: Creation of national educational materials that are standardized, current, and evidence-informed, and were developed based on the needs and desires of the instructors and learners. In essence, the instructors and learners from across the country have influenced the future of this specialized professional training in Canada.

Conclusion: This project is a real-life example of best practices for developing a national, evidence-informed, educational program that is meaningful to instructors and learners because they participated in its development.
Title: Cultural Competence in Healthcare, Are We There Yet?

Author:
Sherrill Rutherford, BScPT, MCIsCPT, EdD
SRPT Education Consultants

Author Address:
608 Bruce Avenue
Nanaimo, BC, Canada
V9R 3Y7

Author e-mail:
srutherford@telus.net

Topic Area of Submission: Health Education

Presentation Format: Poster Session

Abstract:
In recent years, the medical community has proclaimed that cultural competence is the key to equitable, effective healthcare that ensures positive health outcomes for all individuals. However, research evidence that cultural competence education for healthcare professionals results in culturally competent care, and improved equity in healthcare delivery and health, is lacking. This poster reviews the influence of culture on health and healthcare, and displays what culturally competent healthcare entails. Inequalities in healthcare delivery and health outcomes are revealed, with evidence that this disparity is caused by the culture of the healthcare system as well as the culture of healthcare providers. A series of steps that could become the path to truly culturally competent healthcare are described. These steps include: developing self-awareness through self-reflection; building interpersonal relationships and community through effective communication, storytelling, and collaboration. Finally the poster shows how these concepts could underpin the development of a cultural competence curriculum for healthcare providers. For instance, how this learning could be conveyed in experiential contexts involving culturally diverse patients, patient communities and interdisciplinary care providers as collaborators, advisers and assessors. This type of interactive collaborative education must be ongoing throughout a healthcare professional’s educational career so that these experiences become incorporated into their worldview and transform them into truly culturally competent individuals. This will eliminate inequities in care delivery that result from cultural bias, and in turn improve patient access, satisfaction, participation, and ultimately health outcomes.
Teaching an Online Graduate Course in Public Safety and Security Studies for Adult Learners: A Case Study

Irmak Renda-Tanali, D.Sc.
Professor and Program Chair, Homeland Security and Emergency Management Information and Technology Systems Department, The Graduate School University of Maryland University College (UMUC) Adelphi, Maryland, U.S.A. irmak.renda-tanali@umuc.edu

Abstract
This paper discusses self-directed and context-based learning design for adult learners in online classroom settings. The paper focuses on student and instructor perspectives concerning teaching public safety and security studies graduate curriculum to adult learners who are in the midst of their career. Specific examples of assignment formats are discussed based on adult learning theories and students’ reflections. The paper will conclude with suggestions on how to improve context-based learning based on feedback from students and faculty.

Key Words
Skills-based learning, competency-based education, context-based learning, adult learning

Introduction
Adult learning is moving towards more skills-based or competency-based model where institutions are providing career-relevant educational program choices to the potential applicants and their current students. The trend as much as being self directive, is also based on the competition among the institutions to maintain or increase their market share in the adult education market. Many of these institutions offer hybrid (face-to-face and online) and/or fully online programs.

As part of this trend, University of Maryland University College¹, a premier public university that is one of the 13 degree awarding institutions in the University System of Maryland, decided to ramp up its current curriculum structure by incorporating state-of-the-art and workplace-relevant set of activities that students can engage in, in order to be more desirable in today’s job market. This decision is one of the many strategic decisions that involve not only the university itself but also (relatedly) is a step forward to enhance the quality of the workforce that caters to the Maryland and the Washington DC Metropolitan Area.

¹ UMUC - University of Maryland University College (2016). Main website http://www.umuc.edu
A recent survey assessing the most needed academic skills for the workforce of the Department of Homeland Security and its sponsored organizations and agencies, indicate that the top sought-after skills include understanding of HS operations and procedures, laws and law enforcement practices, responding to and mitigation of disasters, and critical thinking2.

The existing curriculum on Homeland Security and Emergency Management3 employs contextualized material that enhances student understanding of dealing with threats from naturally induced phenomena and/or from intentional or unintentional acts that threaten the physical and/or virtual systems that provide the well-being of societies. In the curriculum the theoretical underpinnings explaining how the National Emergency Management system and the institutions and systems that deal with Homeland Security evolved over years, but the bulk of the curriculum is based on studying actual events as well as plausible future events that carry the risk of disrupting a major bulk of infrastructure systems and/or causing mass casualties4. Hence, competency-based adult learning models fit well with the Homeland Security and Emergency Management academic programs.

UMUC’s Homeland Security and Emergency Management graduate courses, like many other programs in its Graduate School, are offered solely online using a teaching platform that allows discussion postings in an asynchronous format, downloadable lecture notes and readings in .docx, .pdf, or .pptx formats. Students can download materials to their computers at their spare time without having to log on in each time and without having to

---

be present online at the same time with other students or faculty present in the classroom. A typical online classroom mimics a real classroom and in many ways in a more organized and featured way without the face-to-face interaction. Once the student logs in to the classroom, they see the daily/weekly announcement(s) indicating the topics to be covered or the exams due. With the help of the navigational tabs, the student can navigate through the virtual classroom from discussion threads pertaining to weekly topics to the lecture notes to the learning material such as case studies, research articles, actual reports from the government, private or non-profit organizations, to the assignment folders where the student has to upload finished work for instructor’s grading or the gradebook area to view grades and feedback.

Sample group exercises used in Context-Based Model

With the new spin towards making the academic programs more context-based and employment-related, academic chairs/directors at UMUC began to enhance the teaching material by introducing more real life like scenarios and added role playing for students to participate in. The course that particularly deals with large scale emergency response preparedness scenarios requires students to work in groups. The groups either pick or are assigned one of the three crisis scenarios by the instructor. This paper will present the three crisis scenario case studies used in the online classroom that was taught in fall of 2015 and had twenty-six students in total.

Scenario 1 – Adult Residential Care Facility

In scenario 1, students are “confronted” with a real life-like situation where they all work as senior managers for an adult care residential facility that serves persons who suffer from a range of physical or mental illnesses or disabilities, but who are pretty functional and independent. The facility’s address and location is provided on a real map where students can check out on MapQuest and determine its proximity to major population and activity centers including businesses, and public facilities. The facility’s capacity in terms of number of residents, facility features including the layout of the common and private areas and operating hours and schedule are also provided. Then a superstorm scenario is presented including its projected path, intensity, and potential destruction patterns including the area where the adult care facility is located.

In a series of coreographed activities students individually will first take 3 short courses provided by the Federal Emergency Management Agency (FEMA)’s Independent Study Courses that are self paced and can be completed in a few hour periods. They consist of hurricane mitigation basics for mitigation staff, community hurricane preparedness course and a course that is about including people with disabilities and others with access and functional needs in disaster operations.

Next, students locate the residential facility via GoogleEarth and GoogleMaps, and then identify the major terrain features including flood plains, waterways, lakes, as well as

---

5 HSMN 630, Resilience Planning and Preparedness for Disaster Response and Recovery (3)
major transportation networks including roadways and railways. Students are also asked to identify local assets for available healthcare and other assets that have any significance within the context. The next step is to contact the actual facility and determine the answers to some initial questions such as the assets and training provided to staff for evacuation of the facility, auxiliary power capacity and capabilities. Students also ask for permissions to review and critique the facility’s extant Emergency Operations Plan.

After that, students are asked to locate the residential care facility on a Storm Surge Mapping Tool; locate county emergency shelters over extant facilities sheltering populations in place during a major storm; and identify whether the facility has a Memorandum of Understanding or a Mutual Aid Agreement with other county agencies or adult care facilities in severe events.

Students are then asked to review several documents and reports that pertain to historic storm events that affected the greater geographic area that the facility is located on.

Next, students are presented with more details of the fictitious but plausible superstorm scenario that is predicted to affect the area. While the scenario focuses on the response and recovery phases of the Disaster Management Cycle for a single entity, there are numerous such facilities located within the given county and region. Given the vulnerability of the given extreme weather, students are asked to review mitigation and preparedness issues prior to working collaboratively with fellow classmates.

Students are then placed in groups, and asked to pick and assume one of each of the suggested roles of Director of Residential Services, Director of Facilities, and Director of Administrative Services of the adult care facility.

Using several templates, groups are asked to address the following questions at each phase of the disaster: Initial Response, Short-Term Response, and Early Recovery and Restoration. For each area of responsibility, groups are asked to state which activities are critical to perform as part of the responses as it progresses, i.e. create Status Reports. The status reports should also indicate what resources will be needed by organizations and people including equipment, materials, and supplies. They should indicate whether there are any recommendations or decisions that need to be made by the Board of Directors. A final report which is to be based on a provided template is to be written to the Executive Director this has to be direct, specific, and very clear. Students are asked work collaboratively and present one report to the Board of Directors at the end of the exercise. Students are asked to prepare an additional report, After-Action Report, that will summarize the things that went well and those that need improvement based on their work.

Scenario 2 – Terrorism preparedness in Johnson City, Tennessee

In scenario 2, students are “confronted” with a real life-like situation where they all work as members of the Incident Command System that is setup to respond to a series of fictitious terror attacks involving 8-15 members of an armed terrorist organization utilizing advanced squad tactics, conventional weapons and explosives. The potential for the use of advanced conventional weapons and false flag operations should not be ruled out. The city location is provided on a real map where students can check out on
MapQuest and gain an overview of the region, major transportation arteries, and significant terrain features. Using the city government website, students become familiar with the assets and liabilities of the city including the leading employers, businesses, employment parameters, major retail venues, cultural assets, strategic and tactical targets, significant terrain features, bordering cities. Students also familiarize themselves with the political parties that are dominant or active in the city and region. Students also identify targets of opportunity as well as targets of strategic interest throughout this region including the existence of unified emergency management command center, sheriff’s office, major factory production sites, shopping malls, community events, places of worship etc. that can be targets for terrorist groups.

In a series of choreographed activities students individually study successful terrorist attacks on similar venues across the globe, and develop a likely terrorist profile that would attack the city. Students also familiarize themselves with the effectiveness of conventional weapons and the potential use of advanced conventional weapons via studying various sources that explain the capacity and damage assessment reports from past incidents involving the use of such weapons. Students also identify the primary first responder organizations and major media outlets within the region; research the training, equipment, and other assets that might be available to local, regional, and state law-enforcement organizations. Next, students identify the major trauma centers within the locale and region.

Students are then placed in groups, and asked to pick and assume one of each of the roles of the Commander staff including Safety, Public Information, Legal Counsel, and Liaison; Section Leaders such as Planning, Logistics, Finance & Administration; Operational positions such as Law Enforcement, Emergency Communications, and Air Operations, Fire, Emergency Medical Services and Water/Wastewater.

**Scenario 3 – Levee Breach Response in Elk Grove, California**

In scenario 3, students are “confronted” with a real life-like situation where they all work as members of the Incident Command System that is setup to respond to a levee breach caused by a regional disaster – a California earthquake- and a secondary disaster caused by the earthquake, namely the breach of levees protecting the city of Elk Grove, CA. One caveat is that levees in nearby Sacramento are likely to be affected as well, constraining the resources available. The city location is provided on a real map where students can check out on MapQuest and gain an overview of the region, major transportation arteries including railways and roadways, and significant terrain features including flood plains, waterways, and lakes. Using the city government website, students become familiar with community resources available such as the police, fire, first responders, hospitals, volunteer organizations, and businesses.

In a series of choreographed activities students individually study individual and family preparedness resources for Elk Grove residents from the city website resources, study the recent capital investment projects in the region, detail or note any emergency management structures or reports, mitigation efforts, preparation training events or drills, and interviewing actual persons that take part in emergency preparedness. Students also review Census Data from government websites; note the presence of special need populations, immigrant populations, major industries in the city and region, assets that
would be helpful for successful recovery as well as vulnerabilities against known hazards. Students then make themselves familiar with the definitions and technologies used to predict earthquake hazards including likelihood, Richter Scale measurements, existing mitigation protocols for flood and earthquake hazards, reports prepared by Multi-Agency Coordination Group, levels of implementation of mitigation and preparedness plans, etc.

Students are then placed in groups, and asked to pick and assume one of each of the roles of the Commander staff including Safety, Public Information, Legal Counsel, and Liaison; Section Leaders such as Planning, Logistics, Finance & Administration; Operational positions such as Law Enforcement, Emergency Communications, and Air Operations, Fire, Search and Rescue, HazMat, Emergency Medical Services and Public Works including all utilities.

Using several templates, the three groups are asked to address the following questions at each phase of the disaster: Initial Response, Short-Term Response, and Early Recovery and Restoration. For each area of responsibility, groups are asked to state which activities are critical to perform as part of the responses as it progresses, i.e. create Status Reports. The status reports should also indicate what resources will be needed by organizations and people including equipment, materials, and supplies. They should indicate whether there are any recommendations or decisions that need to be made by the Board of Directors. A final report which is to be based on a provided template is to be written to the Executive Director this has to be direct, specific, and very clear. Students are asked work collaboratively and present one report to the Board of Directors at the end of the exercise. Students are asked to prepare an additional report, After-Action Report, that will summarize the things that went well and those that need improvement based on their work.

The collaborative report has the following sections:

Initial Response (first 24 hours):  
- **Resources Needed:**  
- **Decisions to be made by Board of Directors:**
Short-Term Response (first three days):  
- **Resources Needed:**  
- **Decisions to be made by Board of Directors:**
Early Recovery and Restoration (next seven days):  
- **Resources Needed:**  
- **Decisions to be made by Board of Directors:**

Additional information:

The After-Action Report sections are as follows:

Initial Response (first 24 hours):  
- What went well:
- What did not go well:
- What mitigations can be put in place:
- What preparations for response and recovery need to be implemented:
Short-Term Response (first three days):
What went well:
What did not go well:
What mitigations can be put in place:
What preparations for response and recovery need to be implemented:

Early Recovery and Restoration (next seven days):
What went well:
What did not go well:
What mitigations can be put in place:
What preparations for response and recovery need to be implemented:

Survey methodology and administration

At the end of the exercise which consisted of 3 weeks of work, we asked students and the faculty teaching the course several questions using an online questionnaire. The aim of the survey was to explore the effectiveness of the scenario-based learning tool, which consisted of the three case studies detailed above. Survey consisted of 10 questions which combined the following categories: (a) 5-point Likert scale responses to statements, each of which corresponded to a specific attribute of the learning model that we intended to assess, (b) questions that lead the respondent to make specific preferences, and (c) open-ended questions. We intended to use the level of agreement for each statement as success levels of the intended purpose. We tried to keep the questions as short and as limited in number as much as possible since the survey was optional. We sent an e-mail to the students and the instructor containing the survey link, and asked them to respond to the short survey.

The faculty survey questions were as follows:

1. I feel that the “skills-based” approach is an engaging way for students to work on a career-relevant project and demonstrate mastery of specific competencies.  
   Strongly Agree/ Agree/ Neutral/ Disagree/ Strongly Disagree
2. I would like to see this approach used in future classes.  
   Strongly Agree/Agree/Neutral/Disagree/Strongly Disagree
3. Which one of the following provided the best learning experience for your students? (pick only one)  
   Exams/papers/discussion forums/projects (using the “skills-based” approach)/ other
4. Using this novel approach, I feel that students were able to make a better connection between project activities and what is needed at work than in previous classes.  
   Strongly Agree/ Agree/ Neutral/ Disagree/ Strongly Disagree
5. I feel that this approach helped students gain needed competencies for their current or future job.  
   Strongly Agree/ Agree/ Neutral/ Disagree/ Strongly Disagree
6. Students demonstrated higher learning and submitted better quality work through this approach.
The student survey questions were similar to the faculty survey questions with the omission of question 6 above. They were as follows:

1. I found the “skills-based” approach an engaging way for students to work on a career-relevant project and demonstrate mastery of specific competencies.  
   Strongly Agree/Agree/Neutral/Disagree/Strongly Disagree
2. I would like to see this approach used in future classes.  
   Strongly Agree/Agree/Neutral/Disagree/Strongly Disagree
3. Which one of the following provided the best learning experience for you? (pick only one)  
   Exams/papers/discussion forums/projects (using the “skills-based” approach)/other
4. Using this novel approach, I was able to make a better connection between project activities and what is needed at work than in previous classes.  
   Strongly Agree/Agree/Neutral/Disagree/Strongly Disagree
5. This approach helped me gain needed competencies for my current or future job.  
   Strongly Agree/Agree/Neutral/Disagree/Strongly Disagree
6. What did you like about the approach? (open-ended)
7. What didn’t you like?
8. In general, how can this approach be improved (later you will be asked for specific improvements for the projects you administered). (You may choose more than one.)  
   Better instructions needed/more resources required to complete the project/make it less rigorous/more time needed/better technology needed/other
9. Please identify specific improvements to the project assignments you administered. (open-ended)

Survey Results
Since the survey was optional, the response rate was at a low rate of 23%. Only 6 students responded out of the 26 students that took the class. The following is a summary of the answers:

1. 5 out of 6 students reported that they found the “skills-based” approach an engaging way for them to work on a career-relevant project and demonstrate mastery of specific competencies. Of those 5, 3 of them strongly agree with the
above statement. Only 1 out of 6 students strongly disagreed. The instructor agreed that the approach used was engaging, although he did not agree strongly.

2. All the responding students (6 out of 6) and the instructor strongly agreed that they would like to see this (“skills-based”) approach used in future classes.

3. Half of the responding students (3 out of 6) stated that the skills-based projects provided the best learning experience for them, while 2 students preferred papers, and 1 preferred discussion forums over other methods. The instructor’s preference was also skills-based projects. None of them favored exams.

4. 5 out of 6 students agreed that they were able to make a better connection between project activities and what is needed at work than in previous classes. Of those 5, 3 of them strongly agreed. Only one out of the 6 strongly disagreed. The instructor’s position was to agree with the statement but not strongly.

5. 5 out of 6 students agreed that this approach helped them gain needed competencies for their current or future job. The instructor’s position was neutral in this question.

6. When prompted with the question of what they liked about the [skills-based] approach, students gave the following responses:
   a. “More direct relevance and easy to use”
   b. “The project put you in the middle of it all. The project made you think about what you would do if you were in that situation. I like the 'hands-on' feel to it. That is the kind of critical thinking that I enjoy and something that writing a 25 page paper can't teach you. I also enjoyed the story that went along with the project.”
   c. “I like that this approach forces me to put myself into the situation and think critically about what it is that I need to do. Not only does it require me to think critically about the situation but it allows me to hone the skills I feel are necessary for the career path in which this degree will take me.”
   d. “Nothing”
   e. “The interaction between my classmates was awesome; instructor set the tone and everyone followed her [sic] lead.”
   f. “I like that the [...] assignment tackled a subject that was new to me and has significant focus in homeland security (resilience), and the interviews caused me to thoroughly explore and apply the concepts we were studying.”
   g. The instructor stated “I think requiring some FEMA-EMI IS courses as preparation or a prerequisite has some merit, although the amount of courses required has to be kept reasonable.”

7. When prompted with the question of what they did not like about the approach, students gave the following responses:
   a. “Directions need to be clearer, and the number of FEMA courses to do must be limited due to the time it takes to do one of them completely in many situations.”
   b. “It was difficult to come up with answers and situations for things that weren't discussed in the story. I felt I should limit my actions to only that which was told in the story. I didn't think outside the story like I should
have and make up other situational-awareness activities that are most likely going on at the same time.”

c. “I found the pilot program redundant and tiring. I have participated in group projects […] for five years and they are all the same. No one is willing to do the work until the very last minute and the rest of us are left holding the bag, along with the grade. Groups do not get communication […] when students drop out and we spend hours, sometimes days, trying to contact this person only to find out they dropped the class weeks ago. […]”

d. N/A

e. N/A

f. “I did not like that this extra assignment added to a heavy term workload. The quality of work suffers as quantity increases.”

g. The instructor stated: “I think the amount or number of FEMA-EMI IS courses listed as required prerequisites for each individual was overly burdensome for most of the students, although a few had no problem with this. Also, I think more information needs to be provided for the rationale or intent for the new approach or content, and the desired outcomes.”

8. When asked in general, how this approach can be improved, 2 students responded indicating that better instructions are needed; 2 of them stated that it needs to be less rigorous, and 1 student stated that better technology is needed. None of the responses indicated that more resources are required to complete the project, or more time is needed. One stated the following: “I did not like that this extra assignment added to a heavy term workload. The quality of work suffers as quantity increases”. The instructor stated that better instructions are needed, as well as more resources and the project should be less rigorous.

9. When asked to identify specific improvements to the project assignments they administered, students provided the following responses:

a. “Less research papers. At this level we know how to do research - more learning is acquired from the discussion questions each week, especially since the Professor is active in the discussion and keeps things going.”

b. “In regards to posting responses to the completed projects. Allowing the class to view the scenario will allow us to critique the actions taken by the group.”

c. “The depth notes and instruction were vital.”

d. “I believe that more time should be spent on the Individual Assignment and the Group Project should be deleted. I have come to understand why resilience is such a critically important subject […]. I believe it should be among the very first topics explored in the EM program because it is integral to all phases of the disaster life cycle. Early exposure and ongoing reinforcement throughout the program would ingrain the concepts and provide the opportunity for original thought along with practical application in pursuit of mastering the topic.”

Findings and Conclusions
Despite the low response rates, the survey results indicate that the new “skills-based” learning approach has a promising future. It is understandable that group projects may be frustrating for some students since some students tend to pick the bulk of the work while others do not feel contributing at a level that is acceptable to others. If the skills-based approach can be evaluated with the absence of negative group dynamics, the results might have been more favorable.

Although it was hard to get the big picture due to the low rates of participation, the mini survey shed some light onto the perceptions of students and we were able to assess how they value the skills-based approach. Instructor perspective is equally important since faculty engagement affects student perception and performance. It is obvious from the survey results that the instructor of the course has the necessary skills to teach and is highly regarded by students; therefore there were no issues that had an artificial effect on students’ perception of the skills-based approach employed in the Homeland Security/Emergency Management course that was the subject of this research.

In general, students are looking for clearer instructions, less busy work, case studies directly pointing to the practical issues that pertain to the subject matter, and more use of technology, possibly audio-visual presentations that attract and keep their attention. The survey results partially aided us in enhancing our instructional design and we will continue to use methodical approaches to assess student learning.

Although the instructor’s position was neutral when asked whether student grades were better as compared to other classical ways of performance assessment (exams, papers, or quizzes), in the future, as we collect more data and make the appropriate comparisons, we will be able to determine whether there is a notable difference in student success and hence learning effectiveness. The results of this survey opened us a door to explore better ways to teach skills-based curriculum to students.

Acknowledgement: I would like to thank Dr. Les Pang for his preparation, testing, and administration of the survey tool.

Abstract

In the contemporary environment, word-of-mouth is no longer sufficient as a means of getting one’s name out there, nor are individual vignettes on mainstream media. Moreover, one’s web presence can no longer be basic or textual. Now, one’s presence must be rich, informative, visually appealing, and useful – all of which can be both Data Driven and Data Fruitful. The Professional Science Master’s National (PSM) Office and the movement have been and are continuing to grow for many years, but they have also met challenges to the growth, including the challenge of marketing, meaning, motivation and more. Part of the challenge to this expansion has been the context. The world is changing, and due to the influx of various mediums of information attainment that not only students have access to but also faculty, institutions, employers and other industry constituents, not only through a regular computer but now through mobile devices, a concerted effort was over the last few years being realized to address these needs of strategic and thoughtful application of anecdotal and other data to communicate the message of the office and movement to the world. Beginning in 2013, a number of issues were identified, including an outdated website, with poor maintenance, over abundant misuse of services, tools and providers, and lack of real-time information on usage. From these challenges, meetings with various stakeholders, including the boards of the office and the sister organization, and other partners, as well as program leaders were held to determine a path to improvement. A vendor selection process was conducted and an optimal vendor was secured based on needs, timeline, cost, and other factors. In 2015, over a 6-month period, a select team of a developer and designer on the part of the vendor and the administrative director as well as a consultant on the part of the national office worked arduously to realize a new platform for all the professional science master’s stakeholders to access information, beginning from an informal needs assessment through development and implementation and testing. What was delivered was a site that is easy to use, easy to
navigate, easy to maintain and easy to track. The results of this effort include – a new way for visitors to access information for which they are searching, and the office’s ability to provide both visitors and partners real-time information on usage, tracking, and interest through Google Analytics, moving the office’s website from being reactive to proactive and increasing the data-driven ability to respond to student, staff, faculty, employer, government, and industry needs. This presentation will discuss these activities and the resultant positive impact on website usage, and other organization’s web development and further challenges still to be addressed, including continued content renewal.

Abstract

There is a high demand from business, industry, and public agencies for highly-skilled and well-trained STEM graduates who can contribute immediately to the workplace. Curricular development aligned with verifiable student learning outcomes, particularly in the STEM fields, has been discussed to meet the demand. This is particular observed at the master’s level of education in STEM, where master’s students seek opportunities to enhance their graduate education with preparation for their future careers in industry. As a result, Institutions of Higher Education are facing challenges on their curricula to both address various sectors as well as provide education that aligns students’ subject interests with industry needs. Fortunately, there are examples of master’s programs meeting both the needs of the students as well as their future employers. Our presentation will discuss some of these specific program examples, particularly focusing on their experiential and professional skills components built into the science curriculum to enhance student learning outcomes and to meet employers’ expectations for tomorrow’s STEM workforce. We will share why such examples have worked well and what tipping points needed to be managed to build and implement such curricula. A several examples derive from surveys and interviews of 350 programs from 150 institutions across the nation that have developed their new curricula over the last 5 to 10 years, focusing on lessons learned from farther in-depth site visits of and discussions with a particularly successful institution with a number of exemplar programs in Southern California. We hope that this presentation will contribute to curricular designers and program leaders as examples for consideration when building such components into new, fledgling or redesigned graduate programs.
Abstract

In a traditional Doctor of Philosophy (Ph.D.) program, usually undergoes a 5 to 7 year course of study with a minimum of 2 years of coursework and some culminating experience, ordinarily a dissertation. Similarly, a Doctor of Education (Ed.D.), such as one at USC, has very similar requirements in a much more condensed time frame, usually taking 3-4 years (though a Master’s degree and years of previous work experience are also required prerequisites, which many traditional Ph.D.’s do not). In the traditional doctoral program, there are many non-dissertation and coursework related requirements and opportunities afforded to the students that are not afforded to students in the expedited ones. These opportunities include publishing, presentations and teaching. Research and Teaching assistantships (RA’s and TA’s) are usually part and parcel to any Ph.D. program, preparing students, under the guidance of seasoned faculty, with the knowledge they need for future careers in academia and industry. Ed.D.’s, like myself, are not prepared so robustly for such futures, often expected to already be seasoned in disparate fields themselves. As one such individual, pursuing academic opportunities outside of the career I already had prior to my program, that of an Information Technology Manager, was a challenge, even with a Masters and Doctorate in Education. When consulting and teaching opportunities finally did arise, there was a large learning curve to understand everything from where to order books for my class to getting the course roster, and all of these were lessons before even being placed in front of the students themselves. Moreover, in spite of my many years of formal learning about course design and pedagogy, there was nothing like actually standing in front of the students. This presentation will discuss lessons learned from my first term as teaching and present ideas for future teaching endeavors.

Abstract

In Information Technology (IT), the major concern for most technical staff is the functionality of a product or service – making sure whatever someone is using is functional as opposed to appealing or for that matter pleasing. However, with the changing student user to that of more of a consumer and education as a field changing to be more on demand and non-traditional, the user experience is changing how education and as a consequence IT and IT-related products and services are being supported and delivered. Within the academic space, gamification of the education is becoming more and more important as is ensuring that course-related materials are all posted in the institutional Learning Management System (LMS). Similar, one often overlooked system that affects all current students is the student portal. Anecdotally, many institutions simply using the landing page of their Student Information System (SIS) as their student portal; however, there are other institutions who are making a concerted effort to employ a better, more seamless user experience. In the case of this institution, since 2012, they have worked with several vendors to move from just student information to a rich experience where all the information a student might need, links to services they would use, and automatically sign into and attention to the experience on any device has been considered. This has resulted in a much more tenable, usable and seamless experience for the. So successful this effort has been in fact, that additional attempts at providing a corresponding mobile device application and a role-specific experience have been made. Now, where efforts to adjust the experience to everyone from applicants to alumni are being sought, and moving the institution’s public website’s non-recruitment related data is underway where all nonessential information is moving internally to that new portal for students, staff and faculty to access and not distract from the message of the public website, that of recruitment. This presentation will discuss, from an IT perspective, lessons learned over the last 4 years, including successes and areas that need to still be improved and next steps.

Establishing Student Centered Advising Model in Japanese Higher Education

Introduction

In Japanese higher education, the concept of academic advising as a system is relatively new. Japan Student Service Organization (JASSO) conducted a survey on the student support service programs in 2010. On that survey, the questions related to academic advising were not asked. In 2013, JASSO added a question on an academic advising (See Table 1), while questions on “meeting with students who have excessive absence and academic probation,” “Consultation counter for academic concerns,” and “Academic & Learning Support, including academic writing and seminars” were eliminated.

Based on the 2010 survey, 88% of the faculty and staff had concerns about students who had excessive absence and on probation. 60% had concerns on academic and learning support (JASSO, 2010). These two questions were further looked at in detailed categories. These changes were also affected by the accreditation organizations, which made changes in the assessment criterion.

Ways to work with students on excessive absence and on probation were divided into 16 categories. At 75.6% of the institutions, faculty and staff contact students with 3 or/and 5 absents with notification, and 83.5% of the institutions implements individual meeting sessions with faculty and staff when students were absent for more than 3 times (JASSO, 2013).

Hypothesis of This Study

This research has several hypothesis. They are the following:
1. The advising system implemented at Japanese higher education is not functioning well;
2. Advisors who have a Prescriptive advising style show more ethnocentric orientation;
3. Advisors who have a Developmental advising style show more relativistic orientation.

Methods

This research was conducted with four data gathering methods: 1) faculty survey on Intercultural Sensitivity model and advising style, 2) student’s survey on utilizing advisors, 3) individual faculty interviews on advising, and 4) secondary data analysis of advising sessions with students on probation.

Faculty surveys on intercultural sensitivity and advising style

54 faculty members from two institutions took a survey which included two scales. The first scale is Intercultural Development Inventory (IDI) which is designed to measure sensitivity and orientations toward cultural differences (Hammer, Benett, & Wiseman, 2003). This scale has six developmental continuum orientations from “ethnocentric” mindset to “ethno-relativism” mindset: Denial, Defense, Minimization, Acceptance, Cognitive Adaptation, and Behavioral Adaptation (See Table 2, Hammer, 2011).

The second scale is on advising styles. Prescriptive advising is automatic and one-way advice, like the prescriptions in pharmacies. Advisors always have right answers when students do not know anything. Developmental advising aims to develop
autonomous and independent learners. It encourages students’ self-reflection and self-determination. Students and advisors work together to reach students’ goals. The approaches might vary depending upon individuals and situations.

Among 54 faculty members, 46 were male, and 8 were female (Table 3). The departments varied, such as Law, Economics, Literature, and Engineering. More than 50% were 50 years old or over.

2nd Year Student Survey

During the fall semester in 2015, the online survey toward second year students on advising was administered. All 2nd year students from one university were invited to take this survey. 222 students (about 25% response) answered the survey with five questions. Due to protect students’ confidentiality, the survey did not ask demographic information.

Individual Faculty Interview

34 faculty advisors from three different institutions and ten different departments and units were interviewed. The interview included nine questions and was conducted during summer break and fall semester of 2015. Among 34, 19 were male and 15 were female. The interview questions were given to interviewees prior to their appointments. Ages are from 30’s up to 60’s.

Secondary Data Analysis of Advising Sessions with Students on Probation

Advising session notes with students on probation were also analyzed as secondary data. 1233 notes were reviewed, which consisted 369 5th year and over students, 292 4th year students, 364 3rd year students, and 208 2nd year students during 2014 and 2015 academic year. The grades of students were as of spring semester 2016.

1. Reliability of the scale

Reliability analysis was conducted to examine internal consistency of two scales. Table 4 shows the Cronbach Alpha. It shows that the reliability of subscales of IDI and advising styles are between .65 and .78, which means they are moderately high.

2. Gender and Age Differences

To examine gender and age differences in two scales, t-test and ANOVA were conducted. For IDI scale, there was no gender difference. For advising style, on the other hand, male had statistically higher scores in Prescriptive advising style.

Based on age, there was no difference in an advising style scale. IDI scales, however, showed differences in age group. The group of 40-49 years old had a higher score in “disinterest” in Denial orientation. Furthermore, the group of 30-39 years old had statistically lower scores in Describing/Enjoying in Acceptance orientation and Complexity in Behavioral Adaptation orientation.

3. Correlations between IDI and Advising Style Scales

The relationship between two scales were examined by correlation analysis. Table 5 shows correlations among subscales in IDI and Advising Style scale. It shows several moderately high positive correlations between two scales and within IDI scale.

Correlation between ethnocentric orientations, such as Denial and Defense, and an advising style scales, there was no significant difference. From this result, our hypothesis 1 (faculty who has Prescriptive advising style shows more ethnocentric orientation) is not supported. There are lower or no correlations between ethnocentric orientation and two advising styles.

Although correlations between ethno relativism orientation, such as Cognitive Adaptation and Behavioral Adaption, and Prescriptive advising style are positive, they are lower than correlations between Cognitive Adaptation/Behavioral Adaptation and Developmental advising style, exception of Bridge. This result would support our
hypothesis 2; subjects who have Developmental advising style shows more ethno-relativism orientation. This means high correlation with Behavioral Adaptation.

</table>
than 1%, and related to an internship and balancing study and other things were less than 25%.

Faculty Interview Analysis

77% of interviewees pointed out the need of restructuring the advising system. The current advising system tends to simply fulfill the required duty as an advisor. In three institutions, during students’ first semester at the university, faculty advisors teach a First Year Experience course. After that, students tend to meet with their advisors only when they are on probation. Even when students are on probation, faculty advisors talk with students and keep a simple record. They are not asked to follow up with their advisees. Most faculty advisors feel the need of change in this system; however, they do not feel that it is their place to restructure the system.

Related to the concern above, all the faculty members who were interviewed felt that there was no common understanding of what advising is and what the expectations from advisors are. Most of them felt that they are involved too much with students’ personal issues. Since they meet with students when they are on probation, faculty advisors tend to discuss students’ basic academic competence, time management, mental health, and so on. Faculty advisors do not feel that these are their responsibilities. They prefer working with students on “academic” issues, which is on faculty’s area of study.
The other common concern that faculty shared was that there were significant number of students who might need support in mental health. It is correct that they should not take responsibility for mental health issues, however, faculty felt institutional initiative to make sure students receive appropriate support.

</tbody>
</table>

Table 6 shows that the longer they are enrolled, the ratio of repeating probation increases. This indicates that the first and second years of their student life are critical to improve their GPA. It also shows that the advisors tend to think of their students’ improvement in grades with no concrete reasoning. While the advisors hardly refer students to students and/or academic support (between 24 and 40%), more than 80% of the students were expected to improve their grades. Looking at the rate of repetition on being on probation, the advisors’ assessment of students’ ability is not accurate. In the comments, advisors give reasons why they believe students would improve their grades. The top reason is because students told their advisors that they would not repeat the same mistake. In addition, even when students get referral to student and/or academic support, only 20% of the students actually use the resources.

Discussion

Stated as the assumption 1, based on the analysis of various data, the advising system in Japanese higher education is not well functioning. As stated in the analysis, students do not feel in need or were not aware of academic advisers (60%), while not all students on probation (about 15% of total students) meet with their advisors despite the requirement. On the contrary, faculty advisors feel that they are doing too much, when they act as academic advisors. They do not mind to advice academically, yet, many of them do not believe the function of advising fit in that arena. There are two suggestions
that higher education in Japan can approach.

**Clearly Defined and Stated Advising System**

Higher education institutions in Japan need to inform students how to be successful. Student survey showed that students prefer asking their seniors for consultation, rather than faculty and staff. Also, more than 10% of the students were not aware who their advisors were. Students who are on academic probation in Japanese higher education are between 10%-20% of the student body. Faculty advisors also need to know what their responsibilities are. Currently, significant number of students are not being successful as university students even when they work with faculty. It is also possible to look into ways of collaboration between staff and faculty. Depending upon the institution, staff and faculty can divide advising responsibility and work with students collaboratively. In this case, also, it is important to clearly define and state what staff and faculty advisors’ roles and responsibilities are.

**Faculty Development Opportunity for Advising Issues**

The Faculty survey results showed that faculty who is in his/her 30’s scored low in Acceptance and Behavioral Adaptation orientation on IDI. The reasons are interpreted as the following. First of all, most college faculty members start full-time academic job in their 30s. They are not used to juggling their work responsibilities with time restriction. With the appropriate mentor system in their academic and political arena, they might need advice on advising.

Faculty also have a tendency to assess inaccurately on students’ academic performance and progress. This could be the result of faculty believing that they were advising students developmentally, but they are not assessing based on data and information. Although it is important to believe in students’ ability, faculty has to work with students realistically.

DIGITAL ETIQUETTE PRACTICES IN A DIGITAL WORLD

ABSTRACT

As the prevalence of digital tools utilized by today's youth continues to increase, more and more schools are incorporating technology into their curriculums as a way to connect with their students. This is providing educators with the opportunity to not only teach students the content within subject they teach, but allow for them to model the appropriate and responsible ways to use the technologies that envelope the world they live in. Furthermore, professors of education are being charged with the responsibility to not only teach future educators about the modern classroom and their roles in the school system, but also how to maneuver themselves professionally in a very technological world. The goal of this study was to address why and how educators today are incorporating digital etiquette practices into their everyday curriculum. A total of 81 education professors and 190 education students were surveyed on their current technology practices and their opinions on the need for the incorporation of digital
etiquette practices into the lives of today’s youth. According to the research participants, it was found that the majority of educators and students alike consider it critical that digital etiquette practices and responsible online habits are incorporated into the education of today’s students. However, the results showed that there was a disconnect between both the type and amount in which technology is utilized by education professors and their education students. It was also found that there are limited resources designed to educate individuals on proper digital etiquette practices. Such findings indicate a need to define and align expectations regarding digital etiquette and its role in education today.

Keywords: Digital etiquette; technology; higher education; classroom procedures

Categories: Research; Mixed; Technology
INTRODUCTION

Background

According to Ribble (2011), Digital Etiquette is defined as ‘the electronic standards of conduct or procedure’ (p.29). As the prevalence of digital tools utilized by todays' youth continues to increase, the need to educate these students on how to responsibly use and manage such technology continues to rise. As Ribble (2011) states, ‘there needs to be a structure that can teach students (and parents) how to act with respect to this technology’ (p.9). Gone are the days where libraries are the only sources of information for our youth, and face-to-face conversations are their only mode of social interaction. With the help of smartphones, tablets, laptops, etc., students and teachers have endless resources for information and social connection capabilities right at their fingertips. However, the abundance of and ease at which students can maneuver such tools has created an unarguable need to teach youth how to manage themselves online in such a way as to not misrepresent themselves.

Throughout this study, the focus will be on addressing why and how educators today are incorporating digital etiquette practices into their everyday curriculum. Considering that a majority of today’s youth spends most of their time in some form of school setting, educators have an undeniable opportunity to address and model appropriate behavior online to their students. Moreover, professors of education have a responsibility to not only teach these future educators about the modern classroom and their roles in the school system, but also how to maneuver themselves professionally in a very technological world.
Rather than banning the use of technology with an abundance of rules and policies, there has been a movement in schools on all levels to embrace the digital movement by capitalizing on the capabilities of such devices and in turn educating students and themselves on how to be responsibly represented online. As Tan (2011) states, ‘It is not enough to create rules and policy; we must teach everyone to become responsible digital citizens in this new society’ (p. 31).

Research Questions

Are those in education familiar with the term ‘Digital Etiquette’ and are they incorporating it into their curriculum? How do today’s educators incorporate digital etiquette practices into their curriculum? What are the overall attitudes of those in education concerning current digital etiquette practices?

REVIEW OF LITERATURE

Few can argue that the modern world in which this generation is being educated in is vastly different than that of previous generations. The digital world has indeed integrated itself into the everyday lives of society in general, but specifically into the lives of today’s students and teachers. With the availability of ever growing and changing technologies at their fingertips, a new dilemma has presented itself in the classrooms around the world: How are we to educate these digital natives to use technology in an appropriate and responsible manner? If we, as educators, strive to prepare our youth to thrive in the modern world, then the need to address social norms and etiquette in this digital world must be made a priority in conjunction with the taught norms of the ‘real world’.
Digital Citizenship is a term developed by Mike Ribble to describe the norms regarding appropriate and responsible use of technology. According to Ribble (2011), Digital Citizenship consists of nine elements: Digital Access, Digital Commerce, Digital Communication, Digital Literacy, Digital Etiquette, Digital Law, Digital Rights & Responsibilities, Digital Health & Wellness, and Digital Security. While each element is certainly of equal importance, Digital Etiquette seems to be one that strongly affects those in education today. Digital Etiquette is defined as ‘the electronic standards of conduct and procedure’ (Ribble, 2011, p. 29). With the increasing prevalence of cyberbullying and other behaviors that can be detrimental to both a student’s or educator’s health and reputation, teachers are beginning to take an offensive (rather than defensive) approach to online behavior by educating adolescents and themselves on how to one should manage their behavior online in an appropriate and responsible way.

The Importance of Digital Etiquette

While it is overall understood among educators that teaching digital citizenship to our youth is important in today’s world, there is little research concerning how exactly to implement these practices into the classroom curriculum. Ribble (2012) finds that educators are too often apprehensive about discussing these issues with their students because they themselves feel they are not well informed on the current events related to technology. For this reason, many school districts are creating and implementing long-range technology plans with the overarching goal of equipping their teachers so, in turn, they can equip their students to be productive citizens of this connected world. In a survey done by the National Association of Colleges and Employers, it was found that
the majority of U.S. employers use Web 2.0 technologies and social media as a way to prospect for potential hires (Greenhow, 2010). With this considered, the importance of educating students and teachers on digital etiquette practices and online reputation management is at its peak. According to Susan Crawford, the assistant to the president for Science, Technology, and Innovation, ‘The best software is between the ears’. Teachers are unable to watch their student’s online behavior 24 hours a day, but the ‘risks to youths online can be reduced through Digital Citizenship education’ (Tan, 2011, p. 30). In order to prepare todays’ students to thrive online, educators must not hide behind their policies and procedures, but instead teach them how to become digital citizens.

**Using Web 2.0 Technology as an Educational Tool**

Considering that the parents of todays’ students are oftentimes learning technologies alongside their children and mimicking how they see their peers using these tools, it makes sense that schools ‘are in a better position to teach kids appropriate digital etiquette’ (Ribble, 2011, p. 29). In the past, it has been the norm for districts to either partially or completely restrict personal student technology use during school hours. As the commonality of technology in our daily lives increases though, it is becoming more and more apparent that schools must not hide behind their Acceptable Use Policies (AUPs) but instead teach their educators and students about how to use these devices in a safe and appropriate manner.

In the classroom, technology is no longer limited to computer labs that students can visit to perform online research or create PowerPoint presentations. The modern classroom can implement a variety of the technology trends that have emerged and are
increasing in popularity. The trend that seems to be gaining the most momentum is referred to as ‘Bring Your Own Device’, or BYOD, in which educators are utilizing the technology devices students already own for educational purposes. Like most trends though, there are pros and cons to their implementation. Bruder (2014) discusses a number of advantages of letting students use their own devices such as the theory that its practice encourages participation by allowing students to use devices they are familiar with. While this is certainly the more economical choice in technology trends (as opposed to the 1:1 initiative in which teachers and students are all issued the same devices by the district), schools have noticed that allowing students to use their own tech devices has only widened the already existing the gap between the lower income students and their peers. No matter what (if any) tech trend a district chooses to implement, the need to make digital citizenship practices a priority remains.

Teaching Responsible Technology Use

Given the ever-increasing popularity of tech tools among society today, Ribble (2011) found that there are actually very few rules established regarding the proper use of such devices. However, most researchers and educators seem to agree on what digital citizenship education should include. Greenhow (2010) states that ‘digital citizenship ought to include their developing awareness of social and political issues as well as their online participation in public life’, primarily through the demonstration of ‘respect for the rights and responsibilities of self and others in the digital commons’ (p. 25). Yang (2013) simplifies what digital citizenship education should include by stating that ‘Digital citizenship isn’t just about recognizing and dealing with online hazards. It’s about...using your online presence to grow and shape your world in a safe, creative
way, and inspiring others to do the same’ (p. 440). This basic understanding of what a digital citizen should ‘look like’ seems to be understood by most, and as Tan (2011) puts it, an educator’s responsibility is to teach our students where the virtual worlds’ ‘lines’ are that should not be crossed. However, the question that remains is where exactly should these lines fall?

Prior to the implementation of digital citizenship education, Ribble (2012) finds that the schools must first establish a direction for how to use the tools of technology in their classrooms, despite how quickly it continues to change. A growing number of school districts are beginning to organize technology teams, from which long-range technology plans and goals for the district are being established and carried out. School districts are also creating the position of and hiring Instructional Technologists who are often former teachers who specialize in the incorporation of tech tools to help enrich the learning experience of their students. As these movements into the 21st century classroom continue to take place, educators are beginning to understand the need for the incorporation of digital citizenship education; however, there are little resources available that provide them with the information they need to set it in place. According to Ribble (2012), digital etiquette and citizenship education are best explained through the use of example scenarios and discussions with the students. As he says, ‘allow students to provide experiences they have had with technology and discuss how situations might have been handled better’ (p. 150). Oftentimes, awareness of the issue is the first step in a positive change being made. Ribble (2011) also provides educators with the following continuous Four-stage Reflection Model to help lead the discussions on any of the digital citizenship elements:
1. Awareness
2. Guided Practice
3. Modeling & Demonstration
4. Feedback & Analysis

Yang (2013) lists four indicators as well, as provided by the International Society for Technology in Education (ISTE), that are essential to digital citizenship education, all of which use the term 'model' in their text. If educators expect to impact the ways in which students behave online, they must first lead by example and continuously model, dialogue and discuss with students the appropriate and responsible ways to present themselves online.

**Digital Citizenship Practices in Higher Education**

Incoming teachers and the professors who are expected to prepare them are being presented with numerous challenges concerning the most effective ways to ensure the next generations of educators are ready for the ever-changing technology expectations of the modern classroom. In 2001, Mark Prensky popularized the term ‘digital natives’ but has since emphasized the need for ‘digital wisdom’ (Paulus & Ingersoll, 2015). While (college) students may be considered ‘tech savvy’, the ability for these young adults to manage their own digital footprints in a professional manner seems to be lacking (Osborne & Connelly, 2015). In turn, these very ‘adults’ are becoming tomorrow’s teachers for the upcoming generation. Education professors have a unique opportunity to ensure that proper digital etiquette practices are in place not only for the students they release into the field of education, but for the children whose lives they will impact in their future classrooms.
The current literature describes various strategies currently being implemented on college campuses today. These strategies include the incorporation of digital citizenship practices into the curriculum of pre-service teachers (Dabner, 2015), campaigns such as the ‘Manage your Digital Footprint’ Campaign developed and currently utilized by the University of Edinburgh, and a variety of Tech Desks designed to aide students in the incorporation and implementation of various software systems as well as troubleshooting help for their hardware issues. Those in higher education appear to be attempting to meet the modern technological needs of their students, but as with the education field in general, the need to match (or even exceed) the requirements of the time will grow continually.

Summary

The literature seems to indicate the need for the implementation of digital citizenship and etiquette education into the everyday curriculum. As more and more schools recognize the need to prepare their students for both the real and virtual world they are growing up in, the ‘look’ of the modern classroom is changing drastically. Technology trends such as BYOD, the 1:1 Initiative, and Blended Learning are beginning to become the norm in schools around the world, requiring educators to address how adolescents should present themselves online in a responsible and appropriate manner. There is indeed more in-depth research and resources needed for educators to not only implement digital etiquette practices into their curriculum, but also to ensure they are themselves informed on the issues concerning digital citizenship education. Although technology is ever growing and changing, the need to raise
awareness and educate society on proper online behavior as a whole will continue to remain the same.

METHODOLOGY

Convergent Design

The researchers used a convergent design in this study in an attempt to gather both quantitative and qualitative data at the same time with respect to the research problem. The quantitative data was analyzed using a Cross-Tabulation approach, while the qualitative data was utilized to add greater depth and substance to the research.

Participants

The participants involved in this study were collected from a variety of locations in Texas, depending on their current role in education. Participants indicated as student teachers were limited to one university in Texas while participants indicated as education professors were from a variety of universities across the state of Texas. The student teacher participants included 190 individuals, all of which are currently pursuing their degrees in education. The education professor participants included 81 individuals from a variety of public and private universities in Texas. The participants were provided with a web-based Google Forms survey at the beginning of which they were informed that their participation was entirely voluntary and any responses would not only remain anonymous but analyzed primarily as a whole with the existing data.

Instrumentation

The survey was originally constructed by a graduate student at a university in southeast Texas and a trial run was administered to public school teachers in the north Texas area. The survey was revised and a completed application sent to IRB for
approval. The approval was obtained and the survey was then sent to the College of Education at a southeastern Texas university for validation and to establish a base line for comparison to other Texas universities. Revisions were then made and the survey was sent to all colleges of education in Texas.

The web-based survey utilized for this study were created using Google Forms (www.google.com/forms). The participants were able to complete the survey on paper or from any device with Internet capabilities. The format of survey consisted primarily of multiple-choice questions with some opportunities for open response. After submission, the responses from their surveys were sent anonymously to Google Drive in the form of an ongoing spreadsheet. This data was then entered into IBM SPSS Statistics 22 and a Cross-Tabulation was run to establish relationships with variables.

Procedures

The surveys used for data collection were administered in two ways: paper copies on which responses could be recorded or via the sharing of a hyperlink, which sent participants directly to the survey. After receiving the surveys, data was collected for a two-month window, after which the spreadsheets containing the participant’s responses were downloaded from Google Drive to an Excel spreadsheet. From the spreadsheet, data was analyzed and grouped according to common criteria. The survey and content of this study could easily be replicated and used to determine similar findings for random or selected groups.

Limitations

The results of this study were gathered only from Education Professors in Texas and Student Teachers at one texas university. Considering that the location of the data
gathered was limited to individuals in one state, the findings of this research can only apply to the state in which it was administered.

**RESULTS**

The overarching goal for this study was to determine the overall attitude on the need for Digital Etiquette practices among those in Education as well as discover how Digital Etiquette practices are addressed among pre-service teachers and education professors in Texas. The results from the provided survey describe the experiences and opinions of 81 education professors and 190 student teachers planning to enter the education field within the next couple years.

**Summary of the Results**

*Are those in education familiar with the term ‘Digital Etiquette’ and are they incorporating it into their curriculum?* According to the participants in this study, 73% of education students consider themselves familiar with the term ‘digital etiquette’ while 62% of education professors have the same consideration. 5% of education students and 7% of education professors stated that they were not familiar with the term at all. Of the education professors surveyed, 68% went on to state that they did incorporate digital etiquette practices into their routine, which was interesting considering that a lesser percentage considered themselves very familiar with the term in general. Furthermore, only 57% of education students stated that they have taken courses in which digital etiquette practices are included.

*How do today’s educators incorporate digital etiquette practices into their curriculum?* The quantitative data collected from this survey indicated that the majority of professors do provide at least some sort of information within their syllabus regarding
online etiquette and/or technology expectations. There were also a large number of professors who mentioned ‘modeling’ their expectations to their students as the semesters progressed. There were a variety of responses that indicated a lack of understanding with what the term ‘digital etiquette’ includes, primarily mentioned as some form of technology restriction.

What are the overall attitudes of those in education concerning current digital etiquette practices? Based on the data collected, 74% of education students consider the incorporation of digital etiquette practices in education today ‘extremely critical’. Less education professors (56%) found the practice as critical. However, on a 1-5 scale with 5 being labeled as ‘extremely critical’, 17% of education students and 31% of education professors would at least rate the level as a ‘4’.

DISCUSSION & CONCLUSIONS

Discussion of the Findings

Technology use has indeed become common practice in today’s classrooms, for both educators and students alike. While technology use in the classroom has increased exponentially, there seems to be a lack of understanding of what it means to ‘teach’ responsible online behavior as part of the curriculum. Evidence of this is apparent in the fact that the majority of educators surveyed still consider the implementation of some form of technology restriction as a means to ‘educate’ students on proper technology use. While learning when it is appropriate to utilize technology and when it is not can certainly be viewed as ‘proper etiquette’, the focus needs to shift to a more in-depth understanding of exactly how one is expected to behave and represent themselves in online settings.
The data indicates that there is a fair percentage of both student teachers and education professors alike that understand the importance of the topic within education today; however, with limited literature on exactly how to incorporate such practices, educators are left to interpret the specifics on their own. While the literature and most participants surveyed agree that modeling appropriate behavior is the best way to educate both students and future teachers on proper digital etiquette practices, there still seems to be a need to define exactly what these practices should ‘look’ like. Until this occurs, the prevalence of and level at which digital etiquette practices are administered within education curriculums will vary significantly.

Implications & Conclusions

In my opinion, our survey data and the research indicates the need for today’s teachers (both pre-service and those in higher education) to be educated on Digital Etiquette practices in order to effectively educate their students on responsible online behavior. The desire and ability for educators to teach their students to be responsible digital citizens in this modern world seem to be disjointed. There seems to be a need to make general Digital Citizenship practices a priority, especially with the constantly increasing prevalence of different forms of technology devices/programs in the modern classroom. Analysis of the survey data also indicated that education professors have concerns about their students’ apparent inability to create a divide between professional and social forms of communication. This ‘inability’ could be impactful on their digital footprint viewed by not only peers but by future employers. Furthermore, the apparent lack of programs or software available regarding digital etiquette make it difficult for educators to determine where such lines should fall and how they should be presented.
to students of a different, more tech-savvy generation. As the need becomes more pressing, there may be a rise in the literature available on topics such as ‘digital etiquette’ and other terms related to digital citizenship in education today. As this occurs, the integration of digital etiquette practices in modern curriculums may become more commonplace as opposed to being the ‘novelty’ that they are today.
APPENDIX

SURVEY: Digital Etiquette Practices in a Digital World

1. Which of the following roles currently describes you best? Choose all that apply.
   - Parent
   - College Student
   - Public School Teacher
   - College Professor
   - Other (please specify)

2. What form of technology do you use most often, for personal purposes?
   - Smartphone
   - Tablet
   - Desktop Computer/Laptop
   - Other (please specify)

3. Does this form of technology differ from that used for professional purposes?
   - Yes
   - No

4. If you respond ‘yes’ above, please describe your reason for changing the form of technology in your professional life.

5. How often do you utilize some form of technology for personal and/or professional purposes?
   - 1-2 days a week
   - 3-5 days a week
   - 7 days a week
   - I don’t utilize technology

6. Are you familiar with the term ‘Digital Etiquette’ in regard to its use in education?
   - Yes
   - Somewhat
   - No

7. In your opinion, how critical is it that Digital Etiquette practices be included in today’s education on a scale of 1-5, with 5 being the highest?

8. Do you currently try to incorporate Digital Citizenship/Etiquette practices into your routine? (For Professors only.)
9. Please list/describe the ways in which you incorporate these practices with your learners, if at all. (For Professors only.)

10. If you do incorporate Digital Etiquette practices into your curriculum/routine, what specific programs and/or software do you implement? (For Professors only.)

11. Would you consider yourself ‘digitally responsible’? (For College Students only.)

   Yes
   Somewhat
   No

12. Do you feel that you were educated on how to be digitally responsible prior to entering college? (For College Students only.)

   Yes
   Somewhat
   No

13. Have you taken any courses in which Digital Etiquette practices were incorporated? (For College Students only.)

   Yes
   No
   Unsure

14. If you have taken courses in which Digital Etiquette practices were incorporated, can you list/describe the specific programs and/or software that were used for its implementation? (For College Students only.)

15. Who do you feel had the most impact on your current online behavior? (For College Students only.)

   Family
   Friends
   Teachers
   Other (please specify)

16. Please elaborate on your reasoning regarding the previous question. (For College Students only.)
17. What have you observed in your students regarding their digital responsibility and
etiquette? (For Professors only.)

18. Based on your opinions and experiences, how impactful is a family’s attitude toward
technology use on a learner’s online behavior? Please rate on a scale of 1-5, with 5
being the highest.

19. Please elaborate on your reasoning regarding the previous question.

Panel (Higher Education)
Different Cultures, Different Views: Introducing Film into Education
Chaired by Yoko IMA-IZUMI

This panel discusses the ways in which film should be introduced into class for
teaching a variety of cross-cultural subjects in humanities and social sciences. It is
true that documentary films have been providing evidence to establish history, but
feature narrative films, which are grouped as art and fiction in opposition to
knowledge and fact, can also be used to understand human activities and cultures.
Focusing on feature narrative films that are globally renowned, we will detect key
images and motifs in them to explore different views originated from different
cultural backgrounds. The films discussed include: *Black Rain* (1989, Japan), *Black
*A World without Thieves* (2004, China), *If You Are the One* (2008, China), and
Centimeters Per Second* (2007, Japan).

“Two Black Rain Films Revisited: Japan and America”

Yoko Ima-Izumi
University of Tsukuba

This paper will connect two Black Rain films, America’s and Japan’s. The identical titles have been regarded as a mere coincidence. It is true that the two films may have nothing in common: the American Black Rain is a bloody action film focusing on conflicts between mafia and police while the Japanese film deals with the psychologically intense issue of the effect of the atomic bombings on ordinary people. But the two films bear a profound similarity to each other, despite the evident differences, in that they refer to nuclear fallout, especially black rain, of the bombings of Hiroshima and Nagasaki in August 1945 as a significant factor in determining human state of mind.

To illustrate the profound similarity, I will start clarifying where the two films stand in a sixty-year-old history of nuclear-bombing films made by the cinematic apparatus of both countries. I have drawn a chart to show side by side American and Japanese films dealing with nuclear bombing and its aftermath (List 1).

There are many more films involving nuclear technology in general, but I have limited myself to the ones with depictions of, or references to, nuclear bombing.
which is characterized by heat waves, blasts, white light, and black rain. Film simply about nuclear power without bombing, such as *Godzilla*, will not come into my perspective this time.

I have added asterisks to indicate that films refer to the nuclear bombings of Hiroshima and Nagasaki in the first column, and that films are documentaries and not narrative feature films in the second column. Closely looking at the way asterisks are mapped, we will notice that there is the fundamental difference between the two countries: Japanese films are marked by the multitude of references to the atomic bombings of Hiroshima and Nagasaki. Almost all nuclear films made in Japan, whether they are documentaries or narrative feature films, have references to the horrifying bombing experience at Hiroshima or Nagasaki. American nuclear bombing films, on the other hand, tend to develop a plot of “unrealistic” nuclear bombing in a U.S. city or in some unidentified distant place. American films often seem to minimize devastating effects of atomic bombs on human beings. Lovers kiss each other near Florida against the backdrop of nuclear bombing without being injured in *True Lies* (1994). People in Los Angeles safely watch the explosion with binocular glasses, when invaders from Mars are smashed away with a nuclear bomb in *The War of the Worlds* (1953). Nuclear missiles are fired to demolish zombies in Kentucky, with no evacuation instructions for residents in the bombing area in *Battalion* (1985). In Utah, the couple are away only a hundred miles from the explosion of atomic missiles, but they are not harmed by radiation. Some films cover the cold war between the United States and the Soviet Union with the nuclear threat, as in *Dr. Strangelove: or How I Learned to Stop Worrying and Love the Bomb* (1964), *Fail-Safe* (1964), *Panic in Year Zero!* (1962), *Countdown to Looking Glass* (TV, 1984), and *The Abyss* (1989).

To show the “unrealistic” quality of American nuclear films, I need simply quote a short ending sequence from Stanley Kubrick’s *Dr. Strangelove*, where military high officers of both the Soviet Union and the United States are insane, and the most insane of them all, Major King Kong, fires the atomic missile against a Russian nuclear base. The destruction of the entire living world arrives (Fig. 1), but amazingly enough this destruction sequence is edited with sentimental romantic music and lyrics and is concluded with a flippant mood: “I know we meet again some sunny day.”
Shohei Imamura's *Black Rain* shows the common image of light and cloud but, at the same time, it shows a truly unique image of black rain. Ashes and dusts are produced in atomic explosion, and rain contaminated by them is sticky and black. It is the female protagonist, Yasuko, who is caught in this black rain on a boat. In the sequence of the bombing, both the uncle and Yasuko experience it. The former is on a train (Fig. 2) and the latter on a boat going back home (Fig. 3).

It cannot be too emphasized that the shot of the black rain falling on Yasuko is unique in cinematic representation of the bombing of Hiroshima. There is no other Japanese atomic bombing film that depicts black rain except *Women in the Mirror*.

Yasuko seems as healthy as before, and the aunt is happy about her darling niece. But there is a turning point in their life. The aunt finally sees an unmistakable sign of Yasuko's atomic bomb sickness. In the impressive sequence of Yasuko's hair falling out, her aunt has a heart attack and dies (Figs. 4-9).
At the aunt’s funeral (Fig. 10), everybody wears “black,” the traditional mourning attire (Fig. 11). This image of “blackness” comes into the film and dominates the screen every time a major character dies due to his/her exposure to atomic radiation.
It is not obvious whether Yasuko is dying, but she is certainly seriously ill. She knows that she was affected by the critically contaminated black rain and says: “The black rain was poisonous.” She has been feeling dull, suffering pain, and having little appetite. She collapses and is taken to a hospital by ambulance. She is still alive when the film ends, but her future is not very hopeful. Her ominous future is hinted at by the uncle’s monologue at the very end of the film: “If a rainbow rises now, a miracle will happen. Not an ominous white rainbow, but a beautiful, colorful one. Then she will recover, for sure.” This is a powerful paradoxical statement. The choice of black and white for this film is proved effective. A “beautiful, colorful” rainbow could never be shown in a black and white film, where any rainbow would look “white” which is defined as “ominous.” “Ominous white rainbow” is a logical consequence of the choice of colorlessness.

I have an interesting film clip to show you. It is a discarded color ending to Imamura’s Black Rain. In this color version, Yasuko lives for twenty years or so, using a wig for her hairless head and cosmetics for her spotted face, and on her religious journey she finds a group of stone statues, among which she recognizes the familiar faces of her aunt and uncle (Figs. 12-14).
Yasuko smiles and approaches the statues of her uncle and aunt, and places herself between them (Figs. 15-16). Suddenly she herself comically turns into a stone statue (Fig. 17). The tone of filmmaking here is that of black comedy. The point I wish to emphasize is that Imamura discarded this comical color ending. He decided to make his film faithful with the tragic reality. Japanese atomic bomb films cannot be like American, that is, they cannot be humorous and comical.

When we turn to the American *Black Rain*, the only American film that has a reference to “black rain” (except the documentary film *White Heat / Blake Rain* made by Japanese-American Steven Okazaki in 2007), we immediately notice that
The film begins with a parody of the Japanese national flag. The Japanese flag has a red sun against a white background (Fig. 18), and the opening sequence shows a red sun emerging out of the black (not white) frame, which visually emphasizes the significance of blackness (Fig. 19-21). The vertical, not horizontal, lettering of “black rain” also invokes Japanese-ness. The red sun dissolves into a round skeletal globe (Figs. 22-24), which has curious resemblances to the top of Atomic Bomb Dome in Hiroshima (Fig. 25).
The theme of the atomic bombing is introduced by a yakuza named Sugai. He develops a unique idea about the feelings of a Japanese who was exposed to the atomic bombing of Hiroshima or Nagasaki. Sugai emphasizes that the black rain has produced people like himself and blood-thirsty Sato, and blames Nick for the mental contamination. The skillful use of the angle shows that the two people begin to feel compassion for each other despite the different positions. The initial “low-angle” shot of Sugai makes him look dignified (Fig. 26). He in fact looks down on Nick, who is shot at “high angle” (Fig. 27), which makes him look powerless compared to Sugai. At the end of their meeting scene, the “eye-level angle” is used to shoot both Sugai (Fig. 28) and Nick (Fig. 29), with the indication that their power relation changes from “strong vs. week” to equal. They are not quite equal, of course, as is shown by the different shot size: Sugai remains to be shot in close-up, which gives, in cinematography, the utmost power to the person shot, and Nick is shot in no larger than medium-close-up. However, the slight change in the shot size while shooting Nick, from “medium shot” to “medium-close-up,” positively indicates that he gets closer to being equal to Sugai.
There is a fundamental difference in the way rain functions between the two *Black Rain* films. In the Japanese film, it literally falls on the bodies of people, leaving black stains on their faces, hands, or any exposed body part. The black stains make a prey of the host and proliferate like a cancer to cover the film screen by blackness, which is prominently shown during funeral scenes. In the American film, on the other hand, the rain functions as a metaphor of the U.S. occupation of Japan soon after the Second World War. There is not really any logical connection between the U.S. occupation and the existence of yakuza, but Sugai, who spoke of his experience of the black rain, blamed America for proliferating parasite-yakuza in the once peaceful Japan. This metaphorical use of the black rain is certainly distorted, but ironically it represents the way American feature films develop a fictional, unrealistic story of atomic bombing.

The uniqueness of Scott’s *Black Rain* among American atomic bombing films is mainly derived from the fact that it refers to the black rain falling on Hiroshima and Nagasaki and uses it to explain yakuza’s state of mind. No other American film ever ventures to involve itself in the issue of black rain. But ironically the very use of black rain reveals that the film is as fictional as any other American bombing films. The lack of a literal description of black rain makes the black rain scene look more metaphorical; it does not even clarify whether Sugai was caught in the black rain in Hiroshima or Nagasaki. The filmmaker Scott shows the lack of his
confidence by a repeated phrase, “I think,” in his interview: “The black rain called the ash that fell after, I think, Nagasaki. Nagasaki was the second, I think, after the first bomb.”

Japanese atomic bombing films, on the other hand, are literal when it comes to the depiction of the atomic bombings of Hiroshima and Nagasaki. The image of a flash and mushroom cloud is always inserted. Even the black rain, an unusual fallout to be depicted in a film, is used in Imamura’s film *Black Rain*. We have seen black rain drops gradually stain the faces of characters. It is not a mere coincidence that all Japanese filmmakers of atomic bombing films have some direct experience of atomic bombing. If they don’t, at least their relatives or close friends do.

I am not saying that American atomic bombing films are limited by their lack of direct experience. On the contrary, I have observed that America turns a serious film topic into a black comedy when realism does not go so well with it. This observation is applied to Scott’s *Black Rain* as well as Kubrick’s *Dr. Strangelove*. In an interview, Kubrick clarifies that he originally intended to make *Dr. Strangelove* a serious film of realism, but that he felt uncomfortable about it. This uncomfortable feeling by a filmmaker in face of a serious issue, of which he does not have direct experience, can possibly explain his turn to a black comedy.
“The Integration of Different Cultures in the Immigration Films”

Lin Zhang
University of Tsukuba

Abstract

The film can reflect the culture, the ideology and the history of a society, so it is also considered as the important material to record the past. Conflicts between different cultures have been always depicted in immigration films. This paper is mainly a comparative study of *The Gua Sha Treatment*, (a Chinese film in 2001) and *Gung Ho* (an American film in 1986). These two films described the life of Chinese and Japanese immigrants into the United States, and I will examine cultural similarities and differences between Chinese or Japanese immigrants and American people.

*The Gua Sha Treatment* emphasizes that it is impossible to persuade Americans to believe in a traditional Chinese medical treatment, and that Datong, the leading role, decides to be blamed by Americans in order to save his family bond and value. This film shows that Datong protects his family members and takes responsibility for what other members of his family have done.

*Gung Ho* is an American comedy film portraying the takeover of an American car plant by the Japanese. Americans and the Japanese regard the others culture incomprehensible. For Americans it is unintelligible that Japanese workers perform morning calisthenics every day and go to the river near the factory together to take a bath. For the Japanese, it is beyond comprehension that Americans do not have a strong working ethic and rely too much on the labor union.

Analyzing the messages conveyed by these two films, this paper clarifies what cultural differences and why the differences are finally integrated.

Full Paper

There are always the conflicts and the fusions of the different cultures in the films concerning the Asian immigrants in the United States. This paper is mainly about the comparative study of the Chinese film *The Gua Sha Treatment*, released in the year of 2001 and the American film *Gung Ho*, released in the year of 1986. These two films both pictured the life and work of the immigrants from China and Japan in the United States. The purpose of this study is to compare the features of Japanese culture, Chinese culture and American culture by interpreting these two
films to analyze the similarities and the differences between Japanese culture and Chinese culture against American culture.

*The Gua Sha Treatment* is designed to discuss the culture differences. Gua Sha has been used as a treatment for thousands years in China, and many people advocate it for their own experience. Like many ancient Chinese technique, it is useful but can’t be explained clearly. So it seems to be impossible to persuade westerners to believe. Then the culture conflict happened. Actually, Datong, the leading role, was not the person who did the Gua Sha Treatment to his son. It was his father. But Datong decides to be a scapegoat. This is one of the culture differences. In Chinese traditional culture, family bond is much more important than anything else. Though we admire those people who can put justice in the first place rather than family, it is another thing when that happens to ourselves. If a family member did something wrong, traditional Chinese people thought if they could bear the consequence for him, the family member would be safe. So it was kind of protection or responsibility for them to bear the consequences that their family members should have done. This film showed us was that many Chinese theories are based on sensibility and experience while American theories are based on evidence.

*Gung Ho* is an American comedy film in 1986. The story portrays the takeover of an American car plant by a Japanese corporation. It mainly view the friction between Japanese culture and American culture in the film. The Americans think it is ridiculous that Japanese people do morning exercises every day and they have their lunches with chopsticks. The Americans also feel ludicrous that the Japanese go to the river together near the factory to take a bath. On the other hand, Japanese people think the American workers have a poor work ethic and very lackadaisical to quality control. So they set new rules for their American colleagues: dismissing the labor union; lowering the wages and starting job rotation to make everyone familiar with every job in the factory as well as setting a seemingly impossible standard of efficiency and quality. Then culture conflict occurred. This film showed us was that Japanese culture is high-context while the American culture is low-context.

Through analyzing these two films and interpreting the progress of the integration of the different cultures, this paper discusses what is the culture difference and indicates the reasons why the different cultures finally be integrated. I will clarify the messages conveyed by the films through describing the culture differences of Asian immigrants in the United States.

The film *The Gua Sha Treatment* describes the living condition of the Chinese
immigrant Datong’s family in the United States. When Datong succeeded in his career, he wanted to take care of his father to fulfill his duty as a son, so he asked his father to live with them in the United States. One day, the grandfather used the Chinese traditional treatment Gua Sha to his grandson Dennis in order to bring down his fever. This Chinese traditional treatment would left some red spots on the back of Dennis, which was misunderstood by the American Association for the protection of children, so Datong was accused of ill-treated. In the film, the director portrayed a heroic Chinese traditional man who sacrificed himself for his family and for his parents through the camera lens.

At the beginning, it was the scene that Datong won the computer game design awards. The award hall was firstly shown by the camera lens from top to bottom. The participants in the banquet taken by the high angle long shot were impressed with their modesty and weakness (fig.1). However, in the next shot, the camera’s angle was completely changed.

The main character Datong was taken from the bottom up by a low angle (fig. 2), which made Datong look great, powerful and dignified. Datong lifted the trophy and made a speech with loud voice. “for 8 years ago, I was just an new immigrant, but now I’m standing here……this is my piece of American dream.” It is easier for an immigrant to feel the loneliness in a foreign country, especially for the man who is the breadwinner for his family, so the priority target for him is the success in career. Therefore, it is considered that Datong’s speech fully represented the male immigrants for their grave responsibilities.

In this scene, the director depicted the image of a successful male Chinese immigrant in the United States to foreshadow his individual heroic performance later.

![Fig.1](image1.jpg) ![Fig.2](image2.jpg)

The second scene is that the red spots left by the treatment Gua Sha on
Dennis’ back were seen and Datong was accused by the Association of Children Protection. Datong admitted it was him that did Gua Sha to Dennis instead of his father in front of the judge.

However, Jiannin, the wife of Datong, would like to tell the truth that his father was the person who did Gua Sha, but was stopped by Datong (fig.3). In the end, Jannin kept silent and Datong admitted that he did Gua Sha (fig.4·fig.5). Although he understood that if he admitted he might be convicted as guilty, Datong told the lie without any hesitation. A very serious look on Datong’s face was taken by close-up shot where always wore smiles to highlight the image of the individual heroic Chinese men who was ready to sacrifice himself to protect his own father.

Fig.3  Fig.4  Fig.5

From figure 6 to figure 8 is the very important scene where the attitude and feelings of Datong started to change greatly. It was taken by a long shot that Datong was bending his back in the corner of the room. So far, Datong was a highly proud and powerful person who would never want to show his weakness in front of the people except for his family. No matter what happened, he could always cope with a smile on his face and wasn’t allowed to fail by himself. Now he came to a breakdown for the first time (fig.6). Datong, who decided to lay down his pride and show his weakness to the public in order to protect his family and his son, was taken by three shots (fig.6·fig.8) at an eye-level angle. It pictured Datong’s eyes shining with tears by using medium shot (fig.6), medium close-up (fig.7), and super close-up (fig.8). They are the scenes the director would like to show the audience a father’s consciousness objectively that compared with the safety of his own son, the pride he had considered the most important as a man so far was nothing. This is also an aspect of Datong’s individual heroism.
The third scene is that Datong’s father finally knew what happened to Dennis, asked the address of Datong’s American friend Quinlin and told Quinlin that he was the right person who had done Gua Sha to Dennis. When he went back home together with Quinlin, he met Datong who was looking for him round and went into the room with Datong, while Datong’s wife Jenin was answering questions from Quinlin. It was taken by the POV shot and shot reverse shot.

The medium shot was used to take Quinlin who was looking at the father and son (fig. 9). It is the POV shot used in the next scene from the sight of Quinlin (fig.10) and it showed the back of Datong and Datong’s father in profile. The back view of Datong in figure 10 could be considered as a wall refusing to understand the different cultures completely. Contrarily, Quinlin was taken from the front fully in figure 9 and this full-frontal view could be considered as an implication that Quinlin went to China alone to find out the truth in the following plots.

When Quinlin learned the truth, he asked Jiannin why Datong had admitted with a question about Datong’s lie but no opportunity to ask Datong himself (fig.11). Jiannin said that because he was a Chinese (fig.12). Quinlin was looking at the back view of Datong and his father thoughtfully as soon as hearing the answer of Jiannin (fig.13). It was the back view of the father and son climbing up the steps from the POV shot of Quinlin (fig.14), which enhanced the sense of dignity sense of Datong and his father by a low angle and the low angle is also showed the Quinlin’s respect and attention to this Chinese culture as the first time he learned.
From figure 15 to figure 16 is the scenes that Datong walking out with Dennis was arrested for breaking the law. This scene depicted an image of an emotional man who sacrificed himself for his father, became a criminal for his son and left the house for his wife.

In the next plot, the truth of Gua Sha was finally cleared. Datong’s American friend Quinlin, who was shocked by Datong’s self-sacrifice spirit, went to China alone in order to find the truth of Gua Sha. In figure 17, the foreigner Quinlin and the native Chinese were both in the same flame, but it was
clearly divided into two layers of front-back or upper-down, which indicated the conflict between two different cultures. However, after Quinlin experienced the Gua Sha treatment in person and saw the same red spots on his back from the mirror, he eventually understood the Chinese culture Gua Sha which has existed for more than 2000 years. In the figure 18, the mirror was used as a prop reasonably putting the expression on Quinlin’s face and his back in the same flame to show the acceptance of the Chinese traditional treatment by leaving the red spots on the foreigner’s back. Contrary to the previous incongruousness, this was a hint of the cultural integration.

![Fig.17](image1.png) ![Fig.18](image2.png)

This is the most touching scene in this film.

On the Christmas Eve, Datong was dressed in Santa Claus, creeping up on to the 9th floor along the pipe outside the building with the full-hearted hope to meet Dennis. A long shot was used to show the action and position of Datong in figure 19 to indicate clearly that it was a very dangerous behavior. Datong chose to climb up the building that might threaten his own life without any hesitation, which reflected his strong feelings and loves to his family.

Figure 23 is a scene that when the safety of Datong was confirmed, the people there under the building began to clap hands gladly. Figure 24 is a close-up shot, which depicted a scene that the children, the head of the Association and the Quinlin’s family were all moved to tears by Datong’s behavior and his love to his son. As a result, the misunderstanding and conflict between the two cultures were eliminated. The most interesting thing here is that Datong, the representative of the traditional Chinese man, was wearing the red clothes of Santa Claus, the representative of the western culture, when he reunited with his family. The dressing is also the director’s trick with a special meaning to show the final integration of the Chinese and American cultures.
The Japanese collectivism culture in the film *Gung Ho*

In the last section, it analyzed the differences between Chinese and American cultures in the Chinese film and discussed the individual heroism of traditional Chinese men. In this section, it comes to analyze the differences between Japanese and American cultures.

*Gung Ho* is an American comedy film. The reason for choosing this film is that the Japanese culture shown in the film is totally different from the Chinese traditional individual heroism analyzed above. In this film, the Japanese collectivism and teamwork are mainly and clearly highlighted.

Some scenes would be chosen in the next paragraph to analyze the confrontation and cooperation between the Japanese and American cultures.
investigate the conflict and integration between the Japanese and American cultures.

The first scene was the comparison of the two fragments, which were the first morning exercise for the Americans and the ending scene of the film. Fig. 27–fig. 29 was the first morning exercise time after the reopening of the factory, while fig. 30–fig. 32 was the morning exercise scene at the end of the film. In the figure 27, it clearly showed the power condition as well as the superior and subordinate relations by the positions of the characters. Mr. Takahara which means the Japanese side, represented by Mr. Takahara standing in front of the frame and standing near the central line on the platform, was in the strong position. Compared with this scene, the positions of the characters in the figure 30 were slightly different. Takahara and Hand were standing side by side instead of front-back to show the equal relationship between them. Besides, the positions of all the employees standing on the ground were also changed a lot (fig. 31–fig. 32). Different from the mess in the figure 28 to figure 29, the formation in the figure 31 to figure 32 was very neat and ordered with a strong impact.

This comparison showed the mutual understanding and integration of the two confronted cultures.
In the next scene, the director indicated the collectivism of Japanese culture. A special expression called voice over was used in the opening, in which the voices appeared without the characters and the screen was dark (fig.33). It was the big dark screen that made the focus of the audience on the voices and strong indication as well as explanation to the next scene. In the next shot, the focus was shifted to the characters. The facial expressions of the character taken by the close-up shot reflected the importance of this character, one of the main characters, the Japanese factory director Mr. Takahara.

In the fig.34-fig.36 there were the scenes about the employee training in the Japanese factory. People gathered together to get training, which was not concerning the skills or the knowledge, but the spirit. Especially in the figure 36, when Mr. Takahara saw the man in the front was exhausted and fell down, instead of rescuing, the action he took was looking around and shouting slogans much more loudly, which clearly showed the Japanese culture that collective interests comes first. Furthermore, the content of the slogans was exactly the same as the words on the cloth posting on Takahara’s chest in the figure 36. Please pay special attention to the red cloth with the content. In Japanese, it’s read “協調”, translate into English is cooperation, which means the process of working together to the same end, which could be considered to indicate the Japanese culture the director wanted to show us.

Fig.33 Fig.34

Fig.35 Fig.36
In this film, the director described the differences of the Japanese and American cultures by Three shots each in figure 37 to figure 45. Japanese men would go to take a bath in the river together in every weekend to tough their minds. The Japanese stuck to their own traditions while the Americans kept a cool eye on it. In order to run the company more efficiently, Japanese installed cameras in the factory while the Americans were sniffy about it with thinking that it was the violation of human rights. When they were eating, the Japanese ate ra-men noodles by chopsticks while the counterparts laughed at them with imitation and vilification. The director of this film showed the unintegration between Japanese and American cultures very visually by these three scenes. Especially, it always started from the close-up shot of the Japanese behaviors in every scene to emphasize the Japanese culture. This kind of shooting technique has strengthened the description of culture conflicts.
There were conflicts, there were also mutual aid, and the image of a Japanese man was established. The ultimate goal is to find common roads and solve problems. Such a Japanese male statue is seen. This is the scene that the Japanese and American combined their efforts to achieve the production target. The director used the symmetry (fig.46-fig.47) to interpret the integration of the Japanese and American cultures perfectly.

This paper discusses the differences between Chinese and American cultures as well as the differences between Japanese and American cultures by analyzing and comparing the two films. Meanwhile, it also makes a comparison of Chinese and Japanese culture to conclude the reasons for the eventual integration of the different cultures.

The film *The Gua Sha Treatment* shows the Chinese traditional culture by describing the individual heroism of traditional Chinese men. The hero of the film Datong, as father and son, chose to sacrifice himself to take all the responsibilities. Datong falsely admitted to do the Gua Sha for his son so that his old father could avoid the punishment. And Datong also falsely claimed that he was fully responsible for the issue and his wife knew nothing about it so that his son could be taken care by his mother instead of living in a welfare home lonely. As a result, Datong lost his job as well as his family and he was forced to separate from his wife.
and son. Datong’s non-explain individual heroism, contrary to the American’s pursuit of individual rights, is the main difference between Chinese and American cultures that the film would like to show. This culture difference has caused the conflict between the two parties in the film. However, it is precisely the cultural difference that determines the happy ending of the cultural integration. Although Datong’s American friend still could not understand the traditional Chinese treatment of Gua Sha very well, the behavior of self-sacrifice to protect his old father and his little son has moved him to make this traditional American believe that Datong wasn’t the cruel father against the law. And so, he went to China alone to find the truth and came to the final mutual understanding as well as cultural integration. It is the self-sacrificing individual heroism of baring family responsibility in the Chinese culture that the director wants to show to the audience as well as the reason for the final cultural integration.

At the other hand, the Japanese culture shown in the film Gung Ho is totally different from the Chinese traditional individual heroism analyzed above. In this film, the Japanese collectivism and teamwork are mainly and clearly highlighted. Therefore, the film focused on describing a lot of scenes of Japanese people living and working in the United States, such as doing morning exercises every morning to enhance the sense of community and bathing in the cold river together on every holiday in order to build up willpower and improve the sense of collective honor. In order to ensure the benefits of the factory, Japanese chose to reduce the pay and break time. It is the Japanese collectivism culture of sacrificing one for the team that caused the conflict in the film. Like the analysis for the Chinese film mentioned above, American people advocate to protect the personal rights while ensuring the collective benefits, where lays the main difference between Japanese and American cultures in the film.

At last, it comes to compare the differences between Chinese and Japanese cultures shown in the two films. Although the self-sacrifice spirit could be found both in the Chinese traditional individual heroism and Japanese collectivism, Chinese culture emphasizes individual while Japanese culture lays stress on solidarity, which is the biggest difference between Chinese and Japanese cultures shown in the two films.

“The Chinese Family Values in Feng Xiaogang’s Film”

Zhilixiang Zhang
University of Tsukuba

This paper examines the Chinese family values by analyzing 4 of The Feng Xiaogang’s movies---The Dream Factory(1997), A World Without Thieves(2004), If You Are the One(2008), Back to 1942(2012). Feng Xiaogang is a Chinese film director who is well known in China as being a highly successful commercial filmmaker. Because of the character in his film shows typical Chinese people, Feng Xiaogang also be called as “The Chinese’s Director”. As a conclusion, the character in Feng’s films is representative.

Family is the core unit of society, with parents at the nucleus. In addition, there is a lot of social differences between Asian and Europe, and the root of these differences is from family structure and the family values between Asian and Europe. The another problem is that social system in China is based on the division of labor by gender. And this problem also based on the Chinese family values.

With these two facts, Chinese family values can be showed in Feng’s films by shot analyzing theory. And these family values can help to see the China’s society and social problems around gender, strata, and social function. Besides, it could be a reference that how to build a real Chinese character when making a film.

The historical and disaster film Back to 1942 is released in 2012. This film is based on Liu Zhenyun’s novel Remembering 1942, and it tells a tragedy about The Famine in Henan. People always call this tragedy as “The Chinese famine of 1942-43”. The Director Feng use hundreds of actors to build a huge stage to reproduce this history. The famine occurred within the context of the Second Sino-Japanese War and resulted from a combination of natural and man-made factors. 2 to 3 million people died of starvation or disease and upwards of 4 million fled Henan. Because millions of refugees died in this famine. So the theme of this film is about the disorganization of the family, humanity&instinct. And through these scene we can get a lot family values.

The Placement of Characters in a scene can show lots of things. Then, back to the film, through Fig.1 we can see the two actors are standing on the left side and middle of the screen, and the actress are leaning on the wooden cart. Focus on background, other actors are walking toward to the left to taking refuge from the famine. Through these actors who are moving, we can see that the main actors are stuck for some reasons. According to the plot of the film, here are two families in there, and they are waiting for one of member that did not come back from last night. Absolutely, they can’t just stop and wait here. So this problem must be solved as soon as possible. It is not difficult to imagine that how anxiously they waited. But the situation is still good in Fig.1 because the actors in background is still passing by. It means the main actors are not fall behind with other refugees. But when it comes to the next shot, the camera get high and faraway. In this extreme long shot we can totally understand what is happening. The trees without leaves, the barren land, the shabby house, which those sights can’t be seen in fig.1. Through the fig.2 we can understand how badly of the situation that characters are stayed in. What’s more comparing with fig.1 we can see the background actors are reduced in number. And we can clearly see that almost nobody coming from behind. As a conclusion, they’re already dropped out. So they have to give up waiting and take their departure again. The director Feng use a shot changing to build an anxious air.

Moreover, focus on the main character’s pose and position, we can see that the men are standing straightly and their sight line is higher than the women. On the contrary, women are looking at ground, leaning on the wooden cart. Although, there are three women on screen, but the space they take is small than two men. Absolutely, the males show more power than females. In the long history of China, treat women as inferior to men is widely existed in everywhere. Especially in rural area of China, sex discrimination is serious. This phenomenon exist in many other countries. In this scene, director Feng use the placement of Characters to shows a traditional Chinese family statue.

In fact, they are waiting here for three days with no result. So when a family member got lost, although the another family is unwilling to wait, and the situation is bad for them. But still, they will find and wait until the last.
In the previous paragraph, the placement of characters plays a very important role. But in figure 3 and 4, it will show another pattern. Because the feature of this film. The background of the scene is always barren land and refugees. It will be a challenge to director Feng that how to let the monotonous background tells more.

Then focus on fig.3, this scene is almost close to the end. These refugees were threatened by the gunshot and runaway, also the main actor Master Fan is one of them. But when Fan noticed that his grandson is dead in his arm, he stops running and just kneel on the ground. And now he is the only one who stopped. When all characters are running away but one stopped, it shows a lot of negative emotion about the one who stopped. What’s more, these characters is runaway for surviving, so it is not hard to imagine that Master Fan lost the meaning of living. (fig.4) Like the Fan stopped in the center of flame, his life also getting frozen.

And when it comes to the end of scene. Fan lost his whole family, the only thing he can do is looking for a death. According to the fig.5, the dutch angle with handheld shot can be seen. It shows a unstable of his mental. And the left side we can see corpse lying on the ground. And every refugee is moving toward for living, only Fan is moving backwards and towards to the corpse. According to these facts, we can clearly understand that Fan don’t want to live anymore. So the focusing of feet shows that he is not a human anymore, he is already became a ghost. Then the refugees warned Fan that moving backwards will just kill himself. But Fan didn’t stop and says that he wants to die nearly from homeland as close as possible. And the shot comes to the face of Fan, (fig.6)the firm faith to die can be seen through his face. Then, refugees back to the background again. As the result, Chinese humanism is based on their family. And the placement of characters in Feng’s Films have told lots of family values.
“Loneliness and Its Causes in Japanese Animation Films”

Shan Xue
University of Tsukuba

Abstract

It is fair enough to say that Hayao Miyazaki is the greatest animation director of the world. However, Makoto Shinkai, known as his successor, is now the most popular one worldwide. In Kiki’s Delivery Service and 5 centimeters per second, two animations directed by them respectively, the loneliness of the characters is one of the most stressed themes. Loneliness, generally, refers to a kind of state where a person holds no contact, relationship or connection with others. However, even being in a community, differences between a desired social relationship and the reality can still cause loneliness.

In Kiki’s Delivery Service, the heroine’s ego heterogeneity contradicts with the new community and damages its orders. Her original identity is lost, yet the new identity is not vivid either, which makes her feel lonely: While 5 centimeters per second is quite another story, in which the hero, separating from others at his own will, is constraint by reality and the loss of beautiful memories, thus tasting the loneliness. Here, we will make shot analyses on the two productions above, to review different ways employed by the directors to express the loneliness of the characters, and the reasons for their loneliness.

Full Paper

When it comes to loneliness, generally, the concept is to create a character that lacks connections with the society or other people. Yet, in Kiki’s Delivery Service and 5 centimeters per second, two animations directed by Hayao Miyazaki and Makoto Shinkai respectively, loneliness is shown from a different perspective. Kiki, the heroine of Kiki’s Delivery Service, is a trainee witch who’s only thirteen years old. The story shows her experience of leaving home for independent practices. It depicts the challenges and loneliness with which Japanese adolescent girls tend to be confronted as they try to be independent in a new environment. 5 centimeters per second tells a story of Takaki and Akari. They had to separate from each other because of theirs parents’ job transfer, which set back their childhood romance. Before Takaki went for his study in a remoter place, they determined to meet each other for the last one. Characters in these two animations are not secluded in the
mountains, but live in a social community. However, both of them feel lonely and solitary. Thus, their loneliness is not caused by the environment, but rather by themselves. The analyses will focus on the expression of loneliness and the reason for such feeling in these animations, and illustrate different methods of the directors to portray characters’ loneliness.

Directed by Hayao Miyazaki in 1989, *Kiki's Delivery Service* is an animation adapted according to a namesake novel. It tells the story of a trainee witch named Kiki, who leaves her parents at the age of thirteen and grows up independently through practices. In this animation, Hayao Miyazaki didn’t express too much about the magic, but made it a unique skill of the character. In this realistic production, Kiki, a thirteen-year-old trainee witch on the adolescency leaves her living environment and explores new life styles in a strange environment by her own strength. During the process, she is bound to meet all kinds of difficulties, troubles and loneliness. Hayao Miyazaki fairly describes such difficulties and loneliness she meets in this movie.

In the middle phase of the movie, thirteen-year-old trainee witch Kiki leaves home with her talking black cat Jiji. When she newly arrives in the city of Koriko, she feels the coldness of its people, and her requests are rejected every now and then. Feeling there’s no place to live, Kiki, disappointed, comes to a park in Koriko (Figure 1 and Figure 2). In figure 1, the bronze statue in the center line of the frame, and the woods and streetlights beside make it a symmetry picture. Then the camera uses tilt method, gradually moves downward and stays at the position of figure 2. The stopping position of tilt is where the director wants to stress to the audiences. Thus, the background of figure 2 follows the symmetry composition of figure 1. However, for character arrangement, the director deliberately put all the characters other than Kiki to the left of the center line, but Kiki to the right of it. In figure 3, the director purposefully let Kiki sit in the shadow, while the edge of light comes through the side of her body. In a word, the symmetry composition is a symbol of peace and order of the Koriko City. Yet in such a city full of peace and orders, the arrangement of characters and light show the loneliness and disappointment of Kiki, for being rejected by the city community. Meanwhile, through voice-over method, the expression of other kids playing and laughing happily around makes Kiki’s loneliness even stronger.
After leaving the park, in figure 4 and figure 5, Kiki walks alone and aimlessly in Koriko, seemingly abandoned by the world. In these two figures, no other characters show up around Kiki. That is to say, the director intentionally created a totally deserted space. At the same time, longshots are applied to show the non-character and objective features, which makes Kiki’s figure very fragile compared with the surroundings. Kiki’s surroundings are not a natural space, but building blocks represent human communities. Such building blocks, dense and huge, show Kiki the cruelty and stress of social communities. Additionally, Kiki’s small figure seems much uncoordinated with the social community, which implies her expectations and dreams will be very hard to be realized in the community. This society of Koriko is too huge for Kiki.

In the next two shots, Kiki comes to a high place of the city and overlooks the
scenery. Figure 7 and figure 8 are POV shot of Kiki in figure 6. In Kiki’s subjective
POV shot, the camera remains still because Kiki stands still. But through pan
method, the camera, rotating from left to right, shows what she sees to the
audiences. In this subjective shot, all the scenery she sees is the same, which is the
dense building block. And the block, of course, is where Koriko people live. It infers
that sociality is a human nature, and the collectivized feature of Koriko. Yet, such a
community, such a collective society even doesn’t provide a place for Kiki, which
makes her loneliness very intensive. In addition, the POV shot, as Kiki’s subjective
view, shows her wish and desire that she is accepted by the city and adapts to the
society. However, the feeling of distance expressed in the longshot shows that, for
Kiki, there’s still a long way to go. Therefore, in the facet of social relationship, the
difference between Kiki’s wish and desire and the reality causes her loneliness.

Fig.6                                Fig.7

Fig.8

Summarily, just as Kiki arrives in Koriko, she feels the unescapable loneliness
in this major city. However, this is not because she is treated differently from the
others. The root cause lies in herself. Director Hayao Miyazaki has already shown
the reason through shots before Kiki arrives in Koriko.

When Kiki first sees the city of Koriko and flies to it on the broom of the
witch, the director first uses longshot in this sequence to show her flying in the sky.
Through longshots in figure 9 and figure 10, Kiki keeps a distance away from the camera, so the audiences can see the environment more subjectively. By this longshot we know Kiki is not alone when she is flying. The director deliberately adds other elements around her, which are the flying sea gulls. In mother nature, only birds can fly in the sky. It is quite obvious, in other words, that humans are not able to fly. Except Kiki, in this scene with flying sea gulls, the background sea, sky and sea gulls create a picture of nature. The scene, excluding all elements in human society, embraces Kiki who flies with the birds, and stresses that Kiki’s feature more belongs to the nature, and such feature contradicts with human society.

Fig.9  
Fig.10

In the scene that follows, we can be more clear about Hayao Miyazaki’s such intention. Figure 11 and figure 12 are POV shot of Kiki in figure 10, namely, that is what Kiki actually sees. Seeing a ship sailing towards her, she waves to the people on board. (figure 13). In the POV shot of this scene, the ship comes closer to Kiki, but as they are at different levels, they don’t physically knock into each other at last. As the ship sails away into the deep sea, the opposition of Kiki and ordinary people is expressed through space arrangement. Kiki can fly freely in the sky as she inherited the witch’s blood, yet ordinary people can only take voyages in the sea by tools (ship). The expression of the two different features and the opposite space further emphasizes the difference in characteristics between Kiki and ordinary Koriko residents.

Fig.11  
Fig12
Fig. 13

Scenes in figure 14 and figure 15 also show the opposition between Kiki and the human community. When Kiki flies over a port in Koriko on her broom, she can see workers operating at the port: Some are fixing sails, while others are carrying cargos. In this picture, the sky where Kiki is flying and the ground where people are working are clearly separated as two parts up and down. The opposition lying in the sky and the ground implies contradictions between people in them respectively, namely the conflict between Kiki and the city community represented by the port workers.

Fig. 14                               Fig. 15

Beyond that, there's almost no spare place among characters at present and the scenery arrangements in the scene of figure 14 and figure 15. This dense picture created by longshot contains non-characteristic and objective meanings. Such meanings are exclusive from natural environment impacts, yet focus on the meanings of social environment. As for the community built up by such a dense human society, neither does Kiki enter it, nor in fact, was her figure shot normally, quite small. High up in the sky, she passes the community quickly and runs through this scene. It is a very uncoordinated way of showing up, which implies she's inharmonious and isolated with and from ordinary people's live in the community below. However, this isolation is not so called complete isolation in relationship. When Kiki flies over this scene, the director puts standing masts and sails between her and the camera, which blocks her in her flying. Such arrangement shows that Kiki, who cannot be completely isolated from the society, must accept the norms of it
and be constraint by it. And after the scene, the camera is set high in the sky, overlooking the ground. In figure 16 and figure 17, Kiki zooms in from the remote place on the right of the camera, and finally flies beyond the frame higher into the sky. Since she flies towards the camera, her figure grows larger and larger. Through such movement of the character, Kiki flies away from the crowd, the distance between her and the port’s people at the upper right of the frame gradually gets larger, which shows her isolation and difference from the crowd representing the social community. This is also a special design of Hayao Miyazaki in camera angle arrangement.

![Fig.16](image16.png) ![Fig.17](image17.png)

Later, Kiki flies to the upmost of the city, when she looks down to the center of it, the scene made her halt with astonishment. In the objective shot of the longshot in figure 18, the city scenery in the background is composed of two parts, the upper one with traffic jam, and the lower one with crowded people on the plaza. No matter which, the exaggeration is used to express the same idea, which is the expression of community. Yet Kiki, at the close shot, floats alone in the sky. The conflict of space between close shot and remote shot in figure 18 repeatedly shows the opposition between Kiki and the social community.

![Fig.18](image18.png)

Through the expressions of pictures, the two conflicts between Kiki and the Koriko community after her arrival are vividly presented. The difference between her and the ordinary people created this opposition and uncoordinated relationship.
Hence, she cannot rely on this community, that's why she cannot fit in this new environment when she arrives in Koriko. That’s one of the causes of her loneliness.

Apart from the conflict between Kiki and the social community, she cannot comply with its rules, either. Occasions are that she breaks the community orders. When Kiki comes to Koriko and feels its density, she is greeted by an old man at the clock tower window. At the same time, Kiki inquires the old man whether any other witches have arrived in the city. In this scene (figure 19), Kiki comes into the frame from the left to the right. But she doesn’t fly completely near the clock tower, just halts in the sky at the left side of the frame. Through the composition, we clearly see the shot separated in two halves, which are the sky on the left and the clock tower on the right. The sky is totally natural scene, and the clock tower is a man-made architecture. The middle of the frame is the interface of natural scenes and human architectures. By this setting, the director creates conflicts between the left side and the right side. In the shot of this conflict, Kiki floats in the sky on the left, whilst the old man who greets her stand on the clock tower from the right. According to the forgoing analyses, the distance between Kiki with natural characteristic, and human society is shown by the shot. However, more important is the conflict between Kiki and the clock tower on the right.

Fig.19

In figure 19, to say Kiki is in conflict with the clock tower, we'd rather make it more accurate to say she’s in conflict with the huge clock. Clock is a tool that shows time, created for people's well-being. From the concept of user group, it can be sorted as “private time” for personal use and “public time” for common use. Obviously, the clock tower in figure 19 is not built for any individuals for “private time”, but rather for all Koriko people to show the “public time”.

In Clock Tower – Carve the Time of the City by Tadashi Yokoyama, there is an expression of public time that goes:

In the manual proposal of the clock tower in Lyon city council, it says: If a
clock is set in a city that allows everyone to hear its ringing, it will bring comfort to the people and create a public order. ²

Public time symbolizes public orders of the community. It’s a common requirement in most societies to be on time. For example, for productions of a company, the most important thing is workhour and deliver time. Working hours in companies, class hours in schools, operating hours of public traffic are all restrictions of individuals in social communities. Hence, the symbolic meaning of public time is tightly combined with public orders.

In this movie, Kiki keeps distance away from the clock tower that represents public order, which shows her resistance to it, and causes of events that follows, namely, that is the breaking of public orders. When Kiki decides to land in Koriko, her flying in the air of the city is shown in figure 20. And through this whole composition we could see cars running left and right. Buildings on two sides of the frame make the shot a perfect symmetry, which shows the peace and orders of the city. However, Kiki’s presence breaks this symmetry symbolizing the peace and orders of the whole city, which also implies her damages to the organizational rules. Afterward, Kiki’s flying interferes with the city traffics and she receives education from the police (figure 21). In this shot, lines applied to the background building walls are designed as neat straight lines, representing stereotyped social rules that people must obey. But Kiki shows resistance to the order education.

In her flight to Koriko, Kiki hears the ringing from the clock tower. In this scene, Kiki looks towards the direction of the clock (figure 22). The next shot shows what she sees, which is her subjective POV shot. This POV shot applies tilt method, and it moves down from figure 23 and stops at figure 24. Tilt is a way to draw attention, the halt after movements is the very important scene. In Kiki’s POV shot where the camera halts, the clock tower of Koriko lies in the middle of the screen.

² Clock Tower – Carve the Time of the City, Tadashi Yokoyama, Apr, 25, 1986, kajima-publishing.

It’s not related to the style of the set position. Even if the style is not high or specially protected by rules, public clock symbolizes the identity of a city with shared fate. With times passing by, the symbolic meaning of bell tower is gradually taken over by clock tower.\(^3\)

That is to say, for a society, a building like bell tower or clock tower symbolizes the common sense of belonging of it. When Kiki sees the clock tower of Koriko, she says a line: “that is a clock tower, how I wish to live in it”. It clearly shows her willingness to adapt to the society and build up an identity.

However, her will is totally at the other pole of reality. In figure 25 we could see, when Kiki first arrives in Koriko, she uses her mother’s broom and her father’s radio. These tools show her pride as a witch and her previous identity. In the second half of the movie, when she loses her magic and her only pride as a witch, the ability to fly, Kiki loses her old sense of belonging, yet fails to form a new identity in the Koriko society, and that’s the time when she feels unbearable loneliness (figure 26).

\(^3\) *Time and human – a history of American Time*, Michael O’Malley [written], Heigo Takajima [translated], shobunsha published P.190.
At the end of the movie, she manages to fly again by her own power, saves her friends and resolves the city crisis, she doesn’t ride on a witch’s broom but a brush borrowed from a citizen. Therefore, the weakness of her identity is a main reason for her loneliness when she arrives in a new city of Koriko.

Fig.25                               Fig.26

5 centimeters per second directed by Makoto Shinkai in 2007 describes the love between the hero Takaki, a student in Tokyo, and the heroine Akari. After graduating from the primary school, Akari has to transfer to Tochigi middle school for her parents’ sake, and the two will never meet again. When Takaki enters middle school, he receives a letter from Tochigi. Since then, the two start this long-distance relationship through letters. In Takaki’s perspective of this relationship, the atmosphere is lonely and distressed throughout the movie. For Takaki, his loneliness is expressed differently from Kiki’s Delivery Service. If we consider the theme of Kiki’s Delivery Service is growth, Kiki’s loneliness is caused by this growing process, Then the theme of 5 centimeters per second is solely loneliness.

The major technique deployed to express the theme of loneliness in this movie is monologue. In the movie, dialogues between characters are limited, and the driving of plots is the monologues. Takaki’s sadness, with long monologues shows his desire to express his inner feelings and his isolated state with no connections and relations with others. This isolated atmosphere of social reality is a major technique of this movie to express the loneliness.

However, in the situation of sad monologues, Shinkai, the director, also uses camera to express people’s loneliness. The first is to create a totally deserted space with only Takaki in it. Like figure 27 and figure 28 and figure 29, nobody shows up in Takaki’s surroundings. Figure 29 is the first shot of this movie. In this shot, Takaki newly receives heroine’s letter and stands at the mailbox downstairs. As he receives a letter from the one he misses, Takaki doesn’t feel any hint of delight. Almost all the elements, including camera, characters presented and backgrounds
are still, which created such effect. Meanwhile, the hero doesn't face forward the camera in this longshot. The lighting management also puts Takaki in the shadow. Such setting of the tone shows great agony and depression. And the utterly deserted space of the hero shows his deep loneliness as well.

Similarly, the shot before figure 30 is the close-up plate of a classroom door. On the plate it writes “Student Council Room”. Council Room is a place of exchanges, however, in figure 31 that comes, we see Takaki completely alone in such place. Takaki is put in such a dim, deserted place while reading the letter from Akari, there are no dialogues, and only monologue of the content in heroine's letter. Thus loneliness and depression are spread in the scene. Completely deserted spaces are often seen in the movie. figure 32 and figure 33 shows the classroom at different times. In these scenes, no other people come on stage; only through the plot can we infer that Takaki comes in this scene. Also in figure 34, Takaki sits alone in the longshot of the deserted classroom. The objective of longshot shows his loneliness. In the middle phase, Takaki takes a train to meet Akari. However, heavy snow occurs and blocks his way. When anticipating that it is impossible to meet his missed one in time, Takaki feels great loss and loneliness. Inside the train, longshot is also applied as an objective way to show Takaki’s surroundings, which is totally deserted (figure 35). In this sequence, Takaki’s monologue goes:” I don’t know why, but I feel Akari’s loneliness in her letter.” Along with the monologue, the director
deploys graphic match (figure 36 and figure 37) to show Akari and Takaki are in a similar suffering, which is loneliness. Analyzed by the projective theory in psychology, Takaki casts his loneliness on Akari through the monologue and graphic match.
The loneliness of the hero goes through the whole story in *5 centimeters per second*. And it’s also one of the themes in this animation. The reason for Takaki’s loneliness first lies in his relations with other people. The animation shows Takaki subjectively separates from others. Judging from shots, all shots regarding Takaki and other people throughout this movie have one thing in common, that is the way other people shows on stage creates a sense of distance. For example, in the sequence of figure 38, Takaki’s mother comes on stage and says her only one line to him. Takaki makes no respond to it, and the camera doesn’t use shot/reverse shot to show their normal relationship, but uses longshot to show the small profile of his mother and her distance to the camera. Moreover, she doesn't face directly the camera, which makes it hard to see her face clearly. Yet this is a scene in Takaki’s memory, Which is a subjective shot of Takaki. It is certain that Takaki has a sense of distance away from his mother, which represents the character of parents, in his subjective view. However, his parents never come on stage in fact.

![Fig.38](image)

Besides, Takaki has the same attitude towards his friends. In figure 39, for example, the camera shows his relationship with school mates. That camera focuses on Takaki’s face and the others around him become defocused. And the friends’ faces are not put in the frame, which shows an unharmonious relationship. Also, in this sequence of figure 40 and figure 41 of the memories, the camera shots Takaki sitting alone in the classroom from the back side. At this moment, a classmate comes in and talks to him. The camera crosses the 180°line and shots them in the front. This expressing method strongly implicates the uncoordinated relationship between characters. At the same time, the camera moves out of the classroom and shots their dialogue continuously till it ends. Such spatiality and timing of movement also clearly show the distance between Takaki and his friend.
As Takaki isolates himself from others, he is in great hope of meeting heroine Akari, the one he misses, again. Before their meeting, in Takaki’s perspective of the plot, Akari almost never shows up, only her letter appears in fact, while all the letters from Akari to Takaki are expressed by POV shot. What’s more, all shots used the technique of close-up, even super close-up like figure 42 and figure 43. Beyond that, the same method is used in the shots of Takaki’s response to Akari, and the shots of him marking on the train map (figure 44 and figure 45). That means, in Takaki’s perspective of the plot, all shots related to Akari are processed by close-up, even super close-up to show Takaki’s missing of Akari and his wish to get close to her. This is Takaki’s desired relationship.
However, the camera’s expression of real scenes in the movie contradicts with his wishes. Through long monologue that shows the memory of Takaki and Akari, the camera also presents Takaki’s living environment. For example, through the description of city scenery in figure 46 and figure 47, Akari becomes lonely in the space of school as he transfers from the old one. In these scenes (figure 48 and figure 49), we could see two things in common, which are longshot for expression and totally deserted space. According to former analysis, deserted space shows Takaki’s emptiness and loneliness in the reality. At the same time, the use of longshot as mentioned before, are completely different from the close-ups or super close-ups for Akari related things. From the remote & the close, and longshot & super close-up, two different shot sizes create a way of conflict. Through interacts between these two shot sizes, we may clearly experience the opposition between the present and the past in the movie. For Takaki, living with Akari is happy. However, this happy memory may never come to being in reality. The loss of happiness in the old times also causes Takaki’s loneliness.
Further, the differences between monologue and the camera also imply the same case. For a sequence of shot in figure 44 and figure 45, Takaki buys the timetable and map of the train; he has decided to transfer to a remoter place for high school study, and hopes to come to Akari’s place and meet her beforehand. Through camera movement in figure 44 and figure 45, it shows Takaki marking on the train map from the place he lives to the city Akari lives in. These shots all follow Akari, the heroine, so the director uses super close-up to express it. However, in the monologue at the same time, Akari’s lines are filled with shock of Takaki’s moving towards a remoter place, and the chance of never meeting again. Expressions of never meeting again in the future and the preparations for their last meeting right now in the monologue, which conflicts with each other and also emphasizes the theme of emotional loss. This loss here is different from the former, not of the happiness in the past, but of the hope of the future. While losing happy memories of the past, Takaki also loses hope of the future, thus right now, he feels intense loneliness. Such strong sense of loss is one cause of Takaki’s loneliness.

On the other hand, his loneliness rests in restrictions of the real environment. In figure 50, Akari’s letter, through close-up shot, expresses Takaki’s missing and yearning of Akari as explained before. Takaki was reading the letter in the shot before figure 51. By analyzing his behavior, we know figure 50 is his POV shot, and his subjective shot also shows his thoughts. However, there is a longshot, namely figure 52, in this sequence. And the direction of the longshot is from the back side of Takaki, which makes the character’s face indirect forward to the camera. Such effect shows the character’s feeling of loss and pessimism. The objective and non-characteristic feature of the longshot vividly present the environment of the character and their relationship. In figure 52, Takaki sits alone in the classroom, his figure very small and inharmonious with the environment because of the remote shot. Especially the reflects of the window frames from the sunset, their shadows cast to the ceiling and floor of the classroom. Because of the net structure, the
shadows look like a cage that locks up Takaki, creating an image of him restricted by the space. Such expression also reflects the real situation, where Takaki is trapped, unable to meet his beloved Akari. And it also complies with the plot of Akari, who is unable to be independent as a high school student, has to separate from Takaki because of her parents’ job transfer. This separation causes deep loneliness. Hence, restrictions of reality is another cause of Takaki’s loneliness.

In this movie, the same expressions also appear in figure 53. In this figure, Takaki is reading Akali’s letter, the net-shaped window behind him hints a sense of constraint. On the way to their last meet, Takaki’s train was trapped in heavy snow. Inside the train, Takaki is lost in great loneliness for unable to meet Akari for the last time because of the train delay. At this moment, the net for luggage on the train appears in figure 54. Through its net lines we see the remote scene of top lights of the train cabin. In Japanese, “Akari” connotes the meaning of light. Thus in figure 54, Takaki and Akari are separated by the net, which resembles the fact of Takaki being trapped by the train, and the loneliness caused by losing chance of meeting Akari again.
From the analysis about the shots above, we can clearly know both director Miyazaki and director Shinkai happen to coincide on showing the loneliness of modern people. The loneliness expressed by the two directors are different. Kiki has a unique character as a “witch”, which separates her from ordinary people and makes her isolated from social community. What’s more, her pride in her identity as a witch caused damage to the social orders of the new community. Also because she is overprotected by her parents in the old family, she loses her original identity in the new community. At the same time, the belonging of the new community is yet to form, which causes her loneliness. While in 5 centimeters per second, Takaki’s missing of Akari makes him totally isolated from others. As he lost the happy memories of the past with Akari, his dreams are constraint by the reality, which makes him lonely. Neither of these two kinds of loneliness are caused by close objective surroundings, but by their dreams and the difference between their desired relationships with people and the society with the reality.
Creatures in Fantasy World of Hayao Miyazaki Animation Films

Ruojing Jin
University of Tsukuba, Japan

In animation films, fantasy and reality are smoothly connected, and creatures in fantasy world play significant roles just as main characters. There are a variety of creatures live in fantasy world of Hayao Mizayaki animation films, which have well-rounded characters with individual “personalities” and abilities, such as speaking, communicating, thinking, and so on. Most importantly, they are created with various cultural backgrounds, especially Japanese culture. In his own book, Turnaround 1997 to 2008, Miyazaki says that, he pays much attention to the representation of Japanese history and culture. Japanese traditional ideas such as animism, the forest culture, and the environmental conservation are also embodied in his animation films. In my presentation, I will examine two Miyazaki’s animation films in different creation periods, *My Neighbor Totoro (1988)* in earlier stage, and *Spirited Away (2001)* in later stage, to analyze the images of the creatures, their cultural backgrounds, also their deep implications.

Animation film has become more and more popular in recent years. In animation films, fantasy and reality are smoothly connected, and creatures in fantasy world play significant roles just as main characters. There are a variety of creatures live in fantasy world of Hayao Mizayaki animation films, which have well-rounded characters with individual “personalities” and abilities, such as speaking, communicating, thinking, and so on. Most importantly, they are created with various cultural backgrounds, especially Japanese culture. In his own book, *Turnaround 1997 to 2008*, Miyazaki says that, he pays much attention to the representation of Japanese history and culture. Japanese traditional ideas such as animism, the forest culture, and the environmental conservation are also embodied in his animation films. In my presentation, I will examine two Miyazaki’s animation films in different creation periods, *My Neighbor Totoro (1988)* in earlier stage, and *Spirited Away (2001)* in later stage, to analyze the images of the creatures, their cultural backgrounds, also their deep implications.

*My Neighbor Totoro* is a 1988 Japanese animated fantasy film written and directed by Hayao Miyazaki. The film tells the story of two young girls, Satsuki and Mei, and their interactions with friendly forest spirit totoro in 1958, postwar rural Japan. The film won the Kinema Junpo Award for Best Film in 1988. This film and
its titular character, totoro, have become world-famous cultural icons.

In the scene about the cat bus, a small dark vague image with car headlights appeared in the center of the frame. Long shot was used here to attract Satsuki and Mei, as well as audience's attentions. As the image getting closer, the girls recognized that it was not a common bus and were astonished by the weird shape. Figure one to four were shot in the “cat bus--girls--cat bus--girls” order, used the reverse shot, to emphasize the girls’ expressions to this big monster. And then the camera gave the cat bus a close-up to show its appearance, especially the horrible smiling face, which was too big that broke out the frame, and brought a extraordinarily terrible effect. As a contrast, the girls’ scared faces were also showed with close-up shot. In figure eight to ten, the camera kept still focusing on the cat bus and paid much attention to the bus door changed from window, which introduced the function of the cat bus as well. According to this scene, we know that the cat bus is not a bad monster but a kind vivacious cat, on the basis of its excited expressions and warmhearted helps for its totoro friend.
The character Totoro comes from a mysterious image of Japanese children’ stories, which circulate in Miyazaki director’s home town, that totoro is a existed forest spirit which can only sight by children, because they are pure enough. On the contrary of totoro, the old school bus shaped cat bus is a horrible moster in the first sight. But in my opinion, it is a symbol of horror which every kid will feel in his childhood. Things not always have beautiful and kind outside, but they may not as ugly and scary as they look like. To accept and get along with those things is also one of the most important education for children. Furthermore, I think this character may also be a salute to the worldwide famous character Cheshire Cat in Alice in wonderland and Japanese children’story writer Kenji Miyazawa’s story.

I will turn to *Spirited away*. It is a 2001 Japanese animation film also written
and directed by Hayao Miyazaki. This film tells the story of Chihiro, a common ten-year-old girl who accidentally enters the spirit fantasy world with her parents together. After her parents eating forbidden food and were transformed into pigs by the witch named Yubaba, Chihiro takes a job working in Yubaba's bathhouse, trying to find a way to free her parents and return to the human world. The film won the Golden Bear at the Berlin International Film Festival in 2002, as well as the 75th Academy Award for Best Animated Feature in 2003.

The scene I will examine is the final battle between Chihiro, and the monster Kaonashi. In the opening, the camera panned across the scene from Chihiro to Kaonashi, which emphasized the tense atmosphere of “little girl versus big monster”. On the contrary of the extremely magnificent ukiyoe background setting, big black faceless monster Kaonashi, as well as the food rubbish, becoming the symbol of the vile lust and the ugly greedy part of humanity seemed to be much more degenerate. Moreover, in figure thirteen to sixteen, reverse shot was used to show the comparison between Chihiro's equanimity and Kaonashi's unstable state. After Chihiro asked the question Where is your home? Don't you have any friends or family? Kaonashi was beaten instantly. In this close-up shot, he retracted his head into the belly and become a giant black ball. Head is the symbol of oneself, and Kaonashi could not face himself in front of those questions because its belongingness and loneliness, which also indicated that Chihiro was fearless and equanimity because she upheld the faith to save her parents and friend Haku. That's where she belonged to, and that's why she had the confident to win.
On conclusion, the creatures in fantasy world of Hayao Miyazaki animation films in earlier stage are concrete objects who have the nature as well as Japanese traditional culture as their source, while abstract image creature characters appear.
in later stage’s films, which are created as the reflection of the humanity and human nature, good and evil. This change indicates that, although nature and Japanese traditional culture are part of the main focus of Miyazaki animation films, as the creation works turning to the later stage, the society circumstance also becomes more serious. To face this situation and find the answer to solve the problem of the relationship between human and nature, director Miyazaki does a lot of deep thinking and embodies them in his creations. And that is the glamour and fascination of Miyazaki animation films.

Influence of Motivation on Performance at University level of Education: A case of
Universities in Kisii County, Kenya

Callen Nyamwange & Penina Kamina
Kisii University, Kenya SUNY Oneonta, USA

Introduction

Every concern requires physical, financial and human resources to accomplish the goals. It is through motivation that the human resources can be utilized by making full use of it. Building willingness in teachers and students to work can do this. Few studies in university education are available that show effect of motivation on performance of both teacher and learner. The study use self-determination theory based on quality of motivation that differentiates between autonomous motivation (AM) (intrinsic motivation) that originates within an individual and controlled motivation (CM) (extrinsic motivation) that originates from external sources. The study sought to establish whether relative autonomous motivation (RAM) intrinsic motivation) a measure of the balance between AM and CM, affects academic performance through self-study strategy and supervised study effort.

Background

Motivation is a powerful tool that enhances students’ performance to reach their educational goal. It accounts for the difference between waking up before dawn to study the topics one did not understand or not (Clear, 2016). At times it might be easy for students to get motivated, and do insightful tasks, while at other times it is impossible, which may lead to procrastination. Motivation influences the level of academic performance through the mediation of the effort of study during elementary, secondary and university education. Oftentimes majority of students struggle to look for the motive to assist them reach their goals. Without it, they end up wasting too much time and energy on irrelevant concerns that do not add value to their effort in achieving their goals.

There is growing research evidence showing that motivation is critical in influencing study strategies, academic performance, adjustment to situations and students’ well-being in various domains of academic work and achievement and affects every aspect of school-life. It manifests in students’ choices of learning assignments (Peklaj & Levpušček, 2016) and the effort
they dedicate, persistence they show, attendance of classes, extra-curricular activities and systems of coping with obstacles they encounter in the learning process. Evidence from research studies have shown that achieving goals, interest in courses and success expectancies are positively related to the final grade (Ballado-Tan, 2014). Thus, motivation is both an internal and external force that drives students to achieve their own goals. It is what drives a student to perform well in education. The concept of motivation also includes the students’ reasons for learning and the learning achievement goals they set for themselves.

Intrinsic and extrinsic motivations have their strengths and weaknesses. The extrinsic motivation maybe easy to achieve through a reward system but intrinsic motivation can be difficult to tap into because of its personal nature. In some cases, students may be dealing with difficulties in their personal lives that use up their energy leaving little room for academic enthusiasm. In those cases, some interest in the subject can often be encouraged by a teacher willing to show concern for the student. One first step is for the professor to listen to the students, get to know them, their interests, and their dreams. Using such “data” points, the professor can tailor curricula to help hook them into academic work. Cultivating and maintaining intrinsic motivation is a life-long skill that all students can develop. Adults often have tasks at work or home that must be done even though they will receive no outside payment or recognition. Learning to be satisfied with a job well done is an important part of growing up.

Extrinsic motivation is much easier to establish once the teacher knows what the student is willing to work for it. Whether it is recognition, a bit of extra free time or some sort of prize, students usually have a reward they value. A reward system can teach students to put in hard work in order to get a prize, another life skill. However, a downside to extrinsic motivation is that it can get expensive for the motivator. The real problem, though, is that extrinsic motivation works in the short term, but it does little to kindle the fire of curiosity that leads to lifelong learning. It may be that the book a teacher bribes a student to read hooks them into reading; however, there is little guarantee of this. Better to find books that link naturally with the student’s interest and provide multiple entry points for that student to engage in the topic in a meaningful and relevant context.
Autonomous motivation (Intrinsic motivation) is the behaviour driven by rewards that come from one’s inward feeling (Cherry, 2016). According to (Coon & Mitterer, 2010), intrinsic motivation transpires when we act without any obvious external rewards. We either just enjoy an activity or view it from an opportunistic perspective to explore, learn, and actualize our potentials. In addition, the motivation to engage in behaviour arises from within the individual because it is intrinsically rewarding. Consider when reading a social sciences article. If one reads a social sciences article because he is interested in that sector of education and or only just wants to know more about the topic; then he is acting based on intrinsic motivation. One's true enjoyment of activity offers enough rationale for their behaviour. Researchers suggest that people get very creative when they are intrinsically motivated. In as much as extrinsic rewards may increase productivity, the quality of the work is mainly influenced by intrinsic factors. If one is doing something rewarding, exciting, and challenging to self, then he or she is prone to come up with more creative solutions. Intrinsic motivation is likely to increase if students pursue objectives that have a personal attachment, that relate to their self-esteem; when something in the environment attracts their attention and when something about the activity stimulates the person; when they strain to control themselves and their environments and want to determine what they chase; in situations where people gain contentment from helping others wholesomely and in cases where they can compare their performance favourably to others; and, enjoy acknowledgment of their achievement by others.

Autonomous motivation (Intrinsic motivation) holds many aspects in students’ interest to school work, a reason to study, believing in one to have what it takes to do well in school plus ability and the knowledge required. Factors that demean intrinsic motivation include when the student finds schoolwork "boring" or not “simulating”, when the student has the impression that schoolwork is always the same thing daily. Sometimes the student loses motivation because he thinks he cannot invest in education or does not have the energy to study and lacks the effort required.

Finding a perfect balance between extrinsic and intrinsic motivation for a student can be very daunting. In a positive light, every student can be motivated in one way or another. Professors have a massive task to ensure that their students are motivated and in addition,
inspire a behaviour that helps them to aspire to be life-long learners. Motivation pushes a student through behavioural modification towards a particular goal that they might have either set for themselves or have already been set for them. The motivators could result in causing the difference of a student finding study time instead of rote memorising for a test (Wilkinson, 2016). Motivation enhances the student’s ability to follow through what they do even when they think of themselves as incapable. Motivation also increases pride in a job that is done well. Students who have the motivation towards academic success tend to have genuine pride in their effort and recognition. These students are often leaders and seek for respect from their seniors and classmates. The mindset also keeps students’ interest in continuing with the higher education geared towards post graduate and post-doctorate studies. It is, therefore, critical for every learner to be motivated.

While motivation is often a challenging task for teachers, the rewards of having students who are interested and eager to learn make the hard work worth the effort. By combining intrinsic and extrinsic motivators, professors can assist students learn the subject at hand as well as valuable life skills. Few studies in university education are available that show effect of motivation on performance of both teacher and learner.

Method

This study sampled 80 third-year education students. The students completed a Likert formatted questionnaire on a five-scale point. The students rated their level of agreement with the statements that were given. Seven (7) questionnaire items were framed to probe AM while three (3) probed CM and the remaining five (5) items were used to probe both sources of motivation. The questionnaires were coded, scored and entered into the Statistical Programme for Social Sciences (SPSS). Analysis was done using both descriptive and inferential statics in order to answer the research question.

<td>410</td>
<td>1713</td>
<td>4.18</td>
<td></td>
</tr>
</tbody>
</table>
Table 2 shows that although the total score is higher where more questionnaire items were used to probe the source of motivation, the mean score is highest where few questionnaire items were used to probe the source of motivation. In addition it was observed that the easiest source of motivation that both students and teachers may tap into to improve performance is extrinsic motivation while intrinsic motivation is the hardest source to tap into. In this study, results show that combining intrinsic and extrinsic sources was not more favourable than tapping into extrinsic source alone or worse than taping into intrinsic source of motivation.

One explanation why mean score for extrinsic motivation were higher than intrinsic motivation is perhaps because extrinsic motivation is transient or opportunistic as suggested by Coon and Mitterer (2010). The problem with this is that you may need higher and better rewards to continue sustaining the motivation to perform better. Hence, the reward system may not be sustainable in the long run. Although by employing intrinsic motivation may not be beneficial in the short run, it might offer a better and more pragmatic strategy in the long run.

Self-study strategies utilise intrinsic motivation while supervised study strategies employ extrinsic motivation. Table 3 shows the mean scores of Relative Autonomous Motivation (RAM) (intrinsic motivation) which is a measure of the balance between AM and CM.

Table 3: Relative Autonomous Motivation

<td></td>
<td></td>
</tr>
<tr>
<td>Intrinsic &amp; Extrinsic Motivation (A&amp;CM)</td>
<td>-.22</td>
<td>.12</td>
<td></td>
</tr>
</tbody>
</table>

Table 3 shows that individuals are motivated more through taping into extrinsic source of motivation compared with taping into intrinsic sources hence the negative mean scores. While extrinsic motivation may be easy to tap into by utilising a reward system, intrinsic motivation can be difficult to tap into because it differs from one person to another. In certain instances, students may be dealing with difficulties in their personal lives that end up in employing their energy to the extent of leaving little room for academic enthusiasm. In such
cases, some interest in the subject can often be encouraged by a teacher willing to show concern for the student.

Table 4 shows the correlation between the various sources of motivation.

</tbody>
</table>

Key: N = Number of Responses; PC = p correlation

From the study it is clear that to achieve performance one would need to improve (Autonomous motivation) intrinsic motivation by 50.6% while controlled motivation (extrinsic motivation) can be improved by 54.3% and AM and CM can be improved by 61.6 to cause significant difference in performance.

**Conclusion**

Arising from the findings of this study, it would seem that there is no need to look for a perfect balance between extrinsic and intrinsic motivation for a student because intrinsic and extrinsic motivation seem to work independent of each other. Although, it is difficult to motivate students, every student can be motivated in one way or another. Consequently, lecturers face a daunting task to ensure that their students are motivated and inspire a behaviour that helps them to aspire to be life-long learners. Motivation compels a learner to modify their behaviour towards a particular set goal either by themselves or by others. The motivators could result in causing the difference between a student finding time to study and cramming for a test (Wilkinson, 2016).

Motivations empower learners to follow through what they do, even when they think of themselves as incapable. Learners who have the motivation towards academic success tend to have genuine pride in their effort and recognition. It is, therefore, critical for every learner to be motivated either intrinsically or extrinsically.

Teachers usually prepare lesson plans before their class. However, these tend to be teacher-centered lesson plans. In this article, we proposed the concept of a “Lesson Designing Map” based on students’ knowledge and thinking to design student-centered lesson plans.

Lesson plan and proposed Lesson Designing Map

Teachers usually develop lesson plans before their classes. Lesson plans can be represented in various formats, of which the timeline format (see Figure 1) is popular in Japan. It contains information about activities, tasks, supports, feedbacks, evaluations, and so on. These are arranged chronologically as per the activities involved in imparting the lesson. This type of lesson plan is very useful for teachers because designing and moderating the lessons becomes easy for them.

However, it has a few drawbacks. First, it is difficult to represent changes in students’ concepts or schemas over the course of the lesson. Second, it is difficult to connect students’ prior knowledge, tasks in the lesson, concept generation, and objectives mutually with the lesson structure. Therefore, lessons using timeline-formatted lesson plans tend to be teacher centered while lessons must be learner centered and knowledge centered (Bransford, Brown & Cocking, 2000).

Figure 1: An example of a Lesson Plan
To resolve the problems mentioned above, we developed the “Lesson Designing Map” (in short, LDM) (Misono, 2014). Figure 2 shows the example of an LDM. The LDM includes lesson objectives, students’ prior knowledge, activities, supports by the teacher, and students’ thinking. Using the LDM enables teachers to design structured lessons by connecting all these elements.

To clarify effectiveness of a lesson design with LDM, an interview was conducted to an elementary teacher. She drew a LDM to design a 3rd-grade mathematics and that was her first time to draw it. She pointed out that she was able to aware of students’ prior knowledge during drawing the LDM. This is one of strong points of lesson designs with LDM. However, she mentioned that she was not clear from where she should start to drawing it. Therefore, more supports are needed for teachers to draw LDMs more effectively and fluently.

Future research must investigate the effect of designing lessons using LDM compared to that of using the lesson plan.

Abstract
Studies show that less than four percent of United States (U.S.) high school students continue on to complete undergraduate degrees in science, technology, engineering, and mathematics (STEM) disciplines. The amount of U.S. students that matriculate to graduate school and major in STEM is even fewer.

The purpose of this study was to examine the impact that a summer research program had on factors that prepare undergraduates to matriculate into STEM graduate studies. The participants of this study spent eight weeks in a summer research mentoring program on a university campus in the United States.

The program was designed to immerse each participant into a graduate research environment in a STEM discipline. Each participant worked under the supervision of a faculty mentor and an advanced Ph.D. student. Participants conducted research in their STEM area of interest. The research was followed by poster and oral presentations. Various preparatory workshops included presenting a poster presentation, how to prepare for the Graduate Record Examination (GRE), identifying funding for graduate school, research methods, writing publications, professional development, and life as a graduate student.
Students were surveyed before and after the summer research program to measure their change in knowledge about research and attending graduate school. The overall findings of this study indicated an increase in self-efficacy in: conducting research, presenting a poster, presenting orally, conducting literature reviews, academic writing, and finding fellowships.

Furthermore, at the end of the summer research program, results indicated that participants felt more confident about collaborating with a mentor such as a faculty member or seasoned Ph.D. student on a research topic and presenting their research findings in front of an audience. Participants expressed confidence in preparing for the GRE, overall knowledge about graduate school, locating funding such as fellowships, TA-ships, and research assistantships for graduate school.

The findings of this study emphasize the importance of summer research programs that might help prepare undergraduate students to matriculate into STEM graduate programs.

Innovative and Interdisciplinary Program Review Strategies

Dr. Lata Murti and Dr. Sheila Lakshmi Steinberg

This presentation focuses on the innovative and interdisciplinary efforts by Brandman University faculty to complete a program review and program revision for the Sociology and Social Science Programs at Brandman University. We specifically highlight the interdisciplinary and highly engaged methodological approaches that were used to create and to frame each program. Brandman University has a series of pre-defined steps that were followed for every program design--beginning with a literature review, a competitive analysis of other existing and/or similar programs, engagement with stakeholders and consideration of internal feedback from faculty, advisors, counselors and administration. Specifically, in this presentation, we highlight the intensive engagement with our stakeholders and feedback from experts in the real applied fields related to both disciplines of Sociology and Social Science and the very iterative process that we all engaged in. Additionally, we focus upon the collaborative nature of this creative design process, where we were able to discuss and work together to actively update the Sociology program (which had not been updated in 40 years), and to create a completely new program called the Integrated Social Sciences major. Integrated Social Sciences is more focused on multiple methods, and incorporates a systems-based interdisciplinary approach to understanding society and its interaction with the surrounding environment. Through establishing a strong methodological base in both Integrated Social Sciences and Sociology we are equipping our students with the necessary critical thinking skills to engage in creative, yet applied problem solving and to generate useful policy at the local, state, national and international levels.
Effects of changes in physical education curriculums for elementary schools and the recruitment of specialized physical education teachers on students’ physical fitness

Abstract
[Background] In Japanese elementary schools, each teacher has to teach all subjects, and there are few specialized physical education teachers. High-quality physical education programs are not being implemented in some schools without specialized physical education teachers. Furthermore, there is a decrease in the physical fitness of Japanese children compared with that in around 1985.
[Objective] The present study aimed to examine the effects of changes in physical education curriculums for elementary schools and the recruitment of specialized physical education teachers on students’ physical fitness.
[Methods] Two-year longitudinal surveys (2014 to 2016) were conducted involving first-year students of a private elementary school (males: n=20, age = 6.8±0.3 year, height = 116.7±4.6cm, body weight = 20.8±2.7kg. females: n=26, age = 6.6±0.3 year, height = 116.0±3.3cm, body weight = 20.3±2.3kg; means ± SD) in Kanagawa Prefecture. The survey included tests to measure the grip strength of the toes and hand and assess performances in sit-ups, forward-bending in a sitting position, the side step, 20-m shuttle run, 50-m run, and standing long jump. The maximal isometric toe flexor strength in the sitting position was measured using a toe flexor dynamometer (T. K. K. 3361; Takei Scientific Instruments Co., Niigata, Japan). During the period between 2014 and 2015, specialized physical education teachers were recruited. In addition to this, modifications were made to physical education curriculums during the period between 2015 and 2016.
[Results and Discussion] There was a significant improvement in the physical fitness of the children, side step, 50-m run, sit-ups, and the grip strength of the toes in particular, following the recruitment of specialized physical education teachers and
changes in physical education curriculums (2015 to 2016), compared with their
physical fitness during the period between 2014 and 2015, during which only the
recruitment of specialized physical education teachers was implemented. Therefore, it
is necessary to recruit specialized physical education teachers and develop effective
physical education curriculums to improve children’s physical fitness.

[Introduction]

According to a report on the results of a physical fitness/exercise ability
survey published by the Ministry of Education, Culture, Sports, and Technology⁶), the
present level of physical fitness of Japanese children is lower than that of around 1985.
Although their level of physical fitness has not decreased significantly in recent years,
the decreased physical fitness of children is still a serious social issue. In the past,
children enhanced their physical fitness by playing outdoors. At present, children are
advised to learn basic physical movements through various activities in physical
education classes. Therefore, it is necessary to improve such classes implemented in
schools to enhance children’s physical fitness.

In general, elementary schools in Japan have adopted the “classroom-based
teacher assignment system”: One teacher is in charge of a single classroom of students
and teaching all subjects for the class. The opposite is the subject-based teacher
assignment system: In principle, each teacher teaches a specific subject, or their
specialty, for multiple classrooms of students. Education in Japanese junior high
schools or higher educational institutions is based on this system at present. Japanese
elementary schools are allowed to employ “specialized teachers”, who are specialized
in and teach only a single (practical) subject, such as domestic science, music, and
physical education. These specialized teachers are usually not in charge of classrooms.
A school with 12 classrooms is allowed to employ 1.5 specialized teachers. This means
that a school with 12 classrooms (of approximately 420 students) cannot afford to even
employ three specialized teachers for domestic sciences, music, and physical education.
Most Japanese elementary schools have no specialized physical education teachers,
and each teacher is required to teach all subjects. Therefore, quality of physical
education classes are not implemented in those elementary schools with no specialized
physical education teachers. However, few studies have been conducted to examine the
effects of changes in physical education curriculums adopted by elementary schools
and the deployment of specialized physical education teachers on children’s fitness,
particularly on the relationship between their recruitment and children’s fitness and
athletic performance.

Therefore, the present study aimed to examine the influences of changes in
physical education curriculums in elementary schools and the introduction of
specialized physical education teachers on children’s fitness.
[Methods]
1. Subjects

A longitudinal survey was conducted for two years (between June 2014 and June 2016) involving first-year (as of 2014) students (males: n=20, females: n=26) of Private Elementary School M (in Kanagawa Prefecture).

The present study was conducted in accordance with the rules established by the human research ethics committees of Kanto Gakuin University and Nippon Sport Science University, and after obtaining the consent of the subjects (Number: Human Research 2014-1-1, No. 015-H42).

2. Measurement items

The measurement items included the strength of toe muscles, grip strength, sit-up, sit-and-reach, side step, 20-meter shuttle run, 50-meter run, and standing long jump. Students’ fitness and athletic performance were measured or assessed in accordance with the Guidelines for the Implementation of the New Physical Fitness Test (for children aged 6 to 11 years old) developed by the Ministry of Education, Culture, Sports, Science, and Technology3).

(1) Strength of toe muscles

The strength of toe muscles was measured using equipment for the measurement of the toe muscle strength (Takei Scientific Instruments Co., Ltd., T.K.K.3361) 9).

During measurement, the students were asked to sit on a chair without leaning on its back and place their hands on their knees. The students put all of their toes on the bar of the measurement equipment and maximally contracted them. The strengths of toe muscles of the left and right feet were measured twice each. The maximum measurements for the left and right sides were adopted, and the means were calculated.

(2) Changes in curriculum (annual teaching plans)

Figure 1 presents changes in the curriculum of Elementary School M. Between April 2014 and March 2015 (prior to the change in the curriculum), the school provided education based on a curriculum in which “classroom teachers (not specialized in physical education) presented tasks for their students and encouraged them to set goals by themselves”. From April 2015 onward (following the change in the curriculum), education was implemented based on a curriculum developed by teachers specialized in physical education.

Prior to the change in the curriculum (between April 2014 and March 2015), classroom and specialized teachers were responsible for three hours a week of physical education: one to two hours each by classroom and specialized teachers. Following the change in the curriculum (between April 2015 and March 2016), classroom and specialized teachers taught physical education classes for one and two hours a week, respectively.
The curriculum (annual teaching plan) was changed because the results of a physical fitness test for fifth-year students conducted in 2014 had suggested that the scores for all assessment items were lower than the national means and that it was necessary to improve their physical fitness. Classroom teachers were in charge of teaching “stretch exercise” and “play-based exercise” to observe and assess their performance and development, and teachers specialized in physical education were in charge of the “exercise bar” and “vaulting box” to provide professional advice on their movements. The curriculum was changed according to the fields of exercise related to physical education suggested by the Ministry of Education, Culture, Sports, Science, and Technology, and taking into account the development of students of Elementary School M.

(3) Statistical methods

All measurement data are expressed as mean values ± standard deviations. Analyses of variance were conducted to examine changes in the height, weight, strength of toe muscles, and measurements in the physical fitness test according to the age, and Tukey’s test was used for multiple comparison. The significance levels in the risk rate for all items were lower than 5% (P<0.05). Statistical software JMP10 (SAS Institute Inc.) was used.

(4) Analytical methods
The present study aimed to examine the effects of changes in physical education curriculums and the deployment of specialized physical education teachers by comparing the performance of students of Elementary School M in a fitness/athletic performance test for first-to-third-year students with the national levels (published by the Ministry of Education, Culture, Sports, Science, and Technology)\(^6\). Since the strength of toe muscles is not included in a report of a physical fitness/athletic skill survey\(^6\), comparison of the performance of students of Elementary School M and national means were not conducted.

The performance in 2015 was measured prior to changing the curriculum, and the performance in 2016 was measured following the change.

**Results**

Figure 2 presents longitudinal changes in the heights of students of Elementary School M. The increases in the heights of both male and female students of the elementary school were similar to the increases in the national means, and the differences were not significant.

![Figure 2](image1)

**Figure 2.** Longitudinal changes in the height of students of Elementary School M.

![Figure 3](image2)

**Figure 3.** Longitudinal changes in the weight of students of Elementary School M.
Figure 3 presents longitudinal changes in the weights of students of Elementary School M. The increase in the weights of male students of the elementary school was similar to the increase in the national mean, and the difference was not significant. However, the weight of female students of Elementary School M in 2016 was significantly lower than the national mean.

Figure 4 presents longitudinal changes in the physical fitness/athletic performance of students of Elementary School M and those of the national means. Regarding longitudinal changes in the performance of students of Elementary School M, there were significant improvements in the 20-meter shuttle run and
50-meter run in 2015 compared with 2014. However, their performance in the sit-and-reach test in 2015 was significantly inferior to that in 2014. Their performances in the toe muscle strength and side step tests in 2016 were significantly superior to those in 2015.

Students of Elementary School M received lower scores in all tests in 2014 than the national means: the scores in the side step test and 50-meter run were significantly lower. In 2016, students of Elementary School M received significantly higher scores in the 20-meter shuttle run and standing long jump than the national means.

---

**Figure 5.** Longitudinal changes in the physical fitness/athletic performance of (female) students of Elementary School M.
Figure 5 presents longitudinal changes in the physical fitness/athletic performance of female students of Elementary School M and those of the national means.

Regarding longitudinal changes in the performance of students of Elementary School M, there were significant improvements in sit-up, 20-meter shuttle run, 50-meter run, and standing long jump in 2015 compared with 2014. There were significant improvements in the strength of toe muscles, sit-up, side step, and 50-meter run in 2016 compared with 2015.

Female students of Elementary School M received significantly higher scores in 20-meter shuttle run than the national means in 2014. Students of Elementary School M received significantly lower scores in grip strength, side step, and standing long jump than the national means in 2016. However, there were no significant differences between the scores for other measurement items received by students of Elementary School M and the national means in 2015.

[Discussion]

Based on the philosophy of developing students’ “ability to live”, the current Japanese curriculum guidelines aim to develop their academic abilities, personalities, and health, and promote well-balanced intellectual, moral, and physical education, while taking into consideration the status of children.

The objectives of physical education are to encourage people to enjoy sports throughout their lives, maintain and improve their health, and lead an active life by improving their physical fitness according to their individual abilities. In particular, the guidelines have defined elementary school education as follows: “Each school should give proper instruction on physical training and health promotion through all of the school’s educational activities, while giving consideration to the developmental stages of the pupils”, and systematized it by taking into account the transition from one stage of school education to another. However, in Japanese elementary schools, in which each teacher is responsible for teaching all subjects, the number of teachers specializing in physical education is very small, and quality of physical education classes are not implemented.

Private schools have been required to promote characteristic education/research to respond to diversified public needs, and they are conducting unique activities based on their school philosophies. Elementary School M was established for primary school education based on Christianity in April 1949, and some subjects such as music, art, and English are taught by specialized teachers. However, since the school had no specialized physical education teachers prior to the revision of the curriculum, classroom teachers were in charge of physical education classes and the development of the curriculum (annual teaching curriculum in physical education). A previous study conducted by the authors suggested that the first, second, and
fifth-year students of Private Elementary School M (in Kanagawa Prefecture) received lower scores in a physical fitness test in 2014 than the national means reported by a physical fitness/athletic performance survey conducted by the Ministry of Education, Culture, Sports, Science, and Technology. 

In the present study, students’ physical fitness and athletic performance were compared and analyzed prior to and following the revision of the curriculum. In 2015, the tests were conducted prior to the revision of the curriculum (three hours a week of physical education: one to two hours each by classroom and specialized teachers). In 2016, the tests were conducted following the revision of the curriculum (three hours a week of physical education: one hour by classroom teachers and two hours by specialized teachers).

Immediately following admission, students of Elementary School M received lower scores in all tests than the national means (2014). This was presumably because only people who have passed the entrance examination are admitted to the private school, and 83.3% of the students attend it by car or school bus.

Regarding longitudinal changes in the performance of students of Elementary School M, they received significantly higher scores in stamina and running ability in 2015 compared with 2014. During the period of the study, a significant proportion of physical education classes were allocated for “marathon” and “running race”, and teachers specializing in physical education and classroom teachers provided advice. They presumably improved their stamina when they trained to participate in a “marathon race” - one of the school events.

The results of the present study suggested that students of Primary School M received significantly higher scores in the side step test following the revision of the curriculum.

Jumping rope is positioned as a physical exercise associated with such physical fitness and athletic skills as physical agility, stamina, and jumping power. The physical agility of the students increased after they received technical advice on movements required in jumping rope from specialized physical education teachers.

Female students of Elementary School M received significantly lower scores in the sit-up test than the national means in 2014. However, there was no significant difference between the scores received by female students of Elementary School M and the national means in 2015.

According to a report by Yokota et al., teachers of schools with specialized physical education teachers stated that the specialists were able to provide students with consistent education according to their developmental stages and respond to students’ needs for improvement in their athletic skills. Following the revision of the curriculum in 2016, there were no significant differences in the physical fitness/athletic skills between students of Elementary School M and other schools across Japan. The curriculum was revised into one designed to provide students with
appropriate advice required for developing athletic skills and techniques while taking into account the developmental stages of their ability to exercise, and this had positive effects on the physical fitness of students.

Persons who are recruited as specialized physical education teachers by elementary schools are expected to be more skilled than teachers in charge of all subjects at encouraging students to develop the habit of performing exercise and senses of cooperation and responsibility, as well as further enhancing their physical fitness, developing athletic skills, and helping them experience the joy and pleasure of playing sports. Whereas specialized physical education teachers were recruited and the curriculum was revised before the implementation of physical education between 2015 and 2016, only the adoption of specialized physical teachers was conducted before the period between 2014 and 2015, and there were greater increases in students’ physical fitness between 2015 and 2016.

Dunn, LL. et al. stated in relation to the efforts to increase children’s physical activities that: “Teachers trained in Move-to-Improve (MTI) led their classrooms in significantly more physical activity compared with teachers who were not trained. The MTI Program is designed by New York City”. Therefore, the adoption of teachers specializing in physical education is expected to help students experience the joy and pleasure of performing exercise, develop the habit of playing sports, and motivate them to become more interested. There were improvements in students’ physical fitness and athletic performance as positive influences of the adoption of teachers specializing in physical education and the development of physical education curriculums according to their age.

[Conclusion]

Between April 2015, when teachers specializing in physical education were recruited and the physical education curriculum was changed, and March 2016, there was an improvement in the students’ fitness, their performance in the side step test and the strength of toe muscles in particular, compared with the period between April 2014 and March 2015 when the curriculum had yet to be changed.

The above-mentioned results suggest that it is necessary to recruit teachers specializing in physical education and develop effective curriculums for students on taking into consideration their age.

[Acknowledgement]

I would like to express my sincere gratitude to the principal, Mr. Ogi (specializing in physical education), and other teachers, students, and their parents of Kanto Gakuin Mutsuura Elementary School for their cooperation in the study. The study was conducted with the support of 2015 Research Funds for Academic Staff from the Department of the College of Human and Environmental Studies, Kanto

Title of Proposal:  
The Collaborative Community of Learners (CCOL): A New Kind of Professional Learning Community

Topic Area of Submission  
Mathematics Education

Presentation Format:  
Paper Session (Research Paper)

Presentation Description:  
In this report we will focus on a professional development project conducted in the U.S. aimed at advancing teachers’ mathematical knowledge for teaching through site-based Collaborative Communities of Learners (CCOLs) facilitated by mathematics faculty from community colleges. Our paper discusses the data from the CCOLs that reveals two dominating characteristics which contribute most to the success of the CCOLs: (1) richness of discussions relating to teaching practices and (2) meaningful feedback of classroom observations.

THE COLLABORATIVE COMMUNITY OF LEARNERS (CCOL): A NEW KIND OF PROFESSIONAL LEARNING COMMUNITY

Trey Cox

Chandler-Gilbert Community College

April Strom
Scottsdale Community College

The common approach to executing change in a teacher’s classroom practice is through professional development activities and programs. Undoubtedly the most common type of professional development for the teaching profession is the workshop. Institutes, courses, and conferences are other typical forms of professional development that share many of the features of workshops. Although these formats are quite common and can be effective, they have been criticized for lacking meaningful learning experiences, for not incorporating techniques that help to motivate teachers to transfer what they learn into the classroom, and for creating sustainability and change in the educational culture of a school or department.

The belief that many conventional programs are ineffective and wasteful has led to growing interest in adding other more innovative models for professional development, such as mentoring, action research teams, teacher networks, inquiry groups, vertical teaming, study groups, and lesson study. Professional development models such as these differ from the more common and traditional methods in several respects. For instance, they often take place during the process of classroom instruction or during regularly scheduled teacher planning time. By locating opportunities for professional development within a teacher's work day and at his or her own school site, professional development has been shown to be more effective in making connections with classroom teaching. We are also starting to see that these novel formats for growth have more direct influence on changing classroom teaching practices and result in incremental teacher change over time. Furthermore, by design they are more responsive to individual teacher’s needs and goals and are more aligned with how teachers learn.

Reflection and analysis are often individual activities, but they can be greatly enhanced by teaming with an experienced and respected colleague, a new teacher, or a group of teachers. Collaborating with colleagues regularly to observe, analyze, and discuss teaching and students’ thinking is a powerful, yet neglected, form of professional development in American schools. Interest is rising in what is seen as a promising model of professional development designed for groups of teachers from the same school, department, or grade level. There are many terms used in education attributed to a group of educators who come together on a regular basis to explore different aspects of learning and teaching including teacher inquiry groups (Hammerman, 1997), professional study groups (Mitchell, 1989), learning circles (Collay, Dunlap, Enloe, & Gagnon, 1998), communities of practice (Lave & Wenger, 1991; Wenger, 1998), teacher support groups (Rich, 1992), teacher professional groups (Avalos, 1998), faculty learning communities (Cox,
2003), professional learning communities (DuFour & Eaker, 1998), and now Collaborative Communities of Learners (CCOLs).

This report focuses on a professional development project in the U.S. aimed at advancing teachers’ mathematical knowledge for teaching through site-based Collaborative Communities of Learners (CCOLs) facilitated by mathematics faculty from community colleges (non-university tertiary institutions). Data from the CCOLs have revealed two dominating characteristics which contribute most to the success of the CCOLs: (1) richness of discussions relating to teaching practices and (2) meaningful feedback of classroom observations. This report provides a discussion of the professional development project, along with qualitative data to demonstrate success of CCOLs.

**OVERVIEW OF THE ARIZONA MATHEMATICS PARTNERSHIP (AMP)**

The Arizona Mathematics Partnership (AMP), funded by the U.S. National Science Foundation, is a project that supports in-service teachers in advancing their knowledge about the teaching and learning of mathematics as a means for increasing student achievement in middle school mathematics. AMP also produces research about the characteristics of a sustainable professional development program, as well as contributes to the body of knowledge for understanding teachers’ mathematical thinking and beliefs. The AMP project developed a collaborative partnership among seven school districts and five community colleges in Arizona.

The project targets 300 in-service middle school mathematics teachers, 32 teacher-leaders, 40 administrators, and also impacts a total of 24,000 students in grades 5-8. By including a variety of educators, AMP has facilitated the creation of new mathematics educator networks that span within and across regional districts to serve middle school students, with special attention given to those schools serving economically disadvantaged students and underrepresented students.

An objective of the project is to enhance teachers’ Mathematical Knowledge for Teaching (MKT) (Ball et al., 2008) with the goal of improving student learning and attitudes toward mathematics by engaging teachers in approximately 100 hours of professional development per year for two years. Teachers engage in: (1) Institutes and Workshops that emphasize conceptual understanding and problem-solving, with the intent to develop teachers’ subject matter knowledge, (2) Collaborative Communities of Learners (CCOLs) that assist teachers to connect what they learn in the workshops with classroom practice, which develops their pedagogical content knowledge, and (3) Instructional Rounds (City et al., 2009) that provides the opportunity for teachers to make their practice public.

**The Need for Collaboration Communities of Learners**

It seems unlikely that even the most dedicated teachers would be able to acquire and sustain the resources and the commitment necessary for teaching for understanding by themselves. They need the support and advice of colleagues, and they need continuing access to new developments in their fields. In concert with the calls for involvement by institutions of higher education, outside agents are seen as an invaluable link that can provide the support necessary to help with the development and sustenance of teacher learning communities. Thinking pragmatically, it is important to follow up on current efforts which focus on the need to support
the development of teacher learning communities that can both nurture and sustain growth. Franke, Carpenter, Levi, and Fennema (2001) refer to this as generativity and means to not only maintain new practices over time, but also to modify and adapt practices continually in response to new learning and reflection that occurs as a result of a persistent focus on student thinking. Franke et al. (2001) argue that both maintaining practice and generativity can be observed at the level of individual teacher, but a crucial difference between the two is that generativity occurs in the context of collaborative inquiry rather than in isolation. In other words, these generative practices occur and become normative in the context of participating in a teacher learning community.

DuFour and Eaker (1998) suggest further that research both inside and outside education has arrived at the same conclusion: professional learning communities require educators to function as a collaborative team characterized by shared mission, vision, and values; collective inquiry; supportive and shared leadership; an orientation toward action and experimentation; commitment to continuous improvement; and a focus on results.

Despite the obstacles and challenges that exist in all professional development models, the literature is quite extensive in suggesting that the most promising strategy for sustained, substantive teacher improvement is developing the ability of school personnel to function as effective learning communities. Therefore, building upon the previous work related to the learning community structure, the definition of the Collaborative Community of Learners (CCOL) for this project will be:

A collaboration of secondary teachers who meet with the assistance of a trained facilitator for the shared purpose of deepening their conceptual and pedagogical content knowledge, and understanding the process by which secondary students acquire understandings and reasoning abilities for the function concept in order to inform and improve their practice. There will be an expectation of making instructional changes for the improvement of student learning not for the sake of change.

To optimize the impact of CCOLs we strive to keep the size of the CCOLs to a maximum of \( n = 9 \) (ideally 6 – 8 teachers). The CCOLs focus on teachers’ immediate classroom instructional needs. It is designed to be a safe place to discuss in an open forum how to improve teaching practices, deepen individual teacher’s content knowledge, and address students’ learning needs. Each CCOL sets its own agenda with the direction of the trained facilitator to fit the immediate needs of the participating teachers and focus on ensuring success in the students they are teaching.

There are two key innovative features of the CCOLs within AMP. First, the project establishes strong partnerships among community colleges and middle schools, with community college faculty serving as facilitators of the site-based CCOLs. Second, the CCOLs focus on developing teachers’ deep conceptions of the “big ideas” of middle school mathematics by leveraging the expertise of the CCOL facilitator through feedback on content and pedagogy based on classroom observations.
The AMP Model: Embracing Collaborative Communities of Learners

In 2015, the Arizona Department of Education reported that 24% of first year teachers and 20% of second year teachers leave the teaching profession (ADE, 2015). The decision to leave the profession is often based on the lack of support received during these early years, and one of the most effective ways to retain high quality teachers is to improve the support system. In response to this retention issue, AMP provides professional support through a CCOL, initially facilitated by community college faculty. Teachers are supported in shifting their thinking about mathematics as a set of skills and procedures to thinking about mathematics as well-connected ideas that anchor their curriculum and instruction. The site-based CCOLs, ideally comprised of teachers at one school, are designed to support the emergence of an intimate collaboration between the CCOL facilitator and the teachers, as a means of enhancing teacher collaboration. The CCOL name was adopted because its emphasis on "learner" suggests that each member of the collaborative is both learning with and learning from other members of the community for the purpose of enacting a shared research-based vision of effective learning experiences for students.

The CCOL design draws from the body of literature on professional learning communities (Cox, 2005; DuFour & Eaker, 1998). Research findings from other projects have revealed the importance of a strong CCOL facilitator who has deep and connected understandings of key mathematical concepts. Thus, each CCOL consists of a community college faculty and a group of teachers (n < 9) who meet together for 18 hours per year (ideally 9 two-hour sessions), and invest 12 hours per year in CCOL preparation. During the first semester, each CCOL articulates a shared vision, needs and goals, identifies content areas and standards as well as pedagogical needs in an effort to address their students' mathematical struggles. The Didactic Triad (Thompson, 2009) provides the foundation for facilitators to plan for the CCOL meetings. The Triad helps teachers simultaneously focus on the learning goals for their students, the tasks they will use, and the teaching strategies to be implemented.

During the first two years of each cohort, community college mathematics faculty serve as CCOL facilitators. In the third year, emergent teacher-leaders facilitate their own CCOLs with project support. In this way, AMP develops sustainable, locally-led CCOLs where teachers regard their CCOL as an important element of their professional practice. CCOL facilitators and teachers form collaborative teaching teams to embrace and create an environment for public-openness of teaching. In the CCOLs, common readings are chosen to highlight aspects of mathematics teaching. The CCOLs have focused on Principles to Actions: Ensuring Mathematical Success for All (NCTM, 2014). Each CCOL is very different, as many groups are composed of teachers from different AMP cohorts, different grade levels, and different professional concentrations.

In an effort to insure that the time spent in each of the self-directed CCOLs is beneficial and productive, a framework of an agenda is shared with each facilitator and they are encouraged to generally employ its elements. The agenda framework includes:

1. Open Discussion (10 - 15 minutes)
   ○ Time to talk about important issues regarding mathematical content knowledge, or the teaching and learning of mathematics
2. Let’s do some math! (20 - 30 minutes)
   ○ A relevant math task or problem is provided for participants to work through designed to challenge and build teacher content knowledge

3. Topic of Investigation (60 - 90 minutes)
   ○ Investigation is focused around the framework of The Didactic Triad (Thompson, 2009) including: Learning Goals, Teaching Practices, & Curriculum Materials

4. Action Items for next meeting (5 minutes)
   ○ Readings
   ○ Classroom tasks
   ○ Research
   ○ Implementation of a lesson
   ○ Student interviews, etc.

**Making Practice Public**

Another important part of the CCOL structure is the focus on making the teacher’s practice public. This occurs in two major ways within AMP CCOLs. First, the community college faculty facilitator schedules regular classroom observations for teacher feedback and coaching opportunities. Typically, the teacher being observed communicates with the faculty observer to indicate a specific teaching issue on which the observation will focus. For example, one CCOL group decided that feedback on the Math Teaching Practices (NCTM, 2014) would be most beneficial to improve their teaching practice. After the lesson, the facilitator provided detailed written and verbal feedback using the eight Math Practices as the framework.

Second, the AMP CCOL structure includes instructional rounds. Borrowing from the medical profession and the idea of medical rounds, teachers from a CCOL (and other invited professionals) observe other classrooms and observe student thinking. While instructional rounds need not look exactly the same for all CCOLs, the common approach is for the CCOL members to work together to plan the lesson that will be observed. On the scheduled day, the CCOL teachers make plans to observe the lesson in other classrooms. At the next scheduled CCOL meeting, the group debriefs and discusses the observation. A goal of working through this process is to afford teachers the opportunity to work together to create a lesson, to observe how that lesson can play out in another classroom (observers), to receive feedback from peers (teacher), and to generally grow in both mathematical content knowledge and pedagogical knowledge.

The self-directed instructional rounds allow AMP teachers to do something that has not been typical for our teachers - to make their practice public. This has the potential to create a school culture where teaching and learning is open and a culture where teachers work together to challenge one another, to grow in their own content knowledge, and to increase their ability to support student success.

**Evidence of Success of Collaborative Communities of Learners**

Qualitative data gathered from the CCOLs, through videotaped sessions and written reports, have
revealed two characteristics which most contribute to the success of the collaborations in supporting teachers’ development: (1) richness of discussions relating to teaching practices and (2) meaningful feedback of classroom observations that is embedded to both mathematics and pedagogy. Both of these characteristics are detailed below.

As an example of discussions that occur in the CCOL meetings, teachers from one CCOL recently discussed an excerpt on illustration from Principles to Actions (NCTM, 2014). Illustration relates to teachers establishing clear goals, along with clarifying and understanding the mathematical expectations for their students’ learning. The goal is for students to develop a more precise understanding of the mathematical concepts discussed during a lesson, and to develop the ability to connect mathematical ideas and concepts to problem-solving situations. Students focus not only on finding answers but also attend to how the various problem situations relate to the mathematics.

In the CCOL discussion on illustration, teachers shared their observations about their ability to provide complete yet concise illustrations of mathematical ideas for their students. The reading highlighted an example of illustration of subtraction for 2nd grade. The teachers collectively shared the sentiment that they do not possess the mathematical content knowledge to provide such learning opportunities for their students. In particular, one teacher felt she had inadequate resources to provide students with appropriate illustration for any given topic, while she acknowledged that she would be a better mathematics teacher if she were able to “do this.” Another teacher shared the vision that perhaps teachers should start “small” by trying to implement such methods incrementally from year to year. This is one example of how the CCOL meetings provide teachers a safe environment (devoid of school administrators) to read and reflect on materials relevant to their teaching practice and to support each other in their professional growth.

As an extension of the CCOL experience, the community college faculty facilitator observes teachers in their classroom and provides feedback about content and pedagogy. Feedback varies for each teacher and by CCOL facilitator. Teachers choose an area of focus with which the facilitator can use as a lens for the observations, thus the feedback for the teachers is based on their self identified area. Often, the Mathematics Teaching Practices from the Principles to Actions book (NCTM, 2014) serves as the primary lens for observing the teaching and learning of mathematics. After each class observation, the CCOL facilitator provides a written report to the teacher, which includes a description of things that went well in the session, as shown below.

Your students are very eager to share their work as illustrated by the warm-up activity with integers. This integers warm-up went a lot slower than I anticipated. Your questioning of the students challenged them to think more carefully about their actions. For example, I liked how you asked a student who had written \(-7 - 5 = -2\) (after reasoning with color chips) to represent the operation on the number line and explain how it compares to her work using color chips. Like in constructing understanding for any concept, it is challenging for students to develop a conceptual understanding of what it means to add/subtract. I really liked how you kept the meaning of these operations the focus of this portion of your lesson. You were intentional about asking questions such as “what does this
operation mean” in reference to operations such as \(-7 - (-5)\), which kept the meaning of the operation at the center of the activity. You then leveraged the students’ responses such as “\(-7\) take away \(-5\)” to justify the algorithms they used (color chips or the number line). This is a great way of building your students’ procedural fluency from conceptual understanding. [Observation of Trevor’s 8th Grade Class, October 8th, 2015]

In addition to complementing the teachers, the facilitator’s feedback aims to connect what the teachers learn from the workshops to the teachers’ practice. For instance, Trevor was learning about constructing meaning of mathematical concepts as well as strategies for these concepts in the workshops. In this feedback the facilitator is commenting Trevor on how he is integrating and enacting ideas learned in workshops into his teaching practice. The feedback also highlights areas that teachers can work on to perfect their craft, as shown below.

When the students were working on the handout Distance Between Two Rational Numbers you gave them sufficient time to work in pairs and explore distances between rational numbers using number lines. As they worked on these tasks you walked about posing questions to prompt the students to think carefully about their work. The students were not quite as successful in coming up with a generalization/formula of the distance between two rational numbers, \(p\) and \(q\), on their own…I wonder if it would be more fruitful to leverage their work on the warm-up to help them make sense of the formula \(|-| - |\|\). Your students have already spent a considerable amount of time trying to make sense of the difference between two rational numbers, \(p\) and \(q\) (i.e., \(|\| - |\|\)): “how far is \(p\) from \(q\)” (with + or – to indicate where \(p\) is located relative to \(p\)). Maybe the students would have an easier time making sense of the distance formula if you build on this knowledge and argue that if we are looking for the distance between two integers, \(p\) and \(q\), we don't care whether we start at \(p\) or at \(q\) (direction) hence the formula is \(|-| - |\|\|. The absolute value allows us to strip off the sign (direction). [Observation of Trevor’s 8th Grade Class, October 8th 2015]

Such feedback allows the facilitator to perturb the teacher to think about the trajectory of the lesson and how to facilitate it in ways that show the connections among the mathematics concepts he/she teaches.

Conclusions

The Arizona Mathematics Partnership provides teachers an opportunity to be challenged and supported in their professional growth. While there are a variety of ways in which this support and challenge is manifested, the Collaborative Community of Learners provides a flexible, self-directed, focused, and site-based opportunity for professional growth. Currently, the CCOLs supported by AMP are facilitated by community college colleagues assigned to a particular school. A goal of AMP is to encourage sustainability and to leave a lasting legacy where a school’s culture is to maintain the focus of local CCOLs. Future research can help to determine if sustainability is possible, strategies for encouraging sustainability as well as strategies for encouraging a successful CCOL model. We acknowledge that this success will vary from school to school and that the measure of success will also vary. There is much work to be done and exciting results to share in the future.
In summary, through the CCOL model, AMP has been very successful in bringing together a community of college mathematics instructors and middle school teachers to work together towards a common goal of improving the quality of mathematics education in the targeted middle schools.

ABSTRACT:
The study aimed to develop an ICT Training program into different areas of Computer Hardware Servicing. Main sources of data came from the 25 ICT Coordinators. The researcher used Frequency and Mean in getting the profile and in assessing the levels of competency in Computer Hardware Servicing. A validated questionnaire was designed for the participants highlighting the 3 areas of Computer Hardware Servicing; Assembly / Disassembly, Installing Computer System and Computer Networking. Findings showed that ICT Coordinators have competent skills in Assembly/Disassembly and Installing Computer System while incompetent in Computer Networking. However, there are items in Assembly/Disassembly and Installing Computer System which have a fairly competent result. There is a need to have an ICT Training Program that will help the ICT Coordinators enhance their skills in Computer Hardware Servicing. In the implementation of K to 12 that integrates ICT in education, the study can provide information necessary for educational planning and decision making concerning ICT training. It will help them in maintaining properly the computers and orienting the teachers on its proper utilization.

KEYWORDS:
Computer Hardware Servicing, Assembly/Disassembly, Installing Computer System, Computer
INTRODUCTION

One of the most vital defining characteristics of our century today is that information is increasing at a level that is too fast to catch up. In such an atmosphere, it is unavoidable to develop, create, and update the different skills of every people in information-based professions. Or else, their status and professional skills may be questionable.

From the given press release of the Department of Education dated last August 26, 2008, former Education Secretary, Jeslie Lapus said that Information and Communications Technology (ICT) will serve as a tool but this will not teach the students. It is the teacher who will continue to teach and impart learning. Therefore, the teachers should be fully technologically equipped and updated in harnessing the full potential of technology in improving learning outcomes. The effective use of Information and Communication Technology as a pedagogical tool integrated to the subject being taught is designed to improve the teaching and learning which are provided by the teachers to all their students. The pedagogy of teachers and their use of Information and Communication Technologies (ICT) as instructional tools are factors in helping to meet the challenge of every school in preparing students with the essential skills necessary for success in a rapidly changing, technology-driven kind of society (Schoen & Fusarelli, 2008). Teachers are important component for enabling students to use technology and they should be equipped to use technology as a tool for instruction.

The researcher, as a member of the academe specializes in teaching computer subjects and as the District ICT Coordinator of Silang II, is motivated to conduct this study, which he believes will be able to provide the district with the data and pieces of information on how to establish an ICT training program to enhance the skills and knowledge of ICT Coordinators in order to sustain and utilize effectively the computers of the school for the teaching-learning process.
The major purpose of the study was to assess the level of competency of ICT Coordinators in Silang II District and fill the gap for the improvement of an ICT literacy training program.

Specifically, the study answered the following questions:

1. What is the profile of the ICT Coordinators in Silang II District in their number of years being an ICT Coordinator?

2. What is the level of competency of the ICT Coordinators with regards to the following areas of Computer Hardware Servicing:
   a. Assembly / Disassembly,
   b. Installing Computer System,
   c. Computer Networking?

3. What ICT training program can be designed from the results of the study?

REVIEW OF RELATED LITERATURE

Basic Computer Skills include learning how to turn on/off the computer, connecting different devices to the computer and manipulating the mouse. However, teachers of the 21st century need more than these basic skills. They need to incorporate computer use in their teaching through the use of computer-aided instruction. In doing this, the teachers should learn how to utilize different computer applications not only in making presentations, and other instructional materials but also in creating reports, making grades and in keeping the student records, and developing different evaluation activities, making examinations, etc. (Wagmare and Budharam, 2012; van Braak et al, 2004; Masagca, 2008).

In response to this demand, schools from all over the world have been conducting ICT training for teachers. In almost all countries in the Asia Pacific region, teachers are being trained in all levels in the use of Information and Communications Technology (ICT) (UNESCO, 2002). However, the number of teachers and occurrence of training vary from country to
country. The more advanced and progressive countries train almost all teachers every year while others select and limit the number teachers to be trained (Tasir, 2012).

In the Philippines, the Department of Education and other non-government agencies have launched programs for Teacher-education. These programs aim to equip the teachers with the much needed ICT literacy that they will apply in teaching. The DepEd ICT4E Strategic Plan is the most recent among these endeavors. This program aims to enhance basic education and help the students develop their abilities to seek, to evaluate, to organize and to present information; higher order thinking skills; habits of life-long learning and an understanding of impact of ICT on their daily lives and the society. Other studies also show that there are three main variables that would make the integration of ICT tools as an easy process: namely, teachers' ICT competency, teacher’s confidence level in using the ICT and teacher’s satisfaction on ICT training programs (Tasir, 2012). This only proves the great importance of ICT in instruction.

However, the success of efforts to integrate technology on teaching does not only rely on teachers’ attitude toward the use of computers application alone (Garland and Noyes, 2004; Sam, Othman & Nordin 2005; Seyal, Rahim & Rahman 2002) but also on the students’ as well (Varank, 2006). This undertaking will not also materialize without the support from the administrators. As mentioned in the study conducted by Chan et al (2007), “The failure and success in the use of ICT in a classroom very much depend on the implementers, the teachers and the administrators.” This only means that in order for the teachers to be empowered, they need the necessary support structure from the administration in order to improve performance. Thus ICT can play a major role not just in learning outcomes, but in system governance as well.

Technology changes so fast that it requires new skills and knowledge to be mastered frequently. And successful implementation of ICT in teaching is only possible when teachers have a deeper understanding of the principles and concepts. And the short term exposure to technology would be inadequate in equipping them with the necessary skills and knowledge for
confident and masterful use of ICT in the classroom” (Albion & Ertmer, 2002; Brown & Waschauer, 2006). Hence they need constant and rigid training to fully use ICT in teaching (Kent & Facer 2004).

It is undeniable that the Department of Education has been doing its best to conduct ICT trainings for teachers. But there is also a need to have trainings to the teachers especially to all the ICT coordinators to properly maintain and maximize the instructional use of computers being given to every public school in the Philippines through their DepEd Computerization Program.

Figure 1 shows the Input-Process-Output research paradigm of the study. The input will be the Level of Competency of ICT Coordinators in Computer Hardware Servicing in Assembly / Disassembly, Installing Computer System and Computer Networking assessed by the ICT Coordinators of Silang II that will be a basis for a proposed ICT Training Program.

![Figure 1. IPO Made Showing the Research Paradigm of the Study](image)

**METHODOLOGY AND RESEARCH DESIGN**

The study used the descriptive method of research. The reason for using this method is the fact that the study dealt with the assessment of the level of competency of ICT coordinators. It involved gathering of information to find out as to what extent of competency are being demonstrated by the ICT coordinators. The respondents of the study were the 25 ICT
coordinators of 25 public elementary schools under the District of Silang II.

Table 1 shows the Likert scale used in the study with the verbal interpretation from Incompetent to Very Highly Competent.

**Table 1. Scale Used in the Study (Likert Scale)**

<table>
<thead>
<tr>
<th>Scale</th>

<td>1.81 to 2.60</td>
<td>Fairly Competent</td>
</tr>
<tr>
<td>1</td>
<td>1.00 to 1.80</td>
<td>Incompetent</td>
</tr>
</tbody>
</table>

To assess the level of competency of ICT coordinators in Silang II District, the researcher used a self-made questionnaire which was validated by experts. It was administered to the respondents as a measuring instrument in determining the level of competency of the respondents. This questionnaire was mainly about the level of competency of ICT coordinators in the areas of Computer Hardware Servicing namely Assembly / Disassembly, Installing Computer System and Computer Networking as stipulated in the Training Regulations of Computer Hardware Servicing from TESDA.

The results obtained from the survey were analyzed and interpreted using the frequency and mean. Mean is the sum of the scores in a distribution divided by the number of scores in the distribution. It usually refers to arithmetic mean that is the commonly known average. Frequency refers to the number of times the event occurred or the characteristics present in the study. A table of the raw data collected, including the frequencies, are presented in a frequency distribution table. The frequency was used in determining number of years of the respondents as ICT Coordinator. While the mean was used in determining the level of Competency of ICT Coordinators in Assembly / Disassembly, Installing Computer System and Computer Networking.
RESEARCH RESULTS AND DISCUSSION

The results of the study are presented to answer the following problems.

**Problem 1.** What is the profile of the ICT Coordinators in Silang II District in their number of years being an ICT Coordinator?

<table>
<thead>
<tr>
<th>ICT Coordinator Experience (Year)</th>
<th>FREQUENCY</th>
<th>PERCENTAGE (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 1</td>
<td>7</td>

<tr>
<td>4 - 5</td>
<td>6</td>
<td>24</td>
</tr>
<tr>
<td>6 and above</td>
<td>2</td>
<td>8</td>
</tr>
</tbody>
</table>

Table 2 shows the profile of ICT coordinators in Silang II in terms of the number of years they served being an ICT coordinator. Finding shows that **10 or 40%** from **25** ICT coordinators are serving as the ICT coordinator for **2 – 3** years while **24%** and **28%** served for **4 – 5** years and **0 – 1** year respectively. There are only **2 or 8%** who are ICT coordinators for **6 years and above**. Result shows that majority of the ICT coordinators are new in the position and have been serving in less than 4 years.

**Problem 2.** What is the level of competency of the ICT Coordinators with regards to the following areas of Computer Hardware Servicing:

a. Assembly / Disassembly,
b. Installing Computer System,
c. Computer Networking?

Table 3 shows the level of competency of ICT coordinators of Silang II in Computer Hardware Servicing under Assembly / Disassembly. Result shows that ICT Coordinators are highly competent in removing and connecting monitor in the system unit with a mean of 4.00 and removing and connecting mouse and keyboard in the system unit with a mean of 4.30. However, the rest of items under Assembly / Disassembly have fairly competent results with a mean of 2.05 to 2.45 in the skills of removing and connecting video card in the system unit, removing and connecting RAM in the system unit, removing and connecting hardisk in the system unit and removing and connecting power supply in the system unit.

The findings strengthen the claim of Brown and Warschauer (2006) that teachers perform better in using ICT when they are well grounded in the technology. Albion and Ertmer (2002) state that teachers’ short-term exposure to technology would be inadequate in equipping the teachers with the necessary knowledge and skills for the confident and masterful use of ICT in classrooms.

Table 4 shows the level of competency of ICT coordinators of Silang II in Computer Hardware Servicing under Installing Computer System as **competent** with an overall mean of **2.84**. Result shows that ICT Coordinators are **highly competent** in **Installing Microsoft Office Programs like Word, Excel or other application in the computer** and **Installing Antivirus in the computer** with a mean of 3.41 and 3.59 respectively. They are also **competent** with a mean of **2.77** in **Installing Windows Operating system using CD / DVD**. However, **Formatting hardisk of the computer** and **Installing Windows Operating system in the computer using Flashdrive or USB** got a **fairly competent** results with a mean of **2.32** and **2.09** respectively.

</tr>
</tbody>
</table>

Table 5 shows the level of competency of ICT coordinators of Silang II in Computer Hardware Servicing under Computer Networking interpreted as incompetent with an overall mean of 1.80. Finding shows that ICT Coordinators are fairly competent in Installing and configuring Router with a mean of 2.05. However, the rest of the items under Computer Networking got an incompetent results in Connecting two computers using network cable with a mean of 1.82, Sharing a printer in the network with a mean of 1.77, Sharing a folder and file in the network and Creating straight-through and cross-over network cable with a mean of 1.73 and 1.64 respectively.

This affirms the claim of Truscott (2003) that technology requires new skills and knowledge to be mastered. Adaptation to it would only be possible based on a sound understanding of the principles and concepts of ICT. In another study by Barnett (1994), he reported that teachers who started out their careers in an era when technology was not available would be difficult to convert to become users of modern technology.
Problem 3. What ICT training program can be designed from the results of the study?

As an output of this study, a proposed ICT Training Program for ICT coordinators of Silang II is hereby presented by the researcher. Based from the findings of the study, the proposed ICT Training Program will focus on the topics of the different areas in Assembly / Disassembly, Installing Computer System and Computer Networking. This will enhance and address the gap the assessed ICT Computer Servicing Skills of the respondents with Competent, Fairly Competent, and Incompetent results.

The Proposed ICT Training will be implemented last for in a span of 3 months. Each
focused course content area will be given one month training and where ICT coordinators will participate in the District of Silang II, using the available ICT room in the schools. The training will be conducted by the trainers expert in Computer Hardware Servicing, with the help of the District ICT coordinators as the facilitators. Different activities will be done in conducting the training that will serve as an application of all the topics that will be discussed in the training. The participants will be given an actual assessment to determine if the knowledge and skills that were presented in the objectives of the training were attained by the ICT coordinators.

CONCLUSION

In the light of the foregoing findings, the study showed that ICT Coordinators are competent in Assembly / Disassembly and Installing Computer System. Some items under Assembly / Disassembly and Installing Computer System have a fairly competent results like removing and connecting hardisk, RAM, Power Supply and Video Card in the system unit, formatting hardisk and installing Window operating system in the computer using flash drive and CD should be improved further.

Moreover, there is a need to improve on the level of competency of ICT coordinators in Computer Networking with an Incompetent result such as creating straight-through and cross-over network cable, connecting two computers using network cable, sharing files, folder and printer in the network and installing and configuring router.

With all these findings taken from the study, there is a need to propose an ICT Training Program for ICT Coordinators in the District of Silang II.

RECOMMENDATION

In line with the findings of the study, the following recommendations are made:

The study recommends that the District of Silang II should make an improvement in the level of competency in Computer Hardware Servicing of ICT coordinators into different areas
and make it a priority goal in the District Faculty Development Program.

A similar study should be conducted every year in order to assess the level of competency of ICT coordinators annually.

The proposed ICT training program should be implemented by the administrators in every elementary school in Silang II district because of a need to improve the level of competency of ICT coordinators in Computer Hardware Servicing in the areas of Assembly / Disassembly, Installing Computer System and Computer Networking that will give a positive result in the maintenance and utilization of the computers in the school.

Heat transfer is a a core course for engineering students. There are a number of well documented misconceptions commonly held by students in the area of heat and energy, including confusion over factors which impact the rate at which energy is transferred and factors impacting how much energy is ultimately transferred (rate vs. amount) and confusion over how important color is to radiative heat transfer (radiation). Even though most students complete undergraduate courses in this area and can successfully manipulate the relevant equations, they may still falter on the underlying concepts. Our previous work demonstrated that inquiry-based laboratory activities based upon a predict, observe, reflect model were capable of repairing student misconceptions in this area more effectively than traditional lecture.

While previous work showed these activities to be highly effective, it was challenging for them to be adopted at other institutions. Pressures on laboratory space, equipment expense, and student and faculty time meant that even brief activities such as ours are impractical in some settings. For the current study, we re-created activities in four additional forms designed to address faculty adoptability concerns: faculty demonstration, student-performed simulation, faculty demonstration of simulation, and as a thought experiment. These were tested at several institutions and all interventions resulted in a higher level of student post-course conceptual gain than did traditional lecture controls. The most effective intervention is still student-performed laboratory activities, although students in all experimental groups out-performed students in control groups lacking any activities. Packets describing all activities for all five approaches are freely available through the AIChE Concept Warehouse (http://jimi.cbee.oregonstate.edu/concept_warehouse/) , and interested faculty are encouraged to download and try any materials they would like to try in class. The materials are free for faculty use.
Title: The Effects of Dual Enrollment Programs on Social and Emotional Learning, College Readiness, and the Graduation Initiative/Imperative

Lilly, Frank R.

California State University, Sacramento

6000 J. Street, Sacramento, CA. 95819-6079

frlilly@csus.edu

Abstract

For the past twenty-nine years, California State University, Sacramento currently referred to as Sacramento State University (CSUS) has operated a dual enrollment program; Accelerated College Entrance (ACE). This successful program allows interested and qualified high school students the opportunity to take university courses concurrently with their high school curriculum either on-campus, or off-campus (with their partnering high schools). Interviews illuminate emergent themes describing how ACE students perceive themselves regarding the likelihood of graduating from high school, of transitioning to a four-year college rather than a two-year college, of taking less basic skills courses in college, of persisting in postsecondary education, and of accumulating more college credits?
Submission Title: The Technology Driven Student: How to Apply Bloom’s Revised Taxonomy to the Digital Generations

Currently there is a growing concern of educating the modern digital student. As of now, the landscape of education can be considered that of a revolution with technology being the engine powering it. The proliferation of technology has given birth to the biggest generational gap since the induction of rock and roll music, however the field of education has yet to structure teaching and learning to match the millennial generation. The authors do not propose an update to Bloom’s Revised Taxonomy, but call attention to the need of adapting the revised taxonomy to a new generation of students.

This paper presents an overview of the evolution of Bloom’s Original Taxonomy to Bloom’s Revised Taxonomy to the start of what is termed Bloom’s Digital Taxonomy. In addition, the authors argue that current restrictions on the use of technology in the classroom, although well intentioned, fail to build a connection between the classroom and reality. Education has been a cornerstone of human life and success, and if educators are to keep the interest of the youth, adaptation and modification may be necessary.
Relationship between Subject-specific and Generic Competencies: Evidence from a Survey on Japanese Universities

Maki Kato* and Daiju Aiba**

* Mori Arinori Center for Higher Education and Global Mobility, Hitotsubashi University, Japan
** Graduate School of Economics, Hitotsubashi University, Japan

Abstract

This paper aims to clarify the relationship between subject-specific competencies (SSC) and generic competencies (GRC) using the results of a questionnaire survey conducted in 2015, which asked students, academic staff, and graduates of Japanese universities about graduates’ SSC in six university subjects and GRC. The empirical results show that recognition of SSC and GRC has a positive relationship with different levels of correlation among stakeholders and subjects; the relationship in students shows relatively weak ties compared with that of other stakeholders, as well as that of both Chemistry and Mechanical Engineering subjects. Factor analysis indicates the existence of factors that impact both SSC and GRC in all subjects with heterogeneous structures by subjects; five fields excluding Business have fewer relationships based on commonalities between SSC and GRC such as information and communication technology skills and internationalization, but Business has a closely intertwined relationship between SSC and GRC.

1. Introduction

Competency is becoming a key concept in transferring higher education achievement from academic studies to workplaces and across career sequences. In this paper, competencies are defined as the capability to link individual attributes, including knowledge and skills, to the demands of tasks and activities as defined precisely by Gonczi [1]. Recently in Japan, accompanying this educational trend and changing in-house company education under the stagnation of the Japanese economy, significant attention has been given to the competencies acquired by university graduates, especially generic competencies (GRC) such as problem solving and critical thinking [2–4].

Following the increasing attention on GRC, Japanese universities have begun to teach them by setting up new classes separately from subject-specific education, which is the method to achieve the aims of universities to educate students in subject-specific knowledge and skills, i.e., subject-specific competencies (SSC). However, the best way to introduce GRC instruction is currently debated.

The authors question the current educational argument for GRC because we consider that teaching GRC should come after the clarification of the basic mechanism and characteristics of competencies. Based on this problem, the current paper aims to clarify the relationship between SSC and GRC as a very basic mechanism by using the results of a questionnaire survey conducted in 2015, which asked students, academic staff, and graduates of Japanese universities about graduates’ SSC in six university subjects and GRC.

The empirical results show that recognition of SSC and GRC has a positive relationship with different levels among stakeholders and subjects; the relationship between SSC and GRC in students show relatively weak ties compared with that of teachers and graduates, as well as that of both Chemistry and Mechanical Engineering subjects compared with those of other subjects.

The remainder of this paper is organized as follows. Section 2 describes the results of the literature review and introduces the research questions. Section 3 explains the method, and section 4 summarizes the results. Section 5 concludes.

2. Literature review

Japanese universities have attempted to cultivate GRC in students by setting up new classes separately from subject-specific education. For instance, recent survey results show that the number of universities that provide GRC classes have increased steadily (442 universities [61% in total] in 2009 and 566 [76% in total] in 2015); however, these classes are categorized under the subject of career education [5]. The ease of introduction could be the reason for new classes, according to Kawaijuku [6].

However, researchers in the field of education have disagreed on the appropriate method of introducing GRC. Ogata [7] insists that teaching GRC alone deprives students of the opportunity to cognize the relevance of subject-specific learning for
their future working career and the students acquire weak skills in thinking and learning attitudes because of GRC instruction’s weak base in academic learning. Sugihara [8] was concerned with the current GRC education, which was described as losing its real-world context and was simply packaging methods without “realization” because acquiring GRC became the aim instead of a method for learning academic knowledge and skills. However, the criticism against the introduction of new classes does not appear to be successful enough to be supported by academic staff in charge of subject-specific education. One of the reasons for this lack of support could be based on the unclarified mechanism of competencies.

Previous studies have partially shown the relationship between SSC and GRC. For instance, in a comprehensive literature review, Camara et al. [9] concluded that there was a close relationship between study achievement and transferable abilities. González and Wagenaar [10] also described qualitatively that GRC are interpreted differently by researchers in different academic fields and are distinguished from SSC unclearly. This is consistent with Jones [11], who concluded that researchers in different disciplines understand GRC differently. These results suggest that two types of competencies have positive relationships with a variety of subjects.

Previous studies targeting Japanese students have analyzed GRC based on their respondents’ academic fields [12–15]. For instance, Yamada and Mori [12] and the Prog Hakusho Project [13] found that students studying either education or health possessed more GRC, such as higher ability for socialization and self-expression, than did colleagues from other majors. The GLU12 Universities Tuning Working Group [14] concluded that students’ recognition of the importance of competencies were relatively close to that of teachers, but far from that of business personnel. These results indicate the possibility of heterogeneous recognition of GRC depending on academic fields and higher education stakeholders. In Japan, however, former studies have not investigated SSC in depth, other than the participation in the OECD’s Assessment of Higher Education Learning Outcomes [16]. To the best of our knowledge, no studies have explored the relationship between SSC and GRC in Japan. Therefore, the current study set up the following research questions to clarify it empirically in the various perspectives of Japanese university stakeholders:

**Research question 1:** Is the relationship between the recognitions of SSC and GRC positive?

**Research question 2:** Is the relationship between the recognitions of SSC and GRC heterogeneous by university subjects or stakeholders?

### 3. Method

#### 3.1. Sample

A questionnaire survey was conducted from January to March 2015. Data were collected from 2,553 stakeholders of seven universities in Japan (1,850 students, 351 academic staff, and 352 graduates within 5 years after graduation). The students’ academic achievement levels may be relatively higher than the standard achievement of university students in general and homogeneous among the sample because these selective universities were chosen based on the type of research performed. The survey targeted six subjects: Physics, Chemistry, Mechanical Engineering, Civil Engineering, History, and Business. Table 1 shows the number of participants by subjects and stakeholders.

</tr>
</tbody>
</table>

#### 3.2. Questionnaire

The questionnaire was based on the one used by the Tuning Academy in Europe [10], which was translated into Japanese and changed slightly to follow the Japanese context. Each questionnaire included SSC and GRC sections. The number of competencies was 31 in GRC and varied in SSC among the six subjects: Physics, 23; Chemistry, 24; Mechanical Engineering, 24; Civil Engineering, 24; History, 33; and Business, 24. For each competence, the respondents were asked to indicate the strength of their opinion about the importance of acquiring it before graduating from university on a Likert scale from 1 (weak) to 4 (strong).

### 4. Results

#### 4.1. Relationship between competencies

This section shows the result of the analysis on the relationship between SSC and GRC. Although the SSC lists are completely different among the subjects, the authors consider the lists as being comparable regarding them as expectations of
experts in the field to be achieved during university education.

Table 2 shows the recognition of the importance of both SSC and GRC by stakeholders. The respondents evaluated SSC slightly higher than GRC at 0.03. Graduates evaluated both competencies lower than did students and teachers. Students evaluated SSC higher than GRC at 0.05, teachers evaluated them almost equally, and graduates evaluated GRC higher than SSC at 0.05. On average, the difference between stakeholders is quite small.

</tbody>
</table>

A scatterplot of means for SSC and GRC is shown by the stakeholders in Figure 1 and by the subjects in Figure 2. Their correlations are shown in Table 3. Figure 1 indicates the positive relationships between SSC and GRC for all types of stakeholders. Table 3 also shows the different levels of correlations among stakeholders. For instance, the correlation of students is around 0.3, which is almost half of both teachers and graduates at around 0.6. The scatterplot of means for the field also shows the same tendency. The relationships between SSC and GRC for all subjects are positive, but with different levels. The amount of correlation is smaller in Chemistry and Mechanical Engineering at around 0.3 than others showing at 0.6 in Business, at more than 0.5 in Civil Engineering and History, and at around 0.4 in Physics. Therefore, the results conclude that there is a positive relationship between SSC and GRC at different levels in stakeholders and subjects.

Note: *** 1%, **5%, *10% significance levels

4.2. Relationship between the pair of competencies

The different levels of relationships among subjects could be grounded on the relationships between pairs of competencies. We analyzed the relationships between pairs of competencies by subjects, targeting students who were the majority of respondents (72.9% of total), considering the different levels of relationships among stakeholders. Figure 3 shows the correlation and significance of each pair of competencies in GRC and SSC, where each matrix includes 1,458 correlations at least, i.e., the number in Physics is 1,458 based on the formula (31 GRC + 23 SSC)²/2. The color cell means that the P-value is under 0.05 where the null hypothesis that the correlation is zero is rejected.

As shown in Figure 3, two types of relationships are identified: First, a strong relationship within either SSC or GRC (triangles on the upper left side and on the lower right side), but a weak relationship between SSC and GRC (square shape on lower left side). In Figure 3, Chemistry and Mechanical Engineering subjects are categorized into this type with a clear shape of green triangles and white squares. Physics is also categorized into this category with relatively weak characteristics. Second, a relationship without clear differences as opposed to the first type. Business is categorized clearly into this type, but Civil Engineering and History are not categorized into these two types. The results indicate a heterogeneous structure among subjects. Although
the relationships between each pair of competencies are interesting, they are not easily understood from the correlations of pairs. The structure of competencies will be discussed in the following section using the results of factor analysis.

![Diagram of Competency Relationships](image)

**Figure 3 Correlation between competencies**

### 4.3. Structure of competencies

This section shows the results of factor analysis to clarify the structure between SSC and GRC. We focus on the factors that impact on both SSC and GRC (FBTH). The factor analysis used the maximum-likelihood method and promax rotation to target all three types of stakeholders. Kaiser’s criterion sets up the number of factors as one or more eigenvalues in a normalized correlation matrix.

Table 4 shows the number, ratio, and the factor order of FBTH based on the degree of contribution. Business shows a different tendency to other subjects. For example, the number of FBTH is 6 in Business, which is around 40% of the total; however, it is 3 in Civil Engineering and History, and 1 or 2 in the remainder, which is at most 23.1% of the total. The highest order of FBTH in Business is the second order, whereas other subjects do not have that kind of higher order of factors.

Note: The figure shows the mean of correlations

We analyzed the contents of FBTH by subjects. Regarding the natural science fields, in Physics, two factors were categorized into FBTH among 10 factors: the fourth factor is named as social responsibility and the eighth is experimental skills with safety consciousness. In Chemistry, two factors were categorized into FBTH among 12 factors: the tenth factor relates to internationalization both in FSSC and FGRC, and the twelfth relates to the development of the latest research technology in SSC with a negative sign and international work in GRC with a positive sign, which means that these competencies were regarded as being contradictory attributes. The fifth factor in Mechanical Engineering was categorized into FBTH among 10 factors, which include usage of information and communication technology (ICT). Mechanical Engineering has high factor loading in both ICT usage and spatial presentation in SSC as well as ICT usage in GRC. Three factors in Civil Engineering were categorized into FBTH: seventh, applying knowledge; eighth, internationalization; and thirteenth, interpersonal skills.

Regarding the humanities, arts, and social science fields, three factors in History were categorized into FBTH: seventh, internationalization; ninth, ICT usage; and twelfth, social relationship, which relates to social responsibility in SSC and 10 GRC that are
relatively related to interpersonal and collaborative work. Business has six FBTH among 15 factors. The second factor is named as business leadership, which relates to 10 SSC and two GRC with communication and self-criticalness. The sixth factor is the improvement and innovation of business, the tenth is the understanding of business background, the thirteenth is organizational understanding, the fourteenth is the understanding of baseline systems in business, and the fifteenth is collaborative work.

In summary, all six subjects have at least one FBTH, but the number and order of correlations based on the degree of contribution are varied. For instance, there are two FBTH ranked tenth and twelfth among 12 factors in Chemistry and only one ranked fifth among 10 factors in Mechanical Engineering. However, there are six FBTH ranked starting at second among 15 factors in Business. The competencies of FBTH are also varied by subjects. There are commonalities in FBTH: internationalization, interpersonal/collaborative skills, ICT usage, and social responsibility. When these competencies are included in the lists of both SSC and GRC, they tend to be identified as FBTH. However, FBTH in Business indicates different characteristics, which show the more complicated and intertwined relationship between SSC and GRC.

5. Conclusion and discussion

The paper aimed to clarify the relationships between SSC and GRC using the results of a questionnaire survey conducted in Japanese universities in 2015, which asked students, academic staff, and graduates about graduates’ SSC in six university subjects and GRC. The empirical results show that recognition of the importance of SSC and GRC has positive relationships at different levels among stakeholders and subjects. The relationship between SSC and GRC in students shows relatively weak ties compared with that of the other stakeholders, as well as both Chemistry and Mechanical Engineering subjects.

Factor analysis indicates the existence of FBTH in all subjects with heterogeneous structures by subjects, and differences in the number, order, and contents of FBTH. FBTH in the five subjects, excluding Business, are at most three, lower order, and with common contents such as internationalization, ICT usage, and interpersonal/collaborative skills. There are different characteristics shown by FBTH in Business: up to six, higher order as the second, and more complicated and intertwined relationship between SSC and GRC. These results could explain the various recognition of the importance of SSC and GRC by subjects.

The finding showing the positive relationship between SSC and GRC indicates that GRC could be acquired with SSC using subject-specific education in the universities. However, with the heterogeneity of relationships by the subject, the level and contents of GRC in graduates varied by subject. If the whole university attempts to educate students in GRC, the university stakeholders need to pay attention to the varied outputs by discipline and address these outputs appropriately.

The limitation of the generalization of the result is because of a limited sample. The data targeted only selective universities so that a wider targeted sample is necessary to describe the situation in Japan. There are two future research themes: an investigation using participant attributes, such as age, sex, or career plan; and further understanding the background of the results that the current paper shows. For instance, the current paper visualizes the differences in students’ recognition from that of teachers and graduates, but the reason for this difference is not clear. One interpretation for this difference is the more impact of longer years belonging to the higher education and assimilation, but it is necessary to analyze this interpretation using evidence.

Abstract

The ideas and studies around the concepts of student engagement in the classroom is an ongoing phenomenon. What works for one group of students in one year may or may not work for another group in another time. Schools are constantly evolving and striving to reach all students. The school band room is no exception. Strategies studied and recommended by scholars at the Marzano Research Lab have shown to increase students’ active involvement in classrooms, so why not borrow and implement these in the band room? This article aims to provide some background about the music education profession, which will lead to the utilization of Marzano engagement strategies in one music classroom. It involves perspectives from both a teacher and a student.

Keywords: music education, engagement, band, praxial music, aesthetic
Introduction
In Marzano’s (2007) *The Art and Science of Teaching*, the framework around student engagement is identified as one of the most important considerations of classroom teachers. Does this include the band class? Aren’t the band students inherently engaged when they are playing? Perhaps when students are ‘doing’ they are engaged; but are they always engaged during the ‘learning’ opportunities? Author 1 suggests that a particular axiology is inherent to his program design, one that places importance on new strategies for a changing sociology, while Author 2 reflects on ways the recommendations have been implemented in the band class. Generally acknowledged, axiology refers to the role of an individual’s values to his study or process; specifically, being cognizant of the ways these values influence the development, process, or conclusion to a study or implemented operational process (Tomar, 2014; Hesse-Biber, 2010; Engle, 2009; Ponterotto, 2005).

This article is a joint effort between a California music educator (Author 1) and a public school student (Author 2). Using the school band as the classroom environment, within a phenomenon of student engagement, we address a brief history of a broader sociology of music education, along with so-called student engagement strategies promoted by the Marzano Research Labs. Reflections of experiences in the band class are offered from Author 2’s student perspective, within the framework of the article developed by Author 1.

Serving the populous
Public schools are collections of people, representing the plurality of our regional communities. As such, a praxial approach to music education must have a place in our professional practices. As schools are intended to educate the populus, they are generalist institutions by nature. Music is part of our lives in different ways and serves different purposes (Väkevä & Westerlund, 2012).

With the diverse student base, there should be many ways to approach music education. During the 1960s and 1970s, Kaplan (1978, 1966, 1963) addressed the music education profession as needing to become broader in scope - a time when the national music education professional association was establishing a narrower, aesthetic operating philosophy. The development of an aesthetic focus in music education has created a divide among educators toward an emphasis on aesthetics and the fine nuances identified with standard European classical perspective and an acknowledgment of “extra musical” functionality by others. Those acknowledging a praxial education generally recognize that music has value in other social, practical situations (Elliott & Silverman, 2012b). In her study, Kindall-Smith (2010) noticed that attention by administrators, as well as the general public, is primarily on concerts, activities, and teacher rapport with students—the extra-musical qualities. Often, praise of a program or of a teacher focuses on the types of events and performances or around how well students seemed to work with the teacher. Her observations identified descriptions about music events to emphasize the non-music aspects. For example, school administrators emphasized non-musical components of performance, such as:

- enthusiasm for performance
- costumes and sceneries (especially in musical drama productions)
• the contribution of the music toward the transmission of, or support of, cultural heritage or other non-music connections
• self-discipline and teamwork

Elliott’s (2012a, 2005) work around praxial music education, with its acknowledgment of societal, hence school, pluralism has enlightened my teaching practice. His work has caused me to engage in intentional actions that include deviations from aesthetic-centric-only practices in, what I call, my historically situated ensemble-based classes. Using the band as the formal organization of students to create class period X, my growth has been to honor the Euro-centric elements and methods of tone production, intonation, balance, blend, and interpretation of standard notation while also strategizing to provide individuals time during our class periods to explore personal interests, tutor each other, and to co-create through performing and/or writing. While the former provides a foundation of technical proficiency to engage in formal music-making with a common language, the latter provides opportunities for individuals to self direct toward addressing the 4 Cs of so-called 21st Century learning - collaborate, communicate, create, and think critically.

There must be a balance between serving students’ and communities’ interests and a decades old attention of “fulfilling a composer’s intent” as a performing group (Mantie, 2012, p. 113). Mantie contends that the school band is that—the school band, not the community band or orchestra. It is a place to learn, not solely an outcome-based source of entertainment for a larger community. Furthermore, he posits that the band has become—or is still—the primary format for secondary music education in the US. He argues that as bands became the primary medium for music instruction in US secondary schools, the discourse around music education changed toward the band’s edification through exposure to so-called great repertoire rather than one of supplying music to create a sense of community and/or personal enjoyment. This seems to have been a part of the evolving change in public education accountability, which also was happening at the time MENC was determining the purposes and philosophies of music education.

Mantie (2012) criticizes the structure of school bands for its evolved design over time toward specific musicality to the exclusion of alternatives. I still believe this plays a role in students’ interests in performing, but it affects us on a larger scale for administrative review. Currently, students must be considered for their growth potential as a band student and not for the interpersonal enjoyment through the participation. The sentiment continues to be explored, as evidenced by Gibsons’s study (2015), which identified that band teachers, in general, were not “doing enough to engage students in the band activity” (p. 35), resulting in increased attrition, especially at the middle school level. Toward this phenomenon, Elliott and Silverman (2012b) suggest that music should and can be a participatory experience greater than the standard operating category that continues to recognize European classical music as the standard (p. 28).

Early in MENCs formal development, Kaplan (1966) suggested a broader approach to music education to better represent the broader base of society, especially with the Civil Rights movement nationwide. There were sentiments that suggested when
art and music are broadened, they will inevitably deteriorate in quality. This idea came about from the elitist viewpoint of excellence. So-called excellence is reserved for the few and with a broadening society, and a broadening base of participation, the so-called quality and excellence of an elitist group is washed away. Writing from the 1960s, as part of what he called the Cogno society, or a time of great societal thought transition, Kaplan (1966) advised that arts in education are for a wider audience, as creators and as consumers. Kaplan questioned if excellence in the arts and other interests have a unique meaning in a time of affluence (p. 7). He made a strong case about connecting the machine oriented industrial society from earlier, which he called the kilowatt society, to the aspects of art and any other aesthetic value. He supported the position that the essential logic of the machine is standardization. This is in disagreement with concepts of art as creative experiences and processes; yet standardization governs all aspects of education now, even in the arts and music, as evidenced by documents, such as the California Department of Education’s (2001) Visual and Performing Arts: Music Content Standards, as well as the National Standards for Arts Education through the Consortium of National Arts Education Associations. Now, 50 years since Kaplan (1966), there is a pronounced STEM (science, technology, engineering, and mathematics) (CDE, 2012) focus in schools as well as the movement toward pacing guides and standardized tests, including the development of music and fine arts-specific assessments, as evidenced by the Test Blueprint initiated in the state of Florida as part of that state’s compliance for the federal Race To The Top grant (CFFAE, nd). Production consumption, according to Mantie (2012), has altered the discourse of band participation from being viewed for its intrinsic value to that of the band serving a purpose toward something greater. Mantie says the fabricated dichotomy pits the praxis of band against its purpose, historically. He continues that the current practices favor a kind of musicality and relationship to music, with a focus on the large ensemble, over alternatives. This further supports what I call the elitism of our music education system, especially the instrumental music program, as evidenced by MENC practices, as well as by active contemporary music academicians. Mantie boldly states that current music educators involved with wind band pedagogy (bands) risk operating unethically without realizing it.

With that said, Author 1 is reminded that, as of this writing, he is employed in that specialist’s role. In other words, he is a band director. Does he jeopardize his livelihood with this perspective?

Elliott and Silverman (2012a) provoke the music education profession by saying that we should challenge habits and assumptions. Furthermore, through these challenges, disruptions to traditional or historical operations result in destabilizing and unsettling thoughts of professional practice. What does this look like in a practical setting?

The instrumental music classroom - “the band” or “the orchestra” - is comprised of students from the general school population. The engagement strategies to reach all students may be encouraged in the ensemble-based class, too. I believe that action steps to engage more students more often should be employed in the music room, modified as necessary. While the idea of engagement suggests that students are on task, becoming interdependent and at times autonomous among each other and with the content, the
“teacher as learning companion” is a description borrowed from adult education that suggests the climate is fostered such that students trust the mutual roles of the experience (Cranton & Wright, 2008, p. 33).

Schewe (2016) reminds us that phenomena, like engagement, are changing states of being and are affected by various environments. She continues that the development of engagement strategies should be goals toward the motivation of students. Marzano (2007) encourages action steps to promote physical activity, to challenge students’ thinking, and to stimulate attention. Anecdotally, I believe many of my colleagues would say they facilitate these actions albeit from their large ensembles seated in standard large ensemble formats. However, the large ensemble is not the only means of teaching and learning, and in some scholarly writing, it is now suggested that the focus of large ensemble instruction is detrimental to individual musicianship and growth, hence to the music education profession (Wiggins, in Kooistra, 2016; Mantie, 2012). This article is not going to defend or deny such position; however, this may be an example of the unsettling condition suggested by Elliott and Silverman.

**Art and Science of Teaching (Marzano, 2007)**

From the teaching and learning perspective, an impacting component of the Marzano & Associates research has been in the area of student engagement for learning. The Author 1 will identify three Marzano strategies and his use of these in the large ensemble class that complement a large group session and develop musical literacy without constant teacher-driven direct instruction. Author 2 provides examples, in retrospect, of how these strategies were implemented and realized within the instrumental music class.

**Physical movement**

An argument could likely be made that playing wind and percussion instruments is itself a physical activity. It is; and, there are other ways throughout the week to get students to move differently, engaging more muscles and enhancing greater blood flow. Author 1 intends to have students move to various areas in the room, and to other parts of the building. The small amount time to get elsewhere, to set up and organize within small groups changes the pace, briefly requires full body engagement, and contributes to collaboration and problem solving.

Breaking up the large ensemble by encouraging both like and unalike groupings to practice at various spaces within the room not only involves the act of moving, getting students out of the chairs, but it also adds to the students’ autonomy over how and where they engage in their student-led practice (Kooistra, 2016).

During class, Author 2 reflected on ways that her teacher would utilize physical movement by being a part of a strategy called sectionals. Sectional rehearsal is when you get up from your chair, and go play with your section of instrument in another space, often concealed from the main practice room. For example, Author 2’s section, the
trumpets, would usually go to the instrument storage room, where the trumpet section could practice in the smaller group setting. It's easy to say that the multiple sections utilized all the space that came with the music room. Sometimes a smaller section would even practice in the music office, an identified practice room, or in other small areas of the building. While this happened, the teacher would usually be helping other students with difficult parts of the music we were working on. Usually while playing all together we are sitting, but when in these sectionals, all of the students are standing. I think that with standing comes physical movement. Working on breathing and tone quality is a big aspect of music and standing helps both of those subjects.

As a student, Author 2 does not believe that music, or playing an instrument, is some sort of sport, but she does believe that all things require physical movement. Some instruments require more physical movement than others, but they all require a good amount. Not just in our band classes, but also with music groups all around the world, there is physical movement.

**Demonstrate enthusiasm for content**

Tone, demeanor, and exaggerated behaviors enhance critical situations and content areas. Good and Brophy (in Marzano, 2007) clarify that this intense enthusiasm refers to teachers’ means to identify why, to state their reasons as interesting, and emphasize the topics importance. They add that enthusiasm does not equate to “pep talks or unnecessary theatrics” (p. 113). As a teacher, the attempts to be enthusiastic and extensive in the teaching/learning dynamic have been identified by the co-author,

*Ever since my first day in concert band in 6th grade, my band teacher has been the most enthusiastic teacher I have ever had. He always seems eager to learn new things, even though he's the one that’s teaching us the new things. He is very interested in music and clearly loves his job. It is very important to have an enthusiastic, eager learning teacher because it makes the whole learning environment so much better. The band teacher always takes the time to talk about the music we are playing, like making sure we know how it should sound and the history of the song. I knew he was interested in what we were doing by the way he walked into class everyday. He had the biggest smile and was always kind and caring to every student. I don't know how he did it, but the band teacher made us actually want to learn more and more about music and its culture; not many teachers can have that be said about them. He knows how to teach, and he knows how to do it well.*

**Inconsequential competition/Mild pressure**

Competition with minimal or no rewards. Author 1 states that he is generally no longer a proponent of competition in the music setting; however, there can be benefits. He believes Marzano’s recommendation of inconsequential competition is influenced by mild pressure, another engagement strategy. By having individuals, sections, small groupings, and combos play for each other within the large ensemble setting, students are likely to experience a sort of camaraderie that is both supportive of, but also the pressure
of performing in front of one’s peers is an example of forced attention (Marzano, 2007, p. 102).

Author 2 adds that competition usually means striving for first place; in her class setting, however, it is intended to be about improving. From Author 2’s perspective, the class never focused on being first; only on our own strengths and how we could make the band better by working together with these strengths. We always competed against ourselves, trying hard to improve and get better as each day passed. Although a little healthy competition against other bands is a good thing, our bands are generally just happy to be playing and having the opportunities, whether in a competitive setting or not.

Furthermore, according to Author 2, by playing in our combos, we would take note of other combos if they were playing really well, but we also were impressed and happy for them. The incorporations of combos, as well as the occasional competition, were not to be number one, but to encourage self- and group-improvement, and to want to improve the band overall. All the band classes at our school had such a strong connections to each other that we were happy with our improvement as a group, whether or not we were in formal competition.

Fine

Over the years, different words have been used when referring to students’ on task behaviors. As a practitioner, Author 1 likes to think of our current trend toward engagement to mean not only that students are task-doing, but also that they are fully and actively engaged with their own learning. Having been in the profession for a good amount of time, I have encountered time and time again colleagues who opine that strategies of the day are not intended for or useful in the band room. I encourage any colleague who feels this way to acknowledge everyone’s evolution, including ours in the band room, and try reaching students in ways that may seem different; in most cases, that will be the point. Whatever we can do to reach our current students, reach out to and include new, future students, and sustain a relevant music education, we should. As Cranton and Wright (2008) identify in the field of adult education, being creative and innovative toward connecting with our students helps to develop the safe environment for students to become engaged and “to put the learner into the conversation” (p. 36).

As Reeve (in Marzano, 2007) suggested 10 years ago, “when engagement is characterized by the full range of on-task behavior, positive emotions, invested cognition, and personal voice, it functions as the engine for learning and development” (p.99).

*Action, Criticism, & Theory for Music Education*, (6)4, 96-108.
Abstract:

This essay provides conceptual and practical resources for navigating the emerging imperative of transparency in higher education in the US. First, we offer a distinction between consumer-centered and learning-centered transparencies. Second, we advance what we call a translucent pedagogy, the withholding of learning goals for some classroom activities, especially in critical humanities courses that focus on social justice. Finally, the essay concludes with case studies and recommendations for best practices.

Title: Teacher attitudes toward economically disadvantaged and racial minority students.

Name: Whitney Renée Wright

Affiliation: Virginia Tech

Address: 105 Tee Street, Apt. A, Blacksburg, Virginia, 24060

Email: wwright1@vt.edu

Abstract

Half of students in public schools qualify for free or reduced lunch and racial minorities are projected to outnumber White students in public schools by 2025. The shifts in student enrollment makes it pertinent for educators to be prepared to teach students from diverse backgrounds. The proposed workshop addresses elementary and secondary teacher attitudes toward racial minority and economically disadvantaged students. Attitudes of teachers have been linked to shaping student learning outcomes. Teacher attitudinal surveys can be administered as needs assessments. School districts could use their findings as implications for professional development opportunities to address potential deficits or misconceptions their staff may have.
Abstract

This study aimed to determine the efficacy of Massive Open Online Course (MOOC) camp in the Philippines in building community and continuing professional development. The researchers employed the descriptive method of research. The main data-gathering tool used in the study was validated self-made survey questionnaire. The participants of this study were 50 experienced MOOCers who attended MOOC camp in Mandaluyong City, Philippines. The data gathered were treated statistically using mean and Pearson R for the significant relationship between the demographic profile to the benefits of MOOC camp. Interviews were also conducted to gather more in-depth information to validate the quantitative data gathered from the survey questionnaire. Findings in the study revealed that many young professionals in their twenties are more concentrated and focused in their career wherein majority of them are women. The study also presented that MOOC camp is significant in building community, professional growth and career development, therefore MOOC is impactful if there is MOOC camp. It also showed that learners were satisfied in the activities MOOC camp provided and it was beneficial to them. Aside from getting the higher chance in completing the online course through MOOC camp the participants also are well motivated to help the community and themselves. MOOC camp can be a very good tool promoting Massive Open Online Course.
Introduction

The continuous demand of the 21st-century learners opens the door for Massive Open Online Course(s) in different Universities abroad. The University of Melbourne’s Graduate School of Education (MGSE) has launched a Massive Open Online Course – or MOOC – on how to give school children the skills to survive in a world of ever-changing technology (“Massive Classroom Opens Door,” 2014). In Dublin, the Minister and Education and Skills launched a new Massive Open Online Course called “21ST Century Learning Design” which will be used by teachers across the globe to help support the objective of bringing more technology skills into the classroom (Microsoft Europe, 2016). It became one of the newest ideas of education designed for extended learning and career development. MOOC is an interactive step-by-step course aimed at reaching an unlimited number of participants worldwide to create a community of lifelong learners (What is MOOC?). It allows people from the different region to access and study courses in their preferred universities. It is also a means of an empowering learning community and exchanging culture because the learners are capable of interacting with other people using different platforms like coursera, edX, canvas and etc.

The popularity of MOOC worldwide has reached the Philippines. In 2013, the first MOOC in the country was offered by University of the Philippines Open University (UPOU) in cooperation with wireless leader Smart Communication, Inc. (“Phl 1st massive open,” 2013). This became the latest trend of education in continuing professional development. The Philippines, among ASEAN countries, has been very active in studying MOOC program. Despite many challenges, they were able to produce the most number of participants successful in MOOC. Shaping the Way We Teach 1 and 2 were some of the courses that became eminent especially to teachers participating MOOC. These courses are hosted by the U.S. Department of State’s Office of English Language Programs in the Bureau of Educational and Cultural Affairs (Education and Exchanges program, US Embassy Manila Philippines). Through MOOC camp, offline meet-ups, thousands of participants around the Philippines successfully completed the course. As stated by the U.S Department of States Bureau of Educational and Cultural Affairs, MOOC Camp are most successful with weekly meetings. The increasing demand of learning through Massive Open Online Course would be more effective when there is camp (Fournier et. al., 2014). In an open learning environment, the control of learning no longer rests with an educational institution but with the learners themselves. In this case, the success of a learner through MOOCs rely mainly on his own motivation, therefore makes it as a Self-Directed Learning. However, MOOC camp helps the learner motivates himself to finish the course because people with shared vision surround them (Milligan et. al., 2013). When people learn through social knowledge, they collaboratively develop new knowledge artifacts and products. People learn by both drawing on and, at the same time, contributing
to collective knowledge. So, 'connecting' is only one of the series of actions learners have to take to learn in open, unstructured networks.

Researchers have already experienced to become the student of MOOC and Facilitator of MOOC camp. They believed that being part of this program, individual can automatically be part in building community and continuing professional development. However, the researchers believe that individual is well positioned to help himself to be a better person with the skills needed. This motivated the authors to conduct this study which focused on the efficacy of MOOC Camp in the Philippines. It discusses how it builds community and how it helps individual on their professional development.

Statement of the Problem

The purpose of this study was to determine how Massive Open Online Courses relate to the professional growth, community development and career achievement of the participants of MOOC.

Specifically, this study addressed the following questions:

1. What is the demographic profile of the respondents in terms of
   a. Age;
   b. Gender; and
   c. Educational Attainment?

2. What is the MOOC’s Camp benefit in terms of:
   a. Professional growth;
   b. Community development; and
   c. Career achievement?

3. Is there a significant relationship between the MOOC’s benefits such as professional growth, community development and career achievement to the demographic profile of the participants?

4. Based on the findings, what program can be proposed to enhance the awareness of the people about MOOC?

Paradigm of the Study

The input includes the demographic profile of the respondents such as: age, sex and educational attainment and MOOC variables such as: professional growth, community development and career achievement. The processed was to test the relationship between MOOC and its variables such as: professional growth, community development and career achievement. The output was enhanced MOOC Camp Curriculum.

Figure 1. Paradigm of the Study
Methodology

This study utilized the descriptive method of research to determine how Massive Open Online Course Camp relate to the professional growth, community development and career achievement of the participants of MOOC. The respondents of this study were the 50 participants of the Massive Open Online Course (MOOC) campers of Mandaluyong City. The survey dealt with the benefits of MOOC camp to their professional growth, community development and career achievement to have an enhanced program for people’s awareness about MOOC.

A survey questionnaire was the main data gathering instrument. The research questionnaire was composed of two sets. The first set was the Participants Information Sheet. It covered the demographic information of the respondents such as age, gender and educational attainment. The second set dealt on the level of benefits of MOOC Camp to their professional growth, community development and career achievement.

For items on the level of benefits of MOOC Camp to their professional growth, community development and career achievement, the weighted points, score range and verbal interpretation are as follows:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Range</th>
<th>Verbal Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>4.21 to 5.00</td>
<td>Always or almost always true</td>
</tr>
<tr>
<td>4</td>
<td>3.41 to 4.20</td>
<td>Generally true</td>
</tr>
<tr>
<td>3</td>
<td>2.61 to 3.40</td>
<td>Somewhat true</td>
</tr>
<tr>
<td>2</td>
<td>1.81 to 2.60</td>
<td>Generally not true</td>
</tr>
</tbody>
</table>
Results

Problem 1: What is the demographic profile of the respondents in terms of age; sex; and educational attainment?

Table 2: Demographic Profile of MOOCers in Mandaluyong City According to Age.

<table>

</table>

Table 2 shows the age of the participants attending MOOC camp. The result shows that 12 or 24% of the participants’ age between 21-25 followed by ages between 26-30 and 31-35 years old both with 10 participants 20% of the total number of participants. However, there are 8 participants or 16% with the age of 41 years and above. It indicates that the most of the participants attending MOOC camp are within the range of 16 to 35 years of age.

Table 3 shows the demographic profile of MOOCers in Mandaluyong City according to gender. Finding shows that among 50 respondents of MOOC camp, 34 or 68% of them are female and only 16 or 32% are male. This shows that there are more women who engaged in MOOC camp for their career development and community development.

Table 4: Demographic Profile of MOOCers in Mandaluyong City According to Educational Attainment.
Table 4 presents the educational attainment of MOOCers whereas 22 or 44% of the MOOCers gained Masters Unit or Degree, 19 or 38% of the course takers are under college level and 9 or 18% of them have doctorate units or degree. It points out that professionals are seeking for a new way of helping themselves develop their career and helping the community through MOOC camp. In addition, even a person attains the highest degree of education they urge for more to fully develop themselves as an individual and as a professional.

**Problem 2:** What is the MOOC Camp benefit in terms of professional growth, community development and career achievement?

Table 5: Benefits of MOOC Camp in Terms of Professional Growth.

<td>4.32</td>
<td>Generally true</td>
</tr>
<tr>
<td>OVERALL MEAN</td>
<td>4.36</td>
<td>Generally true</td>
</tr>
</tbody>
</table>

Table 6 shows the benefits of MOOC’s in terms of community development. Finding shows that the participants believed that MOOC has a benefit in the community development having an overall mean of 4.36 with a verbal interpretation of Generally True. Among the items, participants said that MOOC camp allows them to gain new friends and collaborate with others with a mean of 4.50 followed by MOOC gives them the opportunity to network with other similar groups having a mean of 4.44. Result also shows that most of the participants were encourage to join because of the usefulness of the program to their lives.

This result coincides on the presentation of Mrs. Rebecca Sagot during the TESOL 2016 at Baltimore Maryland. According to her, “to be successful in MOOC, we must conduct MOOC camps, identify the allies, leaders and resources, conduct meet-ups, form learning actions, cultivate mentors, keep the graduates engage, celebrate learning and pass it on.” In Davao Del Norte, Philippines, English teachers took Shaping the Way We Teach English 1 and 2 offered by University of Oregon wherein there were three batches of MOOC camps. During the first batch of camp, there was a 75% completion rate for the first course and 100% completion rate on the second course. Moreover, 98% and 97% were the completion rate for the second batch of Shaping the Way We Teach English 1 and 2. In addition, during the third batch of MOOC camp, there were 99% and 98.56% completion rate of the two courses. This clearly shows that the teachers are motivated and interested to study and finish the course when they are involved in a group activity.

<td>-0.52745</td>
</tr>
</tbody>
</table>
Table 8 shows the Pearson r Test on MOOC’s benefits in the Professional Growth, Community Development and Career Achievement in terms of their Age, Gender and Educational Attainment. Result shows that there is a weak and moderate positive significant relationship of the MOOC benefits in Professional Growth and Community Development with a value of 0.02718 and 0.68135 respectively to their Age. However, there is a weak negative significant relationship of MOOC benefit in Career Achievement with a value of -0.07292 to their Age. With regard to Gender, there is a perfect positive relationship of MOOC benefit in professional growth to their gender while there is a perfect negative relationship of MOOC benefit in community development and career achievement to their gender. Lastly, all the MOOC benefits have a negative significant relationship to their educational attainment.

**Problem 4:** What program can be proposed to enhance the awareness of the people about MOOC?

The result of the study revealed that MOOC camp is essential for an individual’s professional growth, community development and career achievement. The researchers proposed the following to enhance the awareness of the people about MOOC and MOOC camp.

**A. Collaboration of Organizations.** Different organizations such as RELO (Regional English Language Office in Manila) and British Council support and promote MOOC and MOOC camps, the Department of Education can work together with these organizations to raise awareness among interested students in taking courses that is suitable for their need. The effectivity of MOOC camp was seen in Davao Region, led by Ms. Rebecca Sagot who is working under Department of Education in Davao wherein part of teacher’s curricular activities is take MOOC and join MOOC camp. If MOOC and MOOC camp will be part of Department of Education in the Philippines nationwide it can produce more successful graduates in open education.

**B. Celebration of Learning.** It is a must have after finishing the course as a reward for those student who completed the program. A simple graduation or recognition program will boost students’ interest in taking MOOC and attending MOOC camp.

**C. Social Media Campaign.** Group page, and other form of social media greatly help the promotion of MOOC and MOOC camp. With the help of MOOC facilitator posting about MOOC and MOOC camp many are encourage to take MOOC courses.

**Conclusion and Recommendation**
Based on the result of the study, it showed that many professionals are eager and motivated to learn new ways of developing themselves. Most of these professionals are characterized by women in our society. MOOC as a new tool of learning must be supported by MOOC camp, this camp is highly significant in developing one’s professional growth, community and career.

The study recommends that the Department of Education must work with different organizations to raise more awareness of MOOC and MOOC camp. Celebration of learning as a reward is also commendable as it increases student’s eagerness in joining the program. Further and more in-depth studies on MOOC camp can be done to support the effectiveness of MOOC camp in the Philippines.

Abstract

Partnerships between academics and practice are essential to educate, orient, and ingrain students into the advanced practice nurse’s role. In this dichotomous relationship students lack equal consideration as a major stakeholder in the educational processes. This paper presents a practical approach for addressing the academic preparation of advanced practice nurses using the Mutually Beneficial Partnership framework that acknowledges this interprofessional relationship between student, preceptor, and faculty as stakeholders in preparing advanced practice nurses. Each stakeholder is considered an equal partner with a common goal of a well prepared advanced practice nurse to care for patients. The Faculty Co-preceptor Clinical Model used within the Mutually Beneficial Partnership framework is examined. Functioning within the framework are the major tenets of the Co-preceptor Clinical Model. The model is influenced by the framework, and the fit of both are discussed. It is hypothesized that promoting the use of the model within the framework will meet the needs of faculty, preceptor, and student experiences in clinical courses, which result in benefits to student, preceptor, facility, and academe. The principles described in the framework and model can guide the advanced practice clinical experience.

Keywords: Framework, mutually beneficial partnership, clinical co-preceptor, model, advanced practice, preceptors, education.
Implementing the Co-Preceptor Clinical Model for
Mutually Beneficial Partnerships in Graduate Nursing Education

The Mutually Beneficial Partnership (MBP) is a framework that has been established across domains and has successfully been applied to the discipline of nursing education. The framework recognizes needs of the three major stakeholders in nursing education as an interprofessional partnership that functions at the point of patient care. Emphasis is placed on these relationships to achieve the common goal of a well-prepared graduate ready for present and future challenges in advanced nursing practice. The MBP represents a practical approach to partnerships at the level of the stakeholders involved to provide guidance in the development and implementation of the advanced practice clinical experience.

Need for the Framework

The steady increase in the number of student enrollments in advanced practice nursing programs coupled with the need to recruit and retain qualified preceptors and training sites for students make it necessary to develop academic-practice partnerships to strengthen and guide clinical based educational experiences. The changing professional nursing roles are demanding the development of new and innovative practice models. To date, no framework exists to address students, faculty and preceptors as equal partners and stakeholders in the academic-practice relationship. The Mutually Beneficial Framework offers a practical approach to the interprofessional partnerships for advanced practice nursing education. Each stakeholder strives for the common goal of a well-prepared graduate to safely and competently care for patients.

In the United States, reports about nursing and nursing education from sources, such as the Institute of Medicine’s (2011 The Future of Nursing: Leading Change, Advancing Health have made recommendations for expanding clinical practice education through partnerships
between academic leaders and health care organizations. These recommendations emerge as the existing US workforce is presented with multiple challenges. In recent months, the Affordable Care Act and Medicare/Medicaid has undergone intense scrutiny as the newly elected administration takes over the US government healthcare programs. The anticipated changes to the existing healthcare system will likely retain the nursing professions place as providers of quality patient care to fill the gap in health care services.

Filling these vacancies has resulted in an increased need for clinical placements to prepare the next generation of advanced practice nurses. This reality coupled with an aging faculty has nursing programs struggling to graduate the number of students needed to meet the rising demand for care (Everett, 2016). A sense of urgency to create mutually beneficial partnerships has emerged to address some of these challenges.

**The Mutually Beneficial Partnership Framework**

Mutually beneficial partnerships (MBPs) are defined as collaborations with identified roles and responsibilities between academics (faculty), students and practice partners (preceptors) within the healthcare community to achieve a common goal (Curwood et al., 2011). Within the MBP framework, the advanced practice nursing student is considered an equal partner in achieving the common goal of preparing a well-qualified advanced practice graduate. Such partnerships with clear expectations and goals can achieve success more efficiently together than separately. This functional relationship is the foundation for the MBP framework for advanced practice clinical nursing education. The MBP as applied to advanced practice nursing education may be depicted as seen in Figure 1.
Traditionally, clinical experiences occur in diverse healthcare settings where patients are provided a wide variety of services. Many of these services are provided by advanced practice nurses. To prepare those providers to deliver the services patients need, clinical practice experiences are irreplaceable for hands on training. Those clinical experiences take place in the healthcare community with a preceptor as the direct line supervisor in partnership with academic faculty.

As an outcome of these practice experiences, students’ must show competencies for providing safe, quality care within the scope of their respective licensing. These clinical experiences allow graduate nursing students to apply theoretical knowledge to the real patient in
the real world of healthcare. This model of clinical learning has been utilized in many programs of nursing education at all levels of academic preparation (Sedgwick & Harris, 2012).

While other clinical education models exist in undergraduate education, the preceptor-based model is primarily used in advanced practice nursing clinical education. The preceptor-based experience has been shown to produce better student outcomes when compared to other models of clinical education (Sedgwick & Harris, 2012). Preceptors can provide relevant, first-hand insights and knowledge to create appropriate clinical experiences and activities for students. These abilities are hypothesized to achieve better educational outcomes than other approaches by closing the gap between theory and practice.

Preceptors that are educationally and experientially qualified and eager to serve are like *gold*. Qualified effective preceptors improve critical thinking, problem solving, decision-making, clinical judgment, and prioritizing and time management skills (Sedgwick & Harris, 2012). Bashford (2002) found that through interactions with preceptors, students learn to recognize subtle changes indicating early warning signs or symptoms of change in condition. Students report gains in self-confidence and improved skills. Effective preceptors can also minimize negative student learning experiences and increase positive learning which can result in attracting the students to the healthcare facility for future employment. Everyone in the preceptor environment notices the student’s work ethic, quality of patient care, communication skills and professional behavior. These are all qualities desired in a team member (Bashford, 2002).

Some advanced practice registered nurses (APRN) may be reluctant to serve as a preceptor based on misconceptions or a previous negative experience with students. For advanced practice nursing students, selection of a qualified preceptor may be their responsibility. These factors can result in ‘warm body syndrome’ (Daigle, 2001) of preceptor selection. This
syndrome addresses the selection of a preceptor out of desperation instead of a willingness to serve in the role. Although not ideal, this ‘warm body syndrome’ has been utilized by many students to meet clinical placement requirements expected of advanced practice nursing education programs. This approach to preceptor participation and selection emphasizes the need for a true partnership.

The Mutually Beneficial Framework can assist in overcoming obstacles by recognizing the needs of preceptors and clarify misconceptions. This partnership can assist in maintaining preceptors and a quality clinical practicum experience. The framework can be used to create best-practices for clinical practicum experiences to educate highly-qualified advanced practice nurses. This model may be applied to any advanced practice nursing program academic-practice partnership and may be generalized to other clinical practicum related programs. It is a model that has evolving from educational experiences and other disciplines using partnerships to improve their outcomes (Bond, 2014). This is an original nursing education conceptual model to be added to the existing literature as a resource to support an effective clinical learning environment from the perspectives of the stakeholders.

**Partnerships in Nursing Education**

Creating mutually beneficial academic-practice partnerships is not a new concept. De Geest et al. (2011) completed a review of the literature from studies across the globe that addressed academic-practice partnerships in nursing. The authors reviewed 114 articles concluding that mutually beneficial goals and the exchange of resources were conditions leading to success across the globe. Other disciplines, such as public health, are implementing academic-practice partnerships with many of the same goals as nursing (Erwin et al., 2016).
The majority of literature on academic-practice partnerships in nursing education has focused on pre-licensure programs. Two examples of academic-practice partnerships for pre-licensure students are Designated Education Units (DEUs). Many programs of nursing have adopted DEUs or variations (Murray & James, 2012; Pearson, Wyte-Lake, Bowman, Needlman & Dobalian 2015; Todero, Long & Hair 2015). They have been shown to benefit the academic partner by providing expanded educational opportunities in the clinical environment (Murray & James, 2012). Using the DEU model, staff nurses are added to the teaching and learning process as clinical instructors or preceptors. Faculty members serve as coaches for the staff nurses to interact with students. The DEU model addresses needs of academics and the health care facilities but overlook those of the individuals representing these entities at the patient’s bedside. While these models add great value to the pre-licensure programs, advanced practice programs work primarily within a preceptor-based model with one-on-one experiences where the preceptor guides the student and serves as a role model for future practice. These models lack the characteristics needed for learning experiences in advanced practice nursing education. To date, no model exists to guide advanced practice nursing education. The existing models and frameworks fail to recognize individual needs of preceptors, students and faculty. Preceptors are essential for advanced practice nurses to achieve competencies necessary to provide safe, quality care to patients.

Studies on advanced practice nursing clinical experiences are limited. In the one study surveying advanced practice students and preceptors, the top three perceived characteristics of importance from both groups were clinical competency/judgement, positive role model and communication skills (Knisely, Fulton, Friesth, 2015). Their study surveyed students (N = 78) and preceptors (N = 278) in a Clinical Nurse Specialist program on 21 preceptor characteristics
that were needed for an effective clinical experience. Both preceptors and students rated clinical competency/judgement, positive role modeling and communications as the top three characteristics for effective clinical experiences.

**Effective Partnerships**

Academic-practice partnerships should be based on mutual trust and respect, shared knowledge, and goals (Everett 2016). Todero et al. (2015) adds clear communication as a key element to successful partnerships. The authors also recognize significant challenges of partnerships at the institutional level. Differences in mission, organizational structure, and accountability are often encountered. In addition, mutual trust and respect, effective leadership, clear communication and a clear vision from key stakeholders are essential for success. The shared goals should be mutually beneficial for each stakeholder while ensuring the clinical practice environment provides practitioners with the experiences needed for success.

**Stakeholders**

Key stakeholders of the MBP share a clear vision of creating a clinical practice experience that will result in a well-qualified advanced practice nurse. The major stakeholders within the advanced practice educational process include the student, academic institution and the preceptor. Each partner has a major interest in the outcome, which are practice-ready advanced practice nurses. Academia views students as an investment in leadership, institutional visibility, and a product of excellence in teaching by faculty participating in the academic process for APRNs. From a business perspective, academia also views students as revenue sources and student success as marks of success or failure of curriculum. If pass rates on certification examinations is poor, academia is on ‘probation’ until corrected. They cannot afford to get it wrong! Academia cannot afford to accept students who are not robust enough to
finish the program. Student attrition is reflected on the bottom line of nursing program budgets. So, student selection and resilience are important student attributes when academic institutions recruit student candidates.

Faculty are major stakeholders in student learning. They bear the burden of curriculum development, quality improvement, and program revisions to meet the needs of advanced practice nursing students. DNP programs are facing program and curricular evolution more rapidly than programs can manage in a timely way (AACN, 2015a, 2015b; National Organization of Nurse Practitioner Faculty (NONPF), 2016). This puts faculty in the middle of ‘knowing’ the direction of education, and actually implementing those changes. In academe, change takes time. This puts an undue burden on faculty to ‘teach’ in the present, and plan/develop for the future. Courses are changing, preceptor requirements are being examined with pressure to develop competencies that must be met and verified as evidence of advanced practice preceptor qualification, and clinical affiliation agreements are legal documents with onerous jargon requirements that some clinical facilities within the community are not willing to accept.

As stakeholders, students need supportive, learning environments to foster a successful outcome. Studies about outcome of APRN practice are easy to find, but qualitative studies about the internal drive for nurses to become nurse practitioners is presumed. It may be reasons related to humanitarianism, increased autonomy, pay, responsibilities, job security, or a desire to excel in their profession. Programs are created with those assumptions in mind. However, from a personal perspective, a need for broadening practice, slowing down in practice, or an opportunity to ‘give back’ to future generations of nurses may uncover unexpected results. Nonetheless,
when a registered nurse decides to pursue higher education, there are some basic rights to accompany the pursuit.

Students need a competent, qualified preceptor that can provide opportunities for students to learn in real-world situations. First, students should be able to ‘be wrong’ without consequences. In saying that, they need preceptors and faculty who recognize the importance of supervision and facilitation of learning. The ultimate responsibility for student learning falls on the shoulders of faculty, but without student investment, and competent preceptors, their mission will fail.

Second, students need mentorship in addition to preceptorship. Preceptors have a collaborative role with established competencies and student outcome expectations. They are responsible for teaching the core professional skills. However, they may evolve to the role of mentor. Mentorship involves both academics and clinical practice. The mentor may be faculty, the preceptor, or it may be someone else in their circle that is willing to be a role model, teacher, sponsor, counselor, and friend. The mentor focuses on both the professional development of the student but also they develop a caring relationship over time.

Third, students have a variety of skills and experiences and they should be recognized as having these commodities by faculty and preceptors. Graduate nursing programs need to provide a seamless progression from baccalaureate education to graduate degrees. It must take into consideration years of practice, types of clinical experiences, and possible specialization while at an RN level of practice.

Preceptors accept the position for many differing reasons (Usher et al., 1999), but primarily they agree to become preceptors to give back to their profession and to train the future generation of nurse practitioners (Bourbonnais & Kerr, 2007). Typically, there is little or no
compensation for the role. It is an extra duty placed on busy providers. They must fit the learning needs of the APRN student into a tightly scheduled day. Preceptors may or may not be recognized by their organization. The benefits may not be readily apparent unless the preceptor markets their abilities to the clinical facility. Bourbonnais (2007) describes the many demands made upon today’s busy advanced practice nurses. Preceptors report more difficulties in accommodating students. APRN must meet daily patient visit targets, manage the required documentation, and provide healthcare to increasingly complex patients (Wiseman, 2013). This seemingly never ending process requires excellent management skills.

Academia has no method beyond awards to recognize preceptors who excel in their efforts. The concept of ‘free’ preceptors provided by facilities and individuals for academic programs may require re-tooling. If requirements for verification of competencies, orientation to the role, licensure and certification verification, and facility approval prior to signing on as a preceptor become the standard, it may become increasingly difficult to find qualified preceptors.

Clinical facilities are stakeholders in that they provide time, space, and tolerance for the arduous process of advanced practice professional skills acquisition. They may be called upon to allow the student access to the electronic health record (EHR). In a large facility with proper procedures in place, this may easily be accomplished. However, in small clinics, each provider (or student provider) who requires a password to access the EHR may be an added expense to the facility. This becomes a matter of economics. One student per year may not break the budget, but three students may adversely affect it. It can be a limitation in student learning. In order to learn diagnostic reasoning skills, students must have access to the full EHR, including medical history, medications prescribed current and past, as well as results of all diagnostic studies. This should be negotiated with academia at the time a clinical affiliation agreement is presented for
signature. Preceptors should have a mechanism for providing feedback and recommendations for changes in clinical requirements and curriculum development. A community member representative of multiple facilities needs to be present and a voting member of curriculum development decisions made by faculty in academia.

Clients/patients are the most important of all stakeholders! They are a measure of the outcome of learning, preceptorship, and skill acquisition. They entrust their lives to care by their provider. They should not be viewed as guinea pigs for students, but collaborators in their care. Students need to become aware of the need to “ask the patient what they feel will help” as an important last question in the ailment interview. It is amazing how well versed clients/patients have become about their care and health maintenance. Clients likewise need input into the education process for graduate nursing students. They are part of the community - a major part! A simple questionnaire sent to clients/patients could provide valuable information for academia, and it would in essence provide true collaborative practice.

Preceptors practice in health care facilities located within the geographical proximity where students complete the clinical practicum requirements. These health care facilities are provided with opportunities to employ well qualified graduates from advanced practice programs by allowing the program of nursing access for the purposes of clinical placements. The potential exists to decrease orientation costs as well. Stout et al. (2016) reported reduced orientation time and a savings of $257,400 for 26 interns that resulted from a partnership. Those partnerships can provide a mechanism for continuous learning for nurses in the practice setting as well as those in academic programs (Todero et al., 2015).

Preceptors also view the student as a potential partner in providing advanced practice nursing to the community. Likewise, the student has an opportunity to assess the health care
institution, preceptor and the community as potential colleagues and for employment. As you can see, partnerships benefit the health care organization with lower orientation costs, a readily available pool for recruitment and potential improved retention.

Programs of nursing education partner with healthcare facilities to work together to meet the needs of each other and the student to achieve the expected outcomes of the clinical practicum experience. This describes a true partnership where the stakeholders all benefit from the relationship. The MBP as a framework for clinical education recognizes the needs of each of the stakeholders to achieve the common goal of preparing a well-qualified advanced practice nurse. The MBP utilizes a preceptor-based educational strategy to promote role formation for the advanced practice nurse.

**Significance of Framework to Grant**

A MBP framework will guide the establishment of partnerships with practice sites in minority, rural and medically underserved communities, which meets the objectives of the Advanced Nursing Education (ANE) grant. Using this framework, professional preceptors and students are mutually responsible for facilitating learning to meet clinical objectives. Adult learning principles of motivation and participation are inherent aspects of the MBP. Advanced practice registered nursing (APRN) students are more likely to consider clinical facilities as future employers because they feel more qualified to evolve into an advanced practice role. Likewise, community partners feel they are an integral part of educating APRNs. Academic partners will have a larger supply of preceptors in a variety of specialties. Preceptors feel satisfied with the process, and preceptors are more willing to participate with future APRN students.
Co-Preceptor Clinical Model

The steady increase in the number of student enrollments in Doctor of Nursing Practice (DNP) graduate advanced practice nursing (APRN) programs coupled with the need to provide qualified preceptors and training sites for students make it necessary to develop enhanced academic-practice partnerships and implement innovative practice models. One model adapted from Giddens et al., 2014 was an attempt to re-envision clinical graduate nursing education. With permission, two grant members re-conceptualized Giddens' Clinical Education Model with additions of competency requirements for preceptors and students. DNP students arrive in the clinical area post standardized preclinical education and competency assessment that demonstrates readiness for clinical practice. The revised model incorporated both American Association of Colleges of Nursing The Essentials of Master’s Education in Nursing (2011), and The Essentials of Doctoral Education for Advanced Nursing Practice (2006) and AACN White Papers (2015a, 2015b) which provide guidance and structure to curriculum for graduate nursing programs. The Co-Preceptor Model requires preceptors and faculty to be co-preceptors. Preceptors are referred to as co-preceptors, and faculty are referred to as faculty co-preceptors. Thus, the model has evolved to improve student learning outcomes and enhance clinical education experiences to benefit faculty, preceptors and students. See figure 2.
There are seven tenets of the CCM. This model builds in entrustable professional acts, standardized assessment, interprofessional education, and innovative education practices. The entrustable professional acts are still to be identified. A modified Delphi study is underway to glean from current preceptors what those entrustable professional acts will be. Examples may be documenting as an APRN student in the electronic medical record, completing history and physical examinations without direct supervision, determining correct billing codes. Skills may include suturing and performing and interpreting diagnostic tests. So what’s different about clinical education using this model? The tenets describe the unique contribution of the model. See Table 1.
The MBP is a framework with an overarching structure that describes the academic-community-preceptor relationship, responsibilities, and unique goals. Further, within the MBP, there is another partnership directly between preceptor, student and faculty that focuses on needs of all parties. This partnership is a subsidiary of the original academic-practice partnership. In order to accurately depict the complexity of the MBP, the model must function as a model within the MBP academic-practice framework has been extended to the subsidiary partnerships of the preceptors, faculty and students in a MBP as a unit, for clinical partners the heart of

MUTUALLY BENEFICIAL PARTNERSHIPS

learning. See figure 3.

**Figure 3. Mutually Beneficial Framework for Co-Preceptor Clinical Model**

Putting the MBP framework around the CCM can serve as a guide for educators, health care facilities and students in redesigning the current system of clinical education. While quality clinical experiences continue to be a challenge, development of academic-practice partnerships with a mutually beneficial goal can assist in the clinical placement process. The model supports the idea that students with a positive clinical experience are more likely to be employed by that facility after graduation. Students and new graduates make career choices when they have good experiences in a healthcare setting. Bashford (2002) reminds preceptors that the educator role is
an extremely rewarding experience. Stakeholders in the educational process must work together to achieve the common goal of producing a well prepared advanced practice nurse. Preceptors feel pleasure and satisfaction watching the students improve their advanced diagnostic skills. Colleagues and other team members have a heightened sense of job satisfaction and energy as a result of seeing the student’s smiling face, energy, and interest in learning (Bashford, 2002).

**CONCLUSION**

Many authors recognize the partnership that is created between preceptors and students; and preceptors and faculty in the clinical setting (Knisely et al., 2015). The MBP can potentially enhance the clinical experience and professional development of advanced practice nurses in the continually evolving practice environment. In addition, the model can assist advanced practice nursing programs to meet the recommendations set forth by leaders in health care. Commitment to the academic-practice and the clinical partnership using the model will better prepare advanced practice nursing students’ for the provider role and provide opportunities for employment.

Fibonacci Numbers: Can They Predict Growth in Children Age Zero to One?

Alina Licia Abraham

ICL Education Group, Auckland,  
www.icl.ac.nz E-mail: alina@icl.ac.nz

Abstracts:  
Research states that Fibonacci numbers represent an expression of growth (trajectory) in the physical world of our planet. Music research speculates that such expression manifests in musical compositions in a variety of cultural contexts. I have found that Fibonacci series relates to acoustics and human perception of sound. I presented my findings since 2003 in national and international conferences in Sydney, Melbourne, Hawaii, Wellington, Dunedin and Auckland. As at 20 weeks time in the fetal stage of human existence, adult-size inner ear is already developed (Woodward, 2011) – and patterns apply (Patterson, 1986), I raise the hypothesis that similar patterns of growth may apply to zero to one year old children, following a predictive trajectory, i.e., of Fibonacci numbers. In the workshop presented I will creatively utilize my findings following a literature review and document analysis design. The topic addresses child development, music education and general education issues but not limited to, inviting specialists in cross-disciplines (education) research, sciences, humanities and others to partake and contribute to the research project.
Much of the content for this paper comes from my experience in higher education, starting with my time as an undergraduate studying English literature and finishing after pro tem contract work as a university administrator at Kwantlen Polytechnic University (KPU). The context for this paper and presentation is both the Canadian and American higher education systems. Some of the Canadian context is provided by the recent re-engineering of higher education funds to support the trades and technology skills gap in British Columbia. The Department of Education’s College Scorecard, which helps to frame the debate around the government’s performance-based funding of higher education in the United States, provides some of the American context.

I have been employed at KPU for the past ten years and I have held various senior management positions, such as the Dean of Trades and Technology and, most recently, the Associate Dean of Arts. In these two roles, I witnessed a significant boost in funding for career-focused, technical programs in one Faculty along with a contrasting stagnant funding model for the other (note: at KPU, the Faculty of Arts includes the Fine Arts, Social Sciences and Humanities). Whilst working as the Associate Dean in the Faculty of Arts, it became evident to me that not only was funding flat, but enrolments across the Arts disciplines were also down. According to Sheldon Rothblatt (2016), “Statistics are compiled to prove that student interest in the humanities and liberal arts is not only waning: it has almost disappeared” (p. 35). How these statistics are compiled and interpreted notwithstanding, the message is clear to the government agencies responsible for funding higher education: do not invest in the liberal arts. The purpose of this paper and its corresponding presentation is to not only support the movement of defending the liberal arts but also keep the momentum of support going. I aim to prove that a liberal arts education is, in
fact, a worthwhile endeavour for university students because it will ultimately help them to achieve success; I hope the governments responsible for funding public institutes of higher education will realize this and consider increasing funding for the liberal arts.

Before proceeding any further, it is important to establish what is meant by the term “liberal arts”. As Mark Roche (2010) explains, the term originated from the medieval concept of the *artes liberalis* and it was originally comprised of the three basic arts known as the *trivium*, which focused on language, oratory and dialectic skills. Roche goes on to explain that the *trivium* was later expanded to include four “advanced mathematical-physical arts: geometry, arithmetic, music and astronomy” (p. 5); however, I will limit my definition of the liberal arts to exclude the subsequently added *quadrivium* and STEM subjects as, at least at the university where I work, Science, Technology, Engineering and Math are taught in Faculties outside of the Faculty of Arts. Henry Shuldiner (2016) goes back to Ancient Greece to identify the purpose of a liberal arts education when he writes, “the liberal arts were intended to produce the ideal citizen: a person of intelligence, with sensible moral judgment and the ability to reason” (para. 4). Shuldiner goes on to give that definition modern context by explaining that, in today’s universities and colleges, the purpose of the liberal arts is to develop a well-rounded student who has the ability to make connections across disparate thoughts and ideas and who can relate to diverse fields of study. This laudable goal to develop well-rounded students and cultivate their ability to make connections across diverse fields of study is what precludes professional and technical programs from being included in the definition of “liberal arts”. Roche (2010) clarifies further: “In a contemporary liberal arts education, in contrast to the specialized orientation of professional or technical curricula, students receive a general education that is a broad grounding in the diverse disciplines” (p. 5). So, why are liberal arts programs struggling?

A few reasons why interest in the liberal arts is in decline are: 1) because of the perception that a liberal arts education does not lead to gainful employment; and 2) students are inclined to avoid disciplines that “appear to be disconnected from labor markets” (Rothblatt, 2016, p. 350).
However, there is plenty of evidence that proves liberal arts graduates earn, over the long run, just as much as those who choose professional degrees and research shows that they end up achieving similar employment levels at high-income jobs (Grasgreen, 2014). In order to demonstrate Grasgreen’s claims, it is necessary to look at the total arc of highly successful people’s careers; this will reveal that liberal arts graduates are competitive and those who supplement their education with further study (e.g. with programs that add management and/or technical skills to one’s curriculum vitae) are best positioned for success (Blumenstyk, 2016). According to Linshi (2015), there are plenty of “formerly disgruntled liberal arts majors” who have successfully conquered the Business world and he lists the CEOs of Disney, YouTube, Starbucks, Hewlett-Packard and HBO as high-profile examples (para. 2). A recent study conducted by Richard Detweiler (cited in Education Advisory Board, 2016b) revealed that liberal arts graduates not only tended to be more successful, particularly in terms of holding leadership and/or elected positions, but they were also more inclined to feel fulfilled over the long term. Scott Jaschik (2016), citing Detweiler’s study, affirms that a liberal arts degree, when compared to other degree programs, produces graduates who have greater odds of being a leader, show an interest in the arts and culture, are viewed as ethical and lead “a fulfilling and happy life” (para. 4).

The American report (Humphreys & Kelly, 2014) on which many of Grasgreen’s claims are based does qualify liberal arts majors’ successes by highlighting: 1) their salaries still lag behind those who majored in STEM subjects, particularly in the late-career stages; and 2) liberal arts majors who also hold advanced degrees are responsible for keeping the comparative earnings close. However, the report also makes it clear that liberal arts majors are far and away the most successful at meeting employers’ expectations. And why is this the case? The simple answer lies in the fact that a significant number of managers (e.g. up to half of managers surveyed by PayScale and Future Workplace in a recent survey) feel new graduates commonly lack “critical-thinking, writing, and presenting skills” (Education Advisory Board, 2016c, para. 1). The development of these “soft skills” is considered to be the “bedrock of a liberal-arts education” (Education Advisory Board, 2016a, para. 3) and so it should be no surprise then that the largest
U.S. tech hubs in Silicon Valley, Seattle and Boston “are discovering that liberal arts thinking makes them stronger” (Anders, 2015, para. 6).

A few of the major challenges facing publicly-funded universities today is how most do not receive adequate funding and, to make matters worse, how focus has shifted away from the liberal arts to programs that lead directly to employment. Daniel Kleinman (2016) contends that the precipitous decline in support for public universities, coupled with “widespread calls for occupationally oriented higher education” in conjunction with “a focus on curricula that will provide students with employment-ready skills”, has created an environment where the liberal arts is “broadly and regularly attacked as economically irrelevant” and perceived to be an “unaffordable” luxury (p. 86). To illustrate Kleinman’s point, here is a list of a few of the newest programs at KPU: an Acupuncture Diploma, a Brewing and Brewery Operations Diploma, a Commercial Beekeeping Certificate program, and a Post Baccalaureate Diploma in Technical Apparel Design. These highly specialized professional programs were specifically designed with industry input and employment outcomes in mind and their approval was dependent upon favorable labour forecasting. Of course, it is important to point out that these are not degree programs and, as such, they do not have the same depth and breadth requirements as bachelor’s degrees at KPU--for which completion of liberal arts credits is normally a graduation requirement. However, the point I wish to make here is that, in an environment of scarce resources, it is difficult to not only launch new liberal arts programs but also support under-subscribed existing ones. Unfortunately, this lack of support for the liberal arts is further exacerbated by the ways governments determine funding for public universities in both Canada and the United States.

While I was the Dean of Trades and Technology at KPU, the provincial government introduced their new initiative called “B.C.’s Skills for Jobs Blueprint: Re-Engineering Education and Training”. In this document, the government claimed the need for “a shift in education and training to better match with jobs in demand” and it was reported that there would be a “major shift in resources” where a ten-year plan would target labour market priorities, resulting in a $3
billion overall shift to trades training over the next ten years (MacDonald, 2014, slide 9). As Kleinman (2016) argues, “political leaders have proposed policies that would provide budgetary benefits to occupationally oriented higher-education initiatives, while punishing liberal arts or humanities programs and students” (p. 86). In the United States, performance metrics that clearly illustrate how budgetary benefits can be achieved by occupationally-oriented higher education initiatives are utilized by both the College Scorecard and performance-based funding models.

The College Scorecard enables the Department of Education to collect data based on “graduate loan repayments and default rates in addition to earnings six and ten years after graduation” (Megan Adams, 2016, p. 13). According to Adams (2016), College Scorecard data has been incorporated into the annual college rankings for the *Wall Street Journal* and *The Economist* and this enables students and parents to make college decisions based on Return on Investment (ROI). Jerry Logan and Janel Curry (2015) report that the Scorecard was developed in response to demands for a way to determine ROI for a college education and Ann Schnoebelen (2013) declares that the Scorecard “highlights a real shift in the national conversation about college, away from college as a liberal education to a professional education” (para. 8). The problem is that the ROI for a liberal arts education is not immediately apparent post-graduation. As stated earlier, liberal arts graduates earn, over the long run, just as much as those who complete professional degrees (Grassgreen, 2014) but it may take more than a decade before the true ROI is reflected in a liberal arts graduate’s earnings. Another recent development that works against the liberal arts is the use of performance-based funding models because they, much like the Scorecard, also focus on student employment outcomes and salaries. Adams (2016) claims that 38 states have either transitioned or are transitioning to performance-based funding for two- and four-year institutions and this means that “new graduates’ salaries can incentivize institutions to prioritize majors in professional fields that earn high wages over other important, but lower-wage fields in the liberal arts” (p. 12).
Since there is plenty of research that shows liberal arts graduates are not disadvantaging themselves when it comes to long-term career prospects (Anders, 2015; Blumenstyk, 2016; Grassgreen, 2014; Linshi, 2015) it is now important to prove to students, parents and government funding agencies that a liberal arts degree is, in fact, worth pursuing. I have already mentioned that employers are looking for employees who have the soft skills that are taught in the liberal arts and this bears further discussion.

Hart Research Associates (2013) conducted a series of employment surveys on behalf of the American Association of Colleges and Universities (AAC&U) and the surveys revealed that employers wanted universities to put more emphasis on the following learning outcomes: critical thinking and analytical reasoning = 82% wanted more emphasis; complex problem solving and analysis = 81% wanted more emphasis; written and oral communication = 80% wanted more emphasis; and the application of knowledge and skills in real-world settings = 78% wanted more emphasis (p. 8). It is also noteworthy that, according to Hart (2013), 93% of employers surveyed agreed that “a candidate’s demonstrated capacity to think critically, communicate clearly, and solve complex programs is more important than his or her undergraduate field of study” (p. 4). Brian Casey, President of DePauw University, a nationally ranked Liberal Arts College founded in 1837, would add creativity and the ability to think for themselves to the list of skills that students are taught in the liberal arts (Belkin, 2014). Pursuant to the Hart Survey, the AAC&U published a report that confirmed 93% of employers think communication skills and critical thinking are more important than a student’s undergraduate major and added that 80% of employers believe students should acquire a broad, liberal arts-based education (AAC&U, 2014).

So, where do we go from here? It may continue to be difficult to convince a student to major in philosophy but what a university and its professors can do is show how the skills acquired in the liberal arts disciplines can not only help students get jobs but also facilitate advancement in their careers. While writing about the vice president of Wake Forest’s Office of Personal and Career Development, Susan Dominus (2013) reveals that Andy Chan’s philosophy is: “if
universities want to preserve the liberal arts, they have a responsibility to help those humanities majors know how to translate their studies into the work world” (para. 7). In other words, it is important to emphasize the real-world relevance of what students are learning and connect key competencies to specific employment outcomes. According to Starbucks CEO Howard Schultz, “No one ever helped me see the value in the knowledge I was gaining” (para. 4) and this caused him to not only question the value of his undergraduate degree in Communications but also prompted him to take Business classes in his senior year. Perhaps it would have helped Schultz if, at the time, professors explicitly told him why what he was learning is important and explained how it will help him in the future.

I will admit that I did not have the foresight to see the long-term value of a liberal arts degree while I was completing my undergraduate degree in English literature. I also fully realize that not all students have the time, inclination or resources to pursue an undergraduate degree in the liberal arts and it is certainly not for everyone. However, for those who have a genuine interest in the Arts, it would be a shame if they were dissuaded from pursuing a liberal arts education because of a seemingly poor ROI. Even though I completed a professional degree in Law and followed that with a graduate degree in Business, I can state conclusively that the ROI I have personally experienced from my liberal arts degree proves that it was money well spent. Indeed, I find that, especially while working in a senior management role, I frequently rely very heavily on the writing, communication, critical thinking and analytical reasoning skills I developed while studying the liberal arts. In the end, I feel it is up to educators to convince the detractors and critics that an investment in the liberal arts is part of a long-term strategy that will payoff eventually and, since the competition for funding has been raging on for quite some time and is likely to continue, it is vitally important that supporters of the liberal arts persistently battle for resources and recognition.

Another approach for educators is to create and promote, in conjunction with their respective institutions, adaptable and flexible programs that integrate technical skills with a liberal arts focus and, vice versa, add liberal arts soft skills to a technical and/or professional program.
Wiart (2016) asserts that soft skills, or “foundational skills”, are those that are fostered in a liberal arts setting and it has been proven that these are the skills employers want (AAC&U, 2014; Hart, 2013). A good example of an integrative program at KPU is the certificate in NGO and Nonprofit Studies as it allows students to take courses in both the Faculty of Arts and the School of Business concurrently. In fact, there are a number of Canadian universities that have successfully integrated the Arts with technical programs and these include: Concordia University’s “STEM to STEAM” program, which adds Arts to tech education; University of Ottawa’s Digital Humanities program, in which humanities and engineering students work on projects together; McMaster University’s ArtSci program, where professors across the university’s six faculties teach in the program; and a host of other programs that are based on “diversification of knowledge, not specialization” at universities like Trent University, the University of Guelph, McGill and the University of New Brunswick (Wiart, 2016, para. 25).

As evidenced above, a way to successfully bridge the liberal arts and technical programs together is by developing programs that focus on the diversification of knowledge rather than specialization; this will not only benefit undergraduates by exposing them to the soft skills employers want but they will also be learning field-specific skills as well. According to David Attis (2016), institutes of higher education can ensure student career success by following best practices such as: offering opportunities for “integrated career exploration”, creating “career-aligned tracks”, encouraging students to acquire supplementary certificates from on-campus professional schools and developing “co-curricular opportunities to integrate work experience with academic coursework” (para. 9). Clearly, the higher-education marketplace has evolved and it continues to change rapidly. What this means is that universities must adapt should they wish to survive. My hope is that survival is not at the expense of the liberal arts.

In conclusion, I leave you with the most compelling reasons why students should study the liberal arts:
• A liberal arts degree will help graduates get a job because they will acquire the soft skills that employers want
• Students receive a broad education that is grounded in diverse disciplines, which makes them more adaptable, innovative and creative
• Over the long run, liberal arts graduates earn just as much as their professional degree counterparts
• Liberal arts graduates are not only more likely to hold leadership roles but they are also more inclined to feel fulfilled over the long term

So, there you have it. Now please go out there and be a champion for the liberal arts!
REFERENCES

It is often assumed that Japan is a modern, middle class, homogenous country with high performing students and dedicated teachers. While for the most part this image holds true, it is not universal, though the mythology of it being so is clung to by the vast majority of Japanese. To be different or unique is not easy. Compliance with unstated, but universally held, standards is the norm. Individuals who deviate from what is viewed as being a “real Japanese” often are marginalized; this is particularly true in schools.

Immigrants, usually called Newcomers, who do not know the strict rules of protocol, which are a large part of Japanese culture, often find themselves at a loss as to how to catch up, blend in, or even disappear amidst the sea of people that populate urban Japan. For the purpose of this talk, I will focus on the education of Nikkei children from Latin America, how they came to be in Japan, why they underperform academically, as well as a bit of context regarding schooling in Japan.

Among people of Japanese ancestry, the Nikkei, are immigrants to Japan from Latin America. Most are from Brazil but others come from Peru, Colombia, Cuba, etc. Sao Paolo has the largest Japanese population outside of Japan. These Nikkei are ethnically Japanese whose grandparents left Japan in the early 1900s, or were sent by the government, to work in the coffee plantations in need of laborers after the diminished supply of Africans slaves and European migrants. At this time Japan was an impoverished nation with a very large rural population that it could not feed as well as an expanding military. Perceiving the need to increase its resources and limit its population, Japan exported to Latin America many poor farmers and those considered “undesirable.” Meanwhile other Japanese were sent as colonists to Korea and Taiwan to exploit resources and export food back to Japan.

Jumping ahead three generations to the 1980s we find a very different Japan, one that
leads the world in economic productivity and pays some of the highest wages in the world. It is also one of the most expensive places to live. Japanese people in the 1980s were not inclined to do the low level laboring work that brought them to this point of affluence. The government considered increasing the number of immigrants to perform what is known as the dirty, dangerous, and difficult work. The first attempts at admitting non-Japanese were not successful; the cultural clashes caused too much disharmony.

So the government looked to Latin America where settlements of Japanese people had lived for generations. Assuming that these people would be less disruptive to contemporary society, they were invited to “return home.” The problems with this notion proved many: for the most part the Nikkei by this time did not speak Japanese; they spoke either Portuguese or Spanish depending on the country of settlement. They had adopted many customs and ways of acting. And, as they soon found out, they were stigmatized by people in Japan who wanted nothing to do with them. They were and are viewed as foreigners, *gaijin*, or outside people. But they did not know this at first. Lured by high wages offered by corrupt brokers who exploited them, Nikkei arrived to serve as a “flexible workforce,” meaning accepting temporary work, mostly in factories, without benefits and threat of deportation. Their children faced very different but equally challenging obstacles that I will highlight here.

**Methodology**

The research took place in Kanagawa Prefecture, near Tokyo, and in Osaka, with a brief time in Nagoya. Over the course of two years I conducted 101 interviews: 45 in the Tokyo area, 53 in Osaka, and 3 in Nagoya.

My access to these communities was facilitated by an elaborate network of connections that I do not have time here to relate. Suffice it to say the network began in 1996 and continues to this day, including a variety of scholars, teachers, principals, professors, translators, community activists, as well as many “typical” Japanese people who do not fit into any of these categories.

I have organized my findings from this research around the following themes that address issues that limit the access of Newcomer youth to the Japanese educational system.

**Lack of persistence in school.**

*Not compulsory*

Free and compulsory education lasts for nine years starting in primary at age six and ending after middle school, age fifteen. All Japanese young people of school age are required to be registered and attend some form of schooling. However, the law does not apply to foreigners. They may attend but they are not required. According to a special report on immigration only 50% of Newcomer youth finish junior high school and go on to senior high school. This is in a country where the average high school attendance rate for Japanese Nationals is 98%.

While the figure for high school attendance might be surprising to some, the number of
Newcomer children not in school in some parts of the country grades 1-8 is even more striking. One interview revealed that as many as 40% of junior high school and some elementary Newcomer youth in Aichi prefecture are not in school.

Situation is paradoxical since access to high school in Japan has become easier over the last ten years due to the decline in number of school age youth and the need to keep schools open and teachers employed. New flexible admissions policies have been put in place where interviews and teacher recommendations are taken into consideration along with exam scores. But such procedures have also led to increased screening by high schools who prefer to not accommodate students with special needs. Many Newcomer youth fall into this category and either do not enter high school or drop out soon after they make a start.

**HS high costs/low quality**

Senior high school, moreover, is not a part of Japanese compulsory education for anyone, and comes with added expenses, including tuition fees. Most Japanese families accept these costs as part of what it means to acquire an education, but for Newcomer families the financial burden for schooling beyond junior high school can appear significant, especially if it gains them access to only the lowest ranked senior high schools, leaving them with little status and few skills to trade on the open market and even less chance to access a good university.

Another reason for the lack of persistence in school is the disconnect between the two systems.

**Disconnect between two school systems**

*4-hr day vs. extended day*

In Brazil, as is true of many developing countries, the school day is divided into four-hour shifts to accommodate all the children needing to attend. Depending on the school, there could be two or three shifts: morning, afternoon and evening, depending on the grade level. Children spend more time at home with their family. In Japan, school goes on all day, with organized required clubs after school, on weekends and during school holidays. Evenings are frequently set aside for private tutoring in the form of *juku*, often a train ride away. Adjustment to such constraints on a child unfamiliar with a life that centers solely on school can be difficult at best.

**Role of Preschool**

Almost every Japanese child attends preschool beginning at age 3, or earlier, where they learn not only how to socialize appropriately with their peers, but how to do school. Most of these preschools are subsidized by the government. Newcomer children who enter elementary school at age 6, which is the norm for Japan, without 3 years of preschool, are not only left behind academically, but also left outside of the immensely important
informal Japanese system of social grouping that continues through life.

**Age placement**

Japan is very organized around the age of people. Children, regardless of ability, are placed with their own age. For Newcomers this does not always make sense if they arrive without knowing any Japanese language, which is true for the vast majority of young people. Parents can, however, request that a child be put in a lower grade to enable the child to catch up. But once this decision is made, the child must stay with this class. Children who go into a lower grade, often find that their size and maturity make them stand out and soon they want to change classes, but cannot. If ostracizing and *ijime* (bullying) become too much to bear, they find a way to move on their own accord, out of the system, and into the streets.

**Senior High School = 15 yrs of age**

Students arriving in Japan at high school age face yet another educational glitch. In Japan you cannot start high school before age 15. After 9 years of education, you then take the high school entrance exam and if you pass move onto some form of secondary schooling. All high schools are ranked and admission is based on your exam score. But Brazil and Peru have 8 years of required education, and children finish at age 14. So if a child arrives in Japan at age 14, they have to go to night school for 1 year and then apply for the high school exam. Night school is very different from day school, often used for children who have to work during the day. Moreover, even if a child has had one year of high school in Latin America, s/he will start in the first year of high school in Japan.

**Time in country = test**

Special compensation, however, is made for young people who have been in Japan less than 3 years. They can enter high school by way of evaluation and recommendations. They do not have to take the regular high school entrance examination. It is an odd kind of reward, since most of these students are unable to read Japanese, cannot keep up with the curriculum, and usually drop-out. However, if a child has lived in Japan for more than three years, s/he must take the regular Japanese exam to enter high school, the test that all other Japanese take.

Unable to pass the exams, few Newcomer students enter high schools that will prepare them to live a productive life in Japan. Entering an already highly competitive job market where youth unemployment is alarmingly high, and job offers are down 80% over the last ten years. Newcomer youth are often left on the streets to fend for themselves. With few skills and no certificates, these young people are often doomed to a life of manual work in factories and construction sites, in jobs their parents never would have imagined doing themselves back home in Latin America.

**Language**

Intimately entwined with persistence in school is language. Seen as one of the major
reasons for high dropout and low performance, language is perhaps one of the most contentious issues discussed by teachers in schools with large immigrant populations, both in terms of learning Japanese and maintenance of the “mother tongue.” Like many immigrant communities around the world, Nikkei children are born and families raised in isolated ethnic enclaves where few adults speak Japanese.

Parental Participation

While language plays a significant role in terms of parental participation in children’s education in any country, in Japan the situation is compounded by long-held expectations that mothers not only assist in their child’s schooling but also learn along side of them. If a parent cannot do so, then supplemental lessons, in some form of juku are expected. Children of parents who cannot afford the time or the money to meet these demands, enter school with a deficit and fall farther and farther behind. For parents unfamiliar with the language, school system, or relevant customs, the link between school and home inevitably breaks down.

Mother language

The debate over maintenance of one’s mother tongue is complex. Some parents believe that if a child is born in Japan, their mother tongue is Japanese. And that the purpose of schools is to teach Newcomers how to learn Japanese better and faster. Others feel that without knowledge of one’s home language, in this case Portuguese or Spanish, children are not able to maintain communication with family and community, as well as potentially lose their identity and culture. The difference between these views is one of location. Newcomer parents know their children need to be able to function in Japanese if they are ever to survive and succeed in Japan. However, parents also need their children to be fluent in the home language to not only facilitate their communication but to assistance them in the daily routines of life, which leads to the next factor that impedes academic achievement: additional responsibilities placed on the child.

Additional Responsibilities

Children fend for themselves

It is common for both parents of Newcomer youth to work. This is not the norm for the typical Japanese family, where the mother stays home and focuses her energy, for good or ill, on the education of the child. Newcomer parents also often work split shifts or at night, leaving children to fend for themselves or care for younger siblings. Many interviews discussed the problem of children arriving at school with no breakfast, having to leave before their parents were awake. In addition, children are needed as translators for parents, at the parents’ workplace, hospital, immigration office, etc. Teachers complain that children are frequently allowed to be absent from school to carry out these functions, and that they are too young to take on these responsibilities. Such assumption of power by young people, combined with lack of enforcement of compulsory education laws, leave children prey to the vicissitudes of urban life, including drugs, prostitution, gangs, and petty crime.
Early marriage and teen pregnancy.

Another possible result of spending more time on the streets than in school, as well as having more unsupervised time at home, is the potential for early sex and teen pregnancy. Teen pregnancy at age 15 or 16 increases burdens not only on the young parents but also the grandparents who are themselves still of working age and cannot assist with the care of the new child. This is happening at a time when many Japanese youth are deferring pregnancy and marriage until their 30’s.

Dysfunctional families.

The dysfunctionality of Nikkei families is one of the most prevalent topics discussed among social workers, immigrant community workers, and foreign liaison officers, although rarely openly discussed among school teachers.

Years of separation.

Every Nikkei child seems to have had some experience of separation within the family. I am told “If there is 1 child in a 100 who has not experienced family separation, it would be a miracle.” For some, it is only from the father as he travels first to Japan to begin the process of getting established. Usually the mother follows and later sends for the children. During this period, the child is left with grandparents, relatives, friends or neighbors in Latin America. The main reason for left behind children is the lack of child care; there is nowhere for the child to stay when the parents are working in Japan. This is also one of the initial sources of child abuse.

Domestic violence.

Nikkei men who arrive in Japan without wives, tend to quickly find other partners. I am told it is an issue of loneliness. But such actions result in domestic violence and retribution by wives, who then attempt to leave their husbands. In numerous interviews I am told that domestic violence, or DV, is rampant in the community, not just among foreigners but also between Japanese men and foreign women. Girls, in the schools where I have worked, are affected both directly (through sexual abuse) and indirectly by observing their parent’s chaotic lifestyle.

Guilt money for kids.

To compensate for their absence many parents send their left behind children money that they would normally never have access to. It is a way of asking forgiveness for their departure. But children with money and without guidance easily fall prey to criminals as well as bullies. They also become consumers in a variety of ways, including buying drugs. These problems are then brought to Japan when they rejoin their parents.

Crime
Even though it is common knowledge that the economic crisis, the layoffs, and temporary employment, have left many Japanese nationals in desperate conditions, (at times resorting to unacceptable behavior), crime tends to be seen as something committed by foreigners. Feeding on the public’s perception that foreigners are dangerous, the yakuza recruit heavily among marginalized Nikkei, as well as among Korean and Chinese residents. But a startling fact pertaining to Nikkei youth jumps from the pages of official statistics on Newcomers. While the overall number given for Chinese criminals is double that of Brazilians, crimes committed by youth (14-19) are 4x higher for Brazilians than for Chinese. There is something behind these data.

Some possible solutions:
- Collect accurate data on the conditions of the families of Newcomers in order to find out what is happening around these children.
- Create conditions in which Newcomer communities can come together to identify and solve their own problems.
- Train people to work as liaisons between the various communities and public services.
- Hire more translators and put them in key places such as hospitals, social welfare offices, schools, public services, etc. Make these positions real jobs.
- Do not rely solely on volunteers. Most Newcomers need to work and their time is limited. Volunteers cannot be held accountable in the same way as paid employees. Training cannot progress through stages if people come and go at will.
- Provide information in different languages.

In conclusion
The Nikkei are Japanese by blood. Their numbers are increasing every year. They have come to stay. If their children are not educated, there will be at least one generation, maybe two or three, lost to society. These dislocated people are taking Japanese citizenship in large numbers and will soon become invisible to statistics that count only non-Nationals as foreigners; they will become part of an ever increasing underclass of Japanese society.

Equity in Education: Improving Access to Financial Aid for Low Income Students by Increasing FAFSA Completion in the University of Hawai‘i System

Abstract
Research shows that although many students do not graduate because they cannot afford to do so, millions of dollars in financial aid are left untouched each year. The co-presenters will share interview and survey results from students and financial aid offices across the University of Hawaii System regarding financial aid barriers and best practices in addressing these issues.

Introduction

Equity: Emphasizing Equal Opportunity for Low-Income Students

The purpose of the University of Hawai‘i System (2016b) is to:

Provide all qualified people in Hawai‘i with equal opportunity for high quality college and university education and training.

Last year, students in Hawai‘i missed out on $10.4 million in federal financial aid. Approximately 45% of high school students in Hawai‘i do not complete the Free Application for Federal Student Aid (FAFSA) (Gill, 2016).

UH Manoa and UH West Oahu Leaver’s Surveys show that one of the main reasons students do not complete their education is due to financial reasons. We explored whether students were applying for and receiving the financial aid they need to continue their higher education and graduate, and if not, what the barriers are.

Our focus is on equity for low-income students and providing equal opportunity for them to attend and complete their education in the University of Hawai‘i System.

Barriers For Financial Aid Studied
Our primary research question was understanding the barriers to FAFSA completion. We researched the different phases in FAFSA completion and the reasons for non-submission at each phase.

In addition, we wanted to see if we could identify common best practices across campuses or unique strategies a subset of campuses were using that other campuses could benefit from.
Finally, from a student perspective, we wanted to learn what their reasons were for not completing the FAFSA, what they found most effective and whether there were common myths or misconceptions.

**Background/UH Strategic Initiatives**

University of Hawai‘i Strategic Directions and the Hawai‘i Graduation Initiative (HGI)

As part of the University of Hawai‘i Strategic Directions for 2015-2021 (2016a), the Hawai‘i Graduation Initiative (HGI) specifically states as a goal for the system to:

*Increase the educational capital of the state by increasing the participation and completion of students, particularly Native Hawaiians, low-income students and those from underserved regions and populations and preparing them for success in the workforce and their communities.*

Broad strategies outlined in the Hawai‘i Graduation Initiative include:

**HGI Action Strategy 1: Strengthen pipeline to improve college readiness and attendance**

Strengthen the pipeline from K-12 to the university to improve college readiness and increase college attendance.

- Institutionalize early college and “bridge” programs
- Expand outreach services and support to facilitate the completion of college admissions and financial aid applications

**HGI Action Strategy 2: Structural Improvements That Promote Timely Degree Completion**

Implement structural improvements that promote persistence to attain a degree and timely completion.

- Reduce gaps in college completion for Native Hawaiians, low-income and underrepresented groups. Strengthen and align financial aid resources, policies and practices for increased access and completion.

While not directly a focus of our study, some of our findings will reflect whether these strategies have been implemented successfully.
Comparing Graduation Rates of Low-Income Vs. High-Income Students

According to Anthony P. Carnevale and Jeff Strohl in *Rewarding Strivers* (2010), the top income quintile students scoring below-average in SATs (800-999) graduate at a 52% rate, compared with 44% for bottom income quintile students scoring the highest SAT scores between 1200-1600.

These findings mirror research by Fox, Connolly and Snyder (2005), which shows that students in the top 25% of income and bottom third of test scores graduated college at a higher rate at 30% than those in the bottom 25% of income and the top third of test scores at 29%.
By viewing test scores as an indicator of academic ability, students from lower income socioeconomic households graduate from college at far lower rates than students from higher socioeconomic households with similar academic abilities.

However, the disheartening lesson from the statistics is that students of superior academic ability, if they come from a lower-income household, are less likely to graduate college than students with poor or average academic ability, that come from a higher-income household.

These statistics indicate that a gap in financial assistance may be the reason for lack of college completion. This data corroborates with the results of the leaver surveys previously cited that financial reasons contribute to students not completing their degrees.

**FAFSA Completion Among Students Qualifying for Pell Grants in the State of Hawai‘i**

Simons and Helhoski (2016) estimated the number of graduating seniors who could have been eligible for a Pell Grant if they had filled out a FAFSA, but did not. The study assumed the rate
of Pell-eligible recipients is the same for students who didn’t complete the FAFSA as for students who did. For Hawaii graduating seniors, 45% of nearly 6,000 students did not complete a FAFSA. Nerdwallet estimated that 2,847 would have been eligible, with an average award of $3,624 based on the students who were awarded Pell Grants.

Congressman Mark Takai (2015) referenced the same statistic- 45% of high school students do not complete their FAFSA - in an email newsletter on March 4, 2016, inviting parents and students to four financial aid workshops.

The Role of Eligibility Information vs. Assistance in FAFSA Completion

Bettinger, Long, Oreopoulos, and Sanbonmatsu (2009) studied the effects of two strategies to help families complete their FAFSA. They found that providing families with information only about their eligibility and options resulted in substantially worse completion than providing families with information and assistance in completing the FAFSA. From the abstract:

H&R Block tax professionals helped low- to moderate-income families complete the FAFSA, the federal application for financial aid.

Families were then given an estimate of their eligibility for government aid as well as information about local postsecondary options.

A second randomly-chosen group of individuals received only personalized aid eligibility information but did not receive help completing the FAFSA.

Comparing the outcomes of participants in the treatment groups to a control group using multiple sources of administrative data, the analysis suggests that individuals who received assistance with the FAFSA and information about aid were substantially more likely to submit the aid application, enroll in college the following fall, and receive more financial aid.

These results suggest that simplification and providing information could be effective ways to improve college access. However, only providing aid eligibility information without also giving assistance with the form had no significant effect on FAFSA submission rates.

Equity in Education

A look at Pell Grant Recipients across campuses, shows that less than 30% of students at UH Manoa received Pell Grants, while nearly 50% of students at Hilo received Pell Grants, and less than 45% of students at UH West Oahu received Pell Grants. The chart below indicates that students who did receive Pell Grants were positively correlated with degree completion.
Therefore, if more students filled out the FAFSA and were eligible to receive Pell Grants, degree completion could increase.

**Methodology**

We conducted individual interviews with representatives from Financial Aid Offices and students from across the UH System, as well as with P20. We also surveyed students within the UH System with an online survey.

**Interviews with Offices Across System and P20**

For the one-on-one interviews, we met with someone from every campus in the system. This included offices on every island and a variety of institutions from community colleges to four-year campuses. The interviewees were all well versed in financial aid on their respective campuses.
We spoke with representatives from:
- UH-Manoa
- UH-West Oahu
- Hawai'i Community College
- Honolulu Community College
- Kapi'olani Community College
- Kaua'i Community College
- Leeward Community College
- Maui College
- Windward Community College
- P20

We asked them a variety of questions, centered around:
- What strategies were currently used to encourage students to apply for financial aid and how successful did they feel each one was?
- Were students taking full advantage of financial aid available to them?
- What were common reasons students did not fill out their FAFSA?
- Were there any common themes, myths or misconceptions students had about FAFSA/Financial Aid?

Interviews were conducted in person, on the phone and via email. We learned the common strategies and challenges faced by the campuses. In addition, we learned that campuses had unique situations based on their student population and the community they served. Follow up questions were asked and results documented.

Interviews with Students

We met with students at the Manoa and Windward campuses. Interviews conducted with students centered around their individual experience with financial aid and FAFSA, and what kind of experiences they had with STAR and scholarships.

Follow-up questions were asked based on the students’ responses, focusing on finding out what kind of knowledge they had about financial aid and FAFSA, what struggles they had, who specifically was most helpful and what parts of the process were easy or difficult. Follow-ups also encouraged more detail about other specific types of financial aid - loans, grants and working on campus.
Online Student Survey Across the UH System

A survey was sent out across the entire system. We received nearly 2000 responses. We asked questions to gauge the students’ understanding and opinions of the financial aid process. The full survey instrument and analysis can be found in the appendix.

Results

Interviews-System-Wide Financial Aid Offices

We reached out to individuals at every campus in the system. We received responses from and interviewed members from each island. Every campus in the system was represented.

Strategies being used on campus, in community, and main challenges are summarized below:

Campus Strategies

The most common on-campus strategies reported included:

- Sending emails and reminders to students.
- Posting banners and flyers on campus.
- Providing one-on-one advising, both walk-in and by appointment.
- Organizing a variety of workshops: FAFSA Specific, Scholarship Workshops, and Financial Aid embedded in other workshops such as New Student Orientation.
- Additional programs that provided on campus services supporting Financial Aid included TRIO and Hulili.

Less common on-campus strategies included:

- “Financial Aid Lab” to provide students with a place to get help specifically with FAFSA. This pilot program aims to provide more targeted resources for financial aid when students are applying for financial aid.

Community Strategies

Common community strategies reported included:

- Community Workshops. A variety of workshops in conjunction with PACFAA (Pacific Financial Aid Association), College Goal 808, TRIO and Gear Up. It was reported that the best turnout appeared to be workshops held when the whole family was available such as on evenings and weekends, and at high schools in the community where the students are. TRIO goes into high schools during the day and was reported to be very successful.

Less common community strategies included:

- Workshops with High School counselors to prepare them to speak with high school students
- Including professors and accounting students in community workshops to assist with filling out FAFSA
- Partnering with peer mentors who go to high schools directly and work one-on-one with students. These peer mentors assist with applications as well as financial aid.

Challenges Reported

Common challenges reported were:

- Misconceptions about eligibility. The most common concern reported was that many students thought they would not be eligible, or did not realize what was taken into account for eligibility.
- Application was difficult. The second most consistent challenge reported was that students found the application overwhelming, or difficult to fill out. It was noted this was more pronounced amongst first-generation students.
- Verifications not completed. The third most consistent challenge reported was students had many challenges with verification, such as confusing it with rejection, or not realizing additional steps were needed.
- Lack of response via email and web notifications. It was commonly reported that students were not checking email, were confused by emails they received or did not know how to check email. Similar challenges were noted regarding web notifications in the online student system.
- Timely tax information not available. Reasons varied from parents not doing their taxes, to parents not being in the picture to provide tax information, to parents having but not wanting to provide the tax information.

Less common challenges that were reported included:
- Not knowing what financial aid could be used for. Some campuses reported students did not realize financial aid was not just for tuition, but could also be used for living expenses and books.
- Stigma of financial aid. There were misconceptions reported that some students felt financial aid had a stigma of welfare, that some students felt there was a stigma associated with being poor and that some students felt a sense of pride prevented them from applying from financial aid, a sense that they should pay for school on their own.
- Staffing vs demand. Additional staff would be helpful for one-on-one advising, additional community workshops and more outreach to students. It was consistently reported that staffing was a constraining factor.
### Table 2 - Common Misconceptions and Reality

<table>
<thead>
<tr>
<th>Misconception</th>
<th>Actual</th>
</tr>
</thead>
</table>
| I am not eligible. Reasons: my parent’s income, VA, I have already paid tuition this semester. | ● Students may be eligible based on a combination of income, total college expenses (not just tuition) as well as number of children in college, family size.  
● In addition, rules change. Students are eligible now to use both VA as well as financial aid.  
● Just because you paid tuition and fees, doesn’t mean you no longer qualify. You can apply even after paying for your tuition. |
| I was not eligible before, so I will not be eligible in the future. Or, I was granted aid before, so I am done with FAFSA. | ● Students must re-apply every year and eligibility is re-assessed every year.  
● As the students’ financial situation changes, they may qualify where they did not in the past. |
| Once I submit the FAFSA, I’m done.                                            | ● Students need to be aware that further actions may be required such as Verification.  
● A related misconception is when students are admitted but have some kind of outstanding issue with financial aid, they continue with their classes but leave it unresolved. They need to see the financial office to get it resolved, or they may end up with a hold that impacts their education and prevent registration the next semester. |
| If I accept financial aid, it means my family is poor. It is welfare/an entitlement. | ● There is no stigma with financial aid. Part of this may stem from in other countries you don’t have to apply for FAFSA or financial aid - other countries the higher ed is just free. |
| Financial aid is only for tuition.                                            | ● Financial aid can be used for books, fees, tuition and also living expenses |
| Financial aid is a separate thing I take care of.                            | ● Financial aid is part of the bigger picture which includes admissions and enrollment.  
● Students need to apply for admission to the campus where you will be receiving aid. Due to federal regulations, certain information cannot be shared across campuses so students must keep this in mind for financial aid and admission. |
| It costs money to apply                                                       | ● Applying is free |

**Student Interview Results**

We conducted four interviews with students who completed the financial aid process. The interviewees received varying amounts of Pell Grants, loans and other scholarships.
Much of the feedback we received mirrored the results of the interviews with the campus offices.

- The FAFSA process was difficult and took longer than they expected
- Workshops were helpful, but the most helpful was one-on-one advising and speaking with someone. This included the Hulili program and financial aid offices.
- One student reported that if not for their financial aid, they would not be attending school
- Getting tax information from the parents was one concern noted
- One student noted that getting help from their counselor in high school helped them to complete scholarship applications and earn scholarships
- There was a general concern about understanding the financial process. One student noted being scared and embarrassed to ask
- One student noted that it would be nice to have better reminders to know when different things were due.

System-wide Student Survey Results

- **Income.** 70% reported household incomes of less than $50,000 a year. 90% of students with household incomes under $50,000 received financial aid. Students in the lowest income bracket were the most likely to stop out of college.
- **Working.** 33% percent reported working on campus while 45% said they work off campus. Around 30% said they do not work at all.
- **Financial Aid Importance.** 90% said that financial aid was very important to them when applying to college. 76% said financial aid was very important when deciding whether or not to enroll.
- **Financial Aid Difficulty.** Those who said they experienced financial difficulty reported the reasons for their situation: 64% said their family could not contribute enough and near 50% said their financial situation worsened. Another 1/3 reported that they did not qualify for financial aid and so experienced financial difficulty. ¼ of students said they stopped out of school because of financial difficulty.
- **Cost of College.** More than 1/2 of students reported the cost of college was higher than anticipated.
- **Difficulty filling out the FAFSA.** 30% said it was not difficult at all to fill out the FAFSA form. 35% it was somewhat difficult. Only 5% said it was very difficult.
- **Taxes.** When applying for financial aid, 47% said they used their parents taxes for the FAFSA form and 53% used their own taxes. 30% reported that it was not difficult at all to file their taxes or their parents' taxes. 35% found it somewhat difficult. Only 10% found it very difficult to file their taxes.
- **Process.** The majority who did not apply for financial aid thought that they didn’t qualify. A little over 1/3 did not apply because they did not understand the process. Another 20% said it was too difficult a process while another 20% missed the deadline.
• Financial aid barriers. The majority of students said that tax preparation was a barrier although only a third found this to be difficult. Half of the students reported that parental income information was a barrier. Being dependent to their parents was a barrier for 30%.

• Assistance. Near 1/2 said they received help from the Financial Aid office, 1/4 from financial aid workshops and 19% from their high school counselor. 33% reported receiving help from other sources (open-ended responses).

Discussion

What Is Being Done Now And How Effective Is It?

Here are some common approaches being used now, and their reported effectiveness from the campus financial offices perspective specifically with regards to completion of FAFSA:

• Web-based FAFSA calculators. Not Effective. All campuses have a web-based calculator available on their website. Consistently, they reported that the calculators were confusing for students and parents alike and they did not feel it was an effective strategy for increasing FAFSA completion. It was noted however that it was a requirement to have such a calculator available.

• Online Notifications: Emails and Information on Student Information System when they log in. Low Effort for Staff, Low Effectiveness. Campuses consistently reported sending some kind of follow up emails, specifically for cases such as students who filed incomplete FAFSAs, students who need to reapply, students selected for verification. Consistently, they reported a concern that students either 1) do not check their email regularly or 2) do not know what to do once they receive the email. The consensus reported was that they continue to use this tool though it is not very effective.

• One-on-one counseling with students and/or parents. Most Effective. Campuses consistently reported that the one-on-one advising was most effective, but the challenges noted were that not everyone comes in for one-on-one advising, and if many students did come in then staff available would be the scarce resource. Campuses also reported that parents were welcome to come with the student, though many students did not know that.

• Financial Workshops on Campus and In Community. Highly Effective. Held on Weekday Evenings and Weekends when parents are available to attend as well. Larger Workshops on Campus where Finances is one subject covered along with enrollment, admissions is also Highly Effective. Held on Saturdays, or in conjunction with new student orientation. Timing is at the beginning of the year (January/February). March is the Priority Deadline so try to get them before that, This works well for those who come in - but not everyone comes in. Next year, some campuses trying an April/May
workshop as well because by then most people should have filed their taxes. Before they get here – the Pacific Association for Financial Aid Administrators-College Goal 808 goes out and helps students do the FAFSA.

Effectiveness of Distributions

It was consistently reported that Pell Grants specifically are not all being utilized, because students are not applying for financial aid. The financial aid officers felt that campus-specific aid was being utilized. If one student did not receive the aid a different student would, and in rare cases when all aid was not expended, the money would roll over to the next year to be used.

Recommendations

Based on the interviews we conducted with financial aid offices, students and the survey, our recommendations are:

- **Continue and expand community workshops and community outreach.** Community workshops and mentorship in the community were consistently reported as being highly effective strategies, and staffing was the limiting constraint. These workshops often take place on evenings and weekends when families are available and are done in addition to normal business hours maintained by staff. Campuses also reported getting requests each year from high school counselors, community based organizations and such to provide staff to do financial aid presentations. However, with the staff available offices cannot say yes to everyone who asks, let alone actively seeking out opportunities to educate the community on financial aid.

- **Related to the above: Community assistance for tax return completion.** There is a huge need in the community to help with the tax return before filling out the FAFSA. Probably more assistance with tax prep would be helpful, but now that the FAFSA has changed, the income tax info might not be as important.

- **Ensure financial aid is addressed as early as possible (such as in high school).** FAFSA completion strategies should be intrusive. Learning about college and financial aid should be part of the high school curriculum.

- **Provide resources to walk people through the FAFSA.** Many of the concerns came down to needing more resources for one-on-one advising and walking parents/students through the process. Some examples include initial FAFSA completion, assisting with verification, and getting current students to re-apply early. Additionally, when students ask their friends or family for help vs financial aid staff it causes misconceptions to spread - do not want them to just ask their friends.
Less reliance on email (unless able to somehow improve the response to email). Currently the scalable solution used for many communications, including reminders, is either email or in some cases physical mail, but it was consistently reported that there is not good response from emails. It is possible that this is further complicated due to income, as it was anecdotally reported that many lower income students were not as familiar with email.

   j) Windward Community College

2) Please choose the appropriate household income level:
   a) Less than $50,000 a year
   b) $50,000 to $74,999
   c) $75,000 to $99,999
   d) $100,000 to $149,999
   e) More than $150,000

3) How many hours per week did you have paid employment while in college or university?
   On campus:
   a) 0 to 10 hours
   b) 11 to 19 hours
   c) 20 to 30 hours
   d) Over 31 hours a week
   Off campus:
   a) 0 to 10 hours
   b) 11 to 19 hours
   c) 20 to 30 hours
   d) Over 31 hours a week

2) How important was financial aid to you when you applied for college or university?
   a) Not important at all
   b) A little important
   c) Somewhat important
   d) Very important

3) How important is financial aid to you in deciding whether or not to enroll for next semester?
   a) Not important at all
b) A little important

c) Somewhat important

d) Very important

4) Have you ever stopped out of school because of financial difficulty?

a) Yes

b) No

If yes, please describe your experience:

5) Please check the following reasons for financial difficulty:

a) My family could not contribute enough

b) My financial situation worsened

c) I lost my financial aid

d) I lost my job/could not find a job

e) I did not qualify for financial aid

6) Have you ever applied for financial aid?

a) Yes

b) No

c) I’m not sure

7) Why haven’t you applied for financial aid?

a) I didn’t think I would qualify or receive financial aid

b) I didn’t think I would need financial aid

c) It was too difficult a process

d) I did not understand the process

e) I missed the deadline

8) Did you turn in your application by the deadline?

a) Yes

b) No

If not, please describe why you did not apply on time:

9) Did you receive financial aid?

a) Yes

b) No

c) I’m not sure

10) How difficult was it to fill out the financial aid form (FAFSA)?

a) Very difficult

b) Somewhat difficult

c) A little difficult

d) Not difficult at all

Comments (if any):
11) When applying for financial aid whose taxes did you use for the FAFSA?
   a) Parents’ taxes
   b) My own taxes

12) Are you claimed on someone else’s taxes or are you independent?
   a) I am a dependent
   b) I am independent

13) How difficult was it to file your parents’ / your taxes?
   a) Very difficult
   b) Somewhat difficult
   c) A little difficult
   d) Not difficult at all
      Comments (if any):

14) What were the barriers to applying for financial aid?
   a) Tax preparation
   b) Parental income information
   c) Not knowing where the forms are
   d) Being claimed as a dependent by a parent/guardian

15) How likely are you to apply for financial aid in the future?
   a) Not likely at all
   b) A little likely
   c) Somewhat likely
   d) Very likely

16) Please tell us any sources of help when filling out the FAFSA. Check all that apply.
   a) High school counselor
   b) High school teacher
   c) Financial aid workshop
   d) College Financial Aid office
   e) College faculty
   f) Other: please describe

17) In what ways could UH have offered more support to you to encourage/help you to apply for financial aid?

18) How familiar are you with the following types of financial aid?
   · Scholarships/grants from a university or college
   · Student loans (Federal Stafford loans, Federal PLUS loans, private loans)
   · Pell Grants
   · Federal Work Study
   · Tax credits
VA Educational Benefits
Supplemental Education Opportunity Grants
Hawaii Community Foundation scholarships
Hawaii businesses/Kamehameha schools etc.

a) Not familiar at all
b) A little familiar
c) Somewhat familiar
d) Very familiar

19) What types of financial aid did you expect to receive? Check all that apply.
a) Scholarships/grants from a university or college
b) Student loans (Federal Stafford loans, Federal PLUS loans, private loans)
c) Pell Grants
d) Federal Work Study
e) Tax credits
f) VA Educational Benefits
g) Supplemental Education Opportunity Grants
h) Hawaii Community Foundation scholarships
i) Hawaii businesses/Kamehameha schools etc.
j) Not sure
k) Decline to answer

20) What types of financial aid did you receive/are you receiving? Check all that apply.
a) Scholarships/grants from a university or college
b) Student loans (Federal Stafford loans, Federal PLUS loans, private loans)
c) Pell Grants
d) Federal Work Study
e) Tax credits
f) VA Educational Benefits
g) Supplemental Education Opportunity Grants
h) Hawaii Community Foundation scholarships
i) Hawaii businesses/Kamehameha schools etc.
j) Not sure
k) Decline to answer

21) How did the actual cost of college compare with what you originally anticipated?
a) A lot less than I anticipated
b) Less than I anticipated
c) About what I anticipated
d) Higher than I anticipated
e) A lot higher than I anticipated
22) How familiar were you with deadlines for applying for financial aid?
   a) Not familiar at all
   b) A little familiar
   c) Somewhat familiar
   d) Very familiar

23) How did you find out about financial aid opportunities?
   a) High school counselor
   b) Online search engine
   c) College or university website
   d) Brochures or printed material from a college or university
   e) College or university admissions office
   f) College or university financial aid office
   g) Family
   h) Friends
   i) Teachers
   j) Other: please describe
   k) I didn’t look for financial aid information

24) How helpful were each of these sources of information in finding out about financial aid opportunities?
   · High school counselor
   · Online search engine
   · College or university website
   · Brochures or printed material from a college or university
   · College or university admissions office
   · College or university financial aid office
   · Family
   · Friends
   · Teachers
   · Other: please describe
   a) Not helpful at all
   b) A little helpful
   c) Somewhat helpful
   d) Very helpful

25) How easy was it to find information about financial aid for college?
   a) Very easy to find
   b) Easy to find
   c) Difficult to find
   d) Very difficult to find

26) How would you rate the quality of information about financial aid that you found?
a) Excellent
b) Good
c) Fair
d) Bad
e) Terrible

27) How would you rate the amount of information about financial aid that you found?
a) Too much information
b) Just the right amount of helpful information
c) Not enough information

28) What would you have liked to have more information on or help with when researching financial aid?
a) Application process
   i) Tax returns
   ii) FAFSA
b) Deadlines and other requirements
c) Scholarships and financial aid options
d) Tuition and other college costs
e) Repayment of finances
Appendix B: Financial Aid Survey Results

Executive Summary

Financial aid is an important factor in students’ decisions to attend and stay in college. However institutional data across the University of Hawai‘i system shows that the percentages of students receiving financial aid are low in comparison to the population of students who are more likely to qualify for financial aid. Because of the positive effects of financial aid on student retention, this survey was designed to investigate student financial aid experiences and why some students do not apply.

The survey was sent out to approximately 50,000 students of University of Hawai‘i universities and community colleges who are at least 18 years old during the Spring 2016 semester. Of 1948 respondents across the UH system, 1890 students consented to participate in the survey. Highlights from survey findings include:

- The majority of students (69 percent) reported household incomes less than $50,000 a year.
- Financial aid is important to 90 percent of students when applying to college. A quarter of students reported they stopped out of school because of financial difficulty, most commonly because student families could not contribute enough, financial situations worsened, or they did not qualify for aid. Many of these students noted that attending college would be impossible for them without financial assistance.
- 95 percent of students said they applied for financial aid; others did not apply because they did not think they would qualify for or receive financial aid or because they did not understand the process.
- 96 percent of students who applied reported that they turned in their application on time. Most students who missed the deadline did so because taxes were not filed in time, especially parents’ taxes.
- 87 percent of students received financial aid, while 11 percent did not. Majority of students expected to receive federal grants and university aid but fewer students actually received these types of aid.
- About two-thirds of students found the FAFSA form to be at least a little difficult to fill out, primarily because of the tax portion and finding the form confusing in general.
- The majority of students said that tax preparation and reporting parental income information were barriers in the financial aid process. Being considered a dependent of their parents was also a barrier although about 52 percent of students said they are independent and used their own tax information when applying for aid.
- Students received help in the application process mainly from the Financial Aid office with fewer students reporting help from financial aid workshops, high school counselors, family members, and friends.
• The majority of students wanted more information and help with scholarships and financial aid options, filing taxes, and understanding deadlines, requirements, and tuition and other college costs. They find financial aid and admissions offices, family, and the internet at helpful sources of information.

Student Participants

Of 1948 respondents across the UH system, 1890 students consented to participate in the survey. 1786 participants identified which campus they are attending. Almost a third of the participants attend UH Manoa, 15 percent attend UH Hilo, and 14 percent attend UH West O`ahu. Leeward had the most participants amongst the community colleges.

*Figure 1. Percentage of participants by University of Hawai`i campus (n=1786)*

The majority of students, or 69 percent, reported household incomes of less than $50,000 a year. Almost 8 percent of students surveyed report household incomes above $100,000 a year.

*Figure 2. Percentage of participants by reported household income level (n=1759)*
About 33 percent of participants reported working on campus while 45 percent said they work off campus. Approximately 100 students work multiple jobs, both on and off campus. Another 29 percent said they do not work at all (see Figure 3 on the next page).

Importance of Financial Aid

About 90 percent of students said that financial aid was very important to them when applying to college. Slightly fewer students (76 percent) said financial aid was very important when deciding whether or not to enroll.
Financial aid was so important that a quarter of students reported they stopped out of school because of financial difficulty. Those who said they experienced financial difficulty reported the reasons for their situation and had a chance to comment on their answer. The top reasons for financial difficulty were that student families could not contribute enough (64 percent) or that their financial situation worsened (48 percent). Many students noted in the comments that attending college would be impossible without financial assistance. Highlights from student comments include:

- Students reported that their parent income was too high to receive aid and their families either could not afford school or would not pay for school. Some students were independent but their parents' income was still considered in financial aid decisions.
- Nearly 170 students said they dropped out because they could not afford going to school due to the cost of living, bills, not receiving enough aid, not wanting to take out loans, and needing to take time off to work to pay for school again. Some students would take just a semester off while it took others years to come back to school after working and saving up. The relationship between school and work was difficult for a majority of students. Students could not afford school with only part-time jobs but could also not focus on school and succeed while working fulltime.
- About 50 students shared that they had to stop school in order to work and/or support their families, either children or ailing parents and family.
- Students who did not qualify for financial aid said it was due to parent income but also low grades, previous degrees, or their part-time student status.
- Small groups of students said they experienced difficulty and dropped out because of bad experiences with their financial aid office, being unaware of financial aid opportunities, or personal health issues.
All students reported how their anticipated cost of college compared to the actual cost. More than half reported it was higher than anticipated. Just over a third of students felt that it was about what they anticipated.

The Application Process

Students were asked a series of questions describing their application process and experience. The following describes the findings from these questions:

- **Application:** Of 1776 students, 95 percent reported that they applied for financial aid. About 4 percent said that they have never applied and 2 percent said they were unsure.
On-time application: 96 percent of students who applied reported that they turned in their application by the deadline. The majority of those who did not apply on time were still waiting for their or their parents’ taxes to be filed. Some parents filed for an extension or W-2 forms did not come in on time. Some students noted that having the financial aid deadline before the deadline for tax filing created problems for them. Other reasons for missing the deadline included not knowing about the deadline or having to reapply every year, late application to school or late acceptance notice, questioning if they would qualify for aid and so not applying, and mistakes on application forms.

Difficulty of FAFSA: Students did not find the FAFSA form to be very difficult to complete. About a third of students said it was not difficult at all to fill out the FAFSA form. Another third felt it was a little difficult and a quarter reported it being somewhat difficult. Only 5 percent said it was very difficult (see Figure 7 on the following page). Students said the FAFSA form was difficult mostly because of the tax portion and waiting for parents’ taxes to be filed. Suppling parent information was difficult for some because their parents do not support their schooling or they are independent. Other students said it was confusing and time consuming.

Figure 7. Percentage of students reporting difficulty of filling out the FAFSA form (n=1607)

Tax Filing: When applying for financial aid, 47 percent said they used their parents’ taxes for the FAFSA form and 53 percent used their own taxes.

- Related to this, 52 percent said they are independent and are not claimed on another’s tax forms while 48 percent are dependents and claimed by someone else.
- A third of students reported that it was not difficult at all to file their taxes or their parents’ taxes. A third found it difficult and a quarter found it somewhat difficult. Only 10 percent found it very difficult to file their taxes. Problems with filing taxes were due to disability, not being able to afford tax preparation help, being inexperienced or a first time filer, not receiving W-2s in time, and complications with military tax filing or VA paperwork.
• **Reasons for not applying:** Only about 5 percent of students did not apply for financial aid. They did not apply because they did not think they would qualify for or receive financial aid (62 percent) or because they did not understand the process (39 percent). Figure 9 shows why students did not apply for aid.

Figure 9. Percentage of students reporting why they did not apply for financial aid (n=95)

- I didn’t think I would qualify or receive financial aid: 62.1%
- I didn’t think I would need financial aid: 13.7%
- It was too difficult a process: 20%
- I did not understand the process: 38.9%
- I missed the deadline: 18.9%

• **Barriers to financial aid:** The majority of students said that tax preparation was a barrier although only a third found this to be difficult. Students said it was difficult because they had to wait for W-2s and tax filings, especially for their parents. Half of the students reported that parental income information was a barrier. Being dependent to their parents was a barrier for 30 percent. Some students said that things weren’t as difficult once they were over 24 years old so they did not have to include parent information anymore.
• **Help in the application process:** Students shared where they received help when applying for financial aid (see Figure 11). Near half of the students said they received help from the Financial Aid office, a quarter from financial aid workshops and 19 percent from their high school counselor. 33 percent reported receiving help from other sources, most often from family members but also from friends, online sources, workshops, and even tax preparers, accountants, and bank officers. Many students said that they figured things out on their own.

![Figure 10. Percentage of students reporting various barriers to financial aid](image)

![Figure 11. Percentage of students reporting receiving help when applying for financial aid by source](image)
Financial Aid Awarded

About 87 percent of students received financial aid, 10.8 percent did not receive aid, and 2.4 percent were not sure. Reasons reported for not receiving financial aid include:

- Parent income too high
- Ineligibility due to low GPA/grades, too many credits, or already possessing a degree
- Not meeting financial aid or tax filing deadlines
- Still waiting for financial aid decision or dispersal

Students were also asked about what aid they expected to receive and what aid they actually did receive. About 79 percent of students expected to receive federal grants while only 65 percent reported receiving it. 65 percent expected to receive financial aid from their university but only 46 percent did receive it. Students’ expectations and receipt of loans were nearly the same at about 50 percent (see Figure 13).

Almost half of students were very familiar with federal grants while a third were very familiar with scholarships and student loans. Students were the least familiar with VA educational benefits followed by Hawaii Community Foundation and Kamehameha Schools scholarships (see Figure 14).

Figure 13. Percentage of students reporting expected aid and actually received aid by type (n=1605)
Figure 14. Percentage of students reporting familiarity with financial aid by type (n=1630)

Improving Assistance with Financial Aid

Students would have liked more information or more help with scholarships and financial aid options. About half wanted help and information regarding filing taxes, deadlines and other requirements, and tuition and other college costs (see Figure 15). Some students requested more information on eligibility requirements for aid and scholarships (i.e. credit maximums, minimum credit loads per semester, etc.) and more information on the financial aid decision process and timing, especially when aid or loans are dispersed late and/or at different times.
Students want to know more information about financial aid processes and opportunities. Figure 16 shows students find financial aid offices, online search engines, family, and admissions offices the most helpful to find out financial aid information.

### Figure 16. Percentage of students reporting how helpful various sources are in informing about financial aid opportunities, by source (n=1582)

The Impact of an Integrated STEM After-School Program on Elementary Students’ Beliefs About the Role of the Teacher

Abstract

The beliefs that students hold about the role of the mathematics teacher are important because they can affect students’ ability and willingness to persevere in solving non-routine problems that are prevalent in integrated science, technology, engineering and mathematics (STEM) education. This case study describes the beliefs about the role of the mathematics teacher of fourth and fifth grade students at a Title I Elementary School in a large Southwestern school district. The elementary students participated in a five-day afterschool program focused on integrated STEM (Science, Technology, Engineering, and Mathematics) Model-Eliciting Activities.

Data collected included a pre and post-questionnaire, five focus groups and six individual interviews selected so that there were two high-, two middle- and two low-achieving students. Interviews and focus groups were done before and after the afterschool program as well as after the completion of each MEA.

Participants initially believed that the teacher should always explain new material first but that the teacher should let students figure out practice problems and then only help the students after they got stuck on the problems. In the post- interviews and focus group the majority of participants believed that the teacher should at times let students figure out problems for themselves before explaining the problems. This is promising for the implementation of integrated STEM education because students’ beliefs about the role of the teacher profoundly affect their ability to solve non-routine problems frequently encountered in integrated STEM education.
The Impact of an Integrated STEM After-School Program on Elementary Students’ Beliefs About the Role of the Teacher

Our society is increasingly more dependent on science, technology, engineering and mathematics (STEM) disciplines. The United States Bureau of Labor Statistics (BLS) (2009) reported that in 2018 over 8.5 million jobs will be in STEM fields and 80% of the jobs in the future will require technology. Currently, there is no evidence to suggest that this trend will change. Being able to understand and apply mathematics is essential for the other STEM subjects. Even if an individual does not pursue a STEM career, they need to have some degree of STEM literacy, including mathematics literacy, to participate in society. The mathematics necessary to be successful in everyday life is different from the mathematics currently taught in schools (Lesh & Doerr, 2003; NAS, 2014). In order to better prepare students for the mathematics they will use later in life, students should be given opportunities to participate in integrated STEM education, which can also give them productive beliefs about mathematics.

Students’ beliefs about the role of the mathematics teacher are important because if students believe it is the teachers’ job to transmit knowledge, students may play a more passive role in their mathematics learning (Kloosterman, 1996). In order to meet the goals of the National Council of Teachers of Mathematics (NCTM, 2000) including communication, connections, and problem solving; as well as the U.S. Common Core State Standards for Mathematical Practices (Common Core State Standards Initiative, 2010) including make sense of problems and persevere in solving them, construct viable arguments and critique the reasoning of others, and model with mathematics, students must be engaged participants in mathematics.
This case study describes the mathematics-related beliefs, about the role of the mathematics teacher, of fourth and fifth grade students at a Title I Elementary School in a large Southwestern school district. The elementary students participated in a five-day afterschool program focused on integrated STEM (Science, Technology, Engineering, and Mathematics) mathematical modeling activities. This study is important because students’ beliefs affect their problem solving behaviors and are shaped by school mathematics curriculum and instruction as well as the socio-mathematical norms that students encounter (Yackel & Rasmussen, 2002).

Model-Eliciting Activities

The activities used in this study were Model-Eliciting Activities (MEAs). MEAs are open-ended problems where students answer to a client and create complex solutions that are generalizable to different situations (Lesh & Doerr, 2003; Lesh & Zawojewski, 2007). In MEAs, students use mathematics that is similar to the mathematics used to solve real-life problems (Lesh & Doerr, 2003). In order to solve MEAs it is necessary for students to mathematize or interpret real-world situations (Lesh et al., 2000) thus developing higher-order thinking skills (Stohlmann, Maiorca, & Olson, 2015). According to Lesh and Doerr (2003), mathematizing is the process of “quantifying, dimensionalizing, coordinatizing, categorizing, algebratizing, and systematizing relevant objects, relationships, actions, patterns, and regularities” (p. 5).

MEAs are implemented in a standard format that includes opening reading or video, readiness questions, problem statement, group work time, presentations, and time for revision or reflection. The opening reading or video is done so that students are able to become familiar with the realistic context of the MEA. Readiness questions ensure that
students have understood the opening video or reading and also for them to begin to think about the problem that they will solve. The problem statement gives groups their specific question they will be answering. Groups work together and then present their solutions. Finally, groups are given time to revise their solutions and reflect on the mathematics they used and how well they worked in their group.

MEAs are problems where groups create realistic models using different representations (Lesh, 2000). Some models are designed to represent complex mathematical situations using technology and can be simpler representations of more complex situations using symbols, graphs, or language (Lesh & Doerr, 2003). While there are multiple models or solutions to MEAs, all of these models can be developed using the four-step iterative process: describe, manipulate, translate (or predict) and verify (Lesh, Doerr, Carmona, & Hjalmarsön, 2003). In order to solve a MEA, students will complete several iterations of this process and will often refine, revise and extend powerful mathematics constructs not ordinarily taught in the traditional classroom setting (Hamilton et al. 2008; Lesh, & Doerr, 2003). MEAs can also be used to integrate STEM subjects by students applying their mathematics and/or science knowledge through the engineering design process as they plan, test, and revise their models (English, 2010). The skills that can be developed through an integrated STEM approach-- including critical thinking, innovation, and communication—are valuable for any career that a student may pursue (National Academy of Sciences, 2014).

**Integrated STEM**

As society becomes more advanced, science, technology, engineering and mathematics (STEM) are becoming more prevalent. New knowledge in STEM fields is
rarely composed of just a single content area because STEM fields are highly inter-
related (Stohlmann, Moore, & Roehrig, 2012). The National Academy of Sciences (NAS)
(2014) described this inter-relatedness,

Scientists use technological tools to conduct experiments and mathematics and
statistics to interpret the data produced by those experiments; engineers draw on
scientific knowledge and mathematical reasoning to develop and model potential
design inventions and solutions; technologists who build and maintain the
products and systems designed by engineers must understand the scientific and
mathematical principles governing their operation. (p. 20)

Even if individuals will not be working in a STEM field, it is important for them to
receive an authentic education that includes integrated STEM because students need to
develop the life skills necessary to succeed in a society that is strongly dependent on the
many applications of integrated STEM. Although there has been increased focus on
STEM education, there remains some disagreement as to what exactly STEM or the
integration of STEM education is (National Academies, 2014). For this study, integrated
STEM is defined as the combination of at least three of the STEM fields through natural
connections in the subjects. In the MEAs used in this study, mathematics and/or science
concepts were developed through the engineering design process and technology was
incorporated as a tool students could use to help to solve MEAs.

Although there are only a few quantitative studies that examined integrated
STEM education, Becker and Park (2011) conducted a meta-analysis to examine the
effects of integrated STEM education. Becker and Park (2011) found that teaching
integrated STEM had a positive effect on student achievement, where as students who
were taught using the traditional teaching methods had no such effect. The researchers also found that integrated STEM education was a more effective teaching strategy than separately teaching the subjects. They indicated “due to the lack of a comprehensive review regarding the effects of integrative approaches among STEM subjects on academic achievement, many teachers are unaware of the benefits of the integrative approaches for student learning” (p. 23). They also found that “various types of integrative approaches could serve as bridges between the theoretical learning of mathematics and science and the practical learning of technology and engineering” (p. 32).

Venville, Wallace, Rennie and Malone (2012) conducted a qualitative research study that described the implementation of integrated science, technology and mathematics in a school environment where these subjects were taught in separate classes. The researchers wanted to know what this would do to student learning. Participants were separately introduced to concepts in their mathematics, technology and science classes and in an after-school program the researcher used technology-based projects to integrate mathematics and science concepts. The researchers found that although it was challenging, teachers with subject-specific backgrounds could work together to provide students with opportunities to learn in an integrated setting. The researchers also found that student learning were enhanced when students were able to apply the knowledge they learned in their separate classes together.

The Common Core State Standards for Mathematics (CCSSM, 2010) suggest students should be able to connect and use mathematics in other contexts, such as engineering and science (NAS, 2014). One goal of the CCSSM is to provide students with the skills and
knowledge to succeed in our technological society and the ability to compete in a global economy. The CCSSM standards for mathematical practice include: the ability to make sense of problems and persevere in solving them; abstract and quantitative reasoning; construct and critique arguments; mathematical modeling; use suitable mathematical tools; attend to precision; the ability to identify and use patterns and structures; and identify and use repeated reasoning. There is a new emphasis on mathematical modeling and the ability to apply these skills to nonmathematical concepts. The CCSSM emphasize a more student-centered teaching approach rather than the teacher-centered approach used in traditional mathematics education. The CCSSM can provide students the opportunity to explore mathematics curriculum and develop higher-level thinking skills (CCSS, 2012). The interaction with other students through collaboration can provide students with the social context necessary to develop a deep understanding of mathematics and the ability to work in teams. **Student beliefs about the role of the teacher**

Students’ beliefs about the culture of their mathematics classrooms influence their problem-solving abilities (McLeod, 1989, 1992; Underhill 1988). This can be seen as students’ responses to non-routine problems are profoundly affected by their views of their role and the teacher’s role in the classroom (McLeod, 1989). For example, students who believe that the teacher’s role in the classroom is to transfer knowledge to students and it is the student’s responsibility to receive it will struggle solving non-routine problems. In MEAs the role of the teacher is to facilitate learning and the student needs to construct their solution independently of the teacher (Lesh & Doerr, 2003). In this setting students might initially struggle because their beliefs about mathematics classroom
culture are being challenged. Also, students who believe that mathematics is being able to do computations quickly and efficient, may not be interested in problems that cannot be solved quickly with a straightforward procedure (Kloosterman, 1996).

For Kloosterman (1996), the role of the teacher was examined from the students’ perspectives. The traditional view of a teacher is a lecturer and the person who provides correct answers. Kloosterman (1996) taught a class to fourth grade students on non-routine problem solving. In this course, Kloosterman did not give students the correct answers because the author wanted to develop the students’ own intuition and skills. The author found that the students’ beliefs about the role of the teacher caused cognitive dissonance. This led to student dissatisfaction and some students’ refusal to work in this class. Kloosterman (1996) stated that students who believe the teachers’ role in the classroom is to transmit knowledge might be less motivated to learn when they are in a classroom where they are required to construct their own mathematical knowledge. Kloosterman (1996) found that most students believed that the role of the teacher was to transmit knowledge and provide students with the answers.

Methods

Participants and Setting
**The School.** The school was purposefully sampled because it was a Title I elementary school with a diverse student population in a large, Southwestern school district. The elementary school serves a diverse student population of 840 students; approximately 82% are minority students. Seventy-seven percent of the students receive free and reduced lunch and approximately 24% of the students are classified as English Learners.

**The Participants.** Twenty-four participants were sampled from the overall fourth and fifth grade populations. There were 11 fourth grade students, 4 boys and 7 girls, and 13 fifth grade students, 6 boys and 7 girls. Eight students identified themselves as white, nine Latino, two Asian, two Black, one Pacific Islander and two as bi-racial. Eighteen students received free and reduced lunch, five students were labeled as English Learners (ELs) and one student was on an Individualized Education Program (IEP).

The Criterion Referenced Test (CRT) scores were collected for all participants. The CRT is a standards-based test that is used to measure specific skills that students should have for third through eighth grades (Great schools, 2014). The CRT scores are separated into the categories *exceeds the standard* for scores greater than 400, *meets the standard* for scores between 300 and 400, and *approaching the standard* for scores that were less than 300. The students’ previous CRT scores were used to determine the achievement levels of students so that all levels were represented in semi-structured interviews that were conducted. Using the CRTs, six participants were purposefully sampled to participate in interviews so that there were two high-, two middle- and two
low-achieving level students. Nine participants were classified as high achieving because their CRT scores were identified as *exceeds standards or meeting the standard* with a score greater than 350. Eight participants were classified as middle achieving because their CRT scores were *meets the standard* with scores between 300 and 350. Four participants were classified as low achieving because their CRT scores were *approaching the standard* and two participants were classified as no score because they did not have CRT scores from the previous year (see Table 5).

Research Context

**The After-School Program.** The program met after school at the elementary school for five weeks. Each session was 2.5 hours long. There were 24 participants who were grouped in fours at six tables for each of the activities. The facilitators included a teacher from the elementary school, the researcher and occasionally another graduate student.

**Day 1.** During the first session participants completed a questionnaire and the Marshmallow Challenge (http://www.marshmallowchallenge.com). The Marshmallow Challenge was used as the first activity because it introduced the participants to the engineering design process and working in groups. In the Marshmallow Challenge participants are given 20 pieces of spaghetti, a yard of string, a yard of tape and a marshmallow. Using only the given supplies, participants were given 20 minutes to build the tallest freestanding structure with the marshmallow on top. After students completed the Marshmallow Challenge they were introduced to the engineering design process and then were given an opportunity to rebuild their marshmallow structures.
Day 2. On the second day participants completed the Survivor MEA (Maiorca & Stohlmann, 2016). In this MEA students were asked to design a shelter that was sturdy, water resistant, and spacious enough for people to survive while stranded on an island. The mathematical topics that this MEA focused on were estimation and mathematical reasoning, proportional reasoning, and problem solving. Students had to work in dissimilar measurement scales and convert between scales. Students also had to make decisions about whether or not a solution meets the needs of a client.

First students were given a video to introduce some science content and set the context for the MEA (FlowMathematics, 2013). Then the students were asked to first answer the readiness questions individually and then share their answers with the whole group. Students were then given the problem statement and given time to build their models. The models were tested to see if they could withstand wind and rain. Students then wrote their letters to the client, shared out their solutions with the rest of the group and completed the student reflection forms.

Day 3. Students completed the Rocket MEA, adapted from Try Engineering’s Water Rocket Launch Activity (2010). In this MEA participants were asked to design a water rocket for Virgin Galactic using everyday materials. This MEA addressed the engineering design process, numerous science standards and the Common Core Standards of Mathematical Practice: make sense of problems and persevere in solving them, construct viable arguments and critique the reasoning of others, model with mathematics, use appropriate tools strategically and attend to precision (CCSSM, 2010).
Students also had to make decisions about whether or not their solution met the needs of a client.

Students were given a background article and took turns reading it aloud to the whole group. Then they answered the readiness questions. Students then were given the problem statement that was read aloud as a whole group and were given time to build their models. After participants built their models, the rockets were taken outside and launched. The participants then returned inside, shared their thoughts on their modeling process with the rest of the participants, wrote their letters to the client, and then completed student reflection forms.

Day 4. Students participated in the Mars Rover MEA, adapted from NASA’s Mars Pathfinders Egg Drop Challenge. Students were asked to design a capsule that protected its payload when dropped. This MEA focused on mathematical reasoning and problem solving. Students demonstrated an understanding of the challenges of soft landing a spacecraft on Mars, made decisions about whether or not a solution met the needs of a client, and communicated the solution clearly to the client.

The students first watched a short video that established the context for the problem. Students then answered readiness questions and as a whole group read out loud the problem statement. Students were then given the remaining time that day to build their models. Initially students were provided a basket that had samples of the materials they could use to build their rovers. Before students were able to begin building the rovers they had to determine what materials they could use that were within the allowed $300 budget. Participants then purchased their items from the classroom teacher. Participants were allowed to buy additional items if their budget permitted but were not allowed to
return any items that were already purchased. During the next meeting of the after-school program the rovers were dropped from the roof of the elementary school.

**Day 5.** The last day of the program began with the participants testing the Mars Rovers, designed during the previous session. The researcher dropped the rovers off the roof of the elementary school while the participants observed from the ground below and timed how long it took for each rover to fall from the roof to the ground. After all of the rovers were dropped the participants returned to the classroom and then used the data collected to calculate the rate the different rovers were traveling while they fell to the ground using the \( distance = rate \times time \) formula. Each group then wrote a letter to their client, shared their strategies with the rest of the participants, and completed student reflection forms.

After the Mars Rover MEA was completed the participants completed the Freighter MEA, adapted from Lee’s (2014) Tinkering with Buoyancy Activity. In this MEA participants were asked to design a boat that could hold the most freight with the least expense to the boat-building company. The mathematical topics that this MEA addressed were estimation and mathematical reasoning, as well as problem solving. Students also had to make decisions about whether or not a solution met the needs of a client.

In this MEA students watched a video to introduce the context of the problem, answered readiness questions, and then as a whole group read the problem statement out loud. Participants were then given time to design and test their model and write their client letter. After participants completed the Freighter MEA they completed the post-questionnaire survey.
Data Collection and Analysis

In case studies it is important to collect documents, artifacts, interviews and observations (Bernard & Ryan, 2010; Creswell, 2013; Marshall & Rossman, 2010; Yin, 2014). The purpose of this section is to describe the questionnaire, interviews, focus groups and classroom observation that were used in this study.

Instruments

Questionnaire. The questionnaire was developed by modifying the Indiana Mathematics Beliefs Scale, which was originally developed to measure the mathematics beliefs that were “related to motivation and thus achievement on mathematical problem-solving” (Kloosterman & Stage, 1992, p. 109) of secondary and college-age students. Kloosterman and Stage (1992) stated, “each scale should be measured separately and there is no overall scale” (p. 114). The original survey was aligned to seven beliefs, including the role of the teacher. The original questions that were prepared were initially given to three mathematics educators at the collegiate level, including Kloosterman, to determine if the questions were related to the beliefs that they were supposed to measure. Kloosterman suggested that questions regarding the category, the social context that mathematics is learned, be removed because elementary aged students would provide inconsistent answers for what it means to do group work. Therefore the questions that related to this belief were removed from the survey. The modified survey was given to two elementary schoolteachers to determine if the wording was developmentally appropriate for the students. After the wording was determined developmentally appropriate the survey was piloted with 91 fifth grade students to determine the validity of the instrument. Crohnbach’s Alpha is used to determine the internal consistency of an
instrument (Tavakol & Dennick, 2011). According to Tavakol and Dennick acceptable values of Crohnbach’s alpha range from 0.7 to 0.9. For this instrument a Crohnbach’s alpha of 0.71 was calculated.

All students in the after-school STEM program completed the questionnaire that consisted of 24, five-point Likert-scale items and three open-ended questions that measured their mathematics-related beliefs (Appendix C). This questionnaire was completed on the first and last day of the after-school program. Students were given 20 to 30 minutes to individually read and answer the questionnaire.

Kloosterman (2003) stated that Likert-scale items provide a baseline measurement of students’ mathematics-related beliefs. Likert-scale items on this survey were both positively and negatively written. An example of positively written item is, “The teacher lets students figure things out for themselves.” An example of negatively written item is, “All knowledge comes from the teacher.”

Interviews. Bernard and Ryan (2010) stated that semi-structured interviews are a useful tool to interview children. Semi-structured interviews produce a lot of qualitative data (Creswell, 2013; Marshall & Rossman, 2011). Kloosterman and Stage (1992) believed that interview questions were more effective than just Likert-scale items, “More open-ended measures might pick up on factors not mentioned in this instrument [Likert-scale items] but such measures also have the risk of not getting to some of the key factors mentioned in the literature” (p. 262). Semi-structured interviews were conducted before and after the program, as well as after each activity. Participants at high-, medium- and low-achievement levels were purposefully sampled from all students participating in the after-school program. These semi-structured interviews were audio taped and conducted
before the school day began. Example question from the pre and post semi-structured interviews included, “Are there times where teachers should let students figure things out or should they explain everything?” Example questions from the semi-structured interviews that were conducted after each activity included, “What math did you use to solve the problem?” and “Did this activity change the way you think about mathematics?” Non-scripted follow-up questions were used as necessary to provide the researcher with more details.

Focus Groups. According to Bernard and Ryan (2010), focus groups provide a sense of a group’s dynamic; allow students’ responses to build off of each other; and provide the researcher with rich data. Marshall and Rossman (2011) thought that beliefs and attitudes were socially constructed and that participants needed to listen to other peoples’ beliefs in order to better form their own. Participants who might not be able or willing to comment about their mathematical beliefs would feel safe in the focus groups to disclose their feelings.

Focus groups were conducted before the interviews and after-school program as well as throughout the program. Focus groups ranged in size from four to 12 participants. All focus groups were video taped and occurred before or after-school. Example questions on the focus group interview protocol included, “How is mathematics used in your everyday life?”, “How is math connected to other subjects?”, “Describe mathematical modeling,” “How is mathematics learned?”, and, “Describe what the role of a math teacher is?” The focus groups were conducted after each activity and used the same questions as the interviews that were conducted after each activity.
Observations. To better explain the change (or not) in the participants’ beliefs about the role of the teacher, the math classes of the students who participated in the after-school program were observed. Only the participants who were in my study were observed; this included interactions with other students and their teacher. One classroom observation was made for three teachers that lasted the entire instructional period, which ranged from 30 to 70 minutes. During these observations only written notes were taken.

Data Analysis
An inductive approach was taken when analyzing the qualitative data (Bernard & Ryan, 2010). Grounded theory was selected as the method of analysis because, according to Bernard and Ryan (2010), the purpose of grounded theory, “is to let understanding emerge from the close study of the texts” (p. 288). According to Charmaz’s constructivist grounded theory (2008) the objective is to understand a phenomenon rather than to explain a new theory. Data were coded inductively from the bottom up using open, axial and selective coding.

Methodological Rigor. There are eight strategies that can be used to validate a qualitative research study: (a) prolonged engagement and persistent observation, (b) triangulation, (c) peer review and debriefing, (d) clarifying research bias, (e) negative case analysis, (f) member checking, (g) rich, thick description, and (i) external audits (Creswell, 2013; Maxwell, 2013). Creswell (2013) recommended that researchers use at least two of these procedures to ensure validity. To ensure validity for this study, rich data were collected and multiple data sources were used to triangulate the findings.
**Rich Data.** Maxwell (2013) stated, “such data generally require verbatim transcripts of the interviews, not just notes on what you felt was significant. For observation, rich data are the product of detailed descriptive note taking (or videotaping and transcribing) of specific, concrete events that you observe” (p. 126). The interviews and focus groups were recorded and transcribed in their entirety. During classroom observations detailed field notes were taken.

According to Yin (2014), the reliability of a case study is increased when the data are organized and analyzed using a computer assisted qualitative analysis software. NVivo was used to analyze the interviews and focus groups. This allowed the researcher to better observe themes that might not have been visible without the use of the software.

**Triangulation.** Triangulation was defined by Yin (2014) to be the merging of multiple data sources to establish the consistency of findings. Multiple forms of data such as focus groups, questionnaires, interviews and observations were used to triangulate the data.

**Results**

**Questionnaire**

A nonparametric Sign test was conducted to compare the pre and post scores for beliefs. There was no significant sign change between the pre (M= 3.522, SD = 0.657) and post (M=3.554, SD = 0.589) questionnaire scores for students’ beliefs about the role of the teacher (p > .10). Although there was no quantitative analysis performed on the individual questions in the survey, there were some changes in the participants’ responses. The researcher defined this change as an increase or decrease of four or more
participants in a category such as no opinion to the categories disagree a little or disagree a lot (see table 2).

</table>
For the role of the teacher is to facilitate learning 78.2% and 56.5% of the participants agreed with this statement on the pre and post questionnaire, respectively. However, on the post-questionnaire 39.1% participants had no opinion versus the 17.4% on the pre-questionnaire. The increase in the number of students who had no opinion could be due to students not understanding what the term facilitate meant. There was little to no change for the statement the teacher lets students figure things out for themselves. On the pre-questionnaire, approximately 35% of the participants either somewhat agreed or strongly agreed with the statement the role of the teacher is to provide answers to problems but on the post-questionnaire only 8.7% of the participants only somewhat agreed with this statement. It is important to note, 17.4% of the participants on the pre-questionnaire neither agreed nor disagreed with the statement the role of the teacher is to provide answers to problems but on the post questionnaire this number increased to 48%. For the statement all knowledge comes from the teacher only 33.7% of the participants disagreed with this statement on the pre –questionnaire while 43.4% of the participants disagreed with this statement on the post-questionnaire.

In the pre and post interviews participants were asked about their beliefs about the role of their teacher. Participants were asked if there were times where teachers should let students figure out problems or whether teachers should explain them first.
**Pre-interviews and focus group.** Seven of the 24 participants reported that the teacher should always explain new concepts first. James (H) said, “She should explain it first and then let us try and figure out how we are going to do it.” Jennifer (H) said, “she teaches us the lesson and then we do some problems with her and then she lets us do some problems on our own.”

Three participants said there were times when their teachers should explain concepts and also times when their teachers should let them figure things out first. James (H) said, “Umm… there should be some times where they should just let us figure it out and also some times when they should explain stuff.” Amy (M) said, “It’s a little bit of like half and half… Some days she knows we can do it by ourselves and some days… when we are learning something new she teaches it.”

Three participants reported that their teachers let them try problems first and then explain the problems. David (L) said his teacher lets him “figure out and then she explains what you did wrong and everything.” Katie (H) said, “She always lets us figure it out first, and then if we don't get it, she'll try to help us but she won't give it all away.”

When asked what the teacher should do when students were being taught a new concept, three participants said that the teacher needed to explain the content first,

*Interviewer: If you are introduced to something new should the teacher explain it first or should they let you figure it out?*

*James (H): She should explain it first and then let us try and figure out how we are going to do it.*

*Interviewer: And what happens if you get to a point where you are stuck and you don’t understand?*
James (H): I usually go up to the teacher and ask her for help.

Interviewer: Okay

James (H): Or I ask... umm... a friend for help.

Jennifer (H) said, “she teaches us the lesson and then we do some problems with her and then she lets us do some problems on our own.” Katie (H) also reported that her teacher explains new concepts first,

Katie (H): She teaches us first and then we all do it.

Interviewer: Okay, so she always teaches first?

Katie (H): Yeah.

In the pre interviews and focus group participants believed that the teacher should explain new material. They also believed that the teacher was the source of knowledge because they reported that if they were struggling they would go to the teacher for help. Only one participant reported that they would ask a classmate for help.

Post-interviews and last focus group. Three interview participants reported that the teacher should let students figure out how to solve problems. Chris (H) believed that his teacher should let him figure out how to solve problems. Chris (H) said, “They should let us figure it out because if they just tell us the answers we won’t learn it.” David (L) said that the teacher should “like let them figure out and then tell them what they did wrong.” James (H) also said that teachers should let students figure problems out and then explain how to solve the problem after the students have been given a chance to solve it.

Interviewer: Okay, so are there times where your teacher should let you figure things out?
James (H): Mmhuh (yes).

Interviewer: Okay, all right. Umm… can you give me an example?

James (H): Umm… at times our teachers help us out well… of when me and my friends are like stuck on a problem and we are working together on it and we can’t figure it out we can go up to Ms. XXXXX and ask her…umm… if she can help us and she says yes and so then we figure it out.

Interviewer: So then does she just tell you how or does she make you try to figure it out all by yourselves?

James (H): Umm… she makes us try and if we can’t get it then she helps us.

All seven of the participants in the focus group said that there are times when the teacher should let students figure problems out before explaining them. Only two of these participants were able to provide an example of an activity where the teacher had students do an activity first and then explained it. Both students were in the same class and described the same activity that was not observed by the researcher.

Interviewer: What were you guys thinking? Becka (M), Mike (N), what were you guys thinking? Does your teacher ever make you figure stuff out first and then tell you something new?

Becka (M): Sometimes.

Mike (N): Sometimes yeah.

Interviewer: Can you give an example?

Mike (N): The water. The pennies and the water and then she showed us a video on water tension.

Interviewer: Okay. So you did it first and then she talked to you about it?
Mike (N): We found out water tension is when a positive and a negative stick together and it feels hard. That's why when you do a belly flop it hurts.

Three participants reported that the teacher explains content and then lets them figure it out for themselves on tests. Amy (M) reported “Both. Like doing a lesson they help us but if a test if we ask them a question they ask us like do you remember the lessons we did the week before.”

One participant said that there were times when the teacher should let you figure out how to do math by yourself but the example that she provided was of the teacher explaining first and then having students solve problems:

Interviewer: is there a time when teachers let you just figure stuff out on your own or should they always give you the answer?

Ashley (L): Umm... what do you mean?

Interviewer: So you’re learning something new, is there a time where the teacher should let you try to figure things out. Like we kind of did in the after-school program... Is there ever a time where a math teacher should do that?

Ashley (L): Probably, yeah.

Interviewer: Can you think of an example?

Ashley (L): Cause well for example when the teacher is telling you to do this... you have to let them do it themselves cause they need to know for ... for like to know if they really know it then not just give an answer away cause you are not going to really learn that way.
Interviewer: Okay, when you are learning math then usually the teacher will work a problem with you and then she’ll give you a problem to do on your own for you to show you how much you know?

Ashley (L): Yeah.

Ashley still believed that the teacher is the source of knowledge. Although Ashley said that there were times where the teacher should let students figure things out on their own, she provided an example where the teacher explained material first.

Two participants in the focus group also said that there are times where the teacher should let students figure out problems for themselves, but these students provided examples where the teacher first explained and then had students work problems. Chloe (H) said, ”Like after the teacher teaches you and then she says, ‘Work on it by yourself’ but when you don't listen to the thing then you get in trouble.” Jennifer (H) agreed with Chloe (H). Jennifer (H) said, “like she [pointing to Chloe (H)] said, the teacher first teaches us and then she gives us a worksheet and we have to work some problems that we learned around that lesson.”

Five students stated that the teacher should explain new content. When Chris (H) was asked what the teacher should do when teaching a new concept he said that his teacher should explain it first:

Interviewer: When you are learning something new for the first time should your teacher give you something and let you struggle with it for a little bit or should she like show you how to do it first?

Chris (H): Show you how to do it first.

Interviewer: Okay so she is going to show you how to do a problem...
Chris (H): And then she lets us try three or four of them to see if we do the right algorithm.

Chris still believed that the teacher should always explain material to students. Amy (M) also stated that if they were learning new concepts the teacher should explain things first.

Interviewer: Okay, now what about if you have something brand new you are doing in class?

Amy (M): She helps us.

Interviewer: Is that always the way it goes? She shows you and then you guys do it together that way?

Amy (M): Yeah, like if we have any questions then we ask her and she helps us.

Interviewer: Now is there ever a time where she gives you something and lets you try to figure it out?

Amy (M): Not that much, she usually helps us with everything.

Amy believed that her teacher should always explain mathematics. In the pre-interviews and focus group, one participant reported that the teacher should both explain content and let students figure problems out for themselves. Three participants, who were not referring to learning new content, said that the teacher should let them try problems first then explain what they were doing wrong. Three participants said that the teacher should always explain new material.

During the last focus group and post-interviews, three participants said that the teacher should let students solve problems before explaining how to do them--referring to practice problems and not new content. Seven participants in the focus group said that
the teacher should let them figure out problems first; however, only two of these participants were able to provide a specific example where they were learning new material. Three participants responded that the teacher should always explain first and then let them practice. Three participants said that they should be allowed to figure problems out for themselves and then the teacher should explain the problems. However, these participants then provided examples of the opposite scenario. Five participants believed that the teacher should always explain new content.

**Conclusion**

Participants initially believed that the teacher should always explain new material first but that the teacher should let students figure out practice problems and then only help the students after they got stuck on the problems. Kloosterman (1996) found that students believed that the teacher was the source of knowledge. On the pre-questionnaire this was also found to be true with approximately 48% of the participants agreeing with the statement that all knowledge comes from the teacher while 18% of the participants stated that they had no opinion. However, on the post-questionnaire only 30% of the participants agreed with this statement and 26% said they had no opinion. Kloosterman also found that participants thought that the role of the teacher was to provide answers. This was not true for this study, as 48% of the participants disagreed with this statement on the pre-questionnaire. This was also true for the post-questionnaire because approximately 44% of the participants disagreed with the statement “the role of the teacher is to provide answers to problems.” In the post-interviews and focus group the majority of participants believed that the teacher should at times let students figure out problems for themselves before explaining the problems.
This is promising for the implementation of integrated STEM education because according to Hmelo-Silver (2004) the teachers’ role is more as a facilitator and not the source of all knowledge in the classroom. Lerman (1989) stated that learning begins with the student and not the teacher and Underhill (1988) suggested that student’ beliefs influence what is considered acceptable classroom behavior. Also, according to McLeod (1989), student beliefs about the role of the teacher profoundly affect their ability to solve non-routine problems like MEAs. So when students believe that they can construct their own knowledge this becomes the acceptable behavior and students learn the critical thinking skills necessary to succeed in society.

Abstract

Currently under the Positive Behaviour for Learning branch (PB4L) at the Ministry of Education in New Zealand. Check & Connect is an early intervention approach to address drop out. Developed in 1990 by Dr Sandra Christenson et.al, at the University of Minnesota, Daniel and Afa have implemented the Check & Connect intervention program to cater to the context of their students. Based in West Auckland, New Zealand and with 90% of their referrals having links to Maori and Pacific heritage. Daniel and Afa have developed a culturally responsive model they call “The Modern Day Village Approach” to encourage school completion. This is a story of their journey over the last two years of implementing the Check & Connect program in West Auckland.

*Please note only Daniel will be presenting.

6. Abstract and/or full paper

Panel Description (75 words or less):

Catholic education is a longtime valued and valuable institution in the US and the world. As the demographics of the US change and Catholic communities increase in countries with rising inequality, Catholic schools have an obligation and the opportunity to become an educational system with a global dynamic that serves all members. This panel explores the role of the Catholic university and K-12 system of schools in increasingly multiethnic and multilingual communities amidst economic inequality and social injustice.
Professional Development School Experiences and Culturally Sustaining Teaching

Dr. Joe Peters
Dean of Education, Georgia College, Georgia, USA

Dr. Becky McMullen
Interim Dean of Education, Fort Valley State University, Georgia, USA
Abstract

Culturally sustaining pedagogy (Hill, 2012; Ladson-Billings, 2014; Paris, 2012; Paris & Alim, 2014), culturally responsive teaching (Gay, 2002), or culturally relevant pedagogy (Brown-Jeffy & Cooper, 2011; Ladson-Billings, 1995a), refer to the use of the students’ own cultural knowledge, experiences, learning preferences, and common cultural examples while developing curriculum, teaching, and managing behavior. Knowledge of learners and cultural awareness is a critical component of teaching (Shulman, 1986, 1987) and the goal is to maintain students’ cultural awareness while preparing them to function competently in the world outside of their own culture. Faculty must address issues of cultural knowledge and assist candidates in developing the skills and attitudes for culturally diverse students. Researchers use Siwatu’s culturally responsive scales (2007) to determine areas of focus when forming experiences for future teachers and to also look at if the professional development school experience helps to facilitate the preservice teachers’ understanding of culturally responsive teaching.
Gaps in the academic performance of African American, Native Hawaiian, Native American, Native Alaskan, Latino, and other minority groups is an important educational challenge (Hammond, Wilson, & Barros, 2011; Jones & Salinas, 2013; Kana’iaupuni, Ledward, & Jensen, 2010; Kashatok, 2011; Ladson-Billings, 1995b, 2005, 2013; Lohse, 2008). In order for these educational deficits to be effectively addressed, teachers need to have a deeper understanding of the students’ culture (Delpit, 1995; Hill, 2012; Howard, 2003; Richards, Brown, & Forde, 2006). Unfortunately, graduates do not always feel adequate to work with all groups (Cruz, Ellerbrook, Vasquez, & Howes, 2014). Today’s classrooms need teachers who are comfortable educating diverse students from various cultures and backgrounds (Gollnick & Chinn, 2002) and can effectively transit between the home and school cultures (Allen & Boykin, 1992; Kea, Campbell-Whatley, & Richards, 2006; Siwatu, 2007).

Ladson-Billings (2011) introduces the concept of cultural competence to describe teachers who work to find out about students’ backgrounds, cultures, and experiences and are able to “work back and forth between the lives of their students and the life of school.” (p. 40). Given the importance of cultural responsiveness (Ladson-Billings, 2011), it is important to explore ways for preservice teachers to better understand the importance of culture and assist candidates in developing the skills needed to bridge the home and school cultures.

The authors of this paper describe the use of Siwatu’s (2007) Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) and the Culturally Responsive Teaching Self-Efficacy Scale (CRTSE) with students participating in a
professional development school experience. The goal was to see if faculty and students working within a diverse setting can better identify and improve their cultural competence and pedagogical practice consistent with Ladson-Billings (2011) definition of “helping students recognize and honor their own cultural beliefs and practices while acquiring access the wider culture, where they have the chance of improving their socioeconomic status and making informed decisions about the lives they wish to lead.” (p. 40).

**Statement of the Problem**

Georgia College is the State of Georgia’s designated public liberal arts university. Although faculty and students are involved with many high-impact educational practices consistent with the goals of *Liberal Education and America’s Promise* (Kuh, 2008), most of our students do not match the local diversity or have the specific experiences to further develop their culturally sustaining teaching. Their work in an urban school environment can lead to cultural misunderstandings (Mason, 1999; Schaffer, Gleich-Bobe, & Copich, 2014).

Given the lack of black teachers (9.3% nationwide) and the less than two percent of black male teachers nationwide (Toldson, 2013) it is imperative for a diverse population, such as the one where the researchers reside, to have teachers that are able to understand K-12 students’ cultural beliefs and children make the transition to the school environment without losing their own cultural attributes and identity. To better develop cultural competence and culturally sustaining teaching practices, the College of Education developed a professional development school partnership with the local school district. It is believed that this relationship would be mutually beneficial in
improving the educational achievement of the local K-12 students. It was also hoped that the preservice teachers would benefit through further development of their cultural awareness and teaching practice as identified and further measured by the CRTOE and CRTSE scales.

**Background**

*What does it mean to be “culturally responsive” or use a “culturally sustaining pedagogy?”*

Ladson-Billings (1995a) discusses the term culturally responsive as more than a simple accommodation of students, but rather a more dynamic or synergistic relationship between home/community culture and school culture (p. 467). They must practice a cultural approach to learning and teaching (Banks & McGee Banks, 2013). When studying culturally-responsive instruction in classrooms, Ladson-Billings found collective efforts being used to encourage academic and cultural excellence where the culture outside of the school was reflected in how students assisted and encouraged each other (Ladson-Billings, 1994, 1995b).

Ladson-Billings (1995a) also introduces the theoretical model of a “culturally relevant pedagogy” (p. 469), noting the positive influence this approach has on achievement. Additionally, Ladson-Billings (1992) describes how culturally responsive teachers develop intellectual, social, emotional, and political learning by "using cultural referents to impart knowledge, skills, and attitudes" (p. 382). Ladson-Billings’ (1995a) and Schmeichel’s (2012) research includes findings on the importance of a teacher exploring his or her own conception of knowledge; including the relationship of the knowledge to the curriculum and the assessment of the knowledge. Thinking about their
own conceptions and pedagogy is an important first step in understanding ways to
reach out to culturally-diverse groups. Osborne (1996), in a synthesis of ethnographies,
notes some examples of strong confirming evidence that culturally relevant teachers
need not come from the same ethnic minority group (p. 289-290).

Paris (2012), questioning the earlier use of the terms “culturally relevant” and
“culturally responsive,” builds on earlier research and provides the stance of “culturally
sustaining pedagogy.” This approach “seeks to perpetuate and foster—to sustain—
linguistic, literate, and cultural pluralism as part of the democratic project of schooling”
(p. 93). In other words, instead of a “tolerance” of culture, there needs to be an
educational program for students where pedagogy is more than “responsive of,” or
“relevant to,” cultural experiences and practices— “it requires that they support young
people in sustaining the cultural and linguistic competence of their communities while
simultaneously offering access to dominant cultural competence” (p. 95). The goal is for
a more fluid approach to pedagogy that supports the pluralistic nature of the students
and the evolving identity and cultural practice (Bristol, 2015; Ladson-Billings, 2014;

**Field Experiences and Professional Development Schools**

*Is simple exposure enough to foster culturally sustaining pedagogy with teaching
candidates?*

Ladson-Billings (1995c) discusses how field experiences have become regulated
to include diverse experiences but these experiences do not always produce beneficial
results and can actually widen cultural gaps. Professional Development School (PDS)
experiences can however, provide an immersion experience that Ladson-Billings
Richmond (2017, p. 7) in an article on community partnerships notes that “it is critical for those preparing to become teachers to understand what surrounds and drives the young people they will teach…” Zeichner (2010) also suggests that there needs to be a better interplay between academic, practitioner, and community expertise.

Chou (2007) provides an outline of potential the benefits of a PDS when working with diverse populations, noting that the experience provides for a variety of instructional strategies. The PDS experience also includes the needed time to debrief and reflect as a way to counter prejudices. Since cultural approaches to pedagogy may not be conceptualized the same by the teachers, faculty, and teaching candidates (Young, 2010), it was important to have a set of common constructs to work from as faculty address issues of cultural knowledge and assist future teachers in developing the skills and attitudes necessary to work with culturally diverse students. The researchers felt that Siwatu’s culturally responsive scales (2007) could help identify areas of common understanding and be a tool for further understanding and fostering of culturally sustaining pedagogy.

**Research Questions**

Given the importance of culturally sustaining teaching and cultural competency, the researchers are exploring the use of the CRTOE and CRTSE scales within a professional development school (PDS) experience. The two questions that researchers are seeking to answer are:

1. Can the CRTOE and CRTSE scales be used to identify areas of need related to cultural awareness with preservice teachers and
2. Will the PDS experience show an improvement in cultural competency as measured by the CRTOE and CRTSE scales?

Methodology

The study was designed for the researchers to look at initial data for areas of need in terms of the areas indicated on Siwatu’s (2007) culturally responsive scales. They also looked for how the overall experience would made a difference with respect to areas related to culturally sustaining pedagogy.

Subjects and School Setting

The subjects were intact cohorts of college students in the undergraduate degree programs in early childhood (grades P-5), middle grades (grades 4-8), and special education general curriculum (grades P-12), as well as masters of arts in teaching students preparing for various subject matter secondary school teaching positions (grades 6-12). There were 110 respondents and two students who did not fill out the informed consent and failed to include an id number on the survey so their information could be matched pre-post. The subjects in the undergraduate programs are primarily from outside the college’s region because of the competitive admission standards to be accepted to the College. The master’s students are generally local and will seek a position on the local schools.

The school district is a small, rural district with a student population racial makeup similar to the county’s population and all schools are identified as Title 1. The student enrollment is 65% black, 28% white, 1% Asian, 2% Hispanic, and 4% multi-racial (Baldwin County Schools, 2014). Only one of the four elementary schools was used and it is identified as a “focus school” due to persistent low achievement. There
are two professors in residence from the college that assist in the schools. One is supporting the superintendent’s reading/literacy programs and the other is facilitating districtwide support in the area of Positive Behavior Interventions and Supports (PBIS).

The Professional Development School relationship is consistent with the National Association for Professional Development Schools (NAPDS, 2008) and includes essentials such as a formal articulation agreement, a working governance structure, and collaborative work among all participants. The balance of power, referred to by Breault (2014) does not lie with either entity and all work is collaboratively in the interest of promoting P-12 student achievement and enhanced teacher candidate preparation.

**Measures**

The variables are the items from Siwatu’s (2007) culturally responsive scales and include 26 items from the Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE). This instrument allows participants to rate, from 0 (entirely uncertain) to 100 (entirely certain), the probability that the behaviors listed will lead to the outcomes that follow the behaviors. Two examples are “A positive teacher-student relationship [outcome] can be established by building a sense of trust in my students” [behavior] and “Incorporating a variety of teaching methods [behavior] will help my students to be successful [outcome].” [See Appendix A],

Another 40 items are from the Culturally Responsive Teaching Self-Efficacy Scale (CRTSE). With this instrument, participants rate from 0 (no ability) to 100 (highest ability) how confident they are in their abilities such as “Identify ways that the school culture (e.g., values, norms, and practices) is different from my students' home culture” and “Implement strategies to minimize the effects of the mismatch between my
students’ home culture and the school culture” [See Appendix B]. These instruments are seen as valid and reliable.

The surveys were administered during class periods at the elementary, middle and high school at the beginning and end of a semester. The pre-post data was matched through the use of student college id numbers.

**Procedures**

Similar to Frye, Button, Kelly, and Button (2010), researchers administered a pre and post survey during the fall 2015 semester. Consistent with the research questions, the study has two parts. The first part was to survey all students in the cohorts and then look at the overall pre-data to see which areas faculty should focus on that term and in the future. Second, re-administer the survey at the end of the semester and look at if there were any pre-post differences.

For the first part simple averages were used to look for areas of focus. For the pre-post analysis, researchers used the Wilcoxon Signed Rank Test (http://vassarstats.net/) to compare pre-post differences of the repeated measures. The Wilcoxon Signed Rank Test is a nonparametric test for the significance of the difference between distributions of two non-independent samples involving repeated measures or matched pairs (Lowery, 2015).

**Human Subjects Protection.** Georgia College Institutional Review Board (IRB) approval was provided for this study. All data collected was coded with students Georgia College identification number so that pre-post information could be matched. A copy of the informed consent is located in Appendix C.
Results

The pre-post comparison yielded a significant difference with the Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) with a two-tailed p-value of <0.01. The pre-post comparison of the Culturally Responsive Teaching Self-Efficacy Scale (CRTSE) was also significant with a p-value of <0.01.

Individual item averages for the pre-data included the following areas that the researchers identified as less than 80% for the CRTOE and less than 70% for the CRTSE and needing further emphasis during courses and field placements.

- Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) [Measures the probability that the behaviors listed will lead to the outcomes that follow the behaviors]
  - Item 5 (pretest average = 76.59): Acknowledging the ways that the school culture is different from my students’ home culture [behavior] will minimize the likelihood of discipline problems [outcome].
  - Item 14 (pretest average = 75.37): Changing the structure of the classroom so that it is compatible with my students’ home culture [behavior] will increase their motivation to come to class [outcome].
  - Item 20 (pretest average = 76.41): The frequency that students’ abilities are misdiagnosed will decrease [outcome] when their standardized test scores are interpreted with caution [behavior].
  - Item 21 (pretest average = 70.17): Encouraging students to use their native language [behavior] will help to maintain students’ cultural identity [outcome].
• Culturally Responsive Teaching Self-Efficacy Scale (CRTSE) [Measures how confident participants are in their abilities]
  
  o Item 6 (pretest average = 63.54): Implement strategies to minimize the effects of the mismatch between my students' home culture and the school culture.
  
  o Item 8 (pretest average = 68.66): Obtain information about my students' home life.
  
  o Item 17 (pretest average = 62.07): Teach students about their cultures' contributions to science.
  
  o Item 18 (pretest average = 56.83): Greet English Language Learners with a phrase in their native language.
  
  o Item 22 (pretest average = 57.56): Praise English Language Learners for their accomplishments using a phrase in their native language.
  
  o Item 23 (pretest average = 68.41): Identify ways that standardized tests may be biased towards linguistically diverse students.
  
  o Item 29 (pretest average = 64.02): Design a lesson that shows how other cultural groups have made use of mathematics.
  
  o Item 30 (pretest average = 65.85): Model classroom tasks to enhance English Language Learners' understanding.
  
  o Item 31 (pretest average = 57.80): Communicate with the parents of English Language Learners regarding their child's achievement.
  
  o Item 33 (pretest average = 68.41): Identify ways that standardized tests may be biased towards culturally diverse students.
There were a few items where the pretest to posttest scores showed very little gains and one where were the pretest was actually higher than the posttest score. These include:

- **Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE)**
  - Item 3 (pre average = 92.93, post average = 94.02, difference = +1.10):
    Students will be successful when instruction is adapted to meet their needs.
  - Item 12 (pre average = 83.98, post average = 85.49, difference = +1.51):
    Conveying the message that parents are an important part of the classroom will increase parent participation.
  - Item 20 (pre average = 76.41, post average = 77.44, difference = +1.02): The frequency that students’ abilities are misdiagnosed will decrease when their standardized test scores are interpreted with caution.

- **Culturally Responsive Teaching Self-Efficacy Scale (CRTSE)**
  - Item 4 (pre average = 77.80, post average = 78.81, difference = +0.90):
    Determine whether my students feel comfortable competing with other students.
  - Item 9 (pre average = 89.63, post average = 90.54, difference = +0.90): Build a sense of trust in my students.
  - Item 13 (pre average = 73.29, post average = 74.15, difference = +0.85): Use my students’ cultural background to help make learning meaningful.
  - Item 25 (pre average = 77.32, post average = 78.17, difference = +0.85):
    Structure parent-teacher conferences so that the meeting is not intimidating for parents.
- Item 28 (pre average = 74.71, post average = 74.68, difference = -0.02):
  Critically examine the curriculum to determine whether it reinforces negative cultural stereotypes.

- Item 38 (pre average = 88.66, post average = 89.20, difference = +0.51): Use the interests of my students to make learning meaningful for them.

The items that included the largest gains were as follows:

- Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE)
  - Item 6 (pre average = 82.85, post average = 91.57, difference = +8.73):
    Understanding the communication preferences of my students will decrease the likelihood of student-teacher communication problems.
  - Item 9 (pre average = 82.07, post average = 90.73, difference = +8.66):
    Revising instructional material to include a better representation of the students’ cultural group will foster positive self-images.
  - Item 21 (pre average = 70.17, post average = 80.98, difference = +10.80):
    Encouraging students to use their native language will help to maintain students’ cultural identity.

- Culturally Responsive Teaching Self-Efficacy Scale (CRTSE)
  - Item 2 (pre average = 75.61, post average = 83.90, difference = +8.29):
    Obtain information about my students’ academic strengths.
  - Item 8 (pre average = 68.66, post average = 78.46, difference = +9.80):
    Obtain information about my students’ home life.
  - Item 14 (pre average = 77.07, post average = 85.98, difference = +8.90): Use my students’ prior knowledge to help them make sense of new information.
Discussion

Looking at the highly significant difference in the pre-post comparison data for both the Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) and Culturally Responsive Teaching Self-Efficacy Scale (CRTSE) suggested to the researchers that the professional development school experience was overall a positive experience in helping students better understand and teach in diverse classrooms. The teaching candidates’ knowledge about culturally sustaining teaching and their ability to prepare and teach diverse students as measured by the Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) indicated they were able to work through their own bias and better understand the cultural background of the students. This translates to a better understanding of student needs and ways to design learning activities based on those needs. It also reduces misunderstandings that can impact classroom instructional time and teacher-student relationships.
Most respondents showed gains in the post-data. However, it was interesting to note that there were some items where teaching candidates showed only slight gains and one where they actually went down slightly from the pre- to post-experience. It may be due to the fact that they were more confident about an area or felt they were more knowledgeable until they were in the actual classroom and had to apply their knowledge and skills.

Limitations

This study is limited to a sample of convenience of students involved in coursework at local schools as part of a professional development school initiative. It is also limited to one predominant culture in a small rural Southern community. It should not be generalized to all cultures and communities without further investigation with large, randomized studies.

Implications for Further Study

Based on the initial data, researchers believe it is important to complete a qualitative analysis of the preservice teachers' professional development school experiences and use of Siwatu’s (2007) culturally responsive scales as a tool to assist in the development of culturally sustaining pedagogy. An emphasis should be consistent with Siwatu’s (2011) study of preservice teachers’ culturally responsive teaching self-efficacy beliefs and the disparities with preservice teachers in terms of culturally sustaining pedagogy.

It is also important to use Siwatu’s (2007) culturally responsive scales in other professional development school experiences to see if there are similar results. This
study was primarily based on the African American populations in rural central Georgia but needs to be explored in other populations.

Another implication is that specific activities for students need to be brought into courses to help identify candidates’ efficacy toward diversity and better understand the cultures that they will be working with in their future classrooms. McMullen, R. (n.d.) suggests activities such as a neighborhood map, classroom diversity audit, ethnographic interview, autobiographical exploration, and a families’ project to facilitate cultural experiences (see appendix D).

**Conclusions**

This study was an important first step in looking at the preparation of candidates for teaching in diverse classrooms. The Professional Development School experience helps to provide the environment for candidates to question their own biases and practice culturally sustaining teaching strategies. The Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE) and Culturally Responsive Teaching Self-Efficacy Scale (CRTSE) are useful tools in identifying areas of need so faculty can arrange appropriate learning experiences at the schools.

Appendix A: Culturally Responsive Teaching Outcome Expectancy Scale (CRTOE)

GCID: ____________

Please rate, from 0 (entirely uncertain) to 100 (entirely certain), the probability that the behaviors listed will lead to the outcomes that follow the behaviors:

1. ____ A positive teacher-student relationship can be established by building a sense of trust in my students.

2. ____ Incorporating a variety of teaching methods will help my students to be successful.

3. ____ Students will be successful when instruction is adapted to meet their needs.

4. ____ Developing a community of learners when my class consists of students from diverse cultural backgrounds will promote positive interactions between students.

5. ____ Acknowledging the ways that the school culture is different from my students’ home culture will minimize the likelihood of discipline problems.

6. ____ Understanding the communication preferences of my students will decrease the likelihood of student-teacher communication problems.

7. ____ Connecting my students’ prior knowledge with new incoming information will lead to deeper learning.

8. ____ Matching instruction to the students’ learning preferences will enhance their learning.

9. ____ Revising instructional material to include a better representation of the students’ cultural group will foster positive self-images.

10. ____ Providing English Language Learners with visual aids will enhance their understanding of assignments.

11. ____ Students will develop an appreciation for their culture when they are taught about the contributions their culture has made over time.

12. ____ Conveying the message that parents are an important part of the classroom will increase parent participation.

13. ____ The likelihood of student-teacher misunderstandings decreases when my students’ cultural background is understood.

14. ____ Changing the structure of the classroom so that it is compatible with my
students’ home culture will increase their motivation to come to class.

15. ____ Establishing positive home-school relations will increase parental involvement.

16. ____ Student attendance will increase when a personal relationship between the teacher and students has been developed.

17. ____ Assessing student learning using a variety of assessment procedures will provide a better picture of what they have learned.

18. ____ Using my students’ interests when designing instruction will increase their motivation to learn.

19. ____ Simplifying the language used during the presentation will enhance English Language Learners’ comprehension of the lesson.

20. ____ The frequency that students’ abilities are misdiagnosed will decrease when their standardized test scores are interpreted with caution.

21. ____ Encouraging students to use their native language will help to maintain students’ cultural identity.

22. ____ Students’ self-esteem can be enhanced when their cultural background is valued by the teacher.

23. ____ Helping students from diverse cultural backgrounds succeed in school will increase their confidence in their academic ability.

24. ____ Students’ academic achievement will increase when they are provided with unbiased access to the necessary learning resources.

25. ____ Using culturally familiar examples will make learning new concepts easier.

26. ____ When students see themselves in the pictures that are displayed in the classroom, they develop a positive self-identity.
Appendix B: Culturally Responsive Teaching Self-Efficacy Scale (CRTSE)

GCID: ____________

Please rate, from 0 (no ability) to 100 (highest ability) how confident you are in your ability to do the following:

1. ___ Adapt instruction to meet the needs of my students.
2. ___ Obtain information about my students’ academic strengths.
3. ___ Determine whether my students like to work alone or in a group.
4. ___ Determine whether my students feel comfortable competing with other students.
5. ___ Identify ways that the school culture (e.g., values, norms, and practices) is different from my students’ home culture.
6. ___ Implement strategies to minimize the effects of the mismatch between my students’ home culture and the school culture.
7. ___ Assess student learning using various types of assessments.
8. ___ Obtain information about my students’ home life.
9. ___ Build a sense of trust in my students.
10. ___ Establish positive home-school relations.
11. ___ Use a variety of teaching methods.
12. ___ Develop a community of learners when my class consists of students from diverse backgrounds.
13. ___ Use my students’ cultural background to help make learning meaningful.
14. ___ Use my students’ prior knowledge to help them make sense of new information.
15. ___ Identify ways how students communicate at home may differ from the school norms.
16. ___ Obtain information about my students’ cultural background.
17. ___ Teach students about their cultures’ contributions to science.
18. ___ Greet English Language Learners with a phrase in their native language.
19. ___ Design a classroom environment using displays that reflects a variety of cultures.

20. ___ Develop a personal relationship with my students.

21. ___ Obtain information about my students’ academic weaknesses.

22. ___ Praise English Language Learners for their accomplishments using a phrase in their native language.

23. ___ Identify ways that standardized tests may be biased towards linguistically diverse students.

24. ___ Communicate with parents regarding their child’s educational progress.

25. ___ Structure parent-teacher conferences so that the meeting is not intimidating for parents.

26. ___ Help students to develop positive relationships with their classmates.

27. ___ Revise instructional material to include a better representation of cultural groups.

28. ___ Critically examine the curriculum to determine whether it reinforces negative cultural stereotypes.

29. ___ Design a lesson that shows how other cultural groups have made use of mathematics.

30. ___ Model classroom tasks to enhance English Language Learners’ understanding.

31. ___ Communicate with the parents of English Language Learners regarding their child’s achievement.

32. ___ Help students feel like important members of the classroom.

33. ___ Identify ways that standardized tests may be biased towards culturally diverse students.

34. ___ Use a learning preference inventory to gather data about how my students like to learn.

35. ___ Use examples that are familiar to students from diverse cultural backgrounds.

36. ___ Explain new concepts using examples that are taken from my students’ everyday lives.
37. ___ Obtain information regarding my students’ academic interests.

38. ___ Use the interests of my students to make learning meaningful for them.

39. ___ Implement cooperative learning activities for those students who like to work in groups.

40. ___ Design instruction that matches my students’ developmental needs.
Appendix C

INFORMED CONSENT
Professional Development School Experiences

I, _________________________________________________, agree to participate in the research Professional Development School (PDS) Experiences and Culturally Sustaining Teaching, which is being conducted by Drs. Becky McMullen and Drs. Darlene and Joe Peters, who can be reached at joseph.peters@gcsu.edu, or 478-445-2518. I understand that my participation is voluntary; I can withdraw my consent at any time. If I withdraw my consent, my data will not be used as part of the study and will be destroyed.

The following points have been explained to me:

1. The purpose of this study is to see the effects of Professional Development School experiences on Culturally Sustaining Teaching.
2. The procedures are as follows: you will be asked to complete a pre- and post-survey.
3. Your name will not be connected to your data. Therefore, the information gathered will be confidential. We will ask for your GCID to be used to match the pre-post forms.
4. You will be asked to sign two identical consent forms. You must return one form to the investigator before the study begins, and you may keep the other consent form for your records.
5. You may find that some questions are invasive or personal. If you become uncomfortable answering any questions, you may cease participation at that time.
6. This research project is being conducted because of its potential benefits, either to individuals or to humans in general. The expected benefits of this study include a better understanding of how offering college courses in a school district setting could help with awareness of cultural issues and enhanced culturally responsive teaching.
7. You are not likely to experience physical, psychological, social, or legal risks beyond those ordinarily encountered in daily life or during the performance of routine examinations or tests by participating in this study.
8. Your individual responses will be confidential and will not be released in any individually identifiable form without your prior consent unless required by law.
9. The investigator will answer any further questions about the research should you have them now or in the future (see above contact information).
10. In addition to the above, further information, including a full explanation of the purpose of this research, will be provided at the completion of the research project on request.
11. By signing and returning this form, you are acknowledging that you are 18 years of age or older.
Research at Georgia College involving human participants is carried out under the oversight of the Institutional Review Board. Address questions or problems regarding these activities to Dr. Tsu-Ming Chiang, GC IRB Chair, CBX 090, GC, email: irb@gcsu.edu; phone: (478) 445-0863
Appendix D

**Neighborhood Map**
Using class readings and discussions as guides, candidates prepare neighborhood maps for the school where they are placed. The maps include keys that explain what they indicate. Along with the maps, there are reflections that address specific ways of learning about the families of children in their classrooms by visiting their neighborhoods. These reflections include clear and specific citations from articles read during the semester. These citations and the references should follow the guidelines of the style manual of the American Psychological Association.

**Classroom Diversity Audit**
This two-part assignment is conducted in coordination with field placement. When teacher candidates strive to interweave multicultural/anti-bias curricula, content, assessments, and instructional delivery in their classrooms, students’ academic performance and the degree of self-efficacy and confidence, they experience growth. This assignment is designed to examine the degree to which their field-placement classrooms are multicultural and anti-biased. In order to assess this project, candidates must reflect on each of the following categories.

**Part A:** This category requires candidates to write a 3-4 page paper on the components of teaching with diversity that they see present or absent in their classrooms. They should provide evidence of specific examples from the classroom and discuss the importance of such components by citing Byrnes and Kiger (2006), and other ancillary materials.

**Part B:**
This category requires candidates to use format of choice – an essay, a letter informing parents of changes in your classroom, PowerPoint to the PTA, a whole-class lesson designed for elementary students, a “how to booklet” on becoming more anti-biased/multicultural in the classroom, or an annotated exhibit – candidates should describe how they would go about remediying those aspects of an anti-biased/multicultural education that seem to be weak or lacking from their classrooms.

Regardless of the selected-classroom presentations, the format of choice should be persuasive, thoughtful, mechanically correct, and touch on all four components of the “teaching with diversity checklist.” Additionally, it should touch on the benefits of anti-bias/multicultural curriculum, content, delivery, and assessment.

**Ethnographic Interview**
**Context and Analysis of Children’s Language**
Teacher candidates conduct an ethnographic interview of a student in her/his placement, following guidelines distributed separately in class. This student should be one with language differences (e.g., dialect or kids who are linguistically different).
Candidates should consider carefully, from readings and from class discussion, how an ethnographic interview differs from other interviews. Using an audiotape to record the actual interview, candidates discuss this interaction through the views of their students’ lenses rather than through their own. They are instructed to write notes about their interactions with the student as well as the language that students’ use. Teacher candidates are required to make notes about particular words, silences, or gestures.

**Autobiographical Exploration**
Teacher candidates are required to choose five identity sources (e.g., race, ability/disability, ethnicity/nationality, social class, sex/gender, health, age, geographic region, sexuality, religion, social status, language) for which they will write a 4-6 page paper exploring how their past experiences shaped their current understandings of self and their future role as an educator. For example, they should ask the following personal questions as writing prompts:

1. What did I learn about (insert identity source here) growing up and how did I learn it? Were my beliefs biased? They should provide a rationale.
2. When I think of (insert identity source here) today, this is what I believe. Have I changed? What contributed to that change?

**Expanded Horizon**
Teacher candidates are required to complete three separate assignments. They choose three items from the lists below, one from each category. For each of these, they choose activities/events that will challenge them. The best choices are ones that make them feel some level of discomfort because the event/experience is new. Reflecting on that discomfort is where we want students to experience the most growth. Note the following activities in which they are instructed to engage.

Watch a film, visit a facility, read a book, and attend an event fully. Briefly describe what you did and answer the following questions in a 2-3 page paper:
- What was the purpose of the film, book, field trip, or event?
- What life experiences have you had that allow you to make connections to or find common ground with the target population/characters/content/presenters?
- What about the film, book, or event challenged your thinking/goals/values/beliefs?
- What new insights/understandings did you gain? How will you use this in teaching?

See choices below:
- **FILMS or BOOKS**
  - Milk
  - Precious
  - The Garden
  - Crash
  - Brokeback Mountain
  - Rent
  - American Violet
  - The Providence Effect
• BOOKS
  o *The Lottery* by Patricia Wood
  o *The Curious Incident of the Dog in the Nighttime* by Mark Haddon
  o *The Glass Castle* by Jeannette Walls
  o *The Short Bus* by Jonathan Mooney
  o *The Diving Bell and the Butterfly* by Jean-Dominique Bauby
  o *Out of My Mind* by Sharon M. Draper
  o *The Spirit Catches You and You Fall Down: A Hmong Child, Her American Doctors, and the Collision of Two Cultures* by Anne Fadiman

• FIELD TRIPS TOURS
  o ESOL Classrooms/Centers
  o Central State Hospital or Georgia Regional Hospital
  o GA Academy for the Blind
  o John Milledge Academy
  o Hancock County Schools
  o Georgia Military Academy
  o Hair Salons
  o Interview a patient who is terminally ill

• COMMUNITY ACTIVITIES/EVENTS
  o Parents, Families, & Friends of Lesbians and Gays (PFLAG) meeting in Macon
  o Volunteer at Rescue Mission, local food pantry, Salvation Army, Meals on Wheels,
  o Literacy Volunteers, or any other community service for a minimum of two hours
  o PRIDE Alliance meeting at GCSU
  o Attend an event sponsored by Best Buddies for a minimum of two hours
  o Attend a religious service other than the one in which you are familiar (need church bulletin as an artifact)
  o Macon NAACP Youth & College Division Meetings or NAACP general meetings

**Family’s Project**
The purpose of this project is for pre-service teachers to think about building partnerships and working relationships with parents and families of P-12 students. They learn to emerge communication and collaboration skills while seeking to understand the parent’s perspective of his/her child, the child’s experiences in school, and the parent’s experiences advocating for their child.

They spend individual time with a student during school hours and then meet with the student’s parents, to discuss prescribed talking points. One of the goals of this assignment is to focus on listening to what parents say as they share their ideas, options, dreams, and goals for their child’s future.

Additionally, this project challenges students to consider their own biases and examine their own attitudes about working with parents and families. The goal is students to gain
greater understanding and appreciation for the student’s strengths and struggles when trying to see them from the family’s point of view.
My Digital Voyage: An Interactive Computer-Based Curriculum on Internet Safety and Ethics for Elementary Technology Learners

Description: *My Digital Voyage* was created for students in grades 4 and 5 to use with teachers and family members to spark relevant and timely discussions about being ethical and responsible digital citizens in today’s perpetually connected online society. We will demonstrate the use of the *My Digital Voyage* Internet safety and ethics program, discuss the educational foundations of the development, and share future research plans to evaluate the program’s effectiveness.

Abstract

Digital technology and Internet access in U.S. schools continue to grow, as evidenced by increased 1-to-1 computing and BYOD or bring-your-own-device case studies. Digital tools enable greater collaboration and creativity, but also increase exposure to Internet misuse. Schools recognize the need for online ethical and responsible behavior strategies not just for children, but also for the adults who support and integrate these approaches into existing policies and practices. An online learning module series called My Digital Voyage was created with the intent to provide a computer-based digital citizenship curriculum for children in grades 4 and 5. Using a mixed-methods design, we will examine students’ and adults’ perceptions of Internet safety and ethics, and analyze feedback to improve the modules for future use.

Keywords: technology-based learning, digital citizenship, Internet safety, cyber ethics

The rapid adoption of digital-communication technologies has created many noteworthy positive changes in our society (David-Ferdon & Hertz, 2009; U.S. Department of Health and Human Services, 2010). Digital tools enable greater collaboration, creativity, and exploration. However, these same tools have also lead to increased exposure to and engagement in Internet misuse, such as online piracy, copyright infringement, plagiarism, impersonation, and cyber victimization to name a few. Schools are now recognizing the need for online ethical and responsible behavior strategies not just for children, but also for the teachers and parents who support and integrate these approaches into existing policies and practices.

Purpose and Objectives

The purpose of this pilot study is to examine the effects of a computer-based, digital citizenship curriculum for students in grades 4 and 5, called My Digital Voyage. This specific age group was targeted because almost half of U.S. children in grades 4–8 are victimized online and the average cyberbully starts at age 9 (i-SAFE, 2004). Our goal was to create a useful learning tool for elementary school children before they enter middle school, where various physical, social, psychological, academic, and behavior issues are often manifested more prominently.
Digital citizenship incorporates the basic tenets of digital ethics, etiquette, and character development that guide technology users toward making ethical decisions, choosing appropriate actions in an online community, and understanding that all actions have consequences, whether observed or not. Decisions are a result of core values and ethics (Enomoto & Kramer, 2007). Therefore, the main objective of the *My Digital Voyage* program is to purposefully and explicitly teach young technology users about values like respect, responsibility, and kindness to increase their ethical decision-making capacity online.

The *My Digital Voyage* curriculum is grounded in character education and delivered in cartoon form through learning activities and age-appropriate content assessments. Teacher and parent support and participation to cultivate Internet-safe climates both at home and in school are also highly emphasized. In this study, we will examine both students’ and teachers’ perceptions of Internet safety and ethics to understand the usefulness of the *My Digital Voyage* program. Data for this study have yet to be collected. However, the goal is to complete data collection and analysis prior to the 2017 HICE conference. The main research question is as follows: To what extent will an online digital citizenship curriculum that encourages adult participation influence students’ and adults’ perceptions of Internet safety and ethics?

As a result of their participation in this session, participants will gain an understanding of the relationships between digital citizenship, ethical decision-making, and online empathy. They will also hear about the results from the pilot study. In addition, participants will have the opportunity to provide their thoughts on how to improve our research methodology and instruments. Success will be evident through the conversations that we have with participants.
Their feedback and comments regarding the computer-based program and research instruments will be invaluable in our future program design, development, and research.

**Perspective or theoretical framework**

Digital citizenship and Internet safety education are still relatively new concepts with few empirically researched *best practices*. Therefore, the content of *My Digital Voyage* was based on recurring themes and ideas from well-cited digital citizenship and Internet safety research and curricula (Patchin & Hinduja, 2012; Willard, 2002; Ribble & Bailey, 2007). The *Six Pillars of Character: trustworthiness, respect, responsibility, fairness, caring, and citizenship* (Josephson, 2015) were also interwoven into the scenarios and ethical dilemmas within each module.

Epstein’s (1995) family-school-community partnerships theory influenced the emphasis on adult participation in this educational effort. Based on Bronfenbrenner’s (1979) ecological theory, Epstein found that school-family-community partnerships are most successful when people from various groups share common interests, goals, and responsibilities to create better opportunities for children. Our key beliefs are that children should be allowed to make mistakes in safe, supported school and home environments, and they should not have to face Internet safety challenges alone. Knowing the kinds of Internet-related problems that exist are important so that parents and teachers can better assist children if problematic situations arise.

Internet safety and digital citizenship education require a shared responsibility between parents and educators, and an interactive digital curriculum that can be used as a platform to start critical dialogues between children and adults could be a solution that brings Internet safety and ethics explicitly into classrooms and homes. Teachers can incorporate this curriculum into their existing class practices and parents can use these activities at home when talking about safe and ethical Internet use. The module activities align to select English Language Arts & Literacy in
Research methods

Pilot Study

This project includes a pilot trial of the My Digital Voyage prototype, which includes the use of a structure-and-sequence teaching guide, and survey/interview instruments. The teaching guide, written for parents and educators, explains the topics to be discussed at different points throughout the module series. Educators can use the guide for suggestions to implement the online learning modules into existing classroom practices.

Participants

A convenient sample of 20 grade 4 and 5 students (five males and five females in each grade) and four to six educators will test the prototype, teaching guide, and survey/interview instruments. Their initial Internet safety and ethics knowledge will be collected through a pre-survey via SurveyMonkey, and after testing the modules, their perspectives will be gathered in a post-survey. Feedback and additional comments will then be collected in small, student focus groups and semi-structured interviews with each teacher participant. After the pilot trial, we will calculate Cronbach’s alpha to test the reliability of the pre- and post-survey instruments for both student and educator versions. Appropriate modifications will then be made to the modules, teaching guide, and instruments prior to phase one of data collection.

Data Analysis

We will use a mixed-methods design. Two versions of a 5-point Likert-type scale survey will be used for the pre- and post-tests before and after program implementation: the Student Internet
Safety and Ethics Survey and the Educator Internet Safety and Ethics Survey. Repeated Measures ANOVA will be used to analyze pre- and post-survey data. We will also conduct follow-up interviews and use thematic analyses to analyze the qualitative data.

Results or expectations

As of this writing, we do not yet have complete results. However, we do expect to have the pilot survey and interview/focus group data from the 20 grade 4 and 5 students and the four to six educators analyzed prior to the conference.

Preliminary results: From an informal talk-aloud session with elementary school teachers who were provided a preview of the computer-based program, they (a) expressed strong opinions on the length of time between information delivery (e.g., “The teacher character talked too long.”); (b) provided suggestions for additional interactivity (e.g., “Different students will think different things, so could we be able to click on different characters to reveal ideas?”); and (c) expressed a desire for a learning management system interface so they could see learning across all students at a glance. Additionally, the teachers recognized that Internet safety and digital citizenship education should be a priority of both teachers and family members, and expressed excitement to see how this program could work in their classrooms.

We have found through literature, as well as our own experiences as research-practitioners, that teachers cannot do this work alone. Parents and community members are just as important in engaging children in ongoing Internet safety discussions, modeling appropriate behaviors, and guiding youth through online exploration and discoveries (Baum, 2005). Our future studies will include the experiences and perspectives of parents and community members using the My Digital Voyage series outside of school contexts and environments.

Educational or scientific importance
Empirical studies on computer-based digital citizenship, Internet safety, and ethics curriculum are sparse. More research is needed to understand the explicit teaching of decision-making, empathy, and self-regulation. This investigation could address gaps in research and could provide relevant insights into the specific roles and responsibilities of adults when it comes to digital citizenship education.

Title of the submission: English Curriculum Reform in Oman in the Context of Globalization

Topic area: Curriculum, Research, and Development

Presentation format: Paper session

Name of the author: Samira Al Hosni

Affiliation of the author: Indiana University

Address of the author: 2788 E Bresingham Way. Bloomington, Indiana. 47401

E-mail: Samira.alhosni22@gmail.com

Abstract

Education is considered a necessary component of development in responding to globalization and achieving economic growth and social development. With globalization challenges, it was essential to reform the educational system. Since a hot debate over the issue of the influence of globalization on education and curriculum reform is taking place currently in Oman, an attempt is made by this preliminary study to explore some aspects of this power. This paper aims at investigating how the post basic English textbooks are reformed in the context of globalization. Particularly, it aims at exploring how the issue and challenges of economic and technological globalization are addressed in the English textbooks of post basic education. It also seeks to find out more about the extent to which the Omani teachers are aware of the different challenges of globalization. Two methods were used to collect data, and they are; post basic English textbook analysis and an interview questions which were addressed to some teachers of post-basic education teachers in Oman. Data analysis revealed that the issues of economic and technological challenges of globalization are adequately dealt with in the post basic English textbooks. It also showed that there is a sort of a gap between the goals to be achieved by the Ministry of Education in Oman concerning globalization challenges and the teachers' awareness of those challenges. Therefore, the study highly recommended having a constructive conversation between the Ministry of Education and the teachers of post basic education to bridging that gap. It also suggested raising teachers' awareness of different aspects of globalization concerning curriculum development and reform.
TITLE: Lived Experiences of Teachers Transitioning To Distance Education In A Traditional University, A Phenomenological Study

Lived Experiences of Teachers Transitioning To Distance Education In A Traditional University, A Phenomenological Study

Topic Area: Distance Education or Human Resource Management

Paper Session

The university will integrate distance education into its traditional teaching and learning method, this study will show how the teachers experience the transition from the time of their selection extending into the training period until the end of their first semester of implementation with the goal that by understanding the experiences from the perspective of the teachers it will enable management to better prepare future teachers who will make the same transition.

Chapter One

Introduction

Education has always been in the forefront amongst the concerns of nations as well as organizations such as UNESCO who are concerned with the development and progress of a country. It is believed that the presence of education and the ability of a country to educate its people is akin with the development and progress of a nation. UNESCO’s Education for All or EFA as well as the Millennium Declaration which has emphasized the importance of education and its relation to progress have been mainstreamed in our country with its inclusion in the Philippine’s Medium Term Development Plan or MTPDP (UNESCO 2008). The 1987 Philippine Constitution guarantees the right of every Filipino to education, this is further emphasized in Republic Act 9155 or the Governance of Basic Education Act of 2001 as well as the Republic Act 6655 or the Free Secondary Education Act. In spite of these efforts however, education is not readily available to the Filipino people for a multitude of reasons and Philippine higher education institutions of HEIs are continuously confronted with the challenge of the attainment of education at all levels for its people, a problem commonly seen among developing countries such as ours.

Purpose of the Study

Education and its delivery has changed over time, some of these changes were brought about by the advent of technology while others occurred due to the need of the times. The advent of distance education or DE has brought about a vast number of possibilities to enable the country to reach the goal of providing “Education for All”. Distance education (DE) has been around for some time and has evolved through several generations based on the mode of delivery
used. This has provided educational institutions with opportunities to expand its reach outside the borders of its own localities, reaching and connecting with new groups of learners other than the traditional student who experiences his learning within the four walls of the classroom. At the same time, distance education also provides learners who for some reason may not be able to attend traditional face-to-face programs with opportunities to study and further themselves using this method of educational delivery. These changes have also led to opportunities as well as challenges in teaching and learning. There are institutions of learning which have specifically been established for the purpose of providing education purely using the distance education mode. The enactment of the Republic Act No. 10650 (RA 10650) entitled “An Act Expanding Access to Educational Services by Institutionalizing Open Distance Learning in Levels of Tertiary Education and Appropriating Fund Therefor” have provided traditional Philippine institutions of higher education an opportunity to offer courses using the distance education mode of delivery (Philippines 2014). This law supports the Commission on Higher Education’s (CHED) policies with regard to distance education as can be seen in its Commission on Higher Education Memorandum Order (CMO) 27, Series of 2005 entitled “Policies and Guidelines on Distance Education” (Commission on Higher Education 2005). This however does not come without a cost be it financially or in terms of transitioning of teachers to enable them to teach via this method and students to be able to learn by this method. There is the question of how traditional educational institutions can offer such programs taking into regard its traditional framework of education in the four walls of a brick and mortar classroom The shift to distance education will entail a change among all its stakeholders and among these are the teachers who will need to understand, design and teach in a new pedagogy.
“There is nothing more constant than change”—Heraclitus 535BC, this was true then as it is now. Change may come from within or may be driven by external factors. Change and transition are two different things. Change is basically external in nature and may due to a different policy, practice or structure that is being brought about, transition on the other hand is internal in nature and is a psychological reorientation that people have to go through before change can take place, another way of putting it is that, “transition is the state that change puts into people” (Bridges and Mitchell 2000). One of the goals or objectives of the university is to provide students with alternative modes of learning and one way to achieve this is to offer courses or programs which will use the distance education approach. To enable the university to do this and shift from a traditional face-to-face pedagogy to a distance education methodology it would mean that some changes will have to occur hence the teacher will need to transition from where they are now in the traditional framework in order to enable them to teach via DE.

The university to be studied is a traditional non-sectarian stock organization in existence for 70 years and provides quality education to the people of the Batangas City, nearby cities, towns and provinces. As the years have passed it has evolved and sees itself as being in the forefront as an educational provider within its geographic area dedicated to providing students with an education that will make them globally competitive in a technology and research driven environment using both traditional and alternative modes of delivery (UB 2015). The university offers programs from basic education to various programs in the tertiary level as well as the Expanded Tertiary Education Equivalency and Accreditation Program (ETEEAP), graduate school and a college of law. Distance education (DE) has come into light at the university as a means to increase its reach especially for programs in the ETEEAP and graduate school levels
and even potentially the regular tertiary programs and even some secondary program classes to enable it to maximize the use of its resources. At the current time ETEEAP students at the university number more than 300 at any one time, coming not only from Batangas City but from other parts of Luzon and even from outside of the Philippines. ETEEAP allows the student to accomplish his or her tertiary program of study within a year by giving credit to work experience and other trainings. During the period in which he is taking his or her courses there is a need to have a physical presence and come to the campus at least twice a month for the conduct of classes. The presence of ETEEAP courses taught via distance education would enable current students to study from a physical location separated from the campus. It will also enable more geographically distant students to accomplish their dreams of being a college graduate by the taking the program through distance education. As an autonomous institution the university also has extension programs for its graduate school as far as Calapan, Mindoro and Lucena, Quezon. There are however limitations as to the number of teachers willing to travel to those places to teach, by using distance education it will enable the graduate school to eventually have more professors sharing their expertise with graduate students as well as enabling more individuals geographically separated from the existing campuses to enrol in graduate educate programs and accomplish their graduate degrees via this method as well.

The university’s management understands that there is more entailed to enable it to offer distance education courses even if it would start only with the blended type of DE, they are however keen on exploring this avenue of possibilities. This provides the researcher with an opportunity to study how the university will integrate distance education into its current traditional method of teaching and learning and how such a method will be experienced and
accepted by the teachers. This change from what is to what the university wants to attain will
entail a change that will affect not only current policies and procedures but will also entail a
transition of its faculty from one pedagogical practice of classroom teaching and learning to
another mode which teaching and learning occurs outside the physical classroom with a
separation of teacher and learner during the process.

This study will subscribe to the definition given by RA 10650 which defines distance
education as a “mode of learning in which students and teachers are physically separated from
each other, it is student-centered, guided independent study, making use of well studied teaching
and learning pedagogies to deliver well-designed learning materials in various
media” (Philippines 2014). This law combines the methodology of DE with that of the concepts
of open learning and flexible learning, hence the modes of delivery may use print, audio-visual,
electronic/computer technology and virtual classrooms as well as face-to-face sessions.

Change is nothing new and organizations of whatever type cannot grow and be successful
by just repeating the practices of yesterday, hence they must learn to be innovative and with
innovation comes change (Bridges and Mitchell 2000). Change is a phenomenon of time which
involves both identity and process and can be polarized from serene acceptance to modern
abhorrance (Chiaburu 2006). For change to occur, a transition must happen. Transition itself
entails a person to go through phases which start at the trigger of the event and ends at the period
of acceptance and involvement. Understanding the change and transition that will happen from
the perspective of the teacher will allow management to better prepare other teachers who will be
making the same transition in the future by providing more support, mentoring and coaching if
and when needed based on the experience of others or of those who have lived the same experience.

Though many have transitioned from the classroom to distance education, there have been no studies seen documenting this transition in the local context. And though foreign literature and studies may be used as a basis to understand the phenomenon it is an accepted fact that the transition that an individual goes through during change is not only affected by the individual’s traits and personality but may also be affected by the culture and practices that exists within the organization itself and in the country in which it exists.

**Review of Related Literature**

Globalization and technology has brought about changes in the world, more so in the field of education wherein not only our views and perceptions of education has changed or has needed to change but also in the ways that we can offer education and in how we can reach a greater multitude of individuals.

The ecological approach to education and business administration used by Katane et. al. states that the educational environment is a 1.) multilevel environmental system hence its environment can be studied from the structural, evolutionary and functional points of view; 2.) multicomponent/multi-contextual and multifunctional environmental system hence it has several features and functioning principles which can be distinguished, analyzed and assessed (Irena Katane 2015). They believed that distance education is a complicated process that needs specific organizational provisions in management, its implementation can ensure competitiveness and sustainability of an education institution (Irena Katane 2015). It provides important advantages
from the standpoint of students and teachers due to the opportunity to study, accessibility, convenience and flexibility while at the same time there are recognized disadvantages which include technological limitation (facilities, incompetence, trust), educators methodological incompetence, digression from academic standards, feelings of social isolation, language competence and lack of learning skills (Irena Katane 2014).

Distance education can obviate the need for a brick and mortar classroom. Globalization and technology not only alters views on education but also provides new avenues for learning (Hisham Dzakiria 2006). Distance education has several modes of delivery which ranges from print, radio, television to online, it can be done purely in the distance mode or via a hybrid or mixed mode or what some would call the blended mode wherein a certain percentage of the classes are done in a traditional classroom or face-to-face while the rest are done in the distance mode irrespective of the technology used.

Any innovation and change in teaching entails that it be studied or researched on because of possible impact on beliefs, pedagogical practices and experiences (Redmond 2011). When an institution chooses to shift or make a change it needs to consider various factors and the sectors that will be affected and often times insight understanding are generated only when the experience is studied are different levels (Hisham Dzakiria 2006). Following this line of thinking it is expected that in shifting from a traditional face-to-face environment to a distance education environment, teaching and learning will challenge the expectations and the roles of both the instructors and the learners (Redmond 2011).

The National Center for Education Statistics (NCES) web site has shown that there are four factors that impact distance education offerings and these are faculty concerns, institutional
barriers, lack of funding/costs, and resources and external support (Greene 1998). These were further confirmed by the study of Styron (2009) wherein they found six emerging themes that should be taken into consideration in the decision making process with regards to distance education and these are: 1.) distance education offerings; 2.) faculty considerations and incentives; 3.) student considerations; 4.) resources and external support; 5.) lack of funding and costs and 5.) administrative characteristics and considerations (Styron 2009). In this same study the findings showed that the level of importance is largely self-determined and that if it was known to have upper-administrative support, buy-in by faculty became much easier. In starting the distance education course offerings the decision making process included examining of the pedagogy of online content delivery based on the individual faculties’ philosophies, prior content delivery experience, workload requirements for cohorts, program uniformity, course consistency and aesthetic features found within each course.

The commitment to any form of distance education and e-learning is shaped largely by economic imperatives and the potential of information technology for massification and extending over distance (Hannon 2011). Progress and change is not without a price, as technology advances, it has caused a change in the nature of face to face teaching and has enabled the rapid growth of blended and online courses. But as it affords new opportunities, it also affords new challenges. Technology impacts the changes in teaching and learning spaces hence a move from traditional face-to-face teaching towards technology enabled, blended and fully online teaching and learning initiates a role shift (Redmond 2011). One must realize however that the challenge of distance education and e-learning start before technology arrives, to re-scope implementation to encompass the pedagogical effort and learning goals of its
practitioners (teaching academics, academic developers learning technologists and educational designers) (Hannon 2011). Studies have shown that transitioning from traditional face-to-face to online teaching and learning challenges the expectations and roles of both the teacher and the learner as they make the transformational shift.

On the side of the faculty their concerns also included issues in regard to tenure and promotion policies as well as faculty incentives. Incentives involved financial compensation as well as faculty recognition. Financial compensation both for development of a DE course and delivery of a DE course (recognition of efforts in the development and implementation of distance education offerings). Recognition involved letters of recommendation to be included in their dossier for the purpose of tenure and promotion. Faculty buy-in as well as faculty openness was noted to be important in that with a new attitude shift and acceptance or buy-in moving forward with the program was easier. Some have voiced out concerns with regard to the rigor and quality of distance education courses while others took note of the time constraints involved in developing the instructional materials and effectively teaching the content needed for the purpose of the course. There was also mention of fears of the brick and mortar schools closing with further progress into DE.

Teachers must redefine not only their professional identity but also their teaching practices. Replicating their existing course design and pedagogical practice commonly occur in instances wherein no training was given prior to their transition as seen in studies by Bonk et.al. (2003). Several studies have shown that the major challenge for teachers as identified by Yang and Cornelious (2005), was in learning how to redesign learning to a constructivist approach.
which results to a change in the roles and responsibilities, use of technology, relationships, presence and perceived lack of prestige (Redmond 2011).

A case study done by Redmond (2011) which followed two traditional face-to-face teachers over a four-year period as they transitioned from the face-to-face to blended then to online teaching chronicled the changes in perceptions and pedagogical practices as the two instructors moved through their transition journey. The first stage of their journey was when they were first introduced to blended teaching, the second stage was when they had some experience teaching via the blended approach and were capable of designing fully online course and the third was when they were able to teach in the face-to-face, blended and online modes. As they progressed through each stage they had realizations at each part of the transition. In essence they felt that their growth was spiral in nature in that as they gained experiences as blended and online teachers they experienced new roles and explored the expectations of what those roles entailed while at the same time developing within them the expertise, knowledge and skills necessary for the DE pedagogy. Paradigm shifts were seen not only in how they communicated with their students but also in the manner in which they designed the courses and how they initiated learning and as they progressed. Although they were more positive with regard to the resulting student outcomes, in essence they felt that what worked in the traditional face-to-face classroom was not as effective in the online space (Redmond 2011).

Administrators mention the importance of having the necessary resources and external support network in their decision making processes in DE. The need to provide not only initial training and support for faculty learning to integrate new technology but also the need for it to be continuously readily accessible with follow-up training to ensure that the tools provided are
being utilized both effectively and efficiently are frequently highlighted. Aside from resources and external support for faculty there were also resources and external support that were applicable to students. Other external support sources which have been identified were grants and fundings in order to fill in the gaps between what the institution currently has and what it needs in order to successfully implement DE. External funding sources may be in the form of grants, alumni contributions, community businesses and partnerships with entities who are interested in the success of the venture. Partnerships may include those of technology leaders, learning management software companies who can provide not only software and hardware but training for the end-user. Financial costing considers not only technology expense and training expense but also expense in terms of greater compensation for faculty teaching via DE. Another factor mentioned of concern was institutional bureaucracy which includes length of time for the program to be approved and getting everyone on board. Organizational change must occur in order to alleviate institutional barriers that serve as a hindrance to the expansion of distance education offerings. There must be an understanding of institutional policies and processes and the establishment of a realistic timeline for the creation/expansion of distance education offerings (Styron 2009).

To be an effective education provider all issues pertaining to learning support need to be identified and addressed effectively, the task is to design and offer an educational experience that encourages learning (Hisham Dzakiria 2006). In this study done on the experience of University Utara Malaysia (UUM), learning support was seen to be of utmost importance. Learning support meant not only that of the teacher facilitating the learning process but also with regard to the other support systems including but not limited to that of technological support and access.
Effectively addressing the issues of the learning support system creates an environment that encourages independent learning and produces effective learning outcomes (Dzakiria, Mastafa et al. 2006).

Much has been said about the changes that must occur within an educational institution in order to effect a shift from traditional to distance education. More often than not, studies have focused on changes in pedagogy, infrastructure, compensation, policies and procedures but only a few studies have focused on the psychological impact it has on teachers as they transition from one form to the other. Any change can cause a feeling of apprehension and uncertainty. A movement from traditional to distance education or distance learning can be considered as a change which like other forms of change can cause a sense of bewilderment which can further be compounded by the feeling of apprehension and uncertainty, it is with this that Forrester’s study underlined the importance of “Induction” which helps the students transition from their existing traditional environment to that of the distance learning with greater ease (Forrester, Motteram et al. 2004).

Change and transition may or may not be periodic events and is dependent on the natural state of the organization. Factors such economic, political, technological, cultural and societal factors contribute to the pace and complexity in which change will occur (Bunker and Wakefield 2005). Change does not happen automatically and it involves grieving, letting go, building hope and learning. In order for change to be in effect, transition must occur and the human dynamics of transition must be addressed. Transition is a three phase process which begins with something “Ending” followed by a “Neutral Zone” and the third and final phase being a “New Beginning”. Transitioning goes through several stages which include 1.) initial resistance; 2.) embracing the
changes; 3.) striking a balance and 4.) hitting the target or mastery. Between “ending” and the neutral zone occurs emotions such as denial, shock, frustration/stress and ambivalence. Between the “Neutral Zone” and the “New Beginning” occurs skepticism, acceptance, importance, hope and enthusiasm (Bridges 2013). Transition is the inner process which allows people to come to terms with the change that they are experiencing and enables people to let go with the way things used to be and reorient themselves to the way things are now (Bridges 2013).

Synthesis of Literature

The advent of distance education or DE has made it possible for teaching and learning to occur outside the four walls of the classroom. It has brought about a number of possibilities and has enabled educational institutions to have opportunities with which to expand its reach outside the borders of its own localities, reaching and connecting with new groups of learners other than the traditional student who come on campus for his or her education. By the same token, it has also provided learners who for some reason have not been able to attend traditional face-to-face programs with opportunities to study and further themselves using this method of educational delivery. Globalization and technology have enabled us not only to change our views and perceptions on education but has also enabled us to do more (Dzakiria, Mastafa et al. 2006, Katane, Kristovska et al. 2014). The end goal of education in the twenty-first century is the systematic improvement of both the quality and accessibility of education throughout the world (Cisco Systems 2008).

The shift from a traditional face-to-face framework to a DE framework entails changes in teaching and learning which evolves through time. As it provides new opportunities it also provides for new challenges because what may have worked in the traditional classroom may not
be as effective in the DE space (Dromgoole and Boleman 2006, Redmond 2011). There are advantages and disadvantages in the distance education environment, in as much as it provides greater accessibility beyond geographic boundaries, it allows individualization as well as flexibility, it also has the disadvantages related not only to high cost of development but also in the need for a pedagogical shift as well as required technological skills and the feeling of social isolation (Katane, Kristovska et al. 2014, Katane, Kristovska et al. 2015). Programs taught in the traditional academic environment can be shifted to the distance education environment to meet the needs of a global community but it entails a shift in the way of thinking and of doing things. Integrating distance education into a traditional institution is seen by many as a way for an institution to ensure its sustainability while at the same time it also entails a cost be it either financial or in human resources and even changes or the unmaking of policies, procedures and practices in order to make them anew (Goho, MacAskill et al. 2003, Katane, Kristovska et al. 2015).

Any change, innovation or shift in traditional practices should not be taken lightly as it affects different levels of the institution and will challenge the roles and expectations of all those involved or affected by the change, hence better insight and understanding can often be possible only by studying those experiencing it first hand (Dzakiria, Mastafa et al. 2006, Redmond 2011).

Leaders and managers have been found adept in creating visions of what should be and initiating reorganization, restructuring or whatever else is needed in order to create change and attain their visions, however there is lack of focus on the human side of the change and the human dynamics of transition (Bunker and Wakefield 2005). Understanding what is involved in
the human side of change would enable the leader or manager to effectively deal with the changes needed to guide people through their transition.

The shift from one stage of development to another necessitates a change and for this to occur those involved must transition wherein individuals concerned must come to terms with the change and should be willing to “let go” of the way things used to be and reorient towards what it is now. Transitions have been described by Goodman (2006) to be “any event, or non-event, that results in changed relationships, routines, assumptions and roles” which are experienced and can have either a negative or positive impact depending on individual and the context in which it is experienced at the time (Hicks 2014). The key to transition is bridging from the old, dismantling and unmaking then looking towards the new (Hill 2014). Change will work only if it accompanied by transition and it is through understanding these transitions that leaders can guide those who need to make the change (Bridges and Mitchell 2004). Transition can be very brief lasting a few days to a few weeks and at other times it can take months to years (Alberta 2002).

Transition can be categorized into: (1) anticipated, (2) unanticipated, and (3) non-events. The impact of the transition is determined by the degree to which it alters one’s daily life, while context refers to one’s relationship with transition and the setting in which it takes place. Schlossberg’s Transition Theory identifies four major factors that influences a person’s ability to cope which transitions and these include: situation, self, support and strategies (Guido-DiBrito 1998). The interplay of the four factors may dictate how a person transitions from one phase to another.
Conceptual Framework

It is believed that change of any kind brings with it a confluence of effects. Change in itself is considered as the external situation that occurs, it is what is being sought to be achieved which may be a change in policy, practice or structure to be brought about. Transition on the other hand is the internal process that people must go through to come to terms with a new situation and eventually adjust and adapt to the change (Bracken 2011). Some would refer to transition as the “psychological reorientation that people go through before change can work” (Bridges and Mitchell 2000). Any change in the current status or ways of doing things implies that a transition must be made from “what is” to “what we want”, it also involves “unmaking” in order to “remake”.

There are several transition models like Bridges’ Model, Schlossberg’s Model, Oconner and Wolfe’s Stages of Transition Model and Hays and Hobson’s Sperm Model. Each of these models have a commonality in that there is a starting point followed by processing and ending wherein the necessary change has occurred. Each of the models have their strengths as well as their limitations and their inherent applicability and usefulness in certain situations and in the process of transition. For the purpose of this study, the focus is a combination of Bridges’ Transition Model and Schlossberg’s Transition Theory.

Bridge’s Transition Model describes three distinct phases in transition which are, “endings” or “saying goodbye”, followed by “exploration” also know as the “neutral zone” or “shifting to neutral” and finally “new beginnings” or “moving forward” (Bridges and Mitchell 2000). During each of these stages the individual undergoing the transition goes through a variety of emotions and experiences before they proceed into the next stage. It’s optimistic nature
presumes that all transition is temporary and the end result is the development of a better person (Brandt 2003).

According to Schlossberg’s Transition Theory, transition has three major parts, the first of which reflects on the experience leading up to the transitions (approaching transitions), the second entails taking stock of coping resources to understand how to cope with the transitions and finally the third part which is taking charge (Guido-DiBrito 1998). Transition is a psychological process of letting go of how things used to be and taking hold of the way they subsequently become, it is how individuals come to term with change (Hicks 2014).

The models of Bridges and Schollsberg are in agreement in saying that for change to occur, transition must happen. Transition itself is a process that people must go through to attain an end result. The institution envisions itself as being able introduce the concept of distance education and migrate or transition some of its courses into this pedagogy. In effecting this change it is believed that the teachers who will be chosen to shift from traditional to distance education must go through a transition process which according to these two models have three phases and each of the phases brings with it certain events and feelings which the teachers must go through in order to effect transition during change. In the course of the transition the teacher must go through an initial process of “approaching transition”, “letting go (of the old or familiar)” or “ending” or “moving in (of the new)” which may bring about feelings of fear, anxiety, sense of loss of the familiar, despair, resistance, frustration and depression. After which he moves into a “transition process” or “moving through”, “neutral zone” or “exploratory phase” during which time there is an interplay of the elements of the situation, support strategies and self which may cause some chaos, confusions, pessimism, skeptics, realization of loss and
resignation. The third and final phase of the transition is “new beginnings” wherein the change has occurred and is rolled out and during which time there is acceptance, relief, hope, excitement, trust, courage and optimism.

As the institutions shifts some of its offerings from traditional face-to-face to distance education it is believed that the shift not only affects the administrative aspect of the institution and its infrastructure but will also involve the end users among which are the teachers. This study intends to look into the “lived” experiences of teachers of a traditional university as they migrate and make a change or transition towards distance education so as to understand their feelings, perceptions and experiences as they shifted from traditional face-to-face to distance education as seen in the Modified Bridges - Schollsberg Model (Figure 1). It is hoped that by being able to study the lived experience of the first set of teachers to undergo change will bring

![MODIFIED BRIDGES-SCHLOSSBERG MODEL](image)

Figure 1. Change Process
about a better understanding of the human dynamics that will occurred which in turn will be able to help others in getting through the transition process.

**Statement of the Problem**

The transition from a traditional or a face-to-face to a DE mode of teaching entails a change and a shift in pedagogy which may in some cases mean a movement or a change from familiar to the unfamiliar. This change will entail transitioning of those involved, in this case that of the teachers who have been chosen to make the shift from their traditional face-to-face method of teaching to a distance education mode which they have not yet experienced. In this study, it is aimed to discover the essence of the lived experiences of the teachers who are transitioning from a traditional face-to-face setting to a distance education milieu with the hope that in understanding their experiences and the psychological processes involved in the transition process other teachers who will make the shift in the future will be better prepared for the shift.

This phenomenological study focuses on the events and experiences of transitioning or migrating from traditional face-to-face to distance education. This will enable to researchers to discover the essence of the phenomenon of transitioning by studying the lived experience of teachers transitioning to the new pedagogy as well as examine their assumptions about teaching and learning in a traditional and distance education environment. The main research question would be “How do teachers describe their lived experience of transitioning from traditional face-to-face teaching to a DE mode of teaching?” This will be focusing on the essence of transitioning to a DE pedagogy based on the lived experiences of the teachers with the belief that in shedding light on the experience of these teachers it will facilitate the transitioning process of other teachers who will make the same shift in the future. This will also provide the
administration with a sense of direction on how to manage the transition and effect the change leading to a smoother transition of a teacher during the change process in the future.

The research questions that guide this study include:

**Grand Tour Question.**

“How do teachers describe their lived-in experiences as they shift or transition from traditional face-to-face teaching to teaching in distance education mode?”

**Sub-questions.**

1. How do the teachers describe their experience in transitioning from traditional face-to-face teaching and learning environment to DE teaching and learning environment? (What was their transitioning like, what did they experience and how did they feel about the process of transitioning?)

2. How did they cope with the transition to a new pedagogy?

3. What were their most significant internal experiences in their own individual transitioning processes?

**Chapter Two**

**Research Design and Methodology**

**Research Design**

The basic framework of this study is phenomenological in nature, it can be considered as a “research in progress” due to the fact that the research will be occurring during the actual time of the planning and implementation of distance education at the university. The university’s expansion into distance education will be studied as it unfolds in its natural setting. We will
attempt to interpret the phenomenon as it occurs and the meanings brought into it by one of the set of stakeholders, in particular, the teachers. Phenomenology focuses on the experience itself and how experiencing something is transformed into consciousness. Using the Giorgi’s methodology, the descriptive understanding of the experience will be based solely upon the presented data from the teachers who are the subjects of the research and will not go beyond what is given.

Phenomenology is a broad discipline and method of inquiry which is based on the premise that reality consists of objects and events as they are perceived and understood by the human consciousness of those who are actually experiencing it or living it (Mastin 2008).

The term “phenomenology” comes from the Greek word “phainomenon” which means “appearance”. Phenomenology is not only a philosophy, a foundation for qualitative research but is a research method in its own right (Hirsch 2015). Phenomenology as it is known today is attributed to Edmund Husserl regarded as the fountainhead of phenomenology in the twentieth century, he launched it in his work “Logical Investigations” in 1901 (Groenewald 2004, Mastin 2008, Kemerling 2011). Husserl’s classical phenomenology was a kind of “descriptive psychology” which later became “transcendental phenomenology” wherein he differentiated the act of consciousness and the phenomenon at which it is directed. Husserl believed that people can be certain about how things appear in or present themselves to their consciousness hence anything outside the immediate experience must be ignored (Groenewald 2004).

The purpose of the phenomenological approach is to illuminate the specific, to identify phenomena through how they are perceived by those in a situation hence it is based on a paradigm of personal perspective and interpretation, knowledge and subjectivity with emphasis
on the importance of the personal perspective of those who are experiencing it (Lester 1999). The foundational question in phenomenology is: “what is the meaning, structure, and essence of the lived experience of the phenomena by the individual or individuals experiencing it?” (Johnson and Christensen 2007). It differs from other qualitative methods as it attempts to understand, analyze and describe the essence of a phenomenon based on the account of the persons who are experiencing the phenomena being investigated in their everyday life or what some would call the “lifeworld” (Hirsch 2015). The aim of the researcher should be to describe accurately the phenomenon without biases or pre-conceived or pre-given frameworks and only remaining true to the facts while understanding the social and psychological phenomena from the perspectives of the people involved (Groenewald 2004). The phenomenological approach can be applied to single cases to deliberately selected samples usually no more than ten. Multiple samples or participants can strengthen the inferences made with the recurrence of factors among the participants. Methods used can vary from interviews, conversations, participant observation, action research, focus group discussions and analysis of personal texts or diaries. Since the aim of phenomenological research is to aspire for pure self-expression, there must be no interference from the researcher and no leading questions must be given so that the participants or subjects are able to be aware of their own ideas (Vickers and Offredy). Analysis involves looking across themes between participants to draw out key issues and commonalities across the participants, faithfulness to the participants should be remembered and personal biases should not be included (Lester 1999, Cohen and Crabtree 2006, Johnson and Christensen 2007).

There are several phenomenological approaches, though all follow the primary concepts of description, reduction, imaginative variations and essences. The different approaches are
mainly categorized into transcendental phenomenology which was founded by Husserl, existential phenomenology by Merleau Ponty and heuristic phenomenology by Heidegger (Hirsch 2015). Each of these main categories have followers who espoused their methods.

The transcendental phenomenology of Husserl forms the basis of all other phenomenologic research methods. According to Husserl the “lived experience” should be captured, described and reflected upon the way the person experienced it and its interpretation should be based on his reality. The reduction process would involve bracketing or epoch wherein the researcher or investigator would set aside his own personal beliefs and prejudices so that he may have a clear view of the phenomenon as originally intended. Hermeneutic phenomenology of Heidegger on the other hand differed in the sense that Heidegger believed that it was impossible to set aside the personal beliefs and possible biases of the researcher. He believed that the researcher’s awareness would enable the researcher to be immersed in the phenomenon and gain better insight and understanding of the experience. Instead of just being descriptive in nature it is also interpretative. This method is exemplified by Van Manen’s approach to phenomenology. Existential phenomenology on the other hand believed that the consciousness and the self could not be separated hence bracketing or suspension of individual presuppositions and biases would not be possible, hence complete reduction is impossible.

For this study, Giorgi’s adaptation of the transcendental phenomenological process was selected as we are interested in the lived experience of the teachers transitioning from traditional face-to-face into the distance education mode and that an insider’s perspective would be most helpful in understanding the phenomenon of transition in this particular case and how management would be able to aid teachers who in the future would be making the same
transition. Giorgi's approach utilizes the phenomenological reduction process that involves several main steps which are bracketing, intuiting, analyzing and describing. *Bracketing or epoche* is the process of removing or holding in abeyance any pre-conceived ideas, opinions and beliefs about the phenomenon being researched (Vickers and Offredy). Others would refer to this process as the assumption of a phenomenological attitude wherein the researcher puts aside his or her presuppositions, theoretical, cultural and experiential knowledge to allow him or her to see the data in its own context without doubt or disbelief (Broome 2011). Researchers should be self critical and aware of their own subjectivity, vested interest, predilections and assumptions and how these may impact the research process and findings (Finlay 2009). *Intuition* on the other hand requires that the researcher be immersed in the study of the phenomenon and that he remains open to the meaning given by those who experienced it resulting in a common understanding of the phenomenon being studied. The data is read in its entirety or in the “naive description” as provided by the participant. *Analysis* is the process of categorizing and making sense of the essential meanings of the phenomenon so that the common themes or essences will emerge. In the process of the analysis demarcations are made so as to divide the narrative into “Meaning Units” which are more manageable portions. After being divided into meaning units, these are reduced to discrete expressions of the experiences by the creation of “Central Themes”. Next is the establishment of the “Thematic Index” which is a non-repetitive list of meaning statements and referents used to search for interpretive themes. The thematic indexes are analyzed collectively and from this arises the “Interpretative Themes”. In the descriptive stage or in describing, the researcher begins to understand the phenomenon and is able to communicate a distinct, critical description of the phenomenon (Vickers and Offredy). This is
essentially the summary of the “Interpretative Themes” which produces an in-depth picture of the experience or the phenomenon under investigation which in this case would be those of the teachers in transition from traditional face-to-face to a distance education environment. The ultimate goal of this process is to reduce the meanings of the teacher’s experiences to their essential structure so as to reveal the essence of the experience. Essence has been defined by Husserl (2001) as “a structure of essential meanings that explicates a phenomenon of interest”

![Diagram of Giorgi’s Descriptive Phenomenological Research Design]

During the study, triangulation of the data will be done in order to improve the validity of findings. It has can be assumed that with the use of triangulation the data will converge and the aggregate truth can be revealed. According to Wargo, “triangulation is a means of checking the integrity of inference one draws” and can be done through various ways such as the use of multiple data sources, multiple investigators, multiple theoretical perspectives and or multiple methods (Wargo 2013). The process espoused by Wargo involves the following: 1.) interviews are conducted and audiotaped; 2.) the audio recordings are transcribed and returned to the participant for review and approval and 3.) the researcher collaborates with an “outside or
external” evaluator or auditor during the data analysis (Wargo 2013). The use of this triangulation method will lessen concerns with regards to subjectivity of the findings.

**Data Sources**

The study will be conducted in a private, non-sectarian private higher education institution which has been awarded autonomous status by the Commission of Higher Education (CHED) as well as having a Center of Excellence in Teacher Education and Center of Development in Business Management. It is International Organization for Standardization (ISO) certified and has accreditation from the Philippine Association of Colleges and Universities Commission on Accreditation (PACUCOA) with levels ranging from levels I to IV across majority of its programs. The program offerings range from basic education to higher education, graduate school and college of law. There are three fully operation campuses across the province and extension programs in Mindoro and Lucena.

A homogenous theoretical purposive sampling will be done as the faculty will be from among those who will undergo the training during the summer semester of 2015-2016 to be able to teach via distance education in the 1st semester of 2016-2017. The faculty to be chosen will be mainly among those who are teaching courses either in ETEEAP or in the Graduate School Level as well as a few from the collegiate and secondary school levels. The faculty members chosen will be oriented individually with regard to the study and it will be made clear to them that they are requested to answer the interview faithfully and honestly and that in no way will their responses be a cause of negative reprisals in any of their performance evaluations. They will be asked to sign the informed consent form explaining that they may withdraw from the study at any time without prejudice.
**Data Collection Methods**

Data collection will be done through a combination of semi-structured face-to-face in-depth interviews and the diary method. In order to illicit their lived experiences as accurately as possible the faculty members will undergo face-to-face interviews at several points during their transition namely, 1.) shortly after receiving notification of being selected to transition to the distance education environment but prior to the commencement of training estimated to be around April 2016; 2.) at the completion of the training period which is estimated to be by the second week of June 2016 and; 3.) at the completion of their first semester of teaching via DE which is estimated to be by the end of November 2016. Interviews will be recorded so as to assure the accuracy of the transcription. At the start of every interview the faculty participant will be reminded they may withdraw from the study at any time without fear of negative reprisals secondary to their withdrawal from the study or from their responses during the interview. All interviews will be recorded and transcribed verbatim. Bracketing will be done throughout the interview process to ensure that the information gathered would be from the perspective of the participant. After each transcription of the interview is done the participant faculty will be asked to review the transcription so as to ensure its accuracy and to validate the raw data. They will likewise be asked to maintain a diary starting after the initial or preliminary interview stage until the end of their first semester of teaching via DE. The diary will chronicle their experiences and the emotions they go through during the process and will allow the triangulation of data and to ensure greater validity. The combination of these methods will enable the researcher to build a better understanding of the process entailed in teaching via DE by capturing the deep meaning of the experience in their own words. It will also enable us to see
how the teachers experienced teaching in DE over a period of time as they migrate from traditional face-to-face to the distance education mode.

**Data Analysis**

Analysis is the process of categorizing and making sense of the essential meanings of the phenomenon so that the common themes or essences will emerge. The researcher begins to understand the phenomenon and is able to communicate a distinct, critical description of the phenomenon.

There are basically six stages in the analysis of data gathered after it has been transcribed: (1) organizing and validating the data, (2) generating categories, themes and patterns, (3) coding the data, (4) testing emergent understandings, (5) searching for alternative explanations, and (6) writing the report (Lari 2008).

After the interview is done, the recording will be transcribed verbatim. After reviewing the transcription, the faculty participant will be asked to review and validate the transcription so as to ensure that what has been transcribed is what was meant by the participant. During the period of transcription and that of analysis, the phenomenology process of epoch will be maintained. Horizontalization of data is done wherein each statement is given equal weight or value. During this process, the transcription is chunked into what is called as meaning units (MU) to promote better understanding. After horizontalization is done the statements are reviewed to see if the experience will contribute to the understanding of the experience and see if it would be possible to label it. The next step in the reduction process was the clustering of the meaning units to form core themes and patterns for each participant in the study. This is followed by creating a textural description, this is considered as the “what” of the experience
After this is done for each of the participants a composite textural description will be made wherein the individual descriptions will be synthesized. Once the composite description is made we will be able to derive the “essences” of the experience of the phenomena.

At the completion of each stage and external reader will be requested to review and analyse the data so as to ensure greater validity and strengthen the analysis of the data prior to the finalization of the research study.
Steps and Procedure Summary

Participants who will be the first to transition to the DE environment are chosen.

Study is explained to the participants and Informed Consent forms are signed.

Initial interview of Participants by Researcher is conducted and the participants are also given a diary for their use.

Researcher transcribes the interview as recorded and the transcriptions are considered as raw data.

Figure 3. Diagrammatic Summary of Steps and Procedures

Researcher transcribes the second interview as recorded and the transcriptions are considered as raw data.

Second interview is done at the end of the training period.

Participant teachers undergo the training program.

Raw data of the first interview undergoes processing using the steps previously shown (Figure 2).

Participant teachers start their first DE classes in the 1st semester.

Third interview is done at the end of the training period.

Raw data of the third interview undergoes processing using the steps previously shown (Figure 2).

Raw data of the second interview undergoes processing using the steps previously shown (Figure 2).

Researcher does Analysis of the implications of the results and derives the Essence of Transitioning based on the lived experiences of the teachers.

Diary of collected Raw data of the diary undergoes processing using the steps previously shown (Figure 2).

Researcher compiles the results of the analysis of the three interviews and the diary and triangulates the
Research Question

**Grand Tour Question.**

“How do teachers describe their lived-in experiences as they shift or transition from traditional face-to-face teaching to teaching in distance education mode?”

**Sub-questions.**

1. How do the teachers describe their experience in transitioning from traditional face-to-face teaching and learning environment to DE teaching and learning environment? (What was their transitioning like, what did they experience and how did they feel about the process of transitioning?)

2. How did they cope with the transition to a new pedagogy?

3. What were their most significant internal experiences in their own individual transitioning processes?

**Interview Questions**

1. Can you tell me how you felt when you found out that you were chosen to teach through the distance education mode?

2. How did you feel when you started in the training program to teach via DE?

3. Can you describe the training process you underwent to teach via DE and what was it like for you?

4. How did you feel at the end of the training process for DE?

5. Can you tell me how you felt when you taught via DE and what was the process like for you?
5.1. During the first few weeks of teaching via DE?

5.2. At the mid portion of the semester?

5.3. At the end of the semester?

6. Did you receive any help?

6.1. What were the resources that you found helpful in transitioning from traditional face-to-face to the distance education environment?

7. Did you feel prepared to teach via DE?

7.1. Was there enough time for you to prepare for the transition?

7.2. Were you adequately prepared?

7.3. Did you have any misgivings?

7.4. Was there anything else that could have been done or provided to you to help you transition from traditional to DE?

8. Do you see any difference in your teaching experience in the traditional face-to-face and the DE environment?

8.1. Based on your own teaching viewpoint?

8.2. Based on the learning experience you saw in your students?

9. Did you experience any difference in your beliefs and assumptions about your own teaching and learning experience in the traditional face-to-face and the DE environment?
10. Looking back at the start of your transition process from traditional face-to-face to DE, do you remember how it affected you personally and professionally?

11. If you were to choose an image to describe your transition from traditional face-to-face and the DE environment, what would that image be?

11.1. Why that image or why did you choose that image?

11.2. Would you have chosen the same image when you were chosen to the time that you started teaching compared to the end of your first semester of teaching?

12. What were your most significant moments or experiences in your transition from traditional face-to-face and the DE environment?

13. Has your transition from teaching in the traditional face-to-face to the DE environment changed your perspectives in the teaching and learning process?

14. How do you see yourself as a result of this experience both as a teacher and as a learner?

15. What are your recommendations for other teachers who would be undergoing the same transition as you have undergone?

16. Do you want to teach another class via DE?

Philosophical and Pedagogical Issues in the Politics of Dress in Arabian Gulf Education

Alan S. Weber

alw2010@qatar-med.cornell.edu

Abstract—Although countries such as France and Germany have experienced large-scale immigration of Muslim populations from North Africa and Turkey for decades and have debated the implications of public dress codes in educational and governmental contexts, only recently has the Arabian Gulf (GCC) evolved into highly diverse and multicultural communities. Specifically, the development of American-style and Western higher educational institutes (branch campuses) and investments in science and technology capacity in the region has increased the number of expatriate experts from Western and Eastern Europe and the United States working in the Gulf. The previous expatriate populations who came to Qatar during the labor shortages of the first oil boom (1940s-80s) originated in other Gulf nations, Pakistan, India and other Muslim-majority nations who shared similar patterns of dress and attitudes towards public modesty. ‘Permissive’ clothing styles associated with Western cultures have become the topic of serious debate in the region. The subject is further complicated by the fact that most Gulf nations have developed an unspoken ‘national dress’ code which confers certain social privileges when in fact (as evidenced in historical photographs), styles of clothing were more diverse in the past, particularly in the use of color and adornment. As globalization and the Internet are increasingly altering cultural patterns in the Gulf, several organizations have called for more regulation of clothing at all levels of education and in public settings. In this contribution, the author attempts to disentangle the complicated debates surrounding proper dress in the Arabian Gulf as a means of understanding deeper sociological issues in higher education, such as access, multiculturalism, Islamic and Western identities, and post-colonialism. The author will demonstrate that these issues are serious, go far beyond the simplistic debates of individual freedom of choice and expression in clothing selection, and do impact the educational experience of both students and faculty.

Keywords: education—Arabian (Persian) Gulf; dress codes; education and religion

I. INTRODUCTION

Since most of the research on school dress codes and uniforms has been carried out in the United States, a brief overview of the most significant scholarship and the salient legal, social and philosophical debates within the U.S. context is valuable. Some of the issues in school dress are similar in the U.S. and Qatari educational systems, while on the other hand, the unique cultural and historical traditions of Qatar as a conservative Muslim country that is undergoing rapid modernization and to some extent Westernization adds certain complexities to the topic. For example, dress and attire are also linked to attitudes towards Qatar’s colonial past (as both an Ottoman and British Protectorate) and local attitudes towards the growing non-Muslim expatriate worker populations who bring with them different customs of modesty, public space, and identity expression through clothing.

Dress codes have been a feature of American, British and European education since the 19th century when mass public education first began. Earlier, religious houses in Europe such as Dominican and Benedictine friars required specific dress to identify their order. Formalized School Uniforms, defined as identical clothing sets with minimal variation, were introduced when a critical mass of student families could afford to purchase the required school attire. Obviously in poorer school districts required uniform purchase was impractical and led to low attendance rates. School uniforms, which strictly specify the actual colors, patterns and styles of clothing worn by all students can be distinguished from school dress codes that only set out general principles for wearing clothes, such as banning political or social statements or symbols on t-shirts and limiting immodest forms of dress. Thus dress codes are generally viewed as less restrictive than uniforms, providing more individual choice for students.

American citizens hold the Freedom of Expression as one of their most important individual rights. Thus dress codes and the ability to choose what one wears has often been framed in legal and individual rights terms. School dress code disputes have reached the various U.S. courts, and cases are often decided on related judicial precedents pertaining to freedom of speech, not to actual laws on dress which are not common in U.S. jurisdictions and usually occur only at the state or local level. In “Tinker v. Des Moines Independent Community School District” (1969) judges determined that students could wear armbands to school to protest the Vietnam War as this was found to be a form of legally protected speech under the First Amendment [1]. In Bethel School District No. 403 v.
Fraser (1986), students were granted the right to free speech expression in school if it was not deemed lewd or offensive by school officials, i.e. speech or expression that infringed on the civil conduct of school proceedings [2]. Similarly in Hazelwood School District v. Kuhlmeier (1988) the court determined if protected speech was found to interfere with activities in the classroom or infringe on the rights of other students (including their personal safety), schools could limit those forms of speech through official school policy [3].

Other pragmatic arguments against dress codes point out that school and administrator time is wasted in enforcing policies, for example requiring teachers to check attire individually in class on a daily basis and asking them to make interpretative judgments wastes precious class time. These judgments will be by necessity subjective, varying from teacher to teacher. Also, sending students to the Principal’s office for corrective action such as warnings or punishment additionally requires extra administrative time and resources. Moreover, adolescents and adults often dress differently for a variety of reasons and agreement on ‘appropriate dress’ will always be difficult, and judging a child’s or young adult’s clothing choice may reinforce existing generational differences and power differentials, increasing the sense of the arbitrariness and unfairness of compulsory school rules among disadvantaged and at-risk youth.

There are also valid and well-articulated arguments against allowing full freedom of dress choice in academic settings and valid points to be made for requiring the wearing of standardized school uniforms. For educators, the primary mission of education is learning and in the opinion of some educators emphasis on dress distracts students from studying, and also poorer students who are not able to buy the latest fashions can feel excluded from the school community, impacting their sense of self-worth and subsequently their academic performance. Also schools in the role of in loco parentis often assume some responsibility for controlling sexual behaviors of adolescents which can be signaled by certain kinds of clothing that sexualize both girls and boys.

Finally, the very important question of whether school dress and uniforms have any impact on academic performance has been the focus of several large-scale longitudinal, case, and retrospective studies in the U.S. Although evidence from case studies is variable, some case study findings suggest that wearing uniforms increases attendance rates, reduces crime and substance abuse, and boosts grades. However, other studies have come to the opposite conclusion. Using one of the most reliable data samples in the U.S., the 1988 National Education Longitudinal Study of 1988 (NELS: 88), Brunsma and Rockquemore concluded: “mandatory uniform policies have been the focus of recent discourse on public school reform. Proponents of such reform measures emphasize the benefits of student uniforms on specific behavioral and academic outcomes. Tenth-grade data from The National Educational Longitudinal Study of 1988 was used to test empirically the claims made by uniform advocates. The findings indicate that student uniforms have no direct effect on substance use, behavioral problems, or attendance. Contrary to current discourse, the authors found a negative effect of uniforms on student academic achievement. Uniform policies may indirectly affect school environment and student outcomes by providing a visible and public symbol of commitment to school improvement and reform” [4].

The constitution of Qatar approved by an overwhelming majority of its voting-eligible citizens in 2004–similar to the First Amendment to the U.S. Constitution—also guarantees freedom of the press and speech, but in practice this freedom is restricted by cultural practices that pre-date Islam, as well as specific Emiri decrees and the civil code. For example, it is unlawful to insult the Emir of Qatar and Qatari citizens have been imprisoned for this offence.

II. HISTORY AND CULTURE OF QATAR

Except for a small population (8-10%) of Shia Muslims, Qataris profess Sunni Islam of various conservative varieties known as either Salafism or Wahhabism. Their spoken dialect called khaleeji or Gulf Arabic is not mutually intelligible to all Arabic speakers, especially those in western Africa (al-maghreb). The learned language of Modern Standard Arabic is standard in school textbooks and the media. Many of the pre-Islamic Bedouin customs of Qatar have survived alongside normative Muslim practice, such as second and first cousin marriage, male and female separate social spaces, and the shunning of alcohol. Qataris venerate the past and hold traditional customs in high regard, hence the persistence of traditional dress, music and dance (ardha), and past-times (camel racing and falconry).

III. EDUCATION IN QATAR

Qatar was a traditional Gulf culture before the first oil exports from the country in 1949. The primary activities were pearling, fishing, seasonal pastoralism, date farming, trade, and piracy (the notorious Gulf pirate Rahman ibn Jabir al-Jalahima frequently kept his headquarters in the northern Qatari city of Zubarah). Most of these activities did not require extensive literacy beyond knowing and understanding the Quran. Hence there was little need for formal school beyond the primary level. Literate Sheikhs would sometimes teach children Quranic recitation and basic mathematical skills at religious schools variously called maktabs or kuttabs. The Dutch Reformed Church of America, despite the local rulers’ unease with Christianity, sponsored several American Mission schools in the early part of the last century in Bahrain and Oman, such as the Al Raja School in Bahrain.

By 1956 a public school system funded by the new oil wealth was established after sporadic government attempts to sustain a small number of schools in Doha beginning in 1948. The new schools contained a strong religious component and focused on basic skills, with memorization as one of the common pedagogical techniques. Qatar University, based on an earlier teacher’s college, was established as the national university in 1977. Since there were almost no trained local Qatari teachers and university professors, most faculty were invited from neighboring Arab countries with a much longer history of tertiary education such as Egypt (whose Al-Azhar University, still in operation, is over 1,000 years old), and Syria, Iraq and Lebanon which have operated prestigious modern universities since the 19th century. This is an important historical development with respect to education and dress
codes in Qatar, since all of these countries were impacted by Western culture, and some teachers arrived in the country wearing western-style cloths. This caused some cultural friction in the conservative and traditional State of Qatar in which the normal patterns of dress were still the thobe and abaya.

Also, during the ascendency of Gamal Abdel Nasser in Egypt, whose Free Officers movement overthrew the Egyptian monarchy of King Farouk, Gulf reigning monarchs were particularly sensitive to potential political activities of expatriate Egyptian sympathizers of Nasser or other Arabs attracted to socialist and communist ideas that threatened the political existence of the Gulf royal families. Even today, the majority of teachers (approximately 75%) in Qatar are non-Qatari, with non-Gulf Arabs teaching in the Independent government Arabic schools. Khaleeji (Gulf) culture is very distinct, with a unique Arabic dialect, foods, and customs that can be readily distinguished from other Muslim nations such as Morocco (Maghrebi culture, encompassing pre-Islamic Berber tribes), Lebanon (with Christian and European influence), and Egypt (impressed by British colonialism).

Concerned with poor performance of Qatari students when compared with their international peers, the previous Emir HH Father Amir Sheikh Hamad bin Khalifa Al Thani (who abdicated in 2013 due to health reasons) and his wife HH Sheikha Moza bint Nasser founded Qatar Foundation for Education, Science and Community Development in 1995. Qatar Foundation manages and is affiliated with a number of scientific research organizations such as Qatar Science and Technology Park and Qatar National Research Fund. Qatar Foundation’s main project is Education City: a campus consisting of nine international branch campuses mostly from the United States and the U.K. In 2008, the Supreme Education Council invested 4.8% of Qatar’s GDP into educational projects [5].

Education City, with its elite American universities such as Weill Cornell Medicine – Qatar, Carnegie Mellon – Qatar, Northwestern University – Qatar, etc., has been allowed greater freedoms in setting educational policy and policing campus behaviors than the national university Qatar University. Thus there is a smaller percentage of fully veiled students and students wearing hijab and shayla in Education City than in the Arabic language schools. The language of instruction at all Education City schools is English. However, Qatar Foundation does possess an official dress policy (detailed below), as do all of Education City campuses in some form. These codes are often modeled on local conceptions of modest dress and appropriate public attire.

IV. DRESS CODES IN QATAR

Historical photographs indicate that dress has been more diverse in past times. After the Iranian Revolution of 1979, a wave of anti-western sentiment swept across the Middle East, causing a return to conservative and traditional attitudes to counter the growing western influences on behavior primarily from cinema. Today the simple white thobe (or kandura) and black abaya have transformed into the standard Qatari national dress (see illustrations below, Figs. 1 and 2).
In addition to being very practical, shielding the wearers from sand and the intense sun and heat of Qatar (summer temperatures reach 50+ Celsius), both the thobe and abaya additionally completely cover the awrah, or private parts. The awrah has been the focus of controversy as to its exact meaning since its semantic range in Arabic can include nakedness, vulnerability, privacy, and weakness. In most of the Sunni madhhabs (schools of fiqh), the male awrah extends approximately from the knees to the navel. For females, the interpretation of awrah is much more complex as evidenced by the variant cultural forms of Islamic female dress.

For example, the full length burqa found in Afghanistan points to an interpretation that the entire body of the female is awrah, while other countries tolerate women appearing in public with uncovered hair. Interestingly, in Qatar, a common fashion is to wear the shayla head covering partially back on the head, revealing a portion of the hair. The hair is clearly fetishized as a sexual object in Qatari society. In a minority highly conservative theological opinion, such as Ibn Al-Arabi, the voice of women is awrah along with her entire existence, which reveals an attitude that women should not appear in public at all, but should be secluded. This attitude is extremely uncommon in Qatar today due to the new active role of women in society, encouraged by the former Emir’s wife Sheikha Moza bint Nasser who encourages women’s rights and greater participation in society.

The use of the shayla—also generically known as hijab, which can be translated as protection, carrying with it the additional metaphorical meaning of protection from unwanted male attention—to cover the hair is almost universal among Qatari women. A small percentage of women, primarily from traditional Bedouin heritage, wear the niqab or full face veil, covering all of the face except the eyes. An even smaller and diminishing number of older women wear the batula, a face mask which is often metal-colored. Although Quranic passages speak of modestly covering the breast with a veil (khimar), and the Prophet Mohammed requested that guests speak to his wives through curtain or veil (hijab), the origin of veiling is contested and may be a pre-Islamic Semitic or Assyrian / Mesopotamian custom. Ahmed points out that laws on veiling in Assyrian law are carefully spelled out – veiling may have been simply an upper class requirement indicating social class, while slaves and harlots were forbidden to veil and were punished, hence the veiling-moderesty nexus [6].

The issue of school dress codes and behavioral expectations in the classroom must be contextualized with these traditions and general public attitudes on dress in the State of Qatar both among local and expatriate communities, which can vary considerably, occasionally leading to open conflict. In the last decade local citizens concerned with the patterns of dress of expatriates have launched a number of initiatives, the most recent of which was “The One of Us” campaign in 2012 [7]. Local volunteers set up booths in public places such as shopping malls and spoke with expatriates to remind them of proper dress in Qatar so as not to offend the local cultural and religious sensibilities. Efforts were increased during Ramadan when Muslims fast for one month and reflect on religion (modesty is an important part of general Islamic practice). The main recommendations of volunteers were for men and women to cover the awrah (shoulders and knees) and avoid tight clothing that accentuates the form of the body, eliciting sexual attention. This campaign reveals the striking differences in attitudes towards clothing present in Qatar’s new multicultural environment – most Western designer clothing, particularly for women, is designed not only to signal status and wealth but also to sexually attract, whereas traditional Muslim clothing has historically been created, and remains so today, as protection from the elements and to hide sexual features of the body. The rise of ‘designer abayas’ throughout the Gulf–variations on the entirely black abaya using unusual cuts, color, and accessories—sometimes elicits the wrath of conservative Imams, who believe the function of female dress is to divert attention away from the wearer, to render her invisible and safe from male lust in public. In 2014, the name of the One of Us campaign was changed to “Reflect Your Respect.” Sponsors included Dar Al Sharq, the Qatar Center for Voluntary Activities (QCVA), and Qatari Women’s Association (QWA). An image from the Reflect Your Respect campaign is provided below.

![Reflect Your Respect campaign image](image)

**Table 1.** Brochure image from “Reflect Your Respect” campaign (c. 2014).

Expatriate responses to the campaign were mixed, with some grateful for the cultural lesson (private companies in Qatar sometimes do not provide cultural sensitivity training for new expatriate employees, assuming that the knowledge of appropriate dress is common sense), while others, including some non-Qatari and non-Arab Muslims, acted angrily. Some expatriates accused the campaign of only focusing on expatriate behavior while ignoring identical behaviors among Qataris. Due to this criticism the group extended its outreach to Qataris as well.

Despite the illustrated brochures, the concept of ‘appropriate’ and ‘modest’ dress is difficult for non-Muslims and non-Qataris to understand as it embodies subtle cultural
attitudes and historical developments which are not documented in print. The concepts as well are not well defined from a civil law perspective or even in many of the written dress codes available for the Qatari workplace. The Qatar Constitution of 2004 simply states in general terms: “Respect for the Constitution, compliance with the laws issued by the Public Authorities, abiding by the requirements of public order and public decorum, and observing national traditions and deep-rooted customs are duties of all who reside in the State of Qatar or enter its territory” (art. 57) [8].

The One of Us campaign and its subsequent variants influenced a related dress code campaign at Qatar University that resulted in the official adoption of a new dress code. The policy forbids the following modes of dress:

- Clothes with inappropriate text or images
- Visible tattoos
- Fad hair styles like dreadlocks and the unnatural coloring of hair
- form-fitting or tight abayas for women [9].

An image from the QU dress bulletin is provided below.

Table 2. Illustration from Qatar University dress code pamphlet. Source: Al-Raya Newspaper.

Since women frequently wear in public (underneath their outer abaya) the Western styles of clothing pictured in the QU dress code bulletin, the code also made reference to the opening of the abaya to expose publically inappropriate clothing underneath. Deliberate abaya-opening behavior can be interpreted as flirtation, a desire to show off expensive fashions, or a flaunting of known taboos as a form of teenage and young adult rebellion.

In Education City, the group of primarily U.S.-based satellite campuses set up as an education hub by Qatar Foundation (QF), Hassan Mohammed Al Hammadi, the Executive Director of Human Resources at QF, sent a memo to education city campuses in 2014 reminding them of QF’s standing policies on appropriate dress [10]. This communication was undoubtedly in response to both the One of Us Campaign and the QU dress code, both in full force during that year. Most of the provisions for appropriate dress in Al Hammadi’s letter echoed the general principles of the modest dress campaigns in Qatar. However, the exact details of this Qatar Foundation dress code and its policies are probably not widely known to most students, faculty and staff at the individual Education City campuses. Each university maintains generalized attire policies on their websites or in student handbooks and students in general follow these guidelines. However, given the diversity of dress styles (for example the popularity of T-shirts for males) within Education City, it is clear that these guidelines allow for a variety of dress practices.

CMU-Q is the Qatar branch campus of Carnegie Mellon University in Pittsburg, providing Computer Science, Business, and Biological Sciences programs in Education City. The CMU-Q FAQ relating to dress is provided in full below: “Q-Is there a dress-code that I have to abide to in Qatar? To familiarize you, Qatari national men wear a thobe, a long white shirt over loose pants. They also wear a loose headdress, called a gutra, in white or red and white cloth, held on with a black rope known as the agal. Qatari national women cover their heads with a black headdress called a shayla and their bodies with a long black dress called an abayah. The national dress for both men and women is a traditional custom that Qatars respect and seek to preserve. However, expatriates are free to wear whatever they like and feel would be appropriate within the society and its customs. They are expected to remain sensitive to the Islamic culture and not dress in a revealing or provocative manner. Men generally wear long pants and a shirt in public. Women’s attire should cover shoulders and knees. Shorts and short skirts are considered inappropriate, although casual dress is becoming increasingly flexible. Western bathing attire is worn at hotels, clubs, swimming pools, some beaches, and in private gated housing communities. Topless sunbathing is not permitted. For business attire, suits are the most common dress for men at work. Working women tend to wear items similar to those they would wear in their home country” [11].

An excerpt from a job posting for a Qatar Academy (a high school within Qatar Foundation) expatriate teacher position provided below spells out the approved clothing for both male and female prospective teachers.

**DRESS CODES FOR TEACHERS**

(Qatar Academy, Doha, Qatar)

**MALE TEACHERS**

- Shirts – long or short sleeved
- Tie (compulsory)
- Long dress trousers/pants
- Shoes (closed toed) – should be smart and professional

**FEMALE TEACHERS**

- Long dress trousers/pants (to ankle at least) or Skirt or dress (below the knee at least). Stomachs must be covered.
- No capri pants

**TOPS**

- Collared shirt or if wearing a round neck top or similar, a jacket must be worn over the top Knitted tops (Professional in style)

- No T Shirts e.g. cotton tops round or v neck with or without a pattern
- Tops must cover shoulders and upper arms

- Shoes should be smart and professional, preferably closed toed/close back

Clothing must not be see through, low cut or obviously too tight fitting. Clothing made of denim material is not allowed.
No national dress is to be worn e.g. abayas or saris (although Islamic dress and hijabs are permitted).

If you are unsure of the suitability of an article of clothing feel free to ask any of the Administrators for advice [12].

Interestingly, the female dress is specified in much more detail, for two probable reasons: 1) women have more diverse choices in clothing selection than males; 2) sexualization of the female is a greater concern to Qatari society than sexualization of the male body. This phenomenon may be related to the Arab cultural custom that family honor resides in the female. Also, ‘national dress’ (thobe and abaya) is prohibited in the job description since the expatriate could be mistaken for a Qatari, who exercise certain social privileges as a result of being in national dress. For example, expatriate unmarried males are banned from public parks and Qatari families are allowed sole access to some malls on Fridays (‘family days’).

V. CONCLUSION

Westernization, secularism, and religious sensibility (rules of awrah or the privacy of certain body parts, and the rules of public modesty) all come into play in attitudes towards dress in Qatar and in the Qatar educational system. Some concerns related to the Qatari dress codes are similar to those found in Western school dress codes in preventing sexualization of students in the educational setting and removing distractions from the classroom. The issues, however, are complicated in Qatar by the expatriate-local relations and the role of clothing as a cultural symbol that instantly distinguishes in public membership in a particular cultural group, since most expatriates wear clothing that is traditional to their country of origin.

alw2010@qatar-med.cornell.edu

Abstract—Although public education only first began in the State of Qatar in the mid-1950s, and its first university Qatar University opened in 1977, the Supreme Education Council (SEC) established in 2001 has operated on the basis of international best practices in pedagogical theory and praxis. Specifically, the government launched the Education for a New Era (EFNE) initiative in 2001 after a review of the country’s educational system by the U.S. RAND Corporation. A series of reports recommended a large number of radical changes in the provision of educational services in Qatar’s K-12 educational system, including Continuing Professional Development (CPD) modeled on western and primarily American models. However, a recent study by Nasser and Romanowski (2012) questioned the impact of these programs on actual teaching practice in Qatar. Also, Qatar still ranks comparatively low in international standardized student test scores, such as PISA and PIRLS as reported by the OECD. Thus the effectiveness of the newly created programs has been variable. This contribution analyzes the available data, case reports, and government statistical websites (Qatar Statistics Authority) to provide an overview of CPD in the State of Qatar, including the related practice of Continuing Medical Education (CME). The paper also suggests improvements in the current assessment, quality, and rewards policies in the education system of the State of Qatar.

Keywords:-- education--Arabian (Persian) Gulf; continuing professional development (CPD); teacher training; Qatar

1. INTRODUCTION

The State of Qatar has only recently arrived on the international scene as a country of note. As a late adopter of the Internet and previously with little regional power in face of the dominant military powerhouses of Saudi Arabia, Iran, and the former Iraq, the small peninsular nation in the Arabian (Persian) Gulf has mostly been unknown in the international press until the last decade. A period of high oil prices coupled with a small native population of approximately 300,000 however created enormous budget surpluses since Qatar ranks 14th in world oil production with 2,055 thousand barrels per day (bpd) and boasts the third largest proven natural gas reserves in the world at 24.7 trillion cubic meters, as reported in 2014 by the U.S. Energy Information Administration (EIA) [1].

These budget surpluses were used to further develop the infrastructure and human resource capacity in the country. Although now ranked as a high-income country with a very high human development index (ranked 32 in HDI with a score of .850 in 2014), in many areas such as healthcare, roads, and sanitation the nation is still developing [2]. Natural gas only became a recent export commodity in Qatar, facilitated by U.S. built refrigerated LNG tankers. Although Qatargas is the largest LNG plant in the world, established in 1984 and delivering its first shipment of gas in 1996 to a customer in Japan, the company’s major production plants did not start operation until 2009, 2010, and 2011 when Qatargas 2, 3, and 4 came online. Also, oil wealth was not equitably distributed in former years and was kept within the hands of a small number of elites, removing public funds for development from the government revenue stream. Thus Qatar’s infusion of wealth has been relatively recent, and basic features of its society such as its educational system have been underfunded and neglected until recently.

Historically, Qatar was sporadically settled by Bedouin tribes with several semi-permanent towns such as Al Bidda, Fuwayrit, and Zubarah. The area was loosely controlled by northern Mesopotamian and Akkadian peoples (Dilmun civilization) for its importance as a trade route for copper, aromatic gums, woods, and spices. A Tyrian purple dye factory using the local gastropod Murex spp. was discovered in Qatar in the 1970s near Purple (Al Ghanim) Island along with Ubaid era pottery shards at Ras Abruk [3]. The area was also ruled by Persian dynasties such as the Sassanians. Both the Ottomans and British exerted political power over the region in the 19th century; however, the sparse population and few natural resources coupled with the difficulty in collecting taxes from the mobile beddu tribes translated to power in name only. The British were primarily concerned with protecting their shipping interests in British India and subsequently signed many maritime truces with local Sheikhs along the Arabian Gulf littoral which came to be known as the Trucial Coast. The British Political Agent Lewis Pelly by settling the Qatar-Bahrain War (1867-68) simultaneously brought recognition to the ruling Al Thani tribe and Qatar as a distinct political region [4]. After the defeat of the Ottoman Empire in WWI, Qatar
became an official British Protectorate from 1916-1971, when it gained full independence.

Qatars profess primarily Sunni Islam and the influence of Wahhabism from neighboring Saudi Arabia impacts culture, behaviors, theology, and sharia law (Hanbali madhhab). Unique in the world is the ratio of expatriates to citizens and only approximately 11-14% of the population are passport holding citizens. The ethnic makeup of Qatar is Arab 40%, Indian 18%, Pakistani 18%, Iranian 10%, and other 14% [5]. Muslims make up 77.5% of the population, with a significant Christian population of 8.5% and 14% other (probably Hindus and Buddhists among the immigrant professional and manual labor population) [6].

The previous history and development of education in Qatar has had a strong impact on current practices. Schooling in the pre-oil (pre-1948) era was sporadic with most instruction occurring at informal schools known as kuttabs where basic literacy—primarily learning to read the Quran—and mathematics were taught. In 1890, there were 10 kuttabs operating in Qatar and in 1913 the religious al-Athariya school opened [7]. From 1947-56 the modern school system of Qatar was built. As an oral and non-technical society, there was originally little need for literacy before the development of the oil and gas fields and the oral nature of the culture continues to this day. Many older locals prefer to receive news and information by telephone or through regular neighborhood meetings called the majlis rather than reading newspapers or books. The Internet is now very popular, however, among younger Qatars with an explosion of social media use from 2008 to the present.

Concerned about low international rankings of Qatari high school students in standardized tests as well as low per capita expenditure on education, the State of Qatar contracted with U.S.-based RAND Corporation in 2001 to analyze and suggest reforms in the educational system. RAND’s analysis resulted in a program called Education for a New Era (EFNE). Arabic and English language curricula was updated and standards increased. Additionally, new student and teacher assessment and professional development rules were put in place [8]. To coordinate the reforms, The Supreme Education Council (SEC) was established in 2002 taking over many functions of the former Ministry of Education (MOE), which was tasked with regulating private education. In 2009, the MOE was absorbed into the SEC for administrative reasons.

II. CONTINUING PROFESSION DEVELOPMENT IN QATAR

Eslami et al. reported in 2016 on a six week teacher development program for Qatari Middle School science teachers. The research was carried out as a pilot program funded by the Qatar National Research Fund. One important finding was that “participants expanded their views of reading by the end of the intervention, discussing reading as a process that needs to be explicitly addressed, taught and modeled” [9].

In 2004-2005, RAND education began work on a continuing professional development system for teachers based on the standards-driven reforms of EFNE and founded on the Guskey model [10, 11]. The main features of the program included:

1. Standards Implementation Support workshops: three five-day workshops were developed in order to introduce the curriculum standards for mathematics and to discuss with teachers in the 12 independent schools the implications for planning the curriculum, teaching, learning, and assessment.

2. Follow-on activities: focus groups, schools visits and classroom observations that take place regularly between and around the workshops mentioned in (a).

3. School Support Organization contributions: each school is assigned an internationally-recruited school support organization that helps facilitate and/or mentor teachers in their daily classroom practice.

4. School-Based professional development: each school is expected to craft its own professional development plan that might vary in shape and style according to the school vision and resources [12].

The State of Qatar, however, ended its relationship with Rand-Qatar Policy Institute in 2013 after their ten year contract was concluded. In 2009, the SEC issued the National Professional Standards for Teachers and School Leaders Policy [13]. During this developmental stage, the Supreme Education Council partnered with the New Zealand educational consulting company Cognition Education. According to Cognition, “Between 2004 and 2009 Cognition provided professional development support for over 80 Ministry of Education schools in Qatar. A key component of this support was dedicated coaching for principals and other senior leaders to develop strategies to implement future focussed policies and practices to accelerate student achievement” [14]. Cognition Education not only sponsored and organized workshops and activities, but they also produced template documents for Professional Development planning for local schools such as “Planning for professional development – some guiding questions”; “Sample Professional Development Needs Assessment Tool,” “Using the standards to identify individual professional development needs”, etc.

The National Centre for Educator Development (NECD) began some of its operations in 2011. The initiative was led by Sheikha al-Misnad, the former President of Qatar University and HE Saad bin Ibrahim al-Mahmoud, Qatar’s Minister of Education and Higher Education. The primary mission of the organization is to provide further training and development opportunities for teachers in Qatar.

Private industry has also partnered with Qatar University and the NECD to develop teacher CPD programs. For example, the National Centre for Educator Development, Qatar University (QU) and ExxonMobil Qatar have jointly sponsored four Qatar University ExxonMobil Teachers Academies for about 45-55 Independent school teachers. According to the Academy, which now includes an initiative called Maharaty started by HE Sheikha Hind bint Hamad al-Thani, “the teachers will undergo a week-long, intensive professional development programme that will foster innovative maths and science teaching skills, helping them inspire their students to develop an interest in the subjects” [15].
Nasser and Romanowski surveyed 40 in-service teachers from two Doha schools who had recently completed CPD activities. Their research goal was to gauge the participants’ views of the effectiveness and purpose of CPD activities. While the authors saw merit in the technical skills acquired by teachers in the activities, they were concerned that teachers were not acquiring the mindset of life-long learning (LLL) that they could take away with them from the workshops.

As Nasser and Romanowski conclude: “Our concern is that the current system of PD is producing technicians who lack the full ownership of the knowledge imparted through PD. We are cautious of evoking the too-often quoted Chinese proverb, but it serves this discussion well: ‘Give a man a fish and he will eat for a day. Teach a man to fish and he will eat for a lifetime’. The problem with PD is that it provides teachers with a fish – teaching ideas, lesson plans and practical solutions to a variety of problems without ever teaching them the theory and reflection involved. Teachers are more concerned with mastering and refining teaching methodologies than with developing the thinking processes needed at times to understand the theory required to sustain real educational reform. In this sense, technical competency, successful teaching and educational reform are defined as treating knowledge as objective, and mastering and applying predetermined sets of teaching and assessment methodologies or applying various technical management skills under the guise of leadership. Completely annulled or else shunted to the margins are the epistemological and theoretical foundations that must be maintained and adapted to bring about educational reform, and we believe that this is essential for the longevity of educational reform” [16].

III. CONTINUING MEDICAL EDUCATION

A. What is CME?

Continuing Medical Education (CME) is a set of practices strongly related to Continuing Professional Development, specifically geared towards the healthcare professions. CME was recognized informally in the 19th century as a necessity for Physicians due to rapid advances in bacteriology (antisepic surgery) and chemically synthesized pharmaceuticals. The “Grand Rounds”, which are still practiced today, have a long tradition. During rounds the senior attending physician selects and examines unique cases for the instruction of junior doctors and nurses. Continuing Medical Education is regulated in the U.S. by the Accreditation Council for Continuing Medical Education (ACCME) formed in 1981 as the successor to two previous organizations, the Liaison Committee on Continuing Medical Education and the American Medical Association’s Committee on Accreditation of Continuing Medical Education. In American and European hospitals, the requirement to obtain a set number of CME credit hours in order to maintain an active medical license is now almost universal, although the exact requirements vary according to the locale [17].

The ACCME’s main goal is “to oversee a voluntary, self-regulatory process for the accreditation of institutions that provide continuing medical education (CME) and develop rigorous standards to ensure that CME activities across the country are independent, free from commercial bias, based on valid content, and effective in meeting physicians’ learning and practice needs. The ACCME accreditation process is of, by, and for the profession of medicine” [18]. The Union Européenne des Médecins Spécialistes (UEMS) coordinates and supports CME for EU member states.

The Gulf Cooperation Council (GCC) of which Qatar is a member along with Saudi, Kuwait, Bahrain, Oman and UAE, has adopted a GCC-wide CPD/CME framework. The Committee for Training and CPD/CME was established at the GCC level in 2001 and most of the Gulf nations have developed CME programs, with Saudi Arabia having the most developed program structure [19].

B. QHPC Regulations in Qatar: CME Comes to a Rapidly Developing Nation

Qatar, whose health system has rapidly evolved in the last decade and is now achieving international standards of excellence such as Joint Commission International (JCI) accreditation of its hospitals, has only recently instituted CME requirements for practicing healthcare professionals. In 2013, the Ministry of Public Health of Qatar formed the The Qatar Council for Healthcare Practitioners (QCHP) to regulate healthcare education and practice in the State of Qatar. The Council created a special division for “Medical Education and Continuing Professional Development.” According to the QCHP, this division “is concerned with developing mechanisms to regulate and accredit activities of medical education/continuing professional development in the state of Qatar and to monitor such activities to ensure their adequacy, quality and compliance with national and international accreditation standards. Effective CME/CPD programs would identify professional practice gaps and lead to a positive change in knowledge, competence, and performance of healthcare practitioners, each in his/her field of practice. This will lead to the development of medical practice to be evidence- and needs assessment-based” [20]. According the QCHP, “All healthcare practitioners in part-time or full-time practice in the State of Qatar are required to complete the annual and cycle-specific requirements of the CPD Program to maintain their registration and renewal of licensure with the Supreme Council of Health (SCH)” [21].

The required credit hour table is provided below.

Table 1. QHCP CPD requirements for licensure renewal in Qatar.

C. Continuing Professional Development at Weill Cornell Medicine Qatar (WCM-Q) and Qatar University College of Pharmacy

In response to these new regulations and requirements, Weill Cornell Medicine – Qatar, Hamad Medical Corporation and Qatar University’s College of Pharmacy led the way to
developing programs in the State of Qatar to provide the legally required programs for healthcare practitioners. According to WCM-Q’s Continuing Professional Development Office mission statement, “The Continuing Professional Development (CPD) division’s mission aims to promote educational endeavors, which extend beyond the undergraduate program and align with the mission of Weill Cornell Medicine-Qatar. To this end, the mission of this division is to:

- Provide high quality professional development opportunities for health professionals based on identified needs and the latest scientific and medical developments that will lead to the improved health care of patients;
- Offer health professionals the opportunity to attain credits toward medical licensing requirements locally and internationally;
- Develop and disseminate best evidence-based practice and health education research; and
- Create opportunities for health professionals to develop a community of practice to interact with one another personally and professionally [21].

Wilbur carried out the first CPD needs assessment of pharmacists in Qatar with a cross-sectional review of behaviors in 2010. Her conclusions were: “Approximately one-third had no or inadequate internet access in the workplace. In the past 2 years, one-quarter had not attended any live local educational programmes. Major obstacles included poor timing (66%) and excessive workload (56%). Most pharmacists preferred interactive CE programme formats and one-third indicated Arabic as delivery language of choice. The majority expressed high motivation to achieve their CPPD goals and only 12% outrightly opposed mandatory CE for pharmacist re-licensure.” Wilbur further concluded that “Qatar pharmacists demonstrated support for enhanced CE opportunities. While views and preferences mirror those of colleagues elsewhere, current conditions merit careful consideration of CPD programme development and delivery, including language and technology capabilities” [22]. Her conclusions on CME/CPD can be extrapolated to other areas of healthcare in Qatar as various institutions face similar challenges, for example provision of up-to-date computers and software and reliable wifi connections in the workplace, a key point since many CPD programs are now online and encourage anytime / anywhere access for busy working professionals.

IV. CONCLUSION

Clearly the related concepts and practices of Professional Development (PD), Continuing Professional Development (CPD), and Continuing Medical Education (CME) are new developments in the State of Qatar due in part to the novelty of high quality education in the State of Qatar itself which began organizing its primary and secondary systems of education in the middle of the last century and only began national tertiary education development in the latter portion of the 20th century. After commitment to excellence by top government officials, progress was rapid and swift with per capita spending in Qatar on education on par with highly successful educational systems such as Singapore. However, in the face of rapid change often comes cultural and organizational dissonance. It is not clear judging from internal assessment reports and internationally benchmarked exams that reforms such as Education for a New Era (EFNE) have yet to have fully impacted the Qatari educational system. EFNE was built upon the pedagogical paradigms of American-style education which had not been adapted to the local Muslim culture and previous educational practices. Some education stakeholders in Qatar were alienated by the rapid changes inaugurated by EFNE without proper planning and feedback, although the basic features of CPD are recognized internationally as best practices.

Clearly more work needs to be done in theorizing CPD within the local and Arab and Western expatriate teacher communities in Qatar to increase awareness of the fundamental rationale of these programs. Once the concept of CPD is grasped, teachers will undoubtedly take more advantage of the many informal self-directed learning activities which are increasing rapidly in Qatar. For example, two museums of Arabic art – the Museum of Islamic Art and Mathaf – not only are building world class collections of Arab art but also offer free public programs for learning about art. Education City campuses in addition often sponsor free public lectures on literature, politics, science, and medicine. When teachers become Lifelong Learners, they not only increase their own knowledge and proficiency in teaching, but also inspire the love of learning in students beyond the classroom. In addition, the need for formal paid CPD programs is reduced creating greater efficiency in the public education system.

Research Proposal

Investigating Science Teacher knowledge and Beliefs regarding multiculturalism: A Qualitative Case Study

Yejun Bae¹, Eunjung Kim²

¹Science Education, College of Education, University of Iowa
²Social Studies Education, College of Education, University of Iowa

Objectives

With the fast growing population of immigrants in United States, the gap in cultural and educational experiences between a teacher and multicultural students must be an issue. According to Van Dijk and Kattmann (2007), a teacher’s learning experience in the past affects his or her epistemic orientations of content knowledge (CK) and pedagogical content knowledge (PCK). Teachers’ learning experiences become barriers of communication with their diverse students in science learning situations. This case study will examine how a teacher and students from diverse background such as ethnicity/race, language, culture, learning ability, and education in a Midwestern high school deal with the cultural and educational gaps and how a teacher’s view of multiculturalism affects diverse students’ science learning. A teacher’s understanding of multiculturalism must have impacts on a level of expectations on students’ achievement and types of learning environments. We will examine hidden multicultural issues of teacher-diverse student discourses in general science class, and provide possible explanations for relationships between diverse students’ science learning and teacher’s multicultural knowledge and beliefs. Through this study, we will make a case for 1) how science teachers understand the concept of multiculturalism through their experiences 2) how science teachers implement multiculturalism into their classes.

Backgrounds

Cohn (2015) asserted that future populations’ ethnic composition will be more diverse within 50 years and the ratio of total immigrant population will be 51 percent of the total US population. That means, teachers and students will experience multicultural gaps when they communicate for science learning. Multicultural issues must be discussed in science education for the sake of nurturing all children’s scientific literacy and ensuring their success in learning science (NSTA, 2000). NRC (2011) also emphasizes the importance of embracing students who are from different countries of origin and have diverse educational and cultural backgrounds in science classrooms. Science teachers should encourage all students to achieve scientific understanding and experience scientific practices by providing their own primary languages and intimate ways of interactions (NRC, 2011).

Midwestern states have especially experienced fast growing foreign-born populations range from 65% in Michigan to 298% in Nebraska from 2000 to 2010 (Scholars Strategy Network, 2012): therefore teacher education and multicultural education programs for both native and non-
Native students are necessary (Alexio, Chin, Fennelly, & Shurilla, 2012). As our targeted research site, a single Midwestern public high school, has experienced rapid growing non-native English speaker students for nearly a decade: 9.7% of K-12 enrollments of all minority students in 2000 increased to 21.8% in 2014, it will be meaningful to investigate multiculturalism in science classroom (Iowa Department of Education, 2015). In this study, we will investigate multiculturalism in an Iowa public high school science classroom with two research questions:

1) Does the gap in cultural backgrounds between a science teacher and diverse students affect those students’ science learning?
2) How are a science teacher’s multicultural beliefs and knowledge related to their diverse students’ science learning?
   a) What kinds of experiences related to multiculturalism does a science teacher have?
   b) How does a science teacher interact with diverse students in terms of teaching strategies and types of discourse?
   c) What kinds of experiences do diverse students have in their affect (feelings or emotions), motivation, and self-efficacy?

**Procedure**

**Participants**

Based on the minority demographic statistics report, we will recruit participant teachers through email and personal contacts. An intended research site is a science classroom for non-native English speakers taught by white native English speaking science teacher.

**Data Collection**

There are two phases of this study.

**Phase I: Classroom observation.**

We will conduct one semester classroom observation. Video recordings and field notes will be collected from the classroom observations.

**Phase II: Teacher and student interviews**

Based on the classroom observations, researchers will come up with interview protocols to capture the teachers’ multicultural perceptions and expectations. Also interviews with students will generate students’ dispositions and attitudes toward the science class.

**Data Analysis**

All video records and interviews will be transcribed and analyzed. A discourse analysis framework will be adopted to develop open coding system and discover patterns in teacher-student interactions (Simon, Naylor, Keogh, Maloney, and Downing, 2008).

**Implication**
Through this study, we intend to contribute to improving science teachers’ practices of multiculturalism and supporting non-native English speaker students’ future science related careers.

The Influence of Family Language Background on the Development of Chinese and English Reading Abilities

Hu Xiangqing, Lam Wai-Ip Joseph, Tse Shek Kam

Abstract

With the bilingual education policy, Singapore’s Chinese students have a unique Chinese-English bilingual background, how schools nurture bilingual talents in Singapore has induced great interest for researchers. The research focuses on the development of bilingual reading ability of Chinese students in Singapore schools, and proposes an evaluation system for bilingual reading capabilities. The study collects the data from Chinese and English reading comprehension test adopted from PIRLS-Literacy and PIRLS. This paper examines the Chinese and English reading abilities of 7-, 9- and 12-year-old Chinese students with three different types of family language backgrounds (Chinese dominant, English dominant, bilingual in Chinese and English) in Singapore. The results show that the impacts of family language background on their English reading abilities have disappeared for 12-years old. As a second language in Singapore school, there is obvious effect of family language background on Chinese reading ability through the whole primary education period. Testing results show that the ability of interpreting and integrating ideas and information, and the ability of evaluating and critiquing content and textual elements are increasing from age 7 to 9 to 12 years old.

Key words

Reading ability Bilingual PIRLS Reading education Family language background

Introduction

In internet age, reading is one of main means for one to access information. Various books and magazines in the world are increasing faster and faster, and scientific journals have been more than hundred thousand (Yan, 2004). It was reported that the information generated by human beings doubles every two years, of which 95% is electronic information (Lymam and Varian, 2000, 2003). With rapid growth of electronic information, the reading platforms have become more diverse, and it changes reading habits of human beings and makes a person in reading through all his life.

How to get more effective information from wide resources in shorter time is becoming a critical issue that a person must handle today. It is one of objectives of language learning and teaching to train this capability. Another important task of language teaching is to ensure that students have the life-long learning ability in the future (Tse, Lam, Lin, and Loh, 2005). Reading teaching will be paying more attentions on the capabilities and skills teaching.
Corresponding to the change, reading test should be not only on the verbal test, but also including the test of reading ability, which covers reading speed, reading comprehension and wide scope.

**Issues of Chinese and English reading abilities of Chinese students with bilingual background in Singapore**

Dual language policy in Singapore requires a student to master English and his mother tongue. English is the official language in school. It is compulsory for a Chinese student to learn Chinese and to reach a certain level in school. From the school view point, Chinese looks like the secondary language in Singapore for Chinese student. But from other view point, Chinese is the most popular local language in newspaper, magazine, TV and radio, and also the main oral language in daily life.

The report by Singapore ministry of education (2010) mother tongue languages review committee on a survey for Chinese students in primary 6 in Singapore, shows that there are 37% of students to communicate to family members solely or mostly in Chinese at home (Chinese dominant), 38% of students solely or mostly in English (English dominant), and 25% of student in both Chinese and English (bilingual in Chinese and English). So for the students in Singapore, there is much more opportunity to contact Chinese than students in other English-speaking countries. Chinese is in the middle between the first language and secondary language for Chinese student in Singapore’s school. Language background is one of key factor to affect development of reading ability, and its role in reading teaching must be pay more attention in the research.

With the international trend of wide employing of English and Mandarin's influence rising, the demand for students to master bilingual (Chinese and English) or even Multilanguage is increasing year by year. Singapore’s Chinese student has a unique Chinese-English bilingual background.

This paper focuses on the development in the bilingual reading ability of Chinese students in Singapore schools, and explores whether the family language background affect the development of Chinese and English reading abilities of Chinese students with bilingual background in Singapore school.

**Literature and theoretical basis**

**Reading types**

Reading can be divided into five reading types: scanning, skimming, rauding, learning and memorizing, which each has different characteristics of reading thinking activities and speed limit. Carver (1981) summarized the characteristics of the five reading types, objectives, activities and their thinking after the corresponding reading speed were extracted by experiment. Carver considered the rauding process is the basic reading process and the most important process because it is the one involved in normal or typical reading. It is the most general and
common type of routine, the purpose was to understand the full message which the author wants to convey in the article (Lam, 2008; Tse and Lam, 2013).

According to rauding theory, there are three slices of time, 1 sec, 1 min and 1 year of reading. One second of reading refers to the cognitive processes that occur during one eye fixation on a word (e.g., Gough, 1972; Carver, 1997). One minute of reading refer to much of the research that presents prose passages to readers that are about 100 to 300 words in length and then measures comprehension or recall (Miller and Kintsch, 1980; Anderson et al. 1983), the comprehension that occurs when the rauding process is executed for 1 min, or 1hr (Carver, 1997; Tse, Lam et al. 2005). One year of reading refer to the research that involves gain during a school year (Juel, Griffith, and Gough, 1986; Carver, 1997). One-second reading, one-minute reading and one-year reading are three important dimensions of reading (Tse, Lam et al. 2005). This paper focuses on the one-min reading experiment.

Chall (1983) believes that there are six stages for the development of children’s reading ability: pre-reading, initial reading or decoding, confirmation, reading for learning the new, multiple viewpoints, construction and reconstruction. First three stages (0~2) belong to ‘learning to read’, later three stages (3~5) belongs to ‘reading to learn’ (Chall, 1983; Tse and Lam, 2013). The study focus on how to develop from ‘learning to read’ to ‘reading to learn’, 9-years-old is adjacent to these two phases; this age is generally just reached the end of children’s early reading education.

**PIRLS**

The Progress in International Reading Literacy Study (PIRLS) and PIRLS Literacy (earlier known as prePIRLS) organized by the International Association for Evaluation of Education Achievement (IEA) is to explore the relationship of primary school children's academic achievement and the experience of language learning in their family and school, and find out the factors that improve the language reading ability (Tse, Lam et al. 2005; Mullis, Drucker, Preuschoff, Arora, and Stanco, 2011). PIRLS is an assessment of reading comprehension that has been monitoring the trends in student achievement at five-year intervals since 2001. PIRLS represents the worldwide standard for reading comprehension at the fourth grade (IEA, 2016). The top-performing countries in PIRLS 2011 were Hong Kong SAR, Russian Federation, Finland, and Singapore (Mullis, Martin, Foy, and Drucker, 2012).

In PIRLS the attention is paid on 9-year-old children’s reading literacy acquisition and formation (Campbell, Kelly, Mullis, Martin, and Sainsbury, 2001). PIRLS examines on rauding type of 1-min reading abilities for 9-year-old students on the watershed between 2nd and 3rd stages of mother tongue reading ability development. 9-years old seems to be used as the watershed in development of children’s reading ability. However, the understanding from “learning to read” and “reading to learn” cannot be simply distinguished. The four processes of reading comprehension is a critical period of personal reading ability developing, but the learning ability seems significantly affected by the development of reading ability before and after the relevant periods (Tse and Lam, 2013).
Table 1. The PIRLS Reading Purposes and Comprehension Processes

<table>
<thead>
<tr>
<th>Processes of Comprehension</th>
<th>Purposes for Reading</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process 1: Focus on and retrieve explicitly stated information</td>
<td>• Reading for literary experience</td>
</tr>
<tr>
<td>Process 2: Make straightforward inferences</td>
<td>• Reading to acquire and use</td>
</tr>
<tr>
<td>Process 3: Interpret and integrate ideas and information</td>
<td>information</td>
</tr>
<tr>
<td>Process 4: Evaluate and critique content and textual elements</td>
<td></td>
</tr>
</tbody>
</table>

Table 1 shows the two reading purposes in PIRLS and four comprehension processes of PIRLS (e.g., Tse, Lam et al. 2005; Mullis et al. 2012; Tse and Lam, 2013; Mullis and Martin, 2015).

PIRLS Literacy is designed to test basic reading skills. Its assessment is consistent with the PIRLS framework for assessing reading comprehension. The same background questionnaires are used and the common expert committees review both the PIRLS and PIRLS Literacy assessment passages, items, and scoring guides (Mullis et al. 2011; Hernández, 2014). In general, PIRLS Literacy was developed in parallel with PIRLS, except it is less difficult than PIRLS and has shorter reading passages with easier vocabulary and syntax. The reading passages and questions in common between the PIRLS Literacy and the PIRLS assessments will enable the two assessments to be linked, so that the PIRLS Literacy assessment results can be reported together with the PIRLS assessment results and directly compared to them (Mullis and Martin, 2015).

**Student reading study in Singapore**

Neo Eng Guan (1992) has conducted eight reading strategies for student reading learning: “intensive reading, extensive reading, skimming reading, seeking reading, speed reading, appreciation of reading and critical reading”, and eighteen reading micro-skills. The “six-level reading ability system” listed the six ability elements: repeat, explain, re-engineering, stretching, evaluation, creativity (Zhu, 2008). For exploring the reading theory and practice of classroom teaching in second language, Aw Guat Poh (2013) is using the QAR reading strategy which is a unique teaching method, "look, think and ask”, to guide students to understand the lyrics which are harder to understand.

The second language extensive and speed reading skills training is emphasised on Chinese language by Singapore, from 2009 to 2010. An extensive rolling reading method by school-based pilot and action research were launched by study group in school (Hu, Aw, and Lim, 2012). The extensive rolling teaching theory and classroom practice study were carried out, and the key words reading pedagogy which is from the rolling reading was refined (Hu, Aw, and Lim, 2013). At the same time, many Singapore researchers and teachers are also actively involved in student reading research.

Reading attitude and reading habits are defined as important parameters in Singapore Syllabus Chinese Language for Primary School (2007). Reading ability is becoming a critical issue in primary language teaching in Singapore. The more reading paragraphs are added in examination and test.
Currently, the assessment of reading ability is designed on the base of cognitive, which consists with “six-level reading ability system”. The questions are focused on the processing of obvious and implicit information, attention on text structure, summarization of chapters, projections and extensions, and highest level of creativity. The questions system is based on the six cognitive levels with 18 types of questions. There is still lack of the questions system for metacognitive ability. The metacognitive ability is very important for bilingual background student, since they have different family background and existing knowledge. Furthermore, the study of reading ability is focused on the Chinese, which cannot systemically reflect bilingual environment.

So far, the correlation study between reading ability and family language has been yet conducted.

**English PIRLS Study in Singapore**

English PIRLS study has conducted in Singapore since 2001. In 2012, Singapore had 24% of students reaching the PIRLS Advanced International Benchmark for English language (Mullis et al. 2012). The proportion of P4 students who attained the ‘Low’ benchmark fell from 24% in 2001 to 13% in 2011 (MOE, 2012).

The results affirm that Singapore has made significant progress in levelling up the performance of the academically-weaker students. Broad-based efforts such as the strategies for English Language Learning and Reading (STELLAR) programme in primary schools cater to diverse range of English language learners through the use of learner-centred and developmentally-appropriate pedagogical approaches (MOE, 2012).

**Focuses of the paper**

Since 2001, English PIRLS study has been conducted for fourth-grade students, but there is not PIRLS study on Chinese yet in Singapore. The study focuses on the investigation and comparison on Chinese and English testing for students from three groups: Chinese dominant, bilingual in Chinese and English, and English dominant, depending on their family language background.

PIRLS normally aims to investigate 9 year-old students’ academic achievement on reading experiences at home and in school, and finds out the factors affecting reading abilities. The study analyses the influences of three age groups 7, 9 and 12 years old, corresponding to the ‘pre-reading’, ‘learning to read’ and ‘reading to learn’ stages in the development of children’s reading ability.

**Research method**

**Test paper design**

Test paper is designed in four sets which all cover typical literary story and information expository texts in different language for PIRLS or PIRLS-Literacy. The questions are designed to cover different layers of reading ability. Every participated student reads a PIRLS-Literacy paper and a PIRLS paper in Chinese and English, a set of paper as shown in figure 2.
Figure 1 shows there are two articles in each set of paper which include Chinese and English, PIRLS-Literacy and PIRLS, literary story and information expository, in these two texts. Its details are shown as table 2.

### Validation

So far, more than fifty countries and regions, and more than 150,000 students are invited to participate the PIRLS. All PIRLS reading proficiency test volumes and questionnaire must be undergone a rigorous screening, verification and validation. The theory and sample volume are reviewed by academic committee in annual meeting. Therefore, this study bases on the PIRLS theory and sample volume, in order to ensure the reliability and validity of the results.
Data analysis

Participants

Total are 903 Chinese students who are from different family language background and are divided in 7-year-old group (225), 9-year-old group (305) and 12-year-old group (373) are involved in study is from 9 Singapore schools. Around 31% of students are from Chinese-dominant family, 26% of them are from English-dominant family and 43% of them are from Chinese-English bilingual family.

The bilingual language background of Chinese students in Singapore are including Chinese dominant (C>E), bilingual in Chinese and English (C=E) and English dominant (C<E).

Results of PIRLS reading test

Through assessments of both informational and literary reading abilities, four processes of reading comprehension has been processed and compared statistically, the p-value = 0.000 < 0.0001 significant. The results of PIRLS assessments have been normalized and standardized to z-scores.

Table 5 shows the results of the normalized mean value of reading test performances on Chinese (CR) and English (ER) for age 7, 9 and 12 groups with difference family language background, Chinese dominant (C>E), Bilingual in Chinese and English (C=E), English dominant (C<E).

The data has been normalized to 100 points. 7y: 7-years old, 9y: 9-years old, 12-years old, FLB: family language background, M: mean, SD: standard deviation, CR: Chinese reading, ER: English reading, CRP1: Chinese reading process 1, ERP1: English reading process 1, CRP2: Chinese reading process 2, ERP2: English reading process 2, CRP3: Chinese reading process 3, ERP3: English reading process 3, CRP4: Chinese reading process 4, ERP4: English reading process 4. For PIRLS, P1, P2, P3 and P4 weight ratios are 0.2, 0.3, 0.3, and 0.2. For PIRLS-Literacy, P1, P2, P3 and P4 weight ratios are 0.5, 0.25, and 0.25 (Mullis and Martin, 2015).
Research Findings and Discussion

Effect of age on the PIRLS results

Figure 2. Visual data of Chinese and English reading results for 7, 9 and 12 age groups.
7y: 7-years old, 9y: 9-years old, 12y: 12-years old, CR: Chinese reading, ER: English reading.

Figure 2 shows the curves of Chinese and English PIRLS results with different age groups, includes mean value and z-score value.

Both of English and Chinese results are increasing with age increasing. The gaps among the ER results of 7-, 9- and 12-year-old groups are obvious. The gap between 7- and 9-year-old groups is slightly larger than the gap between 12- and 9-year-old groups. The mean of 12-year-old group reaches to the level high to 85, it indicates that PIRLS English is more suitable for 9-year-old students.

Chinese PILRS results also clearly reflect the gaps among the results of 7-, 9- and 12-year-old groups, and the gaps among these results with age changing are larger compared to their English PILRS results. The gap between 7- and 9-year-old groups (18) and the gap between 12- and 9-year-old groups (11) are also larger than their English PILRS results. The trend of their variation is consisting with English.

Figure 2(b) indicates that the base point of Chinese and English results is on the result of 9-year-old students group, their Chinese and English reading abilities are increasing with their age growing, and before 9-years old, the growth rate of results with age growing is larger than that after 9-years old.
Effects of family language background

Figure 3. Visual data of Chinese and English reading results for 7, 9 and 12 age with different family language background groups. 7y: 7-years old, 9y: 9-years old, 12-years old, CR: Chinese reading, ER: English reading.

Figure 3 shows the influences of English and Chinese reading abilities with different family language background. The results indicates that the students from bilingual in Chinese and English background of 7-, 9- and 12-year-old groups achieve the best scores on English testing. In other words, the help of the balanced bilingual background for student’s English reading ability development is obvious.

It is interesting that the English reading result of 7-year-old students from Chinese dominant group is better than that from 7-year-old English dominant group. From the results of 12-year-old groups show the influences of family language background on the English test have disappeared. The possible analysis is that the influence of family language background has been becoming very weak since the whole primary school education almost finishes with English as a first language of classroom.

The influences of family language background are more obvious in Chinese reading ability test compared to the English: there are gaps among Chinese reading results of students from different groups. The Chinese reading result of the student from Chinese dominant group is better than that from bilingual in Chinese and English group, although there is a little difference between 7-year-old groups. The Chinese reading result of the student from bilingual in Chinese and English group is significantly better than that from English dominant group. Differently from the English test results, the influences of family language background on the Chinese test results don’t become weak for 12-year-old group. It illustrates the impact of family language background on the development of student’s Chinese reading ability plays important role since Chinese is treated as a second language in school.
**Effects of the FLB and age on the different reading processes**

![Graphs showing the effects on different reading processes](image)

**Figure 4.** Visual data of English reading levels mean and z-score for 7, 9 and 12 age with different family language background groups.

Figure 4 indicates that the result of ER four processes showed a decreasing trend from process 1 to process 4. All of ER four process scores of Chinese dominant and bilingual in Chinese and English groups are better than English dominant group, especially process 1 (focus on and retrieve explicitly stated information) and process 4 (evaluate and critique content and textual elements). At the age of 12, the score of process 4 is increasing obvious compared to 7- and 9-years old. All four ER processes performances of 7-year-old bilingual in Chinese and English groups are at the highest position.
Figure 5. Visual data of Chinese reading levels mean and z-score for 7, 9 and 12 age with different family language background groups.

7y: 7-years old, 9y: 9-years old, 12-years old, CR: Chinese reading, ER: English reading. CRP1: Chinese reading process 1, ERP1: English reading process 1, CRP2: Chinese reading process 2, ERP2: English reading process 2, CRP3: Chinese reading process 3, ERP3: English reading process 3, CRP4: Chinese reading process 4, ERP4: English reading process 4, the p < 0.02 significant.

For Chinese reading, as can be seen from the two figures 5(c) and 5(d), the 9-year-old three groups reflect more balanced and obvious differences. For 7-year-old group, the gap between Chinese dominant and bilingual in Chinese and English groups are small, but there are obvious gaps between them and students from group with English dominant background. The process 4 results of Chinese dominant and bilingual in Chinese and English are higher than process 3 and process 4 is mainly evaluating and critiquing content and textual elements.

Conclusion
The paper has conducted the experiments in the Singapore school aiming to study the effects of age and FLB in Chinese and English reading abilities. Chinese students groups with the bilingual background (Chinese dominant, English dominant, bilingual in Chinese and English) are selected.
The results show that the both Chinese and English reading ability is increasing with age increasing, the gaps among Chinese reading ability of 7-, 9- and 12-year-old students with age changing are larger compared to their English reading results. The growth rate of results with between 7- and 9-year-old groups is larger than that between 9- and 12-year-old groups.

Firstly for English as a first language in Singapore, PIRLS English is more suitable for 9-year-old students and results show that 9-years old is as a watered in development of children’s reading ability, their reading abilities are in transition. The impacts of family language background on their English reading abilities have disappeared for 12-years old.

Then as a second language in Singapore school, there is obvious effect of family language background on the Chinese reading ability through the whole primary education period. It has always existed, and plays a relatively large impact.

Finally, the data of 7-year-old groups indicates that the results of the balanced bilingual in Chinese and English background group and Chinese dominant background group students could achieve better reading test scores compared to the English dominant background group students.

The present study examined the impact of using mobile technology applications and websites on the attitudes and achievement among students learning Chinese as a foreign language in U.S. K-12 classrooms. Student survey and test data were collected from multiple classes taught by teacher candidates in a Chinese teaching licensure program at a state university. Preliminary data analysis indicates positive findings supporting such technology-based instructional innovations.

### Introduction

In recent years, it has been increasingly recognized that proficiency in world languages is one of the most important skills that students need to be competitive in the global labor market in the 21st century economy (National Education Association, 2012). Chinese is the national language of China, one of the world’s most populous countries and most dominant economic powers. Forbes magazine (Patton, 2016) predicts that China’s contribution to global economy will exceed that of the U.S. in 2018. As a result, many educators and parents in the U.S. highly support introducing Chinese instruction to k-12 curriculum. With critical support from many Confucius Institutes funded by the Chinese government, the number of Chinese language programs offered in U.S. elementary and secondary schools has doubled from 2013 to 2015, to an unprecedented 550 schools (Shao, 2015)

While much research has been done regarding the teaching and learning of other foreign languages such as Spanish and French, there is relatively little research on the teaching and
learning of Chinese as a foreign language. With the rapid growth in student enrollment in Chinese language programs, we believe that empirical research is urgently needed to inform educators of the best practices in Chinese instruction. The purpose of the present study is to examine the impact of mobile applications and websites for Chinese learning on the achievement, attitudes, and self-efficacy of K-12 students who take Chinese lessons regularly at school. It is hypothesized that students who regularly used mobile applications for Chinese learning as a foreign language for an extended period of time over the semester would perform better in standardized Chinese tests and demonstrate more positive attitude towards and high self-efficacy for learning Chinese.

Method

Participants. Teacher candidates in a Master’s program in Chinese language licensure for teachers who had been arranged to complete student teaching requirement at a local public or private school were invited to participate in our study by the program director. During student teaching, they were expected to experiment with the use of a mobile technology tool in their classroom and write a project report on their findings.

Instruments. This study involves the use of pre- and post-surveys, as well as pre- and post-tests. The pre-survey consists of a demographic section with questions about the student’s grade level, age, gender, ethnicity, primary language at home, level of Chinese study, and amount of time spent on Chinese learning. In addition, the pre-survey includes three scales. The first scale is a short version of a Student Beliefs about Chinese Learning scale developed by Lan (2014) and consists of 17 Likert-type questions on a five-point response scale (1 = strongly disagree, 5 = strongly agree). Sample questions are “I find great pleasure in learning Chinese” and “Chinese will make me more competitive in the job market”. The second scale on Language Learning Capability for Chinese is adapted from a self-efficacy for foreign language learning instrument developed by the National Foreign Language Resource Center (2000). It consists of 20 questions, 5 on each of the following four areas: reading, listening, speaking, and vocabulary. On a scale that ranges from 0 (not sure at all) to 100 (completely sure), students would rate how sure they are completing a specific Chinese learning task such as figuring out the main topic/gist or retelling in English what they read when reading a text in Chinese. The third scale is modified 28-item Language Learning Strategies scale by Ardasheva and Tretter (2013) based on the original scale developed by Oxford (1990). The rating scale is a five-point scale from 1 (never or almost never true of me) to 5 (always or almost always true of me). Sample questions are “I use flashcards to learn new Chinese words” and “I break long words into small parts to figure out what they mean”. The post-survey is identical to the pre-survey except that the demographic questions were omitted.

In addition to the surveys, the present study also involves the use of Hanyu Shuiping Kaoshi (HSK) tests, i.e., standardized Chinese proficiency tests developed and validated by Chinese government’s Department of Education (see www.hanban.org).

Procedures. All participating teacher candidates administered the same pre-survey at the beginning of the study and the same post-survey at the end of the study in the classroom.
Parental consent forms were distributed in the classroom and students were told to bring them back in a week. During the semester when this study was conducted, none of the participating teacher candidates was assigned to teach lower elementary grades and in the rare cases where there were few students with reading difficulties, the teacher candidate would read aloud the questions. Teacher candidates also administered in the classroom HSK tests that were pursuant to their students’ level of Chinese learning as pretest and posttest.

**Results**

Data collection and entry is complete. Data cleaning, matching, and analysis are on-going. Preliminary analysis based on data from a few classes indicates that the use of mobile Chinese learning applications or websites may result in more positive attitudes toward Chinese learning, higher perceived Chinese competencies in the areas that are targeted by the technology tool, and better performance in Chinese proficiency tests.

**Conclusions**

The present study examines the effectiveness of mobile technology applications and websites for Chinese language learning in foreign language classrooms in multiple k-12 classrooms in the U.S. Our study involves multiple student teachers teaching at various grade levels at different sites and includes both student attitudes and achievement in Chinese as a foreign language learning as outcomes. Given the paucity of research that empirically tests validity of technology tools in Chinese language teaching and learning in an English-speaking country, findings from the present study will likely fill a significant gap in existing research and provide valuable implications for teachers, administrators, students, parents, as well as policy makers and instructional designers.

Abstract:

The purpose of this study is to compare Korean and USA’s research trends of student support in higher education. I use RISS (Research Information Sharing Service provided by Korean Government) and SCOPUS database to collect the verified articles related to student support and student service. After reviewing the documents collected by two database, more than 1,000 articles in each country were analyzed with text mining method using R. The analysis is not finished yet, however I expect it will show the differences between the two countries and give the theoretical and practical implications on student support in higher education.

Key words: student support, student services, text mining, higher education
Engaging Undergraduate Students in Research

Utilizing Peer Mentorship Strategies

Engaging Undergraduate Students in Research
Utilizing Peer Mentorship Strategies

Past research demonstrates that universities tend to segregate underrepresented students from mainstream students; however, if institutions teach all students together, the outcomes could indicate that all types of students have strengths that each type of student could benefit from and every student could succeed academically (Dabach, 2014). This paper considers whether pairing up college students as peer-learning partners based on the results of a pre-academic strengths and needs assessment impacts the students’ academic outcomes as measured by objective goals, such as subjective self-report of academic enjoyment and a posttest academic strengths and needs assessment.

Although, research supports peer mentoring partnerships and relationships in Undergraduate Research (UR), and how these relationships positively impact the UR experience, there is a lack of research in how to properly create relationships based on strengths and needs in order for students to be successful academically. When peer mentoring partnerships are not created strategically, the partnerships are more negatively affected than positively in relation to engagement in university research. Our program is examining whether the success of peer partnerships based on the results of a pre-academic strengths and needs assessment will impact students’ academic outcomes. We will provide peer mentorship opportunities at various levels for undergraduate students from across academic disciplines. The outcomes are measured by objective goals, such as subjective self-report of academic enjoyment, and a posttest academic strengths and needs assessment.

In 2009, President Obama shared that among industrialized nations, the United States ranks 16th for 25 to 34-year-olds that graduate from four-year universities, and that 50% of
college students never end up completing their degrees at all (Luna & Zienkewicz, 2014). More institutions are looking for alternative methods of support to meet their students’ academic needs and to decrease attrition rates. Freeman et al. (2014) demonstrated that peer-learning programs increase student retention and traditional lecturing increases student failure by 55 percent. When looking beyond the peer mentoring concept, we have learned that providing a learning environment where students learn from each other in a positive, supportive atmosphere, will in turn benefit both the mentors and mentees’ relationship. Student achievement increases in positive, inclusive environments, which further increases student retention and graduation rates. (Freeman et al., 2014).

Havnes (2008) discussed that peer learning goes beyond making sure the students are just learning the curriculum. This peer interaction encourages independent and collaborative learning; six outcomes can develop from students using peer learning strategies: students learn to work well with others, they develop critical thinking and reflection skills, they develop the ability to clearly communicate knowledge learned, they manage academic time, they decide which learning style works best, and they develop the ability to conduct self and peer assessment.

Tschofen and Mackness (2012) used personality and self-determination theories in order to gain a look into the individual experience in connective environments, and also explored the meaning of autonomy, diversity, connectedness, and openness. Connectivism, itself, has not been universally accepted, but is being offered as a new learning theory for a digital age. Tschofen and Mackness defined connectivism as “a viable description of learning that incorporates emergent disciplinary and interdisciplinary understandings that may not yet have been tested in traditional forms.” (p.124).
Connectivism is based on the principle that learning starts with a connection, which can occur on conceptual, neural, and social levels (Tschofen & Mackness, 2012). Through the examination of the relationship between connective environments and personality and self-determination theories, the authors determined that learning experiences are less instrumental for learning compared to personality traits; therefore, there may be benefits to amplified attention to the role of personality and self-determination in a connective environment (Tschofen & Mackness, 2012).

Learning Partners

Prata, Letouze, Cerri, and Costa (2015) examined how social behavior can influence student’s learning. Participants consisted of thirty-two sixth graders from a suburban elementary school. The experimenters then placed the students into pairs with “a mixture of mixed-ability and homogeneous ability pairs” (p.251). The experiment lasted four days and the students were given two extensive isomorphic tests: a pre-test and a post-test. On the days in between the pre and posttest, the partners completed a math-tutoring program where they worked together in labs for around 45 minutes a day. The amount of insults that students used against peers was also tracked, and in the results, the researchers indicated that the usage of insults resulted in students abandoning the online learning environment. They also found that students who insulted their partners experienced learning gains, whereas students who were the ones being insulted did not (Prata et al., 2015).

Owen (2011) investigated the educational benefits and challenges that come with using peer educators in the classroom. The author first addressed creating academic partners out of undergraduate teaching assistants. By inviting undergraduate assistants into the classroom to share part of the authority in the class, the instructor was reframing individuals’ responsibilities
and rights as a learner, which means the learning experience of the assistant not only improved, but the students learning experience improved as well (Owen, 2011). By using the undergraduate assistants in the class, the students learned by receiving the opportunity to teach and by working as a peer learning facilitator in which they built mentoring relationships with faculty. The only consequence to this situation is that the undergraduate assistants may have worried about losing credibility with their peers, especially if they were in a position of grading them or having some type of authority over them (Owen, 2011).

The benefits of using an undergraduate teaching assistant for the peer learners is that working with a peer increases the involvement of the learning in their learning experience. The peer learners also relate better to someone who was recently in their place, and in the future are more likely to go to a peer for advice versus an outright authority figure (Owen, 2011).

Chen and Chang (2014) looked at the positive effects of web-based cooperative learning environments, and investigated how to encourage social interaction in online learning situations to create a more productive environment and experience. The authors were interested in creating a scheme for recommending appropriate learning partners in an online environment, and they found that this type of scheme does help encourage learners to interact with their peers more (Chen & Chang, 2014).

**Learning Partners Connections**

Incorporating learning partners into the classroom is not only important because of the relationships it creates and fosters between students, but because of the fact that it encourages the students to take responsibility for their learning (Chen & Chang, 2014; Owen 2011). One of the downfalls of working in a web based classroom, is that there is less personal interaction between students in the classroom. By incorporating peer interactions through partnering, relationship
building occurs along with encouraging interactions that would not arise naturally; these interactions contribute to student satisfaction and success within the class (Chen & Chang, 2014; Prata et al., 2015).

In contrast, Prata, Letouze, Cerri, and Costa (2015) found that peer learning partnerships were positive for both partners as long as they were paired equally and no partner felt in a position of power over the other; the authors demonstrated when one partner felt superior, the other partner suffered. However, Owen (2011) demonstrated that when the learning partners were grouped based on a student teaching assistant and student learner, the outcomes were positive because even though the teaching assistant was in a position of power, the student learner still viewed the teaching assistant as a positive learning partner unlike a peer who may be condescending and insulting in a similar position of power.

**Team Based Learning**

Razzouk and Johnson (2013) addressed how case studies can effect attitudes toward instructions, learning outcomes, and team shared mental models (SMM), specifically when enrolled in an undergraduate psychology course that is centered around a team based learning environment.

This study contained three hypotheses: (1) undergraduate students who are using cases studies will display higher learning outcomes compared to students who are using knowledge representations; (2) the students using case studies will demonstrate more positive attitudes; and (3) undergraduate students using case studies will show higher team SMM compared to the students using knowledge representations (Razzouk & Johnson, 2013). The study took place in an education psychology course, which is where Razzouk and Johnson recruited their participants. In total, out of the 106 students enrolled in the course, 104 of them responded to the
survey, in which all had an educational background before taking the class (Razzouk & Johnson, 2013).

The independent variables in the study were the task type the student learned by, which were either cases studies or knowledge representations. The case studies consisted reading real world problems or dilemmas related to the course concepts and then the students in return would need to help solve these issues. Knowledge representations consisted of an activity that provided an alternative way of demonstrating the principles that were being taught to the students. For example, building a brochure or a concept map would constitute as a knowledge representation. The dependent variables in this study were learning outcomes, which were defined as “recalling and applying the learning theories and principles” (p. 755), the attitude of the learners towards instruction, and the team SMM (Razzouk & Johnson, 2013).

The learning outcomes were measured through a paper-based test, and the participants were administered a pretest before implementation to ensure that the students did not disagree on previous knowledge. These tests were constructed using the instructor’s test bank from the textbook assigned to the course, and were the same for both case study students and knowledge representation students. To score the learning outcomes, the researchers calculated two scores: a knowledge score and an application score (Razzouk & Johnson, 2013).

Learners’ attitudes were measured using the Course Interest Survey in terms of confidence, relevance, satisfaction, and attention. This survey consisted of 25 items; six items each that related to attention, confidence, satisfaction, and seven items that related to relevance and the participants responded to each item using a 5-point Likert scale. A score was then calculated for each of the four attitudes resulting in four scores per participant. This survey was administered at the end of the course before the posttest (Razzouk & Johnson, 2013).
Team SMMs were measured using the Team Assessment and Diagnostic Instrument (TADI). This assessment consists of five factors that relate to team and general task SMM: (1) general task and team knowledge, (2) team dynamics and interactions, (3) communication skills, (4) team resources and working environment, and (5) attitude toward teammates and task. For each factor, participants responded to three statements, which were measured on a 5-point Likert scale ranging from strongly disagree to strongly agree. This assessment was administered after every case study or knowledge representation activity, and it was completed individually, so other participants in their group could not see the others’ responses (Razzouk & Johnson, 2013).

The participant’s response for each factor was then averaged to create one score for each factor (Razzouk & Johnson, 2013). The standard deviation and mean were calculated so each team had a score per factor. The mean represented the perceived amount of each factor that the team had and the standard deviation represented the amount of variation in the individual ratings. The results indicated if the mean was high, then all of the team members viewed the team in a positive way, and if it was low, the team had a less than positive perception of the team. In the case of the standard deviation though, if the score was low, it indicated that the team was thinking alike, but if the score was high, it indicated that the team was thinking differently (Razzouk & Johnson, 2013).

For the first hypothesis, the researchers used a one-way MANOVA in order to determine the effect that the intervention had on learning outcomes of the students. The results of the MANOVA showed a main effect of the task type on learning outcomes. It also revealed differences between groups on knowledge score (p= 0.03) and application score (p=0.01). The standardized difference between group means on the application score was 0.42 standard deviations, and .50 on knowledge score, which are considered medium effect sizes. Since the
results were significantly different, they were able to reject the null hypothesis (Razzouk & Johnson, 2013).

To analyze the second hypothesis, they once again used a one-way MANOVA to determine the effects of the intervention on learning attitudes. The results showed significant differences between learning attitudes: attention (p=.001), relevance (p=.01), confidence (p=.002), and satisfaction (p=.001). The students who used cases studies scored significantly higher in each attitude factor compared to students who used knowledge representations activities, signifying they were able to reject the null hypothesis for the second hypothesis as well (Razzouk & Johnson, 2013).

To evaluate the third and final hypothesis, two separate one-way MANOVAs were calculated. The first one-way MANOVA was calculated to determine the effect of the intervention of the SMM degree for each factor. The results showed that the two groups did not significantly differ when it came to the combined dependent variable of the TADI (p=.73). These results did not support their hypothesis. The second one-way MANOVA was run in order to determine the effect of the intervention on “the combined dependent variable comprising the SMM similarity score for each of the five factors” (Razzouk & Johnson, 2013, p.760). There were no significant differences between the two groups (p=0.88), which once again did not support the hypothesis, which also means they failed to reject the null hypothesis for their third hypothesis.

Ioannou and Artino (2010) conducted a case study to investigate the efficacy of collaborative assessment (CA) in an undergraduate education psychology course. The participants consisted of thirty-one undergraduates who were enrolled in an undergraduate education psychology course (28 females; 3 males). Twenty-eight participants were seniors and
three were juniors. The class met for 16-weeks, twice per week for 75 minutes. The CA was conducted during week 13 and the assessment consisted of 23 multiple-choice questions. Administering the CA consisted of five tasks: (1) students were divided into groups of three or four without the option of working on their own, (2) each test item was projected overhead and the students were given one-minute to answer it separate from the group, (3) the groups were then given a minute to discuss their individual answers and come to a group consensus, (4) students recorded their group response on their individual response sheet, and (5) the next test item was presented and the process was repeated until all 23 questions were completed (Joannu & Artino, 2010).

In the results, the researchers discussed the positive and negative aspects of the CA. The positive aspects of the CA were that the discussion among group members improved understanding, improved their performance and scores, and improved their confidence. The negative aspects were that this type of assessment took longer than a usual exam and it made it easier for cheaters/freeloaders to slip past. Overall, the student data supported the view that the collaborative assessment was beneficial for learning, less stressful than a regular test, almost as fair as a normal exam, and more enjoyable that the usual exam (Joannu & Artino, 2010).

Wallace, Walker, and Braseby (2014) addressed the question of how to incorporate more or create more time for active, collaborative learning in the classroom. A strong method of doing this is by using a flipped classroom because in a flipped classroom, the student’s primary knowledge acquisition happens before class, which allows for more time in which the students can practice applying the learned information. The authors also reviewed the effects of using team-based learning and they found it enriched student content acquisition from pre-class study,
and it allowed the class to use the majority of class time for discussion, to take risks, and to make some mistakes while developing their own expertise (Wallace et al., 2014).

**Team Based Learning Connections**

Team Based Learning is also important to incorporate in the classroom, but it differs from assigning learning partners. As from the title of the action, this type of method is centered more on groups than pairs. All three of the articles agreed on the fact that teams were able to work better and learn better when applying real life situations or problems to the concepts they were learning (Joannu & Artino, 2010; Razzouk & Johnson, 2013; Wallace et al., 2014).

Although there are many benefits from team-based learning, there is further research that needs to be completed in order to control for some possibly less than positive side effects of team based learning; for example, since team based learning allows more freedom for students to cheat or slack off (Joannu & Artino, 2010).

In contrast, students that learned in a flipped classroom were more successful than students in a team based learning environment. Wallace, Walker, and Braseby (2014) attributed this to the fact that more accountability was put on each individual student in a flipped classroom; however, in a team-based environment, some students could fly under the radar and perform poorly, but still be able to hide their poor performance behind the higher achievers in the group.

**Peer Tutoring**

Batz, Olsen, Dumont, Dastoor, and Smith (2015) attempted to answer the question of whether or not weekly peer tutoring is still effective in an introductory biology course when it is offered to the lowest-performing students. The participants consisted of 760 full time students, and the researchers found that students who performed poorly on the first exam of the quarter
participated in a targeted tutoring program, and of those students who attended the peer tutoring sessions, they achieved higher exam performance and ended the year with more well informed perceptions than their struggling peers who did not access help. In the end, this method resulted in persistence throughout the class, and in the long-term, helped in reducing the loss of at risk students (Batz et al., 2015).

Taha, Jalal, Yahya, Omar, and Lin’s (2013) purpose identified how effective the Peer Mentoring Module (PMM) was on peer mentors who had good characteristics and good academic performance. They utilized 20 peer mentors from the Engineering and Information Technology Degree program, and the overall results supported their hypothesis that PMM is effective on peer mentors’ personalities (Taha et al., 2013).

Backer, Van Keer, and Valcke (2010) defined metacognition as “the ability to reflect upon, understand, manipulate, and regulate one’s cognitive activities during learning.” The study explored the prospective success of a reciprocal peer tutoring (RPT) program for university students on the promotion of their metacognition. Sixty-seven first-year Education Science students were randomly assigned to twelve RPT groups; results showed that students reported a higher amount of metacognitive knowledge at both pretest and posttest, although the t-test showed that there was no significant difference (Becker et al., 2010).

**Peer Tutoring Connections**

There are several benefits to peer tutoring in an educational experience because it not only helps the students that are seeking tutoring, but it helps the students who are doing the tutoring. By experiencing peer tutoring, many students reported that by accessing these types of services they obtained a greater sense of knowledge surrounding the topic once the class was finished (Batz et al., 2015; Becker et al., 2010; Taha et al., 2013). Not only did the students
report that they had more knowledge surrounding the subject and greater confidence, but it was also revealed that students who received peer tutoring tended to be more persistent throughout the semester and less likely to give up then students who had never reached out for help (Batz et al., 2015).

However, the studies did not factor in any other variables that may have contributed to the positive outcomes of the students other than the peer tutoring. Since Becker et al. (2010) did not find any significance between peer tutoring and test outcomes, future research should test multiple variables in order to determine if a relationship exists between student achievement and peer tutoring.

Experiential Learning

Experiential learning cultivates student learning by the students acquiring skills and values through experiencing hands on knowledge outside of an academic learning environment (Kolb & Kolb, 2011). The second half of the literature review will discuss experiential learning from several more perspectives: active learning, cross-generational learning, and academic service learning.

Bott and Cortus (2014) placed two groups of agriculture students in two different experiential learning based activities, both involved manure composting. The two groups differed “by gender and the scale of their livestock and land management experience,” (p. 318) Their course material also differed between one another depending on the task they had been assigned, but change in knowledge over time was significant for both groups. Having the opportunity to participate in a hands-on/real life situation increased their learning compared to when the course was mainly based on lectures.
Popov et al. (2014) attempted to answer three different research questions: “When paired in similar or dissimilar dyads in a computer-supported collaborative learning environment, to what extent do students (1) differ in their perceptions of collaborative learning? (2) differ in their learning outcomes? (3) differ in their reported learning experiences?” (p.189). In order to answer their research questions, the students took 120 different participants from two different programs: international land and water management studies (n=60) and international development studies (n=60). The participants were assigned two concepts to learn: community-based social marketing (CBSM) and how to apply that concept in Sustainable Agricultural Water Management (SAWM). The students’ task was to apply these concepts to help foster viable behavior amid wheat farmers in a part of Iran (Popov et al., 2014).

The results ended up showing that regardless of the dyad makeup, that the students who had a collectivist cultural orientation had significantly lower outcomes compared to students coming from an individualistic cultural orientation (Popov et al., 2014). In addition, students with a collectivist cultural orientation had a higher score when it came to their perceptions of collaborative learning than students who had an individualistic cultural orientation. The study demonstrated that when teaching, especially when teaching with experiential learning, the instructor needs to make sure all cultures are rewarded from the process (Popov et al., 2014).

Kolb and Kolb (2011) summarized the most important concepts of Experiential Learning Theory (ELT) – learning style, space, cycle, and deep learning and development; they further discussed how each of these concepts can be used to assess management as an educational experience on several levels: the individual, the team, and the organization. These concepts can also be used to help design and apply management education programs in a higher education environment (Kolb & Kolb, 2011).
Active Learning

Freeman et al. (2014) looked into the question: Does active learning increase exam scores and does it decrease failure rates? The authors investigated this question by meta-analyzing 225 studies that reported data on exam scores and on failure rates when comparing student’s performance in STEM courses. The only differences were that some of the scores were from traditional lecturing courses and others from active learning courses. The researchers found that on average, there was a difference between active learning compared with lecturing by just under half of a standard deviation with the active learning studies in the higher position. After the effect size was calculated, it was determined that students who were in a traditional lecture course are 1.5 times more apt to fail compared to students who were in active learning courses (Freeman et al., 2014).

Bishop and Verleger (2013) conducted a study in a senior level computer interaction class, and in the experimental section of this class, the students/participants watched videos outside of class and then participated in hands-on learning activities in class. Students who were placed in the “flipped” environment obtained a significantly higher score on all the homework assignments, projects, and tests. The authors did recognize that in order for this to become a respected teaching method that research needs to continue, and research needs to occur in controlled studies that examine the students’ performance objectively throughout the semester (Bishop & Verleger, 2013).

Lee’s (2005) purpose was to advance research that investigates “Web-based instruction from language learner’s perspectives,” (p.141). The study specifically looked into whether or not participation in a network-based course of instruction influenced learners’ attitudes and beliefs and directed the development of their Spanish skills and how they used Internet technology. The
participants included 35 students located at a state university situated in the northeast, who were enrolled in two, third-year Spanish classes. A requirement of the study was to use Blackboard, a program used by universities to have an online place for their class and to support their language attainment. They also had to complete online task-based activities (Lee, 2005).

The use of Blackboard as an instructional apparatus helped enable the development of the students’ skills in Spanish, strengthened their cognitive skills, and helped support an active learning environment. The results also showed that the online tasks motivated the students and encouraged them to expand their use of Spanish to improve their knowledge outside of the classroom. Last, this study showed that online-based learning encouraged the students to be more actively involved in the learning process and to take responsibility for their own learning (Lee, 2005).

Active Learning Connections

In all of the studies that were mentioned, each study demonstrated that active learning helped increase and produce higher test scores and grades in students’ classes. In comparison to classes that are mainly lectured centered and when the active learning was performed outside of the classroom, the classrooms that had active learning occur during the class time showed positive effects on the students’ learning outcomes (Bishop & Verleger, 2013; Freeman et al., 2014; Lee, 2005;). These results were especially evident in “flipped classroom” settings where class time was specifically designated to active learning (Lee, 2005).

However, even though each of the study’s results indicated active learning environments have a positive effect on students’ learning outcomes, the authors did not discuss the possibility of other factors that could be effecting student learning; for instance, the quality of the instructor, the size of the classes, the location of the classroom, the speed of the technology used, and so on.
For this very reason, we include a subjective self-report of academic enjoyment at the end of the peer mentoring relationship in order to factor in any other contributing variables to the students’ success or failures.

**Cross Generational Learning**

Murphy (2012) examined the archetypal reverse mentoring relationship between a “baby boomer” senior employee as a mentee and the millennial junior employee taking the role of mentor. The study was not centered on age as much as it was centered on that the participants who were placed in nontraditional roles. What the author discovered from observing this type of relationship was that reverse mentoring is a creative and new tool for organizations to use when looking to encourage cross-generational learning. In addition, by putting the participants into these nontraditional roles, it urged them to look at the same things from a new perspective, which in turn helped develop both groups as leaders (Murphy, 2012).

Lichy (2012) conducted a study that examined cross-cultural Internet use, specifically paying attention to Gen Y and their use of social networking. The results of this study showed that there were broad areas of interest that were common among students of different generations, such as communicating through email, social networking, and information retrieval through sites like Google. There were also disparities and differences between the generations, and these disparities resulted in the author urging instructors to be cautious when moving forward with Web-based instruction so they can avoid over-generalizing the needs of Gen Y students (Lichy, 2012).

Yahr and Schimmel (2013) observed and compared the perceptions of Gen Y, otherwise known as millennials, and Gen X in an experiential learning environment. They hypothesized that because of the different generational values and characteristics that the perceptions between
generations would differ. The results showed that Gen Y actually enjoyed the experiential approach less than Gen X, and Gen X also perceived it as being more complex and therefore, they had learned less. This study demonstrated that even though Gen Y is perceived as being a strong, technological generation, that the need for teacher engagement and interaction, even thru Web-based instruction, is important (Yahr & Schimmel, 2013).

**Cross-Generational Learning Connections**

Cross-Generational partnerships in the classroom are a method that is slowly becoming more common. In some classes, it is not possible for these types of relationships to develop, which is why a lot of the research on these forms of partnerships come from the workplace and not education (Murphy, 2012). The most beneficial factor from partnering people based on their generation is that it allows the two generations to see eye to eye, and objectively understand another point of view. In society, gaps between generations exist due to all the differences that each generation believes exist between them; this type of partnership encourages each generation to see that at the very base, generations are not as different as people think (Lichy, 2012; Murphy, 2012; Yahr & Schimmel, 2013).

**Academic Service Learning**

Waters and Anderson-Lain (2014) examined an assortment of online survey assessments that are utilized in service-learning projects. The purpose of the study was to demonstrate what questions, categories, and concepts are currently being used to evaluate students, community partners, and faculty from numerous Campus Compact member institutions. After this analysis, the authors found six unique concepts: leadership, understanding course details, understanding service learning as an instructional method, course/project description, impact/influence on the community partner, and commitment to service learning. The authors then suggested that those
who are surveying people on Service Learning Projects should choose measures and tools that focus on the core concepts (Waters & Anderson-Lain, 2014).

Longmire-Avital, Chenault, and Haglund (2013) investigated whether the motivation of students in Academic Service-Learning (AS-L) increased when learning in the AS-L process as they gained perspective and knowledge of their own values and goals. There were multiple results from this study; throughout the semester, they assessed the students’ motivation three different times: the beginning, the middle, and the end. They found that there was a decrease in motivation throughout the semester. They also found that there were gender differences in the motivational changes that occurred during the semester; female students started out with high motivation levels that steadily decreased across the semester, but male students experienced a minor increase towards the middle of the semester and then their motivations started to decrease after that point (Darby et al., 2013).

Some of the factors that contributed to the increase of the students’ motivation during the semester occurred when they found the experience enjoyable, held an interest in the people they were helping, were able to form relationships with the clients and their community partner, and when they felt a sense of responsibility for their community partner (Darby et al., 2013). Factors that contributed to the decrease of students’ motivation over the semester were negative communication issues, lack of integration between their class and the AS-L project, issues with transportation, and the time demand in relation to their schedules. These factors were discovered through qualitative analysis of open-ended questions (Darby et al., 2013).

Ellerton et al., (2015) assessed how Academic Service-Learning (AS-L) can be used in order to provide support to urban community college students. In the fall of 2013 and spring of 2014, a quantitative survey was administered to AS-L students. Around 750 students from about
60 different classes participated in this analysis; this sample represented 15 different disciplines (Ellerton et al., 2015). The results from this survey indicated that AS-L projects positively influenced students’ academic learning. These projects also appeared to increase a student’s general confidence when it came to their learning and skills in the workplace. They also found gender differences in the perception of impact that AS-L had on academics. Male students reported that the projects allowed them to apply what they were learning in class more than the female students were, but the genders had a similar response in that AS-L projects helped them learn the materials from class more effectively (Ellerton et al., 2015).

**Academic Service Learning Connections**

Academic Service Learning (AS-L) is a method of teaching that can be very effective, but only if used in the correct way (Ellerton et al., 2015). The one factor the AS-L studies had in common that all of the previous mentioned studies had a positive effect on student learning and their AS-L projects were related to something the students cared about. For some students, if the project was not related to something they cared about, they were less motivated when it came to completing the project and were less motivated when it came to the learning process. As long as the project was related to something the students cared for and related back to the concepts they were learning in class, the projects had positive effects on student learning and motivation (Darby et al., 2013; Ellerton et al, 2015; Waters & Anderson-Lain, 2014).

Conversely, the students discussed many factors in their classes that effected them through the AS-L project. Future research should also consider those variables in order to increase the reliability and validity of the research. Peer learning increases students’ critical thinking abilities through hands on instruction in a student-led environment; therefore, students will also positively improve upon their communication, collaboration, planning, and problem
solving skills (Stathakos). Razzouk & Johnson (2013) found that after students attended lectures on the class material, the professor would then divide the students into peer led learning groups, and the students would then apply the knowledge they gained in class to solved real world case studies. The students who worked together in a student led, hands on learning environment had higher academic outcomes then students who only learned in a teacher-centered classroom with little to no interaction with their peers (Razzouk & Johnson, 2013).

In the past, and currently in education, the classroom was designed mainly for one learning style; however, by bringing the differences of every student to light and showcasing the students’ strengths in order to expose the students’ needs. Our program can provide faculty support and build upon what the faculty are already teaching in the classroom, except by giving their students another alternative to learning the information. The peer mentorship program can provide the benefits of peer learning while also respecting the curriculum developed by the faculty within the classroom; consequently, developing positive outcomes for more students in the process.

**Peer Mentorship and Undergraduate Research**

Auger and Rich (2007) define mentorship as “a role model offering support to another person and sharing knowledge, expertise, and experiences with that person.” The traditional idea of mentorship tends to place an individual who is older and wiser in the position of mentor and tends to follow a hierarchical model where the mentor in some way holds a higher or more prestigious position. Peer mentorship tends to deviate from this traditional mentorship model.

“Peer leaders represent formalized, informed, and experienced agents to help the socialization process of fellow college students, (Shook & Keup, 2012). Utilizing a peer as a mentor for undergraduate students conducting research minimizes the gap between the mentor
and mentee that exist in traditional mentor relationships. There is still an experience gap between students, without this gap mentorship could not be fostered. Although, the gap between mentor and mentee is minimized, the ability to relate between the two is increased, there is shared thought that they have both “been there,” (Gidugu et al., 2015). When the mentor is closer in age and experience to the mentee, it helps open up communication and quickly produces a foundation built on common understanding. Another benefit to peer mentor, is that the mentee tends to still be deeply within the learning process and that makes the mentee not feel alone in their experience.

Although, many of the first year or sophomore experience mentorship programs focus on the social aspect of college, the program through the Office of Undergraduate Research focuses on professional and academic socialization. Previous research shows that characteristics that define the underrepresented student population (e.g. first generation, low income) tend to also predict the presence of a professional language gap. Students with these characteristics may not be exposed to academia the same way as other students whose parents completed college or who are from high income homes. This gap sometimes keeps students from participating in opportunities such as undergraduate research because they lack the communication skills to develop their interests or do not know that research opportunities are available to them (Stephens, Hamedani, & Destin, 2014). This mentoring program would serve as access to research opportunities and skills to not only students in certain disciplines or from certain social backgrounds, but to all students. Providing these students with a chance to gain ownership of academic and disciplinary language and content, it gives them a chance to succeed in a discipline that may have not been previously accessible (Sharer, 2015).
Our department has taken the previous research and the desire to start a peer mentorship program, and utilize it to develop other supports until the program could be more of a possibility. The two main supports that exist out of our office are the SOURCE Ambassador Program and the Undergraduate Research Club. SOURCE is the Symposium Of University Research and Creative Expression is held annual for two days the third week in May. In 2016, over 600 students and faculty from 47 different disciplines participated in SOURCE. In order to provide support to the students applying to present at SOURCE, we developed the SOURCE Ambassador program, which utilizes student volunteers who have previously presented at SOURCE in order to present in different classes across campus and provide support to students new to research. Their presentation consists of several things: providing a brief explanation about SOURCE as a whole, who can present, why they should present, and how students can present at SOURCE. The main goal is for students to present in their department, because it increases understanding between the presenter and the students in the class. Due to the amount of departments on campus, and the amount of student volunteers, most SOURCE Ambassadors end up also presenting in departments outside of their own discipline. This program was born out of the idea of peer mentorship, but utilizing the benefits in a group setting versus a one-on-one relationship.

The Undergraduate Research Club was also founded last year; this is a group for students participating in undergraduate research run by students/officers who come from various disciplines. The group offers social events, professional workshops, and information on research opportunities. This club offers more social support compared to the SOURCE Ambassador program. The Ambassador program focuses solely on the academic aspects, where as the club does place an importance on academics but provides a social situation for students to enjoy as
well. This helps students establish a sense of community and a bond with other individuals attending the university, which in the end, has been shown to be related to retention in higher education institutions (Mendoza, Suarez, & Bustamente, 2016).

Based on both of these supports and the background literature, our department has started to build an individualized peer-mentorship program. The Undergraduate Research Mentoring Program will be a selective program that requires mentors to submit an application and undergo an interview. Mentors will be required to have completed their first year of school before applying, and must have completed the core research/development classes of their department/major. Alongside these requirements, once hired, mentors would go through extensive training to prepare them for the challenges that come with being a peer leader and the responsibilities involved in participating in this program.

This training will be a one-credit internship offered through the Undergraduate Research Department, and led by the program coordinator, who would also be serving as an advisor to the mentors in conjunction with their faculty mentors from each of their disciplines. However, the mentors will come initially from our graduate students. Not only are these students already immersed in research and can properly share the faculty’s’ mentorship goals, but since our university is very limited on the amount of graduate assistantships it can provide, we will be providing employment opportunities for graduate students looking for jobs that will enhance their own research skills to help prepare for future PhD programs.

This collaboration between the mentors and the faculty is a key part of the program. Peer mentors are not meant to replace faculty mentors; they are there to assist in faculty mentor relationships. Faculty only have the ability to serve so many students a quarter, so if peer mentors could focus on teaching students the basics of undergraduate research, once they get into
the faculty mentor relationship, that faculty member will have the time to really focus on the
details and narrow in on the grittier more difficult parts of the learning process. This peer
mentorship program is currently in the works, is awaiting institutional funding, and is scheduled
to be in place by Fall 2017.

Crowdsource Your Class: Unlock the Perspectives of Your Participants to Enhance Engagement and Authenticity

**Topic Area:** Other Areas of Education

**Presentation Format:** Workshop

**Presentation Description:** In this session, the participants will walk through learning how to use the concept of crowdsourcing in order to help them acquire ideas from their participants to, in turn, enhance the engagement of those participants.

**Author:**
Nadia Williams
Digital Transformation Coach
Cobb County School District (Cobb County, Georgia)
Nadia.Williams@cobbk12.org
**Presenter:** Nadia Williams, Digital Transformation Coach for the Cobb County School District (Cobb County, Georgia)

**Session Format:** Workshop

**Topic:** Other Educational Areas

**Session Title:** Crowdsource Your Class: Unlock the Perspectives of Your Participants to Enhance Engagement and Authenticity

**Session Abstract:** Research indicates that students (and adult learners) are more engaged when they are presented with opportunities to experience ownership in their classroom (or organization). Why not use this to enhance your next lesson or presentation? In this session, you will learn about a variety of tools and techniques to provide your pupils with opportunities to share their ideas in a non-threatening manner. This ensures that students and adult learners feel supported in an environment where their ideas are regularly validated. Bring a lesson idea you want to enhance and learn how to crowdsource your class by using tools such as Google Drive, Office 365, Slido, Microsoft Pulse, and more.
Harnessing the Power of Interactive Video

**Topic Area:** Other Areas of Education

**Presentation Format:** Workshop

**Presentation Description:** In this self-differentiated session, participants will learn how to use tools such as TouchCast, Racontr, and EdPuzzle to supplement classroom instruction. Participants will learn how to discern which tool to use for which purpose, how to implement it to support and enhance sound pedagogy, and how to guide students in creating their own interactive content as well.

**Session Format:** Workshop

**Topic:** Other Educational Areas

**Session Title:** Harnessing the Power of Interactive Video

**Session Abstract:** “A picture is worth a thousand words,” or so the saying goes. This session seeks to build upon that while supporting sound pedagogical practices. Participants will first be introduced to a selection of examples of interactive video created to support instruction. Then, based upon participant interest, and technological proficiency, they will self-differentiate using materials provided by the presenter in order to learn how to create their own interactive video. The participants will then share what they learned, how they can see it being applied into their classrooms, and other observed possibilities.
Noor Hussain has done a master degree in Educational Leadership & Management and another master degree in Economics. He has got more than 27 years of work experience with schools, colleges and institute of higher education, both in public and private sector in Pakistan. He has rich experience in k-12 education and has also carried our research studies in the same area and some of his papers have got published in international and national journals. He has written multiple proposals for various interventions in education and led the implementation of various educational projects in Sindh Pakistan. Presently he is supervising seven community colleges in Sindh.
ABSTRACT

This study has been carried out in district Khairpur Sindh Pakistan. The foci of this study are to understand the disparities in girls’ education in one of the districts of Sindh Pakistan and explore the causes of disparities and put forward the parents’ concerns and their suggestions to address the situation. Ministry of Education Government of Pakistan prepared a National Plan of Action 2001-2015 to honor the commitment made in the Dakar Framework. However, despite multiple interventions in education sector in country the provinces of Baluchistan and Sindh lag behind in almost all quantitative and qualitative indicators. It is generally believed that in Pakistan; particularly in Sindh the parents do don’t want to educate their daughters. To understand the beliefs of parents about the education of their female children this paper explores the perceptions of parents and asks their suggestions as well. The purposive sample of the research participants are the parents of the girls-out-of-school. The key reasons shared by the parents for not sending their female children to schools include, safety and security of their female children, lack of awareness at the part of parents, poverty, poor quality of schools and malpractices and corruption. The solutions of the problem suggested by parents can simply be summarized into three government actions, which include, compulsory education for all, school transport for girls and monthly stipend for girls on regular basis.

Keywords: Girls’ Education, Disparities, Perceptions of parents, females out of school
INTRODUCTION

Target 4.1 of the Sustainable Development Goal 4 puts a responsibility on the signatory nations that by 2030, they will “ensure that all girls and boys complete free, equitable and quality primary and secondary education leading to relevant and effective learning outcomes.” However, in Sindh province of Pakistan yet the targets of MDG 3 are far off things, where even the universal primary education seems almost impossible. Target 3.A of the Millennium Development Goal 3 put a responsibility on the signatory nations to, “eliminate gender disparities in primary and secondary education, preferably by 2005, and in all levels of education no later than 2015” and Dakar framework for action 2000 also reiterate the same. Ministry of Education Government of Pakistan prepared a National Plan of Action 2001-2015 to honor the commitment made in the Dakar Framework. However, despite multiple interventions in education sector in country the provinces of Baluchistan and Sindh lag behind in almost all quantitative and qualitative indicators. (UNESCO, 2010) finds “over the period between 2000 and 2008 indicate that the NERs for girls are consistently lower than boys, thereby indicating that in Pakistan girls have less access to primary education than boys”(P.9). Disparities in girls’ education in rural Sindh, as suggested by various surveys are quite high (Annual Status of Education Report, Economic Survey of Pakistan & Pakistan Integrated Household Survey). According to the statistics shared in Sindh Education Sector Plan 2014-2018, “in 16 out of 23 districts, more than 50 per cent of girls are out of school”. According to the Reforms Support Unit (RSU) of the Education & Literacy Department (ELD) government of Sindh the current total enrolment of students in K-12 grades is 306, 550 and out of this the number of girls is120,150 which makes only 39%. This disparity in the enrolment indicates that in future the people of Sindh will continue with a substantial number of illiterate mothers. According to ASER 2013 survey 21% of the school-going-age children are out of school in rural areas and the percentage of females out of school is higher than that of males. ASER finds that 72% of the mothers in Pakistan have never been to school (ASER, 2014). The Sind Right to Free and Compulsory Education Act 2013 provides for education beyond 16 years of age in order to ensure, “that a child is so admitted to secondary education shall be entitled to free education till the completion of secondary education even after sixteen years.”

Among many reasons that account for these disparities the perceptions and concerns of parents about girls’ education, its quality and access to it are of great importance to understand and address the issues. It is understood that researching and analyzing real situations leads to change and improvement. Understanding parents’ concerns and perceptions require a good deal of in-depth understanding of the social context of district Khairpur of Sindh in particular and overall Sindh province in general. This study looks into the concerns and perceptions of those parents whose male children go to school but the girls stay at home and support their mothers and other female family members in household chores.

The purpose of this study is to look into the detailed accounts of actual practices, concerns and perceptions of people who apparently seem to continue with illiterate women for unknown time
in future unless the real issues and problems are diagnosed and addressed properly in time. Thus without proper education these women will remain deprived of the benefits of economic prosperity that comes with education and their illiteracy will surely have a cross effect on the education of their children. The insights gained in the study are helpful in designing such interventions at local level that can facilitate the empowerment of the women of the communities by properly addressing the issues of schooling for girls which can consequently have a positive effect on the lives of women and enable them to play constructive and decisive role in their lives and the lives of future generations.

LITERATURE ON GIRLS EDUCATION

Research and seminal scholarly works are replete with the social and economic benefits of girls’ education. The benefits of girls education are multiple such as Herz and Sperling (2004) give a list of benefits which include, higher wages, faster economic growth, more productive farming, smaller, healthier and better educated families, safe children’s’ lives, women empowerment and many others. However, women illiteracy is vice versa and has its negative social implications. (Toor & Parveen, 2004) contend that poverty is one of the main hindrance in the enrolment of girls in Pakistan, moreover they infer that “many parents view educating sons as an investment because the sons will be responsible for caring for aging parents” (p.142). Thus the parents are ready to invest in boys’ education. A study carried out in Pakistan in nineties shows that “poor families use 8-10 percent of monthly expenditures for education, somewhat less for girls than for boys” (World Bank, 1996). Since educating girls is crucial for social development the role of communities is of critical impotence. The Community is the key role player in educating the children and community is like a total sum of the parents, (Bray, 2003) contends, “Community activity in education has a long history. Indeed, a perspective of centuries rather than decades would generally show a rather minor role for governments until the twentieth century…”(p.32).

CONTEXT OF THE STUDY

Khairpur is one the districts in Sindh which was a princely state at the time of partition of sub-continent and it is reported that before annexation to Pakistan it was a welfare state where the education was completely free and even the students from flung areas were provided with free lodging and boarding facilities where they were served three times meal free of cost. The writer is the eye witness of such students’ residential facilities. Khairpur is one of the rural districts in interior Sindh where the human development indicators are better, however, the situation when seen at micro level indicate that despite overall view and its comparisons with other districts khairpur might seem better but the other side of the coin presents a different view. Khairpur district is divided into eight Talukas1. According to Reforms Support Unit in 2011 in khairpur district total number of schools was 3,679 out of which 3370 are primary, 166 middle, 29 elementary, 97 high and 17 higher secondary schools. Among total 9325 only 2093 (22%) are

---

1 Taluka or Tehsil is a geographical and administrative unit like a sub district
female teachers. In the total enrolment of students which was 331, 884 the number of girls is 130,476 which is only 39% of the total enrolment (RSU. 2011). In district Khairpur there are 3370 primary schools out of which 1325 are for boys 529 are for girls and 1516 are mixed. Thus only 15.6% schools are specified for girls and 39.3% specified for boys. There are 166 middle schools in district Khairpur out of which 61 are specified for girls. There are 29 elementary schools out of which only 3 are for girls and out of 97 secondary schools 23 are for girls. Out of 17 higher secondary schools of the district there is only 1 for girls (RSU, 2011). However, the population of girls is little higher than boys in the district. Except few small towns the whole district Khairpur is rural hence the nature of issues and the dominant socio-economic context is rural where mainly population are related with agriculture.

**METHODOLOGY**

Ethnographic approach was used to know from the parents by long in-depth multiple numbers of semi-structured interviews from the parents. The researcher spent 8 to 10 hours with the every family for interviews and observations. The number of interviews however varied from participant to participant. The interviews continued unless the richness in data was achieved. Thus the number of interviews varied from two interviews to five in different cases. Observations also became the part of data collection strategy. Most part of the observations included the activities of young school-going-age girls who were not going to school but stayed at home. In addition to the concerns the parents were also asked to suggest the viable solutions of such problems which hinder education of their daughters. Regardless of the importance, validity, and practicability of their suggestions, the purpose was to include their voices on the issue that is affecting their lives and will continue affecting in future.

One hundred parents (fifty mothers and fifty fathers) were selected from ten different villages for discussions and semi-structured interviews. All of the parents were purposively selected to represent the parents of both male and female children. Every of the parents had at least one male and one female child, whereas the male child was going to school or had been to school and completed schooling at least till 10th grade and the female child had not been to school or dropped out in the early primary grades. They were from different backgrounds in terms of socio economic status and localities such as families of peasants, small business people, labor class, hailing from small hamlets to bigger villages and towns.

All the interviews and discussion were conducted in their first language (Sindhi) and notes were taken at the time of discussions and immediately after discussion memos and reflective notes were written. The data was analyzed by dividing it into themes and sub themes and the findings are presented into themes that follow the discussion and discussions.
FINDINGS

Parents talked about multiple reasons such as safety security, some unhappy instances that had taken place in various schools, lack of their own awareness, and quality of schools etc for not sending their daughters to school. Below are the detailed findings.

1. Safety and security

Many of the parents (25%) showed their worry about the safety and security of their daughters. Increasing lawlessness was their main concern. A father said, “but you see, God forbid if something wrong happens, who is there to help or support in this lawless country, it is really difficult to take risk for many parents.” Another father said, “There is no safety and security for our girls.” Mother who herself had never been to school said, “We are afraid, if something wrong happens what will we do? You know police will only help if we have money, so it is better that our daughters stay at home.” Thus safety and security and fear of any untoward situation appear to be the main concern of the parents. When asked if there are any such examples, ten parents (seven mothers and one three fathers) mentioned an example of two high school girls, one abducted by an outsider and another example of sexual assault by a school teacher. There are many loopholes in the system where such incidences happen, however, apparently the department of education does not have viable mechanism to stop such things during school hours, moreover, the safety and security is not the domain of education department or schools. Both of the above mentioned incidences happened during school hours and the schools did not do anything.

2. Lack of awareness of parents regarding girls’ education

Another reason that came out as a theme was the lack of awareness and interestingly most of the parents realized that it was wrong on their side that they did not send their girls to school. A father of four uneducated daughters said, “There was no awareness in those days, now everybody wants to educate but what if there is no school.” Some parents think that at the teen age it is not good to send them in schools. “In our village girls go to primary school but after that, they grown up and they are married or parents stop them at home, some of them continue private schooling.”

3. Poverty

Education is free apparently but the parents show multiple concerns and majority of the parents share these concerns. The time the young children spend at home has significant financial benefits for the family such as when the young girls look after their siblings the mothers work in fields. Toor and Parveen’s study (2004) also confirm the same. On the other hand when the parents send a girl to school she needs proper clothing, notebooks and stationery etc. 25% of the parents responded with the same sentence, “assan gareeb manho niyanan je parhai ja kharch Kithan aanyoon” which means, “how can poor people like us afford the expenses of educating
our daughters.” UNESCO (2010) also contends that the primary education in Pakistan is not completely free as the parents have to pay for purchase of notebooks and other stationery items. UNESCO finds a persistent interconnection between illiteracy of women and poverty and terms it a viscous circle which is perpetuated and has a dual effect of keeping girls uneducated and household in poverty. Thus the poverty and illiteracy go hand-in-hand. Uneducated girls have less potential to add in household income and such household retains the same tradition of producing more illiterate females and the circle continues. Most of parents of poor families in a village reported “The chief of the village has announced, no one will send their girls to the school, so we are afraid, we cannot do it, but girls of his family go to school.” This indicates that there are such cruel restrictions for some parents hence they cannot send their daughters to schools.

4. Poor quality of schools

39 parents (31 fathers and 8 mothers) asked, “there is no education in the schools so who will send their daughters in the school?” one of the family shared, there is a girls school in our village but the female teachers do not teach, they do their own work at the school like sewing weaving and then ask the girls to prepare tea for them and the children play whole the day. The father asked, “Can we call it a school?” he added, “No, it is their meeting place or their shop” This indicates there is perhaps no proper monitoring, supervision and support mechanism for school to work properly. A father whose two daughters were not going to school said, “There is nothing in girls’ schools, teachers just come sit and talk and go back girls play whole the day so the parents who are really concerned about education of their daughters send them to boys schools, you can see there are 50% girls in the boys school.”

5. Malpractices and Corruption

One research participant shared something very odd and in fact it indicates the height of corruption. A father said, we do not think that going to school is important, he added, “see if Zarina (pseudonym) can become teacher without going to school for a single day, why should other parents send their daughters to school when they know that it is not the education but it is all relationships and money.” As a result of the probes, he told the whole story of Zarina. According to him Zarina had never been to school but Mr. Shahid (pseudonym) the head teacher of a primary school issued a fake primary pass certificate to her and on the basis of that certificate she appeared in matric examination. She did not appear herself in the exam but another girl impersonated and then another girl impersonated for her in the intermediate examination. Thus she got intermediate certificate from the board and then she was appointed as primary school teacher (PST). The participant then asked, “now what do you think? Will you suggest us to send our daughters to her school?” The malpractices and corruption seems to have
become so severe that people have lost faith in the education system. It is very dreadful situation when people see such practical examples of mockery with education.

SUGGESTED SOLUTIONS

Parents suggested following solutions to address the issues;

I. Compulsory Education for all

A father said, “Education must be made compulsory; if a father does not send his daughter to school he should be arrested by police.” This indicates the height of interest of parent in girls’ education. Despite this keen interest this family could not send her female children to school because of the safety and security. He said, school was not in their village and it was in the nearby village but he shared an example of the sexual assault by a teacher, the incident was reported in the local and international media also.

II. School transport for girls

Mothers specially showed more concern about the security of their daughters, however, they were also very much concerned about education and mostly they suggested the government should provide transportation for the girls to pick and drop them for school. A mother said, “they (political leaders) can spent millions of rupees on their own safety and other extravagant activities why not some amount for girls education.” 15 mothers 10 fathers asked for the transport facility for girls.

III. Monthly stipends for girls on regular basis

A father told that his relatives live in another district where through some NGO funded project the girls are provided with cocking oil dry milk packets and because of that all girls of the village go to school, so if the government can support in this way or at least the girls are provided with regular monthly stipends parents can be motivated to send their daughters to school. Poverty seems the major reason behind not sending girls to school and asking them to support their mothers and household chores or earning activities like labor.

DISCUSSION

1. There is dire need of close coordination between education department and other departments such as police and health. In many instances basic health units (BHUs), rural health centers (RHCs) and government dispensaries exist at some distance from schools, however, there is no mechanism to seek medical help from such facilities during school hours. The schools don’t have resources to send the children to clinic or call the health department personnel to the school. In terms of security, in case of rural villages it is hard to find any police officer to seek help if anything happens or precautionary measures are needed. However, in case of comparatively bigger towns, there are police stations but in Sindh, due to rude attitude of police people hardly
prefer to seek their help and if a school wants to seek their help the police station house officers are hardly ready to cooperate. Hence there is a need of creating some mechanism whereby these three departments-schools, police and health can collaborate for the betterment of the communities.

2. There is readiness among parents to educate their daughters the only thing required is proper planning and making affordable education accessible to their doorsteps. Many activities are being done without planning such as opening new schools, enrolment campaigning without proper planning which results in duplication and wastage of resources. The tax money being used without planning such as opening a new school where it is not needed is just wastage of very useful resource hence there is need of making well informed decisions at district or provincial level.

3. Educating girls is strongly connected with socio economic condition of parents; hence the education department and schools have to think possible ways to connect economic well being of communities. What possible role can school play in suggesting, supporting economic activities of the families, one of the possible input can be introducing skill development programs along with girls education so that the female children along with getting education can learn skills which will also empower them economically and families can benefit from it reasonably.

4. Only teachers coming to school does not serve the purpose, what do they do in the school is more important, hence to ensure the proper functioning of schools a viable monitoring mechanism needs to be developed. The existing monitoring system is very poor in terms of monitoring skills where the monitoring personnel just ensure that the teachers is available in school. The education department should develop some mechanism to assess the quality of student teacher interactions during leaning process. Many teachers are even unfamiliar with the national curriculum; hence their work in the classroom is irrelevant.

5. There is need of proper monitoring and vigilance to stop the malpractices in education department and schools so that the schools can win the respect and trust of the communities can be restored. Many schools in far flung areas are left just on the mercy of teachers; they do what they want it has devalued the image of school. Hence the department needs to be more active and own the schools and remain in close coordination with the schools.

CONCLUSION

The findings reveal that the disparities in girls education exist in Khairpur District and the same is confirmed by the existing literature and surveys carried out by various organizations and the government documents such as economic survey of Pakistan. The efforts to mitigate these disparities have also been made for last about fifty years; however, substantial improvement has not been noticed in the situation. Along with many reasons one potential reason, behind not showing substantial improvement in girls’ education, is not addressing the genuine concerns of the parents. Interestingly the parents’ suggestions are very simple and they have not given a long
list of demands. They have just asked for three things- making education compulsory for all, transport for girls and monthly stipends for girls. Hence it will be extremely important to take into consideration what the parents expect from schools or the government for their female children so that they can send their daughters to schools. Above mentioned suggestions of the parents are genuine and can be addressed within the existing resources available for the schools. In this age when education is considered as a basic right of individuals 50% girls out of schools is a big question mark on the performance of government which is the mass provider of education in country. Hence the authorities are expected to show more responsiveness toward the genuine needs. Without addressing the real issues in existing disparities in girls education there is possibility that the future mothers in Sindh will continue to remain uneducated till the time unknown.

Chapter One

Purpose of the Study

“Ethical dilemmas arise when two sets of values are in conflict requiring individuals to choose between them” (Pontiff, 2007). Special education leaders are faced with ethical dilemmas in a school setting that offers inclusive services such as mainstreaming and pull-out. As they try to balance the needs of both special and general education students, all the while complying and being accountable to federal laws and mandates, and personal values.

Humphrey’s (2008) study stated the following:

“Ethics plays a part in many decisions that student affairs professionals must make everyday (Blimling, 1998; Canon, 1989; Kitchener, 1985; Winston, Jr., Creamer, & Miller, 2001; Young, 2001). As society becomes more and more litigious and political, student affairs professionals are increasingly pressed to make the right decision (Blimling, 1998; Upcraft & Poole, 1991; Winston, Jr. & Saunders, 1998). Additionally, the higher education landscape continues to grow in complexity with more stakeholders and more at stake (Levy & Kozoll, 1998; Upcraft & Poole, 1991). The problem is that there is no simple recipe for how to resolve those situations in which more than one ethical principle is involved.

For student affairs professionals, the challenge of resolving ethical dilemmas begins with recognizing an ethical dilemma when it appears (Canon, 1996; Levy & Kozoll, 1998; Nash, 1997). This first step is further complicated by the ever-increasing diversity of students that the profession serves (Levy &
Kozoll, 1998; Sundberg & Fried, 1997). Such diversity can create multiple perspectives of a single situation (Levy & Kozoll, 1998; Sundberg & Fried, 1997). Levy and Kozoll (1998) suggested that when faced with such daunting circumstances, student affairs professionals must not run away from the challenge because not making a decision is in essence making a decision.” (Humphrey, 2008, p. 32 - 33)

This study wants to explore ethical dilemmas and leadership in special education in the Philippine setting. What does it take to effectively serve the needs of the special education population in a setting that offers mainstreaming/pullout services?

Special education leaders can have a positive or negative effect on their students’ lives. It is important for them to be knowledgeable, empathetic, and consistent. They are expected to know and model standards that parents, general education teachers, interventionists, and others can emulate and learn from. According to Fielder (1967) leadership is most effective when the style implemented is appropriate to a specific situation. He also identified relationships between leaders, followers, and the situation, which is important in the ever-changing educational setting and population of special education.

The complexity of leadership in special education is increasing with the implementation of Education for All 2015 (UNESCO, 2015), which emphasizes the right of every Filipino access to quality education and is reinforced by Republic Act 9155 also known as the Governance of Basic Education Act 2001 and Republic Act 6655 known as Free Secondary Education Act. (UNESCO, 2015 p.2) This means access to education for children and youth with disabilities. According to the World Health Organization (WHO)
(2015), “disabilities is an umbrella term, covering impairments, activity limitations, and participation restrictions.” The Philippines has adapted an Inclusive Education Policy, it is the aim of this policy to reach the un-reached and under served population of learners. (UNESCO, 2015) In the report UNESCO published, Philippine Education for All 2015: Implementation and Challenges (2015), they stated that “DepEd should specifically work on the strengthening and expansion of its SPED classes in the existing public elementary and secondary schools and the strengthening and enrichment of its regular classes to mainstream the people with disabilities.”

This study aims to research ethical dilemmas and leadership in special education leadership in the Philippine setting. It will explore leadership actions, activities, and thoughts that affect decision-making when ethical dilemmas arise. This will be an important addition to current literature as there has been very little literature on the topic. It will also serve as a guide for those special educators and leaders needing guidance in their profession.

According to Department of Education (DepEd) (2015) of the Philippines is pushing the educational system towards the inclusion of special needs students into the general population. However, most schools are not equipped with proper personnel for this transition. In the Philippine setting, special education leaders are usually the classroom teachers themselves without a specific administrator designated to supervise. This has caused many teachers to feel lost within the system as their direct supervisors are not well-informed or educated regarding special education needs and challenges. In a study done in the United States, it has been found that “There is an increasing concern about teacher factors, such as burnout or low efficacy, which have been hypothesized to
Influence student outcomes like achievement or discipline problems.” (Pas, Bradshaw, Hershfeldt, & Leaf, 2010). Special educators and leaders are prone to burnout, due to the exposure to “excessive engagement in overwork, uncertainty about others’ expectations, or excessive worrying on the job coincide with doubts about other people's appreciation…” (Vanheule, & Verhaeghe, 2005)

According to Consolacion (2000), leadership in special education in the Philippines has been riddled with lack of information and transparency that is evident, which makes it unfavorable to the educational community and its different stakeholders (as cited in Orillosa, 2013, p. 13). Different models and perspectives on leadership have been discussed throughout the years. A good example of a leadership model that has grown in popularity since 1970’s is Servant leadership through Greenleaf’s (2007) published works. According to Lanctot & Irving (2010), servant leadership has inspired leaders with a focus of leadership through service. It’s popularity draws from the current societal views of leadership, “truly awful.” (Lowney, 2013, p. 3) Lowney (2013) describes current leaders as, “Too often, those in leadership positions seem preoccupied only with their own status or income. They are unable to inspire or unite us; they are not imaginative enough to solve the seemingly intractable problems that plague us; they are afraid to make the tough choices or even to level with us; and they are insufficiently courageous to lead us through challenge and drive change.” (p.3) The need for research to explore leadership in special education and ethical dilemmas in the profession is imperative especially since it is an emerging field in the Philippines.

The ethical dimensions of teaching have been addressed through different code of ethics imposed in different countries such as the National Education Association’s Code
of Ethics (2015) and Special Education Professional Ethical Principles and Practice Standards from the Council of Exceptional Children (2015). The Philippines also has the Code of Ethics for Professional Teachers (UNESCO, 2015). However, there hasn’t been enough empirical studies done to address the ethical dilemmas in the field of special education especially in schools offering inclusive services such as mainstreaming and pull-out. There is a great need for understanding of professional ethics in the field of special and inclusive education. There is very little known information regarding the different ethical challenges that are encountered in the school setting. The researcher aims to contribute empirical data to the existing body of literature regarding ethics in special and inclusive education by providing insights on leadership in special education and ethical dilemmas.

There are many concerns that plague the special education system in the Philippines. Among these concerns is the lack of “…staff development programs; relevant curricula; inadequate school facilities; instructional tools; and specialized equipment resulting to insufficient funds; comprehensive and accurate data and information not readily available; dearth of researches on the psychology and education of the Filipino child with special needs…” (Orillosa, 2013, p. 13) As of May 22, 2015 according to the Philippine Department of Education (DepEd) website out of the 583,312 teachers only 2,089 are SPED Teachers servicing the growing special needs population of the country.

Special education leaders and educators face a daily variety of responsibilities, from developing individualized educational plans (IEPs), managing student behaviors, coordinating and managing support staff and other service providers, implementing
personalized instruction through modifications, adaptations, and accommodations each student needs for success. To be a special educator they must be able to effectively lead the educational team towards each student’s set of goals and in the Philippine setting the additional role of administrator designee is added.

Different scholars throughout the years have addressed the theoretical and empirical nature of the ethical dimensions of education (Bigbee, 2011; Lucker, 2012; Kieltyka-Gajewski, 2012; Caslib, 2014). However, researches on the ethical challenges within a special and inclusive school have not been the focus. The gap in literature has been noted in the field (Bigbee, 2011; Kieltyka-Gajewski, 2012). As cited in Bigbee (2011),

“ Howe and Miramontes (1992) argue that special education has received minimal consideration as a field of ethical investigation or as a subject in teacher education. Paul et al., (2001) agree, finding it “surprising that a field so replete with…complexities of interests has devoted so little attention to the study and development of applied ethics” (p.1). Despite the long acknowledged need for a greater understanding of professional ethics in special and inclusive education, very little is still known about the ethical challenges experienced by teachers working with the students who have special needs in inclusive classrooms (Berkeley & Ludlow, 2008; Howe & Miramontes, 1992; Keim et al., 1998; Paul et al., 2001; Rude & Whetstone, 2008; Sileo et al., 2008). “ (p.6)

This study aims to contribute to the body of literature in the ethics of special and inclusive education. The results of the study can have enormous implications for policy
Grounded Theory

makers, certifying bodies, teacher education programs, special education leaders’ professional lives as it can provide different insights into the different ethical dilemmas that are present in leading in a school offering special education in the Philippines. This study hopes to influence the development of policies and practices to support leaders, teachers, and the students.

**Research Questions**

The purpose of this study is to examine the ethical challenges and dilemmas that special education leaders experience in their work. The data gathered would hopefully provide insights in the ways in which the leaders manage such ethical issues, the supports available to them, and their recommendation for further supports. A qualitative approach in the form of grounded theory will be used to gain the different perspectives and accounts of the different leaders. Grounded theory allows for the collection of rich data of statements, experiences, beliefs, and events that occur in their school setting.

Research questions will be probing, neutral, and non-leading in order for the story to naturally emerge from the respondents. Questions such as “What does it take to effectively serve the needs of the special education population in a setting that offers mainstreaming/pullout services?”, “What is a typical work day?” or “Can you describe your work day for me?” The questions will be used by the researcher to probe and draw out different notions of ethical dilemmas special education leaders have. As a guide, these questions will not be strictly used as the main interview questions for the respondents but will be used as a motivational start to help respondents in sharing their different notions, opinions, beliefs, and experiences.
Chapter Two

Research Method

An inductive type of qualitative research known classic grounded theory by Glaser (1967) is the proposed method for this study. Previous work on the research problem has been scarce and so this study will take on an exploratory nature. Grounded theory is emergent in nature, it allows for an exploration of the different notions of ethical dilemmas special education leaders have and provides a systematic way to generate a descriptive construct. The research method will allow the researcher to discern, identify, and construct a meaningful theory to explain the phenomena.

Glaser’s grounded theory dictates that everything is considered data. This includes observations, interviews, and artifacts collected from the respondents. In analysis of the data collected, it is imperative to use a systematic treatment of the data to find the concepts out of the different codes. After which, the researcher must then restrict the study to the concepts that are highly related to one another. In doing so, the researcher is able to avoid the potential problem of having different but justifiable interpretations of the data at hand. The objective of grounded theory is to provide an explanatory framework to understand the phenomenon under investigation with theory as its end product. Glaser also dictates that all preconceptions and prior knowledge about the study be cast aside during the procedure, to allow the “emergence of concepts from the data.”

Upon further study of grounded theory, the researcher found that it is best suited for the study at hand. Since there has been little research on the topic, the theory, which will be generated from the data collected, will greatly contribute to literature. It will
hopefully provide insight in the behavior patterns on resolving ethical dilemmas among special education leaders in the country.

**Research Setting and Participants**

Participants are selected based on their knowledge and willingness to share their different accounts on the matter at hand. This study’s participants will be special education leaders who have been in a leadership position for a minimum of five years in a school that has a special education program that offers mainstreaming and pull-out services. In the Philippine setting, the special education classroom teachers most often serve as the special education leaders within a school where there is no specific administrator who is in-charge of the department. This study will make use of both administrative special education leaders and special education classroom teachers who hold administrative duties.

Recruitment of potential participants will be done through personal invitation via email, phone call, or text message. Once the individual has agreed to participate, a letter for voluntary participation will be sent through post or personal delivery. The letter will contain a brief background of the study, proposed dates for the interview, and a copy of informed consent to be signed by the both the respondent and researcher. Interviews will be held at a mutually convenient location, date, and time.
Figure 1. Grounded Theory data collection and analysis process.

**Data Collection**

Grounded theory uses multiple sources of data collection methods such as interviews or personal conversations, observations, and review of different journals or documents. The beginning of a Grounded Theory study begins with a general sense of wonderment regarding a topic. Wherein the researchers are required to begin without having any preconceived notions of the topic. This means that there will be no pre-formulated research questions or guide questions. The study will begin with only a general topic of interest and the initial data collected will be from an open ended interview. A “grand tour” question will initiate the interview. According to Simmons (2009), “A grand tour question is a broad open-ended question related to the general topic area. A grand tour question is designed merely to prompt the participant to respond
to the general topic, on their terms.” Questions that follow the grand tour questions are to be derived from the participant’s response.

Each interview begins with a unique grand tour question depending on the purpose of the interview, as directed by theoretical sampling. Glaser and Straus (1967) defined theoretical sampling “as the process of data collection for generation theory whereby the analyst jointly collects, codes, and analyzes his data and decides what data to collect next and where to find the data, in order to develop his/her theory as it emerges” (p.45). Each interview length varies per respondent and if the respondent appears to have more to share, a follow up interview may be requested if the analysis of the data reveals that it would be valuable to the emerging theory. Everything that is related to the general topic is considered data and can be analyzed using the constant comparative analysis. As the study continues, the topic is funneled to a more specific area of social concern based on the previously collected data. Each following step after the first interview and data analysis will be determined by the data at hand. The following participants are selected through theoretical sampling, which is contingent on the emerging data and their relevance to emerging theory. When theoretical saturation has been achieved and no new concepts are being yield out of the data, it is the only time the researcher can seize to interview new participants. This is the main reason why the total number of participants in a Grounded Theory study cannot be known in advance.

**Ethical Considerations**

The following ethical considerations have been taken will be taken into consideration during data collection: 1.) Possible discomfort or inconvenience to participants and researchers; 2.) Procedures respecting confidentiality; 3.) The implications of monetary
or other inducements to participants and others to be involved in the research; 4.) Potential conflicts of interest arising between the participant’s affiliations and the research project; 5.) Obtaining informed consent, or when necessary from parent or guardians, including the preparation of a written consent form. The ethical considerations all adhere to the DLSU Code of Research Ethics and Guide to Responsible Conduct of Research and an informed consent form has been drafted for use during the study.

Data Analysis

According to Alony & Jones (2011),

“The process of Grounded Theory encompasses an acknowledgment of the researcher’s bias, the selection of a data collection site, the data collection process, the process of coding and analysis, and the compilation of results. Coding and analysis includes three stages: open coding, selective coding, and theoretical coding. Open coding employs constant comparison and memoing and results in themes, sub-categories, and core categories. These results guide the subsequent sampling of participants through theoretical sampling. The next stage of coding – selective coding – also employs constant comparison and memoing. This stage results in dense, saturated core categories. The core categories are then sorted, written, theorized, and cross-referenced with literature, during theoretical coding. The results of this last stage of coding are a basic social process and a theoretical model.” (p. 101)
Data collected through interviews, observations, and artifacts are reviewed using the constant comparative method. Through its iterative process, it identifies the latent pattern present in the words of the different participants. The researcher reviews lines, sentences, and segments of transcripts and codes them accordingly to form concepts that are data derived.
Open coding is the term coined by Glaser (1967) to describe the analysis of the participants’ transcripts through constant comparison – identifying, naming, categorizing, and describing the different phenomena found in the text. In the process of doing open coding, the researcher does a line-by-line data analysis wherein the researcher compares incidents to other incidents in every possible way. Glaser (1998), encouraged researchers to ask several questions to aid in the coding data. “‘What is this data a study of?’, ‘What category does this incident indicate?’, ‘What is actually happening in the data?’, ‘What is the main concern being faced by the participants?’, and ‘What accounts for the continual resolving of this concern?’” (p. 140) These questions encourage the researcher to be attentive on the patterns emerging among the coded incidents to yield categories.

Holton (2010) states “the coding process is not a discrete stage as it is in some research methodologies but rather a continuous aspect of the analytic nature of classic grounded theory.” In Grounded Theory coding is done in conjunction with conceptual memoing to capture the ideation of the researcher regarding the emerging theory. Memoing is present in every stage of the coding process and is an integral part during the conceptual reintegration during theoretical coding. (Holton, 2010, para 62)

Holton (2010) further explains that the researcher must be knowledgeable as to how and when to engage in the different natures of coding that is essential in “capturing the conceptual power of the methodology.” (para 62) A set criteria has to be applied in the ongoing data collection and analysis as the theory emerges. It is impertinent to tailor fit the criteria depending on the data and applied carefully during the analysis. This allows the data to dictate the direction as to which is relevant to the emerging theory. (Glaser & Holton, 2004, para 51)
Coding the data line-by-line ensures that the researcher is able to validate and saturate categories, lessen the chances of overlooking an important category, and ensures relevance to the emerging theory. The researcher will be able to progress the analysis of the data to “toward to higher levels of conceptual abstraction, core emergence, and theoretical integration” (Holton, 2010). As the process continues and leads to the integration of theories, the researcher is able to clearly see the best fit between memos and data that is relevant to the emerging theory. The themes that come out of the data serves as the foundation for theoretical saturation, wherein no other themes come about in the addition of new data to help progress the theory that has emerged. This aids the researcher to see clearly as to which direction the data is pointing towards resulting in a rich theory that is feels complete. (Glaser & Holton, 2004, para 50)

Letter of Participation

Dear Fellow Special Education Leader:

Greetings in St. La Salle!

I am currently working on my dissertation at De La Salle University in the College of Education. I am researching how special education leaders negotiate ethical dilemmas in schools that offer special education programs, which includes mainstreaming and pull-out services. This research will improve the understanding of how ethical dilemmas impact the decision-making process of a special education leader. It will also offer guidance to higher education professionals who seek to improve teacher preparation programs for future special education teachers and leaders.

As a participant, I will interview you at a convenient place and time for you. It should take no longer than hour of your time. If you have any questions, please feel free to contact me at the e-mail address listed below.

I appreciate your time and willingness to participate in this important field of study.

Kind regards,

[Signatures]

Re-establishing a Collaborative Relationship

Marilyn Labrensz, M.S.

Minnesota State University Moorhead

School of Teaching and Learning

INTRODUCTION

The Children’s Preschool at Midwestern University has a long, distinguished history of quality childcare and education. Over the years it has served as a lab school and demonstration site for children of students, faculty, and the community. The Education department at Midwestern University offers a major in Early Childhood Education, providing students the opportunity to complete multiple practica and student teaching at The Children’s Preschool. Within this very experienced staff there existed a strong collaborative relationship with the faculty at Midwestern University. Due to a turnover that occurred at both levels this relationship softened. Each group has something the other needs.

PURPOSE OF STUDY

The purpose of this study was to determine if a collaborative relationship between the preschool staff and the education department faculty could be re-established successfully and if so, how it could be accomplished.

From 1986 to 2008 there existed a strong partnership between these two entities. There were a significant number of events that took place over the years. The dialogue began around the need to coach and guide student teachers. Student teaching seminars were originally prepared by faculty; eventually preschool teachers took over this leadership role. Subsequently, teachers
were invited to give presentations in college classes, faculty members completed research in preschool classrooms often related to dissertations, and preschool teachers and faculty attended national conferences together. Preschool teachers and faculty gave joint presentations at regional conferences, and they attended numerous trainings (such as science training at the University of California, Berkeley; cultural diversity with national experts; and cooperative physical education activities with a nationally published author).

In the fall of 2011, the Children’s Preschool, like many across the nation, was threatened with closure due to budgetary concerns. Former preschool teachers and retired faculty became advocates for the center. Current faculty/staff were added to this group and an advisory board and other committees were developed.

In the fall of 2011, I was hired as a faculty member in the education department. I am a former preschool teacher. As part of my yearly professional development plan, I volunteered to assist and mentor the preschool teachers. Eventually, teachers requested more of a relationship; this was communicated through the director to the Advisory Board, of which I was a member, representing the faculty. As a former preschool teacher, now turned university faculty member, I saw the supportive relationship that used to exist between these two entities. I remember the professional development that took place, the deep friendships that developed, and the close working partnerships that developed between the preschool teachers and the college faculty. Because of a turnover in staff at both levels, this relationship has been lost. As I began my new position, I noticed the need for the re-establishment of this relationship. That leads to two research questions:

1. Can a collaborative relationship between the preschool staff and the education department faculty be re-established successfully?
2. If so, how can we accomplish this successfully?

The goal of the collaborative partnership between the preschool and department is to make sure there is alignment between the two in terms of quality. What is taught about best practices in the college classroom is reflected in the preschool classroom. Working together on this project in the past was characterized by trust and intimacy. This echoed Newbury and Hoskins’ discussion of “relational inquiry,” a methodology that was contextually based, used multiple data, and focused on meaning (p. 644). This collaborative work was based on an ethic of care for the participants, remembering always that being a guest in a teacher’s classroom must be experienced as support, never as a threat.

**METHODS**

This is a human endeavor that involves people, so this research study would lose much if its findings were reduced to numbers alone. A quantitative study would not be concerned about the same factors that I want to take into consideration. Such as, how to establish trust? How can one be sensitive to the feelings of all the participants? How do I help people deal with change? How do you maximize resources that are scarce when they are scarce at every level? How do we improve curriculum so that it reflects best practice?

Qualitative methods were chosen because of the research questions. This was a study of relationships and educational change. The project was informed by the relationship that existed historically. This is about people, and these issues are sensitive, so to reduce it to a quantitative study would diminish the findings.
Another reason this method was chosen is because a qualitative study can be flexible and responsive to changing circumstances. It is responsive to process or the flow of what takes place as the study evolves. Quantitative studies are more product-oriented.

Qualitative research is stronger when the data is triangulated. “The strength of qualitative research lies in collecting information in many ways, rather than relying solely on one, and often two or more methods can be used in such a way that the strength of one compensates for the weakness of another.” (Gay, Mills, Airasian, 2012, p. 393). I used whole group discussion, small group discussion, demographic surveys, pre and post-evaluation surveys, interviews, and individual meetings between the researcher and the participants. I also took field notes on these procedures.

Research Plan: Schedule

What follows is the schedule for the project.

Pre-Project:
1. September 2011 - Establishment of the Advisory Board
2. November 12, 2011 – Preschool birthday party
3. March 2012 - Consultation on Curriculum – Egg Hatching
5. February 2013 – Director consults with teachers about topics for panel discussion
6. February 27, 2013 – Discussion with Bill Ayers about his recent book
7. March 6, 2013 – Discussion on lesson plan format
8. March 19, 2013 – Demonstration of resources – Amaryllis project
9. March 26, 2013 – Round Table Discussion on Superhero Play: Topic #1
10. April 2, 2013 - Evaluation of the panel discussion

Project:
1. April 2013 - Administer survey to both groups (Pre-Survey)
2. April 2013 – Demonstration of egg hatching from the previous year
3. April 16 2013 – Consultation on Curriculum – Farm Animals
5. April 23, 2013 – Round Table Discussion on Prop Boxes: Topic #2
6. April 24, 2013 - Evaluation of the round table discussion
7. May 1, 2013 – Teacher Appreciation: Surprise May Basket
9. May 15, 2013 – Round Table Discussion – Guidance
10. May 17, 2013 - Evaluation of the round table discussion
11. May 23, 2013 – Round Table Discussion on TPA Lesson Plan
12. June 17, 2013 – Administer survey to both groups (Post-Survey)

Research Plan: Ethical Issues

Respecting the rules of confidentiality is very important. All participants need to be reminded of this. There is nothing in this study that would cause harm to people, but we want to be respectful of the feelings of all participants. Because the college faculty is more experienced than the preschool teachers, when making suggestions for improvement, we must be sensitive to and avoid the misinterpretation that we are criticizing the teachers.

Round Table Evaluations

The first round table discussion was on the topic of superhero play. Two articles were disseminated a week prior to the round table discussion. The articles provided a starting point for discussion. Details from each article and ways to implement the ideas in the classroom were debated by the participants during the round table discussion. Teachers made positive comments, such as “more articles on superhero play….the articles were great to start off with and could be put to use in the classroom.” Other suggestions included sharing personal experiences and after trying various techniques in the classroom, it would be a good idea to provide time to revisit or debrief the topic.

The second round table discussion was on the topic of dramatic play prop boxes. Participants discussed appropriate themes, pertinent materials, how to make the prop box multicultural, and created a “wish list” for future prop boxes. Two positive comments from this discussion were
“it was good to hear about other ideas”… “we came up with a great list of things to look for[in the summer]”.

The last round table discussion was on the topic of guidance. This round table discussion was well attended: 15 people in person and one through Skype. Articles were disseminated one to two weeks prior to the round table discussion. As before, these articles were used to provide a starting point for discussion; in addition the articles supported developmentally appropriate practice. Once again, teachers provided positive feedback by stating “a great turnout of educators”… “lots of people with diverse backgrounds and great ideas.” There were also suggestions provided to “return to this topic in the future…to have more time, to repeat the topic twice, and have individual case studies typed up ahead of time.”

**Demonstrations and Panel Discussion**

Demonstrations focused on curriculum and best practice for young children in the early childhood classroom. The first demonstration was on the use of an Amaryllis plant in the classroom. An Amaryllis bulb was given to each classroom/teacher. This demonstration concentrated on how to observe, care for, and record the growth and development of the plant. I also encouraged the teachers to post a picture, which would provide a visual, so children knew what to look for as growth took place. Teachers gave oral comments which I recorded in field notes.

The egg demonstration led to the hatching of chicks and ducklings. This was an extension from the previous year when I brought chicken eggs into the teachers and demonstrated how to set up an incubator, care for the eggs during the incubation period, and care for the chicks once they hatched. This year I extended the experience by providing duck eggs in addition to the chicken eggs.
The farm animal demonstration took place outside of the center, in the parking lot. I brought two chickens, two ducks, a horse, and two goats in a horse trailer. Four faculty members assisted in supervising the animals, while children and teachers from the preschool were involved in a hands-on experience with farm animals. The teachers commented that children REALLY enjoyed the animals and “They talked for days afterwards”. One teacher commented “that most senses were involved, seeing, hearing, touching, and smelling.” After reflecting on this experience, I decided that in the future, I would provide information sheets with simple facts about the animals for teachers to share with children.

The final demonstration was on lesson plans. It was a small group of two teachers and two faculty members. I explained the lesson plan format to the preschool teachers so they understand what future student teachers are required to complete during their experience in the preschool. Teachers provided written evaluations.

There was one panel discussion which took place at the beginning of the project. On the panel were former teachers and faculty who described the history of the relationship between the center and the department. Eighteen people were present. The following categories were represented: former and present teachers, former and present faculty, administrators from both the center and the department, and one faculty from another department. As follow up, teachers generated a list of topics for round table discussion.

**Pre and Post-Survey Evaluations**

</table>
Faculty felt slightly closer to teachers after the project. Faculty’s attitude of sharing resources was largely unchanged. This may have been because the researcher carried the burden of providing the majority of the resources. Faculty felt relationships had greatly improved. Faculty reported using teachers somewhat less as resources. The limited time of the project may account for this. All parties unanimously and strongly agreed that they wish to continue the relationship.

This project began with two questions:

Table 4. Faculty Evaluations After the Project
1. Can a collaborative relationship between the preschool staff and the education department faculty be re-established?

2. If so, how can we accomplish this successfully?

The pre- and post-survey results suggest that for the most part, the project was successful, particularly in terms of relationships. Both groups came to see the other more positively. The teachers seemed to be more comfortable using the faculty as resources than the reverse. From the beginning and to the end, both groups saw each other as more alike than different. This remained high and unchanged throughout. The teachers began to see the faculty as more of a resource. Conversely, the faculty have not yet fully discovered how they can use the teachers as resources. Furthermore, more work needs to be done to clarify how the faculty can share expertise.

This project demonstrated several characteristics of collaboration, also mentioned by Hord (1986), such as establishing shared interests, having respectful communication, allotting enough time for collaboration to work, and learning to share resources. As Bickell and Hattrup (1995), noted, “….equity in status is critical.” Both sets of participants in this study saw themselves as more alike than different, which went a long way toward guaranteeing equity. As work progressed on the project problems were solved as they came up, reflecting a negotiation model as described by Lacey (2001).

It became apparent that this collaboration needed to honor the three R’s [respect, responsibility, and reality], (Lacey, 2001). It is crucial to the success of the project that visitors respect the teacher’s turf and not come in as experts with all the answers. Teachers more than anyone, know what is going on in their classroom (Lacey, 2001). There were times during the project when
there was the clash of cultures as described by Goodlad (1993): teachers ready for swift action, faculty prepared for a slower approach to research and its implications. While one can debate the difference between cooperation and collaboration, this brief project on many levels brought together two groups of people who adopted a shared vision and began the renewal of a partnership. The results of the teacher evaluations as well as the pre- and post-surveys, show that a successful collaboration between the Children’s Preschool and the faculty at Midwestern University was successfully begun. To ensure continued success, plans for the immediate future need to be developed.

CONCLUSION

Relationships between teachers and faculty became closer and improved. They saw one another as more similar than different. Relationships were improved. I found that overall, the historical collaboration between the Children’s Preschool and the early childhood faculty at Midwestern University could be re-established. The project was a success in that it revived the collaboration. This new relationship will need to be supported as we continue to grow in our partnership. The findings may be useful to others in education working to establish, maintain, and improve partnerships, align programs and enhance teacher preparation programs.

Abstracts

Overview: The Open-IoT Platform system market for smart house based on ECHONET Lite (Open-IoT standards) is expanding in Japan. For further market growth, the awareness on the benefits of open systems must be promoted among companies (which tend to intentionally enclose their markets by proprietary products) as well as users (who are often unfamiliar with IoT services). In this paper, we report the current situation and problems with awareness education for the Open-IoT Platform market growth.

Method: In Japan, a government committee has set a strategic framework [1] for market formation, with the international open standard ECHONET Lite [2] (which is based on IP and therefore perfectly “IoT”) adopted as the key technology. Thereafter, a consortium of corporate parties (JSCA)[3], in cooperation with industry associations centered on the eight important kinds of strategic devices (smart meters, PV, EV, PHEV, battery, air conditioner etc., and HEMS devices as (Fig.1) [4], has been promoting market formation by providing standard-compliant equipment. Currently, products which are compliant with the open standards (ECHONET Lite) are available in one half of the devices on the market [5]. Now, with real products provided on commercial levels, the market formation has entered its first preparatory stage. [6] (Fig.2)

For further developments, efforts to educate various segments of people have been underway: (Fig.3)

1) For companies, the education is primarily focused on the fact that the open standards system can reduce procurement costs and facilitate system adjustments. Also, it gives merit expansion of facilities select ability. Example: consortium seminars and general corporate seminars. [7]

2) For users, the education is aimed at explaining that the open standards system gives a freer choice of service providers and service contents. Example: HEMS seminars and public lectures [8]

3) For small and medium-sized to businesses, the education is aimed at explaining that the improved freedom of equipment procurement makes entry into services easier. Example: HEMS center tours, hackathon, and exhibitions. [8] (Fig.4)

4) For salespersons, the “smart master qualification test” has been introduced for educational purposes. Example: smart master workshop [9]

Results and challenges: For the spread of IoT, both the equipment and services need to be spread in cooperation. We believe that the Open-IoT Platform is advantageous over proprietary (“vertically-integrated”) platforms in that it enables service providers to develop more efficient, flexible and easy-to-use IoT environments while offering users a broader range of services as in the Internet-related businesses. However, in the course of the above-described educational efforts, we have learned the hurdle for the open service formation is high. The problem is common to the service formation in IoT business areas, i.e. the consciousness difference between "proprietary services offered by specific service providers" and "enterprises based on the Open-IoT Platform". This is a matter of business (not technology) and must be handled as such: Firstly, we must develop effective methods for making companies and users more aware of our Open-IoT Platform promotion. Secondly, in the promotion, we must present clearer pictures which show that introducing the Open-IoT Platform into business areas provides various benefits in comparison with the vertically-integrated systems.

Summary: We need to develop more effective methods for the awareness education on the "Open-IoT Platform introduction into business areas."
**8 strategic devices in EMS speak ECHONET Lite**

ECHONET-Lite, owned by ECHONET Consortium, has become open interface since on Dec 21, 2011. With following that strategy change, JSCA, government-industry liaison, has decided for 8 strategic devices to speak ECHONET Lite and promote the growth of DSM in Japan

Development of an e-Portfolio System for Educational Technology
Research Based on the Warp and Woof Model of Problem Solving

Toshiki Matsuda

ABSTRACT

My team has designed an e-portfolio system to support literature reviews and the development of gaming instructional materials to cultivate students’ ability to perform educational technology research. Moreover, I have developed the Warp and Woof model of problem solving to develop gaming instructional materials for STEM subject areas. In this article, I combine the functions of e-portfolio systems designed in past studies based on the Warp and Woof model.

Key Words: e-portfolio system, educational technology research, problem solving, master’s thesis study, the Warp and Woof model.

INTRODUCTION

An e-Portfolio System for Supporting Literature Review Activities

Shimada and Matsuda (2012) and Matsuda and Shimada (2013) discussed the design of an e-portfolio system to cultivate the problem-solving abilities of master’s course students through both course works and master’s thesis research by focusing on literature review activities. Their system incorporates the following four features to aid students in preparing for master’s thesis research:

1) A function for sharing sources and summaries of articles read or written by students
2) A test function and a concept map function (Uchino & Matsuda 2007) to support students in understanding and memorizing technical terms indispensable to their master’s thesis study
3) A function for checking a literature review report and helping laboratory members to conduct seminar discussions
4) A function to support students in learning to read and write research papers in English

These features were designed based on a text analysis function that extracts important keywords from sentences using a Japanese morphological analysis system called MeCab (Kudo et al., 2004). A technical term dictionary for the educational technology domain was also created by Shimada and Matsuda (2012).

However, these functions alone were insufficient to effectively and systematically cultivate students’ problem-solving abilities. Therefore, Shimada and Matsuda (2012) designed a rubric for evaluating students’ literature review activities. This rubric represented an important first step toward systematically developing students’ problem-solving skills in producing a literature review; however, the relationship between the functions of the aforementioned e-portfolio and this method of evaluation using a rubric has so far remained
The Warp and Woof Model of Problem Solving

To rectify the above problem, Matsuda (2015b) proposed the development of an e-portfolio system based on the Warp and Woof Model of problem solving. This model has been constructed by developing several gaming instructional materials for STEM subject areas at the secondary school level based on the analysis of commonality and differences among the problem-solving processes in the National Course of Studies (Matsuda 2015a). The model consists of three elements (Figure 1): a problem-solving script (procedural knowledge common for every problem-solving activities), ways of viewing and thinking, and domain-specific knowledge. General strategies, meta-cognitive skills, and domain-specific knowledge are all elements of human intelligence and expert performance (Bruer 1993).

![Figure 1: The Warp and Woof Model of Problem Solving by Matsuda: The Common Framework](image)

In Figure 1, the warp process is demonstrated by the rectangles on the left side, and it consists of five subprocesses for problem solving. Originally, this process was constructed to integrate Tamada and Matsuda’s (2004) method for cyber ethics education into Matsuda’s (2003) method of teaching informatic ways of viewing and thinking. In each of the main processes, activities to “collect → process → summarize” information are performed simultaneously, utilizing the ways of viewing and thinking shown in the balloon. Domain-specific knowledge is classified into internal knowledge (denoted using cloud shapes in Figure 1), which must be memorized, and external knowledge (represented by disk shapes in the figure), which must be referred to when required. This framework emphasizes the commonality among problem-solving processes in many subject areas; the Warp and Woof activities are common for all of them. Moreover, informatic ways of viewing and thinking should be common for the use of all subjects. Anyone who proposes a new or revised model is required to express woof activities more concretely for understandability, add useful ways of viewing and thinking besides informatic ones, and show important domain-specific knowledge explicitly by classifying it as internal and external.

A Function to Support the Development of Gaming Instructional Materials

To perform educational technology research, the development of a lesson plan, an instructional material, and an assessment test and/or a questionnaire is required so that a trial lesson for examining research questions can be conducted. To this end, Matsuda (2015b) proposed a new function of the e-portfolio to help efficient development of gaming instructional materials based on Figure 1. The aim of the function is to offer basic
dialog templates and sample gaming materials, and to prompt their usage. This will help a developer to focus on considering contents of dialog rather than writing programs for controlling dialog.

The above function allows the e-portfolio system to focus on helping the Generate Alternatives and the Rational Judgment processes. To assist in all educational technology research processes of the system, it is necessary to integrate this function into the e-portfolio for literature review activities based on the Warp and Woof model.

**PURPOSE**

In this article, I discuss the development of an e-portfolio system that integrates two previous e-portfolio systems, one for literature review activities and the other for the development of gaming instructional materials, based on the Warp and Woof model of problem solving. The main objective is to organize menu items in each activity to be not only consistent with the model but also the course curriculum and laboratory works. During this process, it is important to associate the results (log data) of each menu task with others to promote their utilization for research activities as well as the systematic acquisition and understanding of inner knowledge while discussing what kinds of work is required in each task and feedback methods.

**MENU ITEMS AND ACTIVITIES CORRESPONDING TO THE MODEL**

**The Introductory Process**

Before starting the goal-setting process, students need to understand the Warp and Woof model (Appendix), including the relationship between the activities in the model and the contents and tasks of course works and laboratory works, to utilize the e-portfolio system. Additionally, to understand points and useful strategies of learning in research activities and to review activities after finishing a study, it is necessary to clarify students’ readiness. The initial menu of the model before passing the verification test and starting the goal-setting process has the following items:

- 0-1: Understand the Warp and Woof model
- 0-2: Understand the purpose and methods of using this e-portfolio system
- 0-3: Keep a record of my present state for performing research activities
- 0-4: Take the verification test

**The First Task of the Goal-Setting Process**

After finishing the introductory process, students perform research activities based on the model. In the goal-setting process, students need to perform literature reviews and, to understand the model, gain experience on the use of instructional materials developed in related studies. As an output of this task, each student is required to choose an appropriate research study and find his or her own research questions while paying attention to the goodness of the research, as well as the influences of their trade-off relationship.

Although woof activities are expected to be performed only once, some repetition will be required in this case. Therefore, any activity of any process in the model can be chosen at the top menu. In each activity of this process, the choices shown in Figure 2 are provided. In Figure 2, items starting with an “x-” in their code are commonly used in every process, named “common menu items” hereafter. Items starting with “y-” in their code are commonly used in some processes. The system not only support students’ research activities but also helps them to learn about the model, utilize ways of viewing and thinking, and acquire internal knowledge. Therefore,
to guide students’ learning, menu items to help them understand what they should learn and how they should perform tasks are provided from x-1-1 to x-1-7. Items x-2-1, y-2-3, and y-2-4 link to the functions of e-portfolio systems developed previously: reviewing slides presented in the lessons, performing literature review, and experiencing sample gaming materials, respectively. The results of y-2-3 and y-2-4 should be registered by choosing y-3-3 and y-3-4 respectively.

The top menu choices of processes, choice of activities, collect, process, summarize, x-1-1: Overview of the process, x-1-2: Relationship between tasks in the process and course/laboratory works, x-1-3: Output of the process, x-1-4: Necessary ways of viewing and thinking, x-1-5: Internal knowledge, x-1-6: External knowledge, x-1-7: Return to the top menu, x-2-1: Acquire internal knowledge, 1-2-2: Literature review exercises, y-2-3: Access to the literature, y-2-4: Find and use gaming materials, x-2-5: Go to processing information, x-2-6: Return to the top menu, x-3-1: Return to collecting information, x-3-2: Get advice on activities, y-3-3: Register/refer to literature data, y-3-4: Register/refer to experience notes of gaming materials, x-3-5: Summarize/refer to internal knowledge, x-3-6: Writer/refer to elements of my paper, x-3-7: Go to summarizing.

Figure 2: Menu Items for Each Activity in the Goal-Setting Process

To practice the woof procedure and promote the acquisition and utilization of ways of viewing and thinking in association with internal knowledge, the following functions and e-learning materials of the e-portfolio system are developed. First, before starting literature review activities, the good points of educational technology research, the instructional design model including the Warp and Woof Model, technical terms, and methods for designing lessons and instructional materials are discussed in the lessons. These can be learned in x-2-1 and y-2-3, summarized in x-3-5 using the concept map function (Uchino and Matsuda 2007), and so on. Second, to facilitate students’ understanding of the methods of literature review and important information resources, support functions to find and summarize the principles of literature review by oneself based on literature review exercises such as the following are provided:

(a) List more than 50 articles published in a year that are related to interested topics.
(b) Choose the most appropriate book to acquire the domain-specific knowledge necessary for a particular research topic systematically and comprehensively.
(c) Summarize papers on a specific topic in the laboratory by focusing on their relations.
(d) Summarize the trends over five to ten years regarding articles from a specific information resource.
(e) Choose important articles found in exercises and summarize the features of their reference papers.
(f) Find useful information that appeals to the necessity and value of a study by focusing on the reports and surveys referred to in the articles found in exercises (a) to (d).
(g) Find useful information resources outside the laboratory by means of the features found in exercise (e).

On finishing this task, students should be ready to write the “Introduction,” “Literature Review,” and “Purpose” of their papers. They are required to create their own reference database on the e-portfolio (y-3-3) and write sentences under the system’s guidance for quoting each study while registering it in the database (x-3-6).

The Second Task of the Goal-Setting Process
The second task comprises creating a work plan for designing a lesson plan, developing gaming instructional material, and performing trial lessons. To this end, information about possible dates and classes of trial lessons, including initial states of learners, should be collected from a teacher of the school where practical lessons will be carried out. It is important to provide a deadline for showing the instructional material (game) to
the teacher, because its development will be time consuming. Since breaching the deadline damages the trust in the relationship between the school (teacher) and university (professor), students must design both an ideal plan and a safe gaming plan. For this purpose, the author proposes the method of initially creating a quiz-type game and then improving it to the role-playing type to solve conflicts regarding the trade-off between time restriction and game quality.

In addition to the common menu items showed in the previous section, the following items are provided in the collect information menu: “2-2-2: Collect information about schedule and constraints,” “2-2-3: Survey initial state of learners,” and “2-2-4: Collect any materials useful to produce instructional materials.” To increase the reliability of the plan, the following are collected as external knowledge: a useful sample game board; a component to compile information resources; schedules for not only oneself but also the cooperators, which are required to determine deadlines, and so on.

Moreover, in the process information menu, the following items are provided: “2-3-3: make a work plan” and “2-3-4: register useful materials to progress the work.” To consider not only an ideal plan but also a safe plan, students need to acquire internal knowledge about what should be considered ideal and safe plans respectively. This knowledge should be referred to, to explain the reason for the plans.

The Generate Alternatives Process

The main purposes of the Generate Alternatives process are designing a lesson plan, gradually developing an e-learning material (game), and considering assessment methods for confirming educational effects. In this study, games are assumed to be developed using the Instructional Activities Game (IAG) system (Matsuda 2005), because all sample games have been developed by IAG, and it is easy for beginners to develop games using the same. The proposed method requires more than two repetitions between the Generate Alternatives and Rational Judgment processes to complete the game, because it requires the two steps mentioned previously.

In addition to the common menu items, y-2-3, y-2-4, and “3-2-2: find sample test items and questionnaires” are added. For developing game material efficiently, the maximal utilization of a sample game board is important. In y-2-3, a sample game board that offers advice on the description methods of various dialogues in a game board along with their experiences can be chosen.

Moreover, in the process information menu, y-3-3 and y-3-4 are provided to register literature and instructional materials as evidence of lesson design, gaming materials, and assessment methods. However, students need to acquire internal knowledge generalized from this evidence. In x-3-5, the system shows a list of typical devices and policies and prompts students to summarize their priorities and reasons briefly. However, because it is difficult to offer sufficient support through dialogues alone within the system, it is assumed that students will make notes in x-4-1 and update them repeatedly based on presentations and discussions in seminar activities, as well as advice from their professors. Further, in x-3-6, students must mention these notes in their papers in the form of points for designing games and lesson plans while using the technical terms they acquired as internal knowledge through literature review activities.

To register alternatives, “3-3-9: register lesson plans, gaming materials, and evaluation plan” is added. Each alternative is a combination of these elements. The alternative examined in the Rational Judgment process should be generated in this task.

The Rational Judgment Process

The purpose of the Rational Judgment process is to examine alternatives (lesson plans, game flows, slide contents, game boards, and assessment plans) critically to determine issues and formulate an improvement policy. The method proposed for cyber ethics education by Tamada and Matsuda (2004) was utilized as shown in Figure 3.
An “ethical issue” includes copyright infringements, mistakes in contents, educationally inappropriate expressions of contents, and unfaithful actions by a cooperator’s teacher. These issues should be concretely considered, memorized, and utilized as internal knowledge, and the viewpoints showed in Figure 3 play a role in categorizing these issues. In the e-portfolio system, the acquisition and utilization of internal knowledge should be supported while showing the viewpoints and choice of evidence that support rational judgments. To this end, it is important to encourage students to write down rules, viewpoints, and reasons for critically thinking about their judgment in literature review activities and to discuss them in a seminar. After the discussion, students are required to assess their judgment and reconstruct their rule and case database for providing better judgments in the future.

To achieve the above purposes, the following menu items for collecting information are added to the common menu items: “4-2-2: Confirm the purpose of my study and goodness of the gaming material chosen in the goal-setting process,” “4-2-3: Confirm my rational judgment framework,” and “4-2-4: Refer to useful information resources for judgment and improvement.” Moreover, the following menu items for processing information are added: “4-3-3: Construct my rational judgment framework” and “4-3-4: Carry out a critique based on the framework.” 4-2-2 is used to refer to internal knowledge acquired in the goal-setting process (1-3-5) for examining alternatives critically. 4-2-3 is used to refer to own the rational judgment framework registered in 4-3-3 to consider whether new knowledge should be acquired to judge the adequacy of alternatives, and 4-2-4 is used to determine if any new knowledge is required.

**The Derivation of Optimized Solution and the Consensus Building Processes**

Several repetitions between the Generate Alternatives and Rational Judgment processes are required to generate some alternatives to appropriate lesson plans, games, and assessment plans. All the alternatives to an optimized solution should be examined in seminars and be approved by the professor.

However, even when such reciprocal processes are performed, issues that one cannot determine by oneself may remain, such as whether the contents of the game are too easy or difficult or whether the approximate estimated time to complete the game is adequate. Therefore, in the Derivation of Optimized Solution process, since it is necessary to “be aware of the mutual relationship between the rightness and responsibility of a
decision,” developers need to entrust the final judgment to the teacher and ensure flexibility in meeting the teacher’s requests in the Consensus Building process. It is also necessary to design an instructional material that includes some optional plans corresponding to different weights of merit. Based on the above discussion, “4-2-2: Collect useful information for ranking alternatives” in the collecting information menu and “5-3-3: Rank alternatives” in the processing information menu are added to the common menu items.

I believe that it is impossible to complete the development of gaming materials while following every alternative before this process. It is reasonable to complete game development after building consensus with the teacher. Therefore, it is important for students to clarify their reliability regarding completing the game’s development to the teacher in the Consensus Building process.

The Review Processes

After a trial lesson is conducted, its results are analyzed, and a paper/report written, the Review process begins. Mainly, two points are necessary for review: considering the gap between the result and prediction and considering the appropriateness and utilization of acquired knowledge and ways of viewing and thinking. The latter includes a review of the research method and internal knowledge to make a research plan. Students enter their learning outcomes into an e-portfolio and utilize them to write a paper/report. After presenting the paper in a seminar and receiving comments from the supervisor, the review activity should be started, and the inappropriateness of the learning outcomes should be considered based on the supervisor’s comments. It is important for an effective review to utilize, as far as possible, stored learning outcomes in the e-portfolio to write a paper/report. In other words, when designing an e-portfolio system, it is important to prompt students to write elements that are directly referable in a paper/report.

SUMMARY AND FUTURE DIRECTIONS

In this article, I developed an e-portfolio system that integrates previous two e-portfolio systems, one for literature review activities and the other for the development of gaming instructional materials, based on the Warp and Woof model of problem solving. The main objective was to organize menu items in each activity not only consistent with the model but also the course curriculum and laboratory works. The approach this study applied was to design an e-portfolio system that was neither function based nor activity based but model based and that clarified what students should acquire and be able to utilize.

After implementing this system, I need to verify its effects through its practical application in course work that focuses on teaching research methods of educational technology and laboratory work. During this application, I will pay attention to the effect of design based on the model. I expect a log analysis from several perspectives to clarify the relationship among the effects of learning and elements cultivated by students.

Title of Submission: American Skin (41 Shots); How One Song Can Teach Issues of Race, Identity and Policing in America.

Author: Jin Thindal
Faculty of Education
Simon Fraser University, Burnaby, BC, Canada

Email: tta12@sfu.ca

Abstract

Race, identity and policing regularly surface to the top in America. Recently, with the movement of Black Lives Matter and numerous police shootings of black men, these issues are yet again in the news. Can schools and teachers have a role and responsibility to prepare their students to deal with matters of race, identity and policing? If so, how can this be done effectively in the classroom? This presentation illustrates one effective approach using pedagogy of song and its power to engage students in a more meaningful manner and enhance learning. Research has demonstrated that young people engage more with their music than any other activity on a daily basis, but educators largely ignore this fact. This presentation will demonstrate how the use of popular music can enhance student learning experience and more importantly, make it more enjoyable. Educators can also use this pedagogy with other learning approaches such as Blended Learning, Case Study or Transformational Learning.

DEGREE OF MASTER OF ARTS

DEPARTMENT OF HISTORY

CALGARY, ALBERTA

March 2013

© Adrian John Wouts 2013
Cooperation was the animating feature of the United Famers and Farm Women of Alberta (UFA/UFWA) and was reflected in their reform initiatives during their tenure in the Alberta Legislature between 1921 and 1935. It was the United Farmers and Farm Women of Alberta who instigated the reform of grade school curriculum leading to the shift from history to social studies beginning in 1935. With the advent of social studies in Alberta, gone was a study of the past; social studies worked to establish a democratic and cooperative society in the future.¹

It is the objective of this thesis to contextualize the shift from history to social studies curriculum by considering the cooperative ethos expounded by the UFA/UFWA in Alberta between 1919 and 1935. At the same time, my objective in this thesis is to expand the understanding of the origins of social studies beyond a widely held view among some historians that it was brought to Alberta from the United States by a select group of educational elites. This narrow perspective ignores the local roots of this momentous curriculum development. The shift from history to social studies took place amidst a rising tide of prairie populism sweeping Alberta during the first three decades of the twentieth century. During these decades, UFWA leaders, rural women school teachers, and their interactions with an emerging educational bureaucracy in Alberta contributed significantly to the emergence of social studies. The onset of social studies involved a wider cast of characters and local movements than has been accounted for to date.

ACKNOWLEDGEMENTS

This research project was partly conceived during my experiences teaching high school social studies in a number of Calgary schools. Students often asked the hard-nosed question at the beginning of the semester, what was the point of social studies? I wondered the same thing. Or, more precisely, I wanted to know where social studies came from and why it replaced history curriculum in schools throughout Alberta. I thank students for precipitating my interest to follow up on such questions in a concentrated way for the past few years.

I would like to thank my supervisor Dr. David Marshall for taking an interest in this project and providing direction and support at every stage. I would also like to thank archivist Maggie Shane from the Alberta Teachers Association (ATA) in Edmonton. Maggie supported my research by way of suggestions, guidance, and leaving the lights on in the archives long after their regular closing hours. I am grateful to her. I must also thank my brother Tim Wouts for always being interested in my work and inspiring me to learn more every time I speak with him. And thank you to my dear friend David Sol, who always makes himself available to listen, but demands of me clarity of mind in all that I do.

Finally, I must thank my parents who have supported all my endeavours and enabled me to devote the necessary time required to complete this thesis. I would also like to thank the Faculty of Graduate Studies and the History Department at the University of Calgary for their generous financial contributions.

INTRODUCTION

Social studies curriculum, taught throughout Canadian schools, regularly garners heated public criticism.¹ Take, for example, the MacLean’s Magazine’s October 2012 cover story, “Why are Schools Brainwashing our Children?”² The article criticizes social studies curriculum for emphasizing ill-defined social justice activities such as organizing student strikes against the proposed Keystone XL Pipeline project.³ A focused study of history is all but absent in Canadian classrooms, according to the author, Cynthia Reynolds. Her argument echoes much of what Canadian historian, Jack Granatstein, has said for years, namely, that social studies does not provide students with an adequate knowledge of Canada’s past, contributing to what he claims is historical amnesia among our youth.⁴

The above-cited article alludes to what educational historians refer to as the so-called “social studies wars.”⁵ The battle is between history and a citizenship-focused social studies for dominance in the classroom. A healthy debate continues to take place regarding which histories should be included in school curriculum and what kinds of citizenship skills students should learn in classrooms.⁶ Rarely, however, are more fundamental questions asked regarding what exactly social studies is and how it differs from its predecessor, secondary history. And why did social studies replace history

³ Ibid.
⁶ Ibid.
curriculum at all grade levels in Alberta schools beginning in 1935? Alberta was one of the first provinces to introduce social studies in Canada, followed by Saskatchewan, Manitoba, the Maritimes, and Ontario. Thus, an examination of the factors leading to the curriculum shift in Alberta makes it a particularly relevant jurisdiction to investigate.

My hope in this thesis is to move beyond a typically polarized or charged debate regarding the rightful place of either history or social studies in classrooms. Instead, I will examine the conditions and movements that precipitated this curriculum transition in Alberta in the first instance. Because education is a provincial responsibility, enshrined in Section 93 of the British North America (BNA) Act, it should come as no surprise that curriculum reform reflects the atmosphere of a province at a given point in time.

In the early decades of the twentieth century, Alberta’s rural society was on the march, and cooperation was their main weapon. Amidst rural degeneration, the economic exploitation of farmers by corporate interests, and fluctuating climactic conditions, farmers organized and cooperated to ensure their interests were heard by government. The United Farmers and Farm Women of Alberta (UFA/UFWA) took direct political action in 1919 and assumed control over the Alberta Legislature in 1921. Thus, a previously unrepresented group in society, farmers, had come to power, and they remained there for fourteen years. The UFA/UFWA rode a wave of prairie populism,

---

nourished by the social gospel and political activism that worked to rid society of greed, competition, and violence. Curriculum reforms during the 1920s and 1930s came to reflect the UFA/UFWA’s larger objective to inaugurate a cooperative and democratic order in the future. Just as the UFA/UFWA presented a bold vision for the future, so too did social studies. The same year that this new curriculum was introduced in high schools in Alberta, H.C. Newland, a most ardent promoter of social studies, proclaimed that teachers must be “evangelists for democracy and social engineers.”

Social studies became the vehicle by which the UFA/UFWA expanded their movement by emphasizing cooperative forms of organization and active political citizenship.

In 1935, Alberta’s Department of Education introduced social studies, claiming that “as its name implies [social studies] is socially directed, dealing with the ‘here’ and ‘now’, subordinating the ‘there’ and ‘then’.” A study of the past became secondary to the need to prepare students for active political service in the present. For example, students were asked how cooperative forms of organization such as the Alberta Wheat Pool could combat contemporary crises of economic depression and international conflict. History students in 1919, on the other hand, were expected to memorize the facts of the British Empire and Canada’s role in it.

Despite the rich rhetoric of reform surrounding this momentous curriculum revision in Alberta, historians have largely overlooked its local roots. Scholars have tended to

13 Program of Studies for History, Alberta Department of Education, 1918.
discuss its genesis primarily in terms of a larger category of educational reform originating in the United States, progressive education. The American influence of progressive education in Canada and Alberta is not contested in this thesis, but to imply, as some scholars do, that progressive education and social studies were imposed upon Albertans wholly from the outside and by a select few, ignores the influence of local leaders, movements, and conditions that precipitated educational reform. I will argue that social studies was not the invention of a single man, women, or government department. Rather, it was the culmination and result of various social and political forces sweeping Alberta throughout the 1920s and 1930s.

The UFA/UFWA and rural school teachers worked at a grassroots level to alter teaching methods and curriculum to better suit the isolated and relatively improvised state in which rural schools operated during the 1920s. These local innovations to teaching methods and curriculum were in fact consistent with what educational experts later termed progressive education and social studies in the 1930s. Ultimately, what I intend to demonstrate is that UFWA leaders and women teachers were vanguards of curriculum change in Alberta and that their roles have yet to be accounted for in the historical record. This is largely because curriculum reforms of the 1920s were usurped by an emerging cadre of educational elites in the 1930s as a means to legitimize and elevate their careers. In this way, social studies was a formal term given to what UWFA and female teachers had informally delivered prior to the arrival of educational elites.

Because social studies curriculum was introduced in the same year that Aberhart’s Social Credit Party ousted the UFA government from the provincial legislature (1935), I
must clarify my decision to focus exclusively on the role of the UFA/UFWA in formulating social studies. It is true that William Aberhart’s Social Credit government promoted and enacted this curriculum change in the legislature, and because of this some may conclude it was the Social Credit that led in the reform of history curriculum. However, most scholars of educational history in Alberta and Canada acknowledge that the momentum for educational change had been developed by the UFA government.\textsuperscript{14} The research I conducted in this thesis, involving a thorough review of Department of Education documents between 1934 and 1935, confirms this assertion. The reform of history curriculum was initiated and promoted by the UFA/UFWA, long before the Social Credit’s assumption of power in 1935.

CHAPTER ONE: HISTORIOGRAPHY

Between 1921 and 1935, the Alberta Department of Education introduced significant reforms to primary and secondary curriculum under the authority of the United Farmers of Alberta (UFA) government. A major pillar of the new curriculum was social studies, the subject that replaced history at all grade levels beginning in 1935. As stated in the Alberta Program of Studies, social studies was to introduce students to the “problems of modern civilization.” According to the report, social studies, “as its name implies is socially directed, dealing with the ‘here’ and ‘now’, subordinating the ‘there’ and ‘then’.” Despite this dramatic change in curriculum focus few scholars have provided a broad-based analysis of the social, political, and intellectual roots of this curriculum revision.

Educational Historiography

First, I will broadly outline some trends in educational historiography and identify opportunities for examining curriculum change at a provincial level. In the 1970s and 1980s historians focused primarily on the development of public education in Ontario in the nineteenth century, a system later adopted by most of the western provinces. Of particular interest to these historians’ examination of the establishment of state education was how schools came to mould citizens amidst shifting social and political values. My perspective is in line with many of these scholars and I consider curriculum in this thesis

---

16 Alberta Department of Education, “Program of Studies for the Intermediate Grades” (Edmonton: King’s Printer), 1935, 2.
17 Ibid.
18 Ibid.
as something that transmits culture from one generation to the next, while also meeting the demands of social change.20

An example of a study that examines curriculum in this way is The School Promoters (1977) by historian Alison Prentice. In this work, Prentice highlights how Ontario school reformers worked to improve society through public education in the mid-nineteenth century. Against the backdrop of rapid industrialization and the scramble for wealth and power in cities and factories, Upper Canadians such as Egerton Ryerson expressed concern for the moral and spiritual degeneration of mid-nineteenth Victorian society.21 Historian Bruce Curtis expands on Prentice’s early work in his Building the Educational State (1986), which examines the shift from schooling as an elective activity organized by parents to a project directed and controlled by government in the nineteenth century. Curtis argues that as Ontario emerged into the industrial age schools were designed to protect upper-class interests against the threat of disruption from those perceived to be “dangerous classes.”22 Missing from these works is an examination of how school curriculum changed within a particular social, political, and economic context.

This idea is developed in George Tomkins’ seminal study on Canadian curriculum, A Common Countenance, Stability and Change in the Canadian Curriculum.23 He shows, for example, how school curriculum was used to educate future Christians and citizens in

---

22 Bruce Curtis, Building the educational State: Canada West, 1836-1871 (Toronto: University of Toronto Press, 1988), 7.
the nineteenth century, and how it was used to promote temperance and mental hygiene in the twentieth century. In his introduction, Tomkins admits that few scholars have concerned themselves with curriculum issues but encourages others to seek out developments in curriculum by unearthing official and unofficial sources that influenced curriculum policy, curriculum guides, and textbooks. While Tomkins produces a landmark study of curriculum change in a national context over two centuries, less attention is paid to curriculum reform in a more regional or provincial context. In this thesis, I intend to show how social studies became a medium to engage citizens in the cooperative movement emerging in Alberta during the 1920s and 1930s.

The trend in the late 1980s and 1990s towards alternative histories, those that require sources of a non-official nature, including teacher memoirs and oral interviews, emphasized the roles played by non-elite members of society. Thus, studies focusing on historical actors, institutions, and communities traditionally relegated to the margins of state power and authority, namely women, rural schools, and farm communities, have become more commonplace since the late 1980s relative to studies of education of a decidedly national focus, such as those focussing on the establishment of public education in Canada. Paul Stortz’s and J. Donald Wilson’s study, “Education on the Frontier” (1993), is a good example of this shift in focus. They explore the experience of remote one-room schoolteachers in North Central B.C. and unearth their relationship to the community and Department of Education. Their point is to show that rural schools,

---

24 Ibid., 4.
25 Ibid., 6.
26 J.D. Wilson, 155.
along with the political and social conditions particular to this region, were markedly different from schools in urban centers.27

Scholar Amy von Heyking has recently published on the contributions made by rural school teachers towards reforming education in Alberta. She argues that rural teachers, mostly women, were pioneers of progressive education and that their pragmatic teaching methods, born out of necessity, were in fact consistent with what educational experts later termed “progressive education.”28 While von Heyking’s argument relates to an issue I raise in chapter three, namely that rural teachers were implementing curriculum reforms that found expression in social studies curriculum in subsequent years, her article does not consider the professionalization of teaching and its relationship to the advent of social studies. I argue that so-called educational “professionals” utilized curriculum reform in Alberta to assert control over the teaching force in the 1930s. Female teachers were never considered “professionals”; they were given prescribed gender roles typical of the period, thus downplaying their innovations as inconsequential relative to those of their male professional counterparts.29 I intend to carefully examine the territory left unexplored by von Heyking, analyzing not only the role that women played in curriculum innovation in the 1920s but also how educational professionals used social studies as a tool to legitimize teaching as a profession and as a way to elevate their own status within Alberta’s growing educational bureaucracy in the 1930s.

In the mid-1980s educational historians Chad Gaffield and Paul Axelrod claimed that the study of education must continue to mature as a field of social history. They argue that “historians must examine the actual ways in which factors such as gender, class, and ethnicity have determined significant educational change.”

But this approach drew criticism from scholars such as Queens University’s Donald Swainson. He laments the demise of the “classical historian” who left one with a feeling that Canada was, at least potentially, an integrated unit. For Swainson, the local and regional historian or the “new historian” leaves one with an atomistic view of the country. But Canada is indeed an amalgam of regions, not to mention a country of limited identities defined by class, gender, and ethnicities, explains historian J.D. Wilson. It is thus not surprising that some historians tend to write of communities, regions, and classes of people rather than the nation as a whole. And because education is indeed a provincial responsibility enshrined in Section 93 of the British North America Act, it should not come as a surprise that reforms to school curriculum reflect, to a certain extent, social and political attitudes particular to a province at a given point in time.

Gaffield suggests that one reason for the relatively few number of examinations of curriculum in terms of shifting social, political, and economic values within a province could be a result of the explosive growth of educational departments in the mid-twentieth century. He claims historians may have assumed that studies of curriculum are

---

32 Ibid.
33 J.D. Wilson, 158.
sufficiently covered by those education departments. In part, he is correct. There are a significant number of M.A. and PhD theses on social studies curriculum at the University of Calgary and University of Alberta. But many of these examinations treat social studies more in terms of pedagogical change and the few bureaucratic individuals involved in the shift. Less attention is paid to how curriculum transitions are tied to regional shifts in social and political values in the province. An important exception is Amy von Heyking’s PhD dissertation, which examines citizenship training in Alberta between 1908 and 1965. Still, von Heyking focuses less on the actual transition from history to social studies and glosses over the grassroots leaders involved in the curriculum change.

Despite Swanson’s lament that regionalized studies of education compromise a national outlook, a social historical approach to curriculum reform, including regional and gender analysis, is in fact extremely relevant to educational matters at a national level. For example, Alberta was one of first provinces in Canada to introduce social studies, and in subsequent years, Ontario, the Maritimes, and other prairie provinces adopted the same program as implemented in this province. Thus, an examination of the origins of social studies in Alberta may in fact bear relevance to larger national debates on its genesis in other jurisdictions. While matters of education are technically a

\[\text{\footnotesize 35 Gaffield, 116.} \]
provincial responsibility in Canada, scholars have focused more on the international and national contexts and less on the regional origins of curriculum.

George Richardson, author of “The History and Social Studies Curriculum of Alberta at the End of Empire,” examines curriculum within an imperial framework. He argues that school curriculum emphasized the fundamentally British character of the nation and was the sustaining force of the imperial connection long after the colonial period. Richardson acknowledges that after the First World War Canada developed a more autonomous sense of self and that this was reflected, somewhat, in curriculum. However, by and large curriculum continued to be grounded in the political and cultural heritage of Britain. This imperial tone is evident in the curriculum objectives for history and social studies in Alberta, at least at the level of prescribed ministerial objectives, Richardson’s primary source of research. However, there also exists a significant regional, or Albertan, point of view in the curriculum objectives and textbooks authorized for social studies curriculum after the First World War. This Alberta perspective conveys social, political, and economic concerns particular to Alberta in the 1920s and 1930s and is evident not only in curriculum objectives and textbooks published in Alberta but also in sources not consulted by Richardson. These include the UFA/UFWA education committee meeting records. I will use the latter to show that the UFA/UFWA influenced a shift away from students assuming British values as essential to their national identity towards curriculum goals that emphasized values essential to Alberta’s populist agrarian movement,

39 Ibid., 184.
40 Ibid., 188.
particularly the belief that cooperation must replace the degenerative effects of imperialism, greed, and competition.

Popular rhetoric critical of progressive education in Canada suggests progressive reforms undermined a well-functioning educational system. Ministries of education are not impervious to the polemics of Hilda Neatby’s *So Little For the Mind* (1953) or Jack Granatstein’s *Who Killed Canadian History* (1998). Neatby and Granatstein argue that progressive education, an educational reform movement that migrated from the United States, was an attack on a so-called Canadian approach to education, characterized by rigorous teaching methods and academic subjects such as history.

W.J. Dunlop, the Minister of Education in Ontario after WWII, agreed with Neatby’s rail against progressive education. He declared a war on “fancy subjects, frills and fads” and resolved to “improve our educational system until the last shreds of this so-called progressive education are gone.” Jack Granatstein similarly took aim at progressive educators, particularly those who have come to dominate ministries of education, arguing that they “remain fixated on remedying societal ills such as sexism and racism and on making students feel good about themselves.” For Granatstein and Neatby, teaching must return to being an “intellectually rigorous” activity.

Neatby’s and Granatstein’s attacks have certainly been tempered by contemporary Canadian historians who have demonstrated well that the advent of progressive education

---

43 Granatstein, 35.
and social studies in Canada did not mean a wholesale loss of traditional teaching methods or curriculum. Paul Axelrod, for example, attributes much of Neatby’s hysteria to her use of sources, predominantly progressive education literature and department of education documents, undoubtedly filled to the brim with startling rhetoric. In “Beyond the Progressive Education Debate” (2004), Axelrod suggests that school teachers and administrators pragmatically used emerging tools to address their instructional needs together with traditional methods of instruction.44 Amy von Heyking confirms Axelrod’s amalgamation thesis for Alberta. She argues that history and traditional teaching practices were not totally abandoned outright with the advent of social studies. Based on her sources, which include student exams and oral interviews with teachers, she concludes that educators incorporated the old with the new.45

R.D. Gidney and W.P.J. Millar’s recent research on how schools worked examines the extent to which the educational reform agenda of the 1920s and 1930s translated into routine practices in the schools.46 According to Gidney and Millar’s How Schools Worked, the school experience across the country between 1910 and 1940 was not as profound as the debate between traditional and progressive education has suggested.47 They challenge those who tend to characterize the early twentieth-century educational experience as academically rigorous and where students learned by rote and drill. Instead, Gidney and Millar seek to provide a more nuanced portrait of the transition from the

44 Axelrod, 228.
45 Von Heyking, Creating Citizens, 10.
47 Gidney and Millar, xix.
early twentieth-century educational experience to the “new education” or “progressive education” of the 1920s. However, my thesis argues that when specific curriculum transitions in a province are examined, such as history to social studies in Alberta, the lofty rhetoric of progressive education presents itself explicitly in textbooks and curriculum objectives, a revelation not abundantly clear when a more national and curriculum-wide survey is employed.

Both Neatby and Granatstein suggest that progressive education and social studies displaced an educational system that in their view was representative of Canada. But this argument ignores that social and political values were shifting in various regions and provinces of the country, particularly in Alberta during the 1920s. Their viewpoint overlooks that some Canadians envisioned a traditional educational framework, one that was largely a product of nineteenth-century Ontario, as ill-suited to shifting conditions and attitudes in their home provinces. Neatby’s and Granatstein’s attack on the advent of progressive education in Canada also perpetuates an ill-defined notion that progressive education and social studies were somehow alien to Canada – that they infiltrated and broke down a Canadian tradition of education.

While Granatstein and Neatby overlook important developments in progressive education, so too have some scholars in Alberta. For example, Robert Paterson overlooks local aspects of curriculum reform when he claims that progressive education came from emerging educational and philosophical theories originating in the United States. These

48 Ibid., xviii.
ideas, according to him, were imported into Alberta by a select few, primarily elite educators that had studied progressive education at Chicago and Columbia universities in the 1920s and 30s, both leading centers of progressive education in North America at the time. Confirming this notion is a graduate student of Patterson’s in the 1970s, Patricia Oviatt, who characterizes H.C. Newland, a key architect of Alberta social studies curriculum in the 1930s, as a “one-man curriculum machine” ultimately responsible for bringing social studies from the United States and into Alberta.

The American influence on Alberta’s educational landscape is well documented and admittedly justified, given the high number of public officials that attended Chicago University and Columbia University between 1920 and 1938. But to imply, as Neatby, Granatstein, Patterson, and other scholars do, that progressive education and social studies were brought to Albertans wholly from the outside ignores the influence of the local movement. The UFA/UFWA promoted and authorized curriculum reform based upon broad-based support for school revisions beginning in the 1920s, long before social studies was formally adopted in 1935. The seeds for reforming history curriculum were sown in Alberta soil and harvested by educational elites years later. UFA/UFWA leaders and rural school teachers worked at a grassroots level to create teaching practices and curriculum that better reflected the conditions in which rural schools operated.

As already mentioned, Chad Gaffield and David Axelrod suggest that educational history must continue to evolve into the realm of social history. With this in mind, I

---

50 Ibid.
52 Patterson, “The Canadian Response to Education,” 64.
intend to expand the understanding of social studies by relating it to a number of key social and political movements: the progressive movement, progressive education, the social gospel, and the UFA/UFWA. I will highlight how scholars have typically analyzed these movements in political and economic terms alone, thus overlooking their interconnections with education and, specifically, curriculum reform.

**The Progressive Movement**

In a general sense, the progressive movement is a term used to describe a host of political, economic, and social reforms that flourished throughout North America from the 1890s to the 1930s. According to American scholar Michael Meir, the roots of progressivism lie in the transformation from a gilded age of nineteenth-century Victorianism to an industrialized age that generated extremes of wealth and poverty, new pleasures, and alien cultures.  

He also claims that progressives carried out their agendas, not in clearly defined policies or in conventional government offices of authority, but in settlement houses, churches, schoolrooms, and unassuming day-to-day activities. In the Canadian context, the progressive movement is described in similar terms. Historians R. Douglas, Richard Jones, and Donald Smith claim the movement encompassed the various social reforms precipitated by massive industrialization, rapid urbanization, and their degenerative effects on Canadian society. However, scholars have focused more on progressive reformers’ work in cities, including campaigns to alleviate urban poverty and

---

54 Ibid., 6.
implement prohibition and workers’ rights, while the movement’s rural nuances have been given less attention. What scholars do focus on in the rural Canadian context is the early twentieth-century agrarian revolt, the rise of prairie farmers who mounted a concerted attack on the political and economic structures of their province and nation.\textsuperscript{56} The political and economic roots of the agrarian revolt have been given significant attention by historians. Less examined are the more social aspects of the movement, particularly the role of UFWA leaders and teachers in educational matters, a gap I intend to fill.

The progressive movement also contained an important religious component. For American scholar Robert Crooned, progressive reformers, writers, politicians, and thinkers were never members of any one movement, but shared common moral values and tended to agree that the nation required a spiritual reformation to fulfill God’s plan for democracy on earth. The movement aimed to directly apply Christianity to the collective ills of society to create a perfect “Kingdom of God on Earth.”\textsuperscript{57} This religious impulse or revival as it is referred to by some historians is also known as the social gospel movement, which I will argue fuelled a range of social political reforms in Alberta in the 1920s and 1930s, including in education. Social studies is an important but largely overlooked site of expression of the social gospel influence.

The Social Gospel Movement

The social gospel developed partially in response to a crisis in religious beliefs precipitated by the rise in popularity of the Darwinian concept of evolution. Ramsay Cook claims that with scientific criticisms came a crisis of faith, instigating criticisms of the bible and its monopoly on truth as well as criticisms of the existing social and political order. Faith in the bible as the unquestioned assumption on almost every topic – human nature, science, politics, and so on – was called into question. The result was a profound intellectual revolution, which, according to Cook, affected not only traditional religious feelings or outlooks on dogma, but also led to a transformation of society itself. Critics of religious orthodoxy reinterpreted Christianity to make it more relevant to the everyday lives of Canadians. For them, when properly interpreted, Christianity should provide that standard against which society should be judged.

For scholars of religious history in Canada such as David Marshall and Ramsay Cook, the irony is that these reformers of the social gospel unwittingly made the church increasingly irrelevant in a world in which other institutions had eclipsed the social roles played by the church. The secular professional replaced the religious shepherd as society’s guide. However, the secularization thesis put forth by Cook and Marshall is not universally accepted among religious historians. For example, Nancy Christie and Michael Gauvreau, Richard Allen, and Phyllis Airhart see the work of the social gospel

59 Ibid., 22-23.
60 See Ramsay Cook and David Marshall, Secularizing the Faith: Canadian Protestant Clergy and the Crisis of Belief, 1850-1940 (Toronto: University of Toronto Press, 1992).
as the apogee of Christianity, not as evidence of its decline. For historians who argue against Marshall’s and Cook’s secularization argument, the socially directed work of reformers gave religion a new beginning, albeit in a different form, rather than leading to its eclipse, as Cook and David Marshall assert. Aligning myself with one side or the other of the secularization debate is not something I intend to do in this thesis, as it would divert attention away from my particular topic at hand, the origins of social studies. My interest in the social gospel in this thesis lies only insofar as it is able to provide insight into the popularization of cooperation in society as a vehicle to regenerate society, a key feature of social studies. Hence my examinations of the social gospel will focus less on religious decline or revitalization and more on how changes to traditional religious orthodoxy shifted to more practical and popular messages of social and political reconstruction, which I argue fuelled Alberta’s agrarian movement and their educational reforms.

William Westfall’s *Two Worlds: The Protestant Culture of Nineteenth-Century Ontario* argues that in order to understand significant educational reforms in Canada, one must first appreciate the pervasiveness of Christian ideals in politics and society in late nineteenth- and early twentieth-century Canada. He suggests that school reformers in Ontario could instigate significant educational reforms “because they justified public education by appealing to a popular version of the basic story of Christian redemption.” Since all people bore the weight of original sin, society must sustain public order by

---

supporting schools…which moderated the anti-social repercussions of human nature.”

Although Westfall was writing about school promoters in Ontario in the nineteenth century, Alberta reformers used a similar Christian message of social redemption to justify reform in the 1920s and 1930s.

Historians have also overlooked the possibility that rural manifestations of the social gospel were distinct from those in urban centres. Often, scholars insinuate that the social gospel migrated into the prairie West as a “metropolitan concoction that the hinterland came to share.” But as scholar Richard Allen points out, when the social gospel came to the countryside, its proposals were not merely the extension of the amenities and social features of urban life. Rather, the social gospel both adapted to and shaped the particular social and political environment of farmers in the 1920s and 1930s. An important manifestation of the unique rural strain of the social gospel was the advent of social studies, which sprang from rural communities and not the cities.

The social gospel fuelled the construction of the agrarian movement in Alberta, one of the most successful movements in North America, argues historian Bradford Rennie, a movement that toppled the provincial Liberal government in a landslide victory in 1921. Education, particularly citizenship training, became a key building block for the UFA/UFWA movement and was formalized in social studies curriculum. Educational

---

63 Ibid.
65 Ibid, 564.
reforms that brought about social studies curriculum in Alberta are best understood by closely examining the fusion of the social gospel and the UFA/UFWA movement.

**The UFA/UFWA**

Many historians such as J.M. Careless describe the UFA/UFWA in specific political and economic terms. The UFA began first as a lobby group that initially focussed on pushing government for legislation that better reflected the political and economic needs of farmers. However, during the agony of social upheaval that accompanied the First World War, the UFA became motivated to take direct political action. In the 1921 provincial election, the UFA won the majority of seats, and it stayed in the Alberta Legislature until 1935. With this victory, a previously unrepresented group in government had come to power: farmers.67

Historian Richard Allen points out that, politically, farmers had been unrepresented in parliament at both provincial and federal levels. While the West was perceived as the stepping stone of nation building, it stood on the sidelines of the federal power structure. Economically, the prairie farmer was disadvantaged by policies of industrialization, which forced him to buy in a protected market and sell in an open one far from the site of production and through agencies entirely unaccountable to him.68 However, Allen also argues that the varied phenomena of the agrarian revolt cannot be explained in economic and political terms alone.

Historian Bradford Rennie takes up Allen’s challenge in *The Rise of Agrarian Democracy*, arguing that the UFA/UFWA was infused with a Christian ethic that forged a cooperative ethos, an ill-defined notion that cooperation should replace competition in economic, political, and social affairs.\(^6^9\) Rennie examines, as few others have done, the rise of the UFA/UWFA in terms of social and spiritual factors, with particular emphasis on the role that gender and education played in constructing the movement. Similarly, in “The Social Gospel as the Religion of the Agrarian Revolt,” Allen suggests that the conditions of farmers were perceived and evaluated in explicitly or implicitly religious terms.\(^7^0\) I intend to build on these scholars’ work by showing that the citizenship training initiated by UFWA leaders helped to build their movement and that this training was the foundation upon which social studies was built. Also, social studies reflected a popular message, its crucible being the social, political, and spiritual environment of rural Alberta, a message of social redemption based on cooperative values.

For the UFA, education was essential for building their movement. According to Rennie, most educational initiatives were left to the UFA’s women section, the UFWA, which was established in 1913. Women of the movement wanted greater autonomy and a name that indicated they were an integral part of the movement rather than a mere auxiliary.\(^7^1\) The UFA did not grant women equality throughout all of the organization, but as Rennie points out, the UFA did endorse a number of the UFWA’s proposed reforms, particularly those on educational matters deemed to be a natural extension of

---

\(^{69}\) Rennie, 8.  
\(^{70}\) Allen, 563.  
\(^{71}\) Rennie, 112.
women’s maternal role as caregivers of children. Men, on the other hand, attained positions of political authority in order to protect the interests of farmers through formal legislation. But how men and women of the movement interacted in the case of curriculum reform remains unexamined. This thesis intends to address that void.

A key educational aim of the UFWA, according to scholar Leroy Wilson, was to popularize the study of social, political, and economic questions by various informal means. Doing so would provide rural youth with the tools to improve the conditions in which farmers lived. Wilson examines the UWFA leadership in these matters, but primarily according to broad statements made by leaders in the farmers’ official publication, the *Grain Growers Guide*, and also in terms of what I would suggest was the informal delivery of citizenship training by the UFWA. The UFA’s Farm Youth programs, the Better Farming Trains, and the Library on Wheels were campaigns led and organized by women of the UFWA and were intended as opportunities to raise awareness of the social and economic conditions particular to rural communities and to build the necessary skills to improve farmers’ political and economic circumstances. The UFWA’s involvement in citizenship training in the early decades of the twentieth century became the foundation of social studies curriculum decades later, but this connection between the informal delivery of citizenship training and social studies remains unexamined by historians.

---

72 Ibid.
Few scholars have discussed the university extension education initiatives beyond the level of factual description. Ralph J. Clark’s study of the Extension Department at the University of Alberta appears to be the only scholarly account of some of these activities.\textsuperscript{74} UFWA leaders and women teachers, often one and the same, extended access to educational materials in rural communities through partnerships with universities and the railways, delivering citizenship training at an informal level. This type of citizenship training directed towards improving rural communities became the foundation of formal social studies in subsequent decades. The informal delivery of citizenship training, led by UFWA leaders, predates the formal arrival of progressive educational experts to Alberta and the formalization of social studies curriculum in 1935. Social studies was a formal term given to what UWFA women were informally delivering throughout rural communities in the 1920s.

Gender historians such as Dianne Miller are also providing new insights into curriculum reform initiated by rural teachers in isolated communities. Based on a series of oral interviews with rural teachers from the 1920s, she argues that traditional history and Latin were of little utility to increasing numbers of rural students flooding classrooms after the First World War (largely the result of mandatory school legislation and the Great Depression, which saw many returning to school in the wake of high unemployment).\textsuperscript{75} Similarly, scholar Amy von Heyking argues that rural school teachers struggled to accommodate expanding classroom sizes, a short supply of textbooks, inadequate teacher

\begin{footnotesize}
\begin{itemize}
\end{itemize}
\end{footnotesize}
training, and students’ varying academic abilities. Amidst these challenging conditions, teachers made changes to curriculum and their teaching methods out of necessity. Teachers’ practical innovations are examined by von Heyking and Miller as being consistent with what educational experts later called progressive education.76 But less discussed by either is how the innovative teaching practices and curriculum adaptations became the foundation of social studies, formally adopted years later. While women teachers and UWFA leaders initiated curriculum change, men in places of public authority asserted control over the teaching force and curriculum reform in order to legitimize a man’s career as a “professional educator.”

The Professionalization of Teaching and Progressive Education

Most scholars of progressive education in Canada appear to be in agreement with leading authority Dr. Peter Sandiford, who contends that progressive education meant curriculum reform based upon the “progressive element in American education.”77 According to Sandiford, top American universities such as Chicago and Columbia, where many of Alberta’s leading educational bureaucrats attended, challenged the established belief that education was synonymous with the acquisition of useful knowledge. Progressive education shifted the preoccupation with subject-centered learning by rigid discipline to more practical activities that allowed students to discover and learn more on their own terms. Expressions such as “learning by doing,” “educating the whole child,” “interest-based learning,” and “democratic education” were typical of the rhetoric of

76 Von Heyking, “Implementing Progressive Education in Alberta’s Rural Schools,”: 93.
reform and captured the support of educators and the public alike, claims educational historian R.S. Patterson. The new school subject social studies, introduced in the United States in the 1920s and supported by leading progressive educators such as William Kilpatrick and Harold Rugg, also captured the attention of Alberta’s educational bureaucracy, especially those men who attended graduate school in the United States. 78

The same year social studies was formally introduced in Alberta, 1935, teaching in Alberta was also recognized by Premier William Aberhart as a “profession.”79 This meant that the Alberta Teachers Association (ATA) would henceforth have input into codes of conduct, salaries, and curriculum design. 80 The culmination of these two events, the introduction of social studies and the government’s recognition of teaching as a profession, relates to a rarely examined topic in educational historiography in Canada or Alberta: the professionalization of teaching and the gendered dynamics inherent in the process. What is the relationship between the advent of social studies and the professionalization of teaching? The emergence of a teaching profession and progressive education in Alberta is tacitly described by historians such as E.S. Patterson and John Chalmers as an achievement by teachers in obtaining control over their trade. 81 This meant that teachers, for the first time, governed curriculum design, textbook writing, and

78 Ibid., 63.
teacher training. No longer did university professors and ministries of education monopolize these areas.\textsuperscript{82}

R.S. Patterson claims it was an “elite few” that brought progressive education and social studies to Alberta from the United States.\textsuperscript{83} As previously discussed, this view is echoed by much of the secondary literature and primary record available, thereby overemphasizing the role of this select few – primarily men – and overlooking female educators. But this so-called achievement by professional educators in establishing progressive education in Alberta was not a gender-neutral or benign process. Because women dominated teaching in Alberta between 1911 and 1970,\textsuperscript{84} a tension existed between practitioners in the field and the authority of men in bureaucratic positions. The contributions of women in curriculum design remained largely unacknowledged by those who asserted control over the teaching force and curriculum development as a means to elevate their own careers.

Allison Prentice and Marjorie R. Theobald explain that the under representation of females in the teaching profession is a result of women being stereotyped as an ancillary to male bureaucratic control, incapable of exerting influence on their own terms. Conversely, men are cast as those directing the political and professional activities on their own accord.\textsuperscript{85} An important point raised by Prentice and Theobald is that the structure of the profession in fact mirrored gender relations in society at large. Just as

\textsuperscript{82} Von Heyking, Creating Citizens, 56.
\textsuperscript{83} R.S. Patterson, “The Canadian Response to Education,” 62.
mothers nurtured children and the family, women were responsible for teaching grade school. And just as men maintained positions of authority in family life, so too were they the primary figures of authority in public life, including in ministries of education.\textsuperscript{86}

I will highlight the lesser-examined role that women played in educational reforms leading to social studies curriculum. At the same time, I will employ a relational approach to understanding interactions between men and women in matters of educational change. Gender historian Joan Scott reminds scholars that the term gender is not to be understood as synonymous with women. Instead it is a relational category of analysis used to explore relationships of power between both men and women.\textsuperscript{87}

My objective is not to deny men’s important contributions; rather, it is to balance their influence with women, who have been all but absent from much of the primary and secondary record. A more nuanced picture of the relationship between the hands-on or grassroots approach of rural women teachers and the influence of men in public positions of authority is warranted. Thus, a relational approach to gender analysis offers insight into the ways in which social studies curriculum was created through interactions of male-dominated governance and female innovation and delivery of education.

Building on Prentice’s, Theobald’s, and Kinnear’s call for further inquiry into the contributions made by female educators is Patricia Coulter’s work on Donalda Dickie. An Alberta rural school teacher, scholar, and one of Canada’s first female historians,

\textsuperscript{86} Ibid., 123.
Dickie authored a significant number of textbooks for social studies curriculum.\(^{88}\) Coulter champions the unexamined role of Dickie in curriculum reform in Alberta during the 1920s and 1930s. I will push Coulter’s argument further by suggesting that Donalda Dickie was a preeminent figure in introducing social studies in Alberta. Notwithstanding, her accomplishments remain muted in the primary and secondary record by those in higher positions of authority, mainly men. Also, I intend to show that Dickie’s experience with male authority figures was typical of the experience of many other female school teachers who interacted with educational bureaucracy.

In his introduction to *Approaches to Canadian History*, Carl Berger reminds readers that “there are hidden factors behind any historical interpretation” and that these need to be raised so that the character of an age in which its authors wrote can be taken into account.\(^{89}\) However, Alberta’s authors of social studies and the textbooks they penned have yet to be contextualized into their time and space. In order to expand our understanding of social studies and reveal those hidden factors motivating historical interpretations, social studies must be brought into the fold of social history. To explore the origins of social studies curriculum is to examine the progressive movement, progressive education, the UFA/UFWA, interactions between rural female teachers in the field, and male educators in positions of authority. Alberta educators, including female teachers, who wrote social studies curriculum and textbooks in the 1920s and 1930s revised the way in which Canadian history was taught throughout Alberta and in many

---

other classrooms across Canada. They too should be considered alongside historians as important authors of historical interpretation.
CHAPTER TWO: CITIZENSHIP TRAINING,  
THE SOCIAL GOSPEL, AND THE UFA/UFWA AT WORK

Historian Richard Allen argues that the social gospel was the religion of Alberta’s agrarian revolt. Building on this, I suggest that citizenship training in the 1920s was the agrarian revolt’s primary tool for building its religio-political movement. Citizenship training delivered by the United Farmers and Farm Women of Alberta (UFA/UFWA) in the first two decades of the twentieth century called for the reconstruction of society based on cooperative and democratic Christian values. Through citizenship training, farmers learned that their political and Christian responsibilities were one and the same – to establish a cooperative ethos in society. My objective in this chapter is to show that citizenship training is a unique expression of the fusion of the social gospel and UFA/UFWA movements. And, as I will argue, citizenship training, delivered by the UFA/UFWA in the 1920s, became the foundation for social studies in Alberta in the mid-1930s. To expand our understanding of the origins of social studies is to imagine social studies as a formalized container for the religio-political movement of the UFA/UFWA in Alberta in the 1920s.

By examining citizenship training, the social gospel, and the farm movement in this chapter, I hope to achieve a broader objective in my overall thesis: to decenter the predominant view among educational historians that social studies was an educational experiment imported from leading American universities, by an elite few, and imposed upon Albertans in the mid-1930s.
The UFA was established in 1909 to address the social, economic, and political grievances of farmers.\textsuperscript{90} A movement concerning itself with grievances similar to those articulated by organized farmers at the turn of the century was the social gospel. The social gospel movement worked to apply Christian ethics to social, economic, and political problems.\textsuperscript{91} Both demonstrated a remarkable degree of consistency with each other in their criticisms of society and their solutions to those criticisms. According to the leaders of both the social gospel and the farmers’ movement, there was a fundamental evil at work in politics, economics, and society that had to be eradicated: competitive individualism. For leaders of the social gospel, the solution was to establish the “Kingdom of God on earth,” conceived as a cooperative and democratic order.\textsuperscript{92} For farmers, infusing cooperation and equality throughout society was their Christian obligation for improving Alberta’s political, social, and economic environment.\textsuperscript{93}

The Christian principles of cooperation and democracy formed the basis for the delivery of citizenship training by various formal and informal means. Infusing Albertans with these ideals was crucial to ensuring the survival and vitality of the farmers’ social and political movement. The \textit{Grain Growers Guide}, the official publication of the UFA/UFWA, as well as Sunday schools, UFA/UFWA union meetings, the University of Alberta Extension Department, and UFA/UFWA Youth conferences, served as channels

for educating citizens about how to engage politically and how to work as apostles delivering the province and nation from the evils of greed, competition, and violence. These forums of engagement allowed the social gospel movement to simultaneously achieve its aims. The social gospel’s association with the UFA/UFWA and their educational initiatives helped guide the transmission of Christianity to a wider audience, a broadcast that was not possible from the pulpit of a single prairie church.

Before 1919, the UFA remained a lobby group only. It was after the war that the UFA mobilized to take direct political action, winning a landslide victory in the Alberta Legislature in 1921. The war and the Great Depression intensified the UFA/UFWA’s long-established grievances about competition, imperialism, and greed and affirmed their conviction that they were in the best position to inaugurate a better society. The slow response of governments and traditional political parties in addressing their concerns catapulted the UFA into direct political action. Farmers, a previously unrepresented group in provincial politics, had come to power and remained there until 1935. Prominent social gospel leaders such as E.A. Partridge and Salem Bland were surely happy with the UFA’s landslide victory, since they saw the possibility of having their convictions and initiatives implemented on a provincial scale. A decade earlier, Partridge had encouraged farmers in a 1909 *Grain Growers’ Guide* editorial to “take your love of God…into politics,” arguing that there was “no abler chamber” than politics for achieving the principles of organized Christians.

---

94 Rennie, 5.
With the rise of the UFA/UFWA from a lobby group to a political party, the social gospel found new life through its intricate connection with the UFA/UFWA. Citizenship training became a unique expression of this union between the UFA and the social gospel. I intend to show that citizenship training was the vehicle used by the UFA to evangelize citizens throughout Alberta’s rural communities.

The Social Gospel Movement

The social gospel movement applied Christian ethics to social problems such as wealth disparity, poverty, alcoholism, poor schools, and violence. It was a phenomenon that began in the closing decades of the nineteenth century and climaxed around the 1920s. The social gospel was not allied with one specific church or institution; associations between Protestant denominations, social reformers, universities, and political leaders were informal. However, there were prominent disseminators of the social gospel such J.S. Woodsworth, a church minister, and Salem Bland, a professor, both of whom provided influential and powerful leadership of the social gospel throughout Canada and especially in the West. Both leaders reworked such traditional Christian doctrines as sin, atonement, and the Kingdom of God to emphasize a social content relevant to Canadian society at the turn of the century. Materialism, political corruption, economic distress, and urban disorder were by-products of an increasingly industrialized, modernized, and urbanized society in the early decades of the twentieth century.

---

century. Amidst the social, political and economic challenges society faced in this new century, Bland and Woodsworth attempted to restate the objectives of Christianity.\(^9^8\)

An evangelical and persuasive pulpit manner was employed by leaders such as Bland to encourage discussion and action in resolving public issues. According to Bland, preaching in evangelical tones involved inspiring and reaching audiences by addressing themes that held universal relevance. This was achieved, for example, by relating the gospel to pressing social, economic, and political issues, while avoiding religious dogma and intellectualism that may detract audiences.\(^9^9\)

The problems of a modernizing nation in the twentieth century were met by a new generation of ministers who claimed that “An old age has passed and a new day has dawned.” The nineteenth-century Victorian-era church, with its adherence to strict theological doctrines such as individual salvation, seemed out of step with the social ills plaguing the nation in the twentieth century. Many critics of the Victorian-era church agreed with Alice Chown, a feminist and social reformer, when she asserted that it was indeed a “dead organism.”\(^1^0^0\) New spiritual leaders emerged and devoted themselves to uniting the Christian heritage of the nation with social service to ensure that their brand of Christianity adapted to, and dynamically interacted with, changes in modern society.\(^1^0^1\) According to Reverend Samuel D. Chown, cousin to Alice Chown and a prominent social gospel leader, “the ill-fitting garments of doctrine and dogma” had eroded the authority

---

\(^9^9\) Ibid., 5.
\(^1^0^1\) Ibid., 1.
of the church by severing it from popular culture and the wider social experience.\textsuperscript{102} J.S. Woodsworth condemned theology’s “intellectual standpoints, with its historical creeds, confessions, and standards…a theology whose phraseology is antiquated and its terminology most unintelligible.”\textsuperscript{103} Woodsworth insisted that a new generation of ministers and social reformers must “run the theologs out of power…and enable society to do more effectual work among those who need it.”\textsuperscript{104} The only way to rescue the church from irrelevancy among growing numbers of Canadians, in his view, was to destroy theology so that Christianity could once again command an authority founded upon direct popular appeal. To this end, the Reverend C.W. Gordon encouraged ministers to eschew dogma and sectarianism and to “look for new channels of access to the life of the world and to win the mass of humanity to a more uniform religious faith and purpose in life.”\textsuperscript{105}

Most historians propose that the social gospel movement stemmed from the late nineteenth-century era of rapid urbanization and industrialization. The negative effects of modern industrial society such as materialism, drunkenness, greed, and poverty were met with calls for a “new Christianity.” Social problems required the “incarnation of God in human relations and institutions.”\textsuperscript{106} This “new Christianity” offered the potential for improvement by elevating the goodness of man to the highest power.\textsuperscript{107} Similarly,

\begin{itemize}
  \item \textsuperscript{102} Ibid., 9.
  \item \textsuperscript{103} Ibid.
  \item \textsuperscript{104} Ibid., 4.
  \item \textsuperscript{105} Ibid., 10.
  \item \textsuperscript{106} Richard Allen, \textit{The Social Passion}, 6.
  \item \textsuperscript{107} Ibid., 7.
\end{itemize}
institutions such as the state and business were to “serve mankind as a whole.”\textsuperscript{108} Christianity became, according to historian Ramsay Cook, the benchmark by which to measure society’s wellbeing. A concern for the moral health of society compelled leaders of the social gospel to interact with other movements and institutions. Indeed, their interest in political, economic, and social reform reflected a belief that there were no barriers to the regenerative influence of Christianity.\textsuperscript{109}

Although Richard Allen disagrees with the claim that the social gospel was alien to the West and that it migrated into the prairies from urban centers in the East, he acknowledges the pervasiveness of this viewpoint among some scholars of religious history in Canada.\textsuperscript{110} But as Ramsay Cook suggests, the social gospel was just as much a response to religious doubt in general as it was a response to urban and industrial conditions.\textsuperscript{111} Thus, the social gospel need not be considered an urban import alone; it should also be considered in its local Alberta context. Doing so reveals that citizenship training in the 1920s was born from conditions unique to Alberta in that decade. These conditions included shifting religious attitudes amidst increasingly diverse prairie inhabitants and the spiritual nourishment the UFA/UFWA received from the social gospel movement, both of which effectively boosted the transmission of the organized farmers’ social and political message throughout the province.

\textsuperscript{109} Phillips, xv.
\textsuperscript{110} Allen, “The Social Gospel as the Religion of the Agrarian Revolt,” 570.
\textsuperscript{111} Ramsay Cook, \textit{The Regenerators, Social Criticism in Late Victorian English Canada} (Toronto: University of Toronto Press, 1985), 5-6.
The prairies presented two regionally specific types of problems for a church intent on expanding into the West with the aim of ensuring that the Christian heritage of the nation was maintained among settlers, immigrants, and bachelors flooding to the region. Chief among these was population dispersal and dwindling numbers of supporters for rural churches.\textsuperscript{112} Rural populations, when compared with urban ones, were sparser, and for many people churches were not accessible. As the \textit{Church Guardian} noted in 1896, many prairie Methodist families were “located eight or ten miles from church,” and “regular attendance at Sunday school was quite impossible.”\textsuperscript{113} Also, because of diversity in rural communities, which included non-Anglo Saxons, bachelors, and immigrants with a wide range of church backgrounds, few areas had sufficient numbers of adherents to a particular denomination to form a single congregation.\textsuperscript{114} Historian Paul Voisey similarly examines population dispersal in the prairies and its impact on church attendance and leadership. He argues that settlers overcame distance and low population density through interdenominational cooperation and church union. Parent churches struggled to supply every rural district with preachers on a weekly basis.\textsuperscript{115} One result was that Sunday services were administered by clergymen from any one of half a dozen denominations. Voisey also claims that when census takers arrived in Vulcan in 1910 many settlers could not accurately report their religious affiliation. For example, some listed their traditional faith, despite the fact that they more often attended services of a different church, while

\begin{flushleft}
\textsuperscript{113} \textit{Christian Guardian}, May 27, 1896, in George Emery, 9.
\textsuperscript{114} Emery, 10.
\end{flushleft}
others named the church they usually attended. According to Voisey, many settlers suggested that they belonged to an interdenominational Christian faith – a category missing from the census checklist.\(^\text{116}\) A key feature of this interdenominational practice was that preachers often took a passage from the bible and treated it as an allegory or parable that revealed some universal moral truth relevant to contemporary society.\(^\text{117}\) Theological discussion rarely crept into any sermon. This approach to religion ensured that its multi-denominational audience could easily digest a message that would unlikely offend any one listener.

Although Voisey avoids labeling these non-sectarian church sermons as representative of a distinct social gospel outlook, he does point out that the social gospel was better suited to the progressive attitudes of this prairie region.\(^\text{118}\) As Richard Allen has pointed out, agrarian reform organizations crusaded for economic and political change with a moral fervor often specifically Christian in nature.\(^\text{119}\) In 1916, a Union preacher in Vulcan spoke on the subject of “Applied Christianity” for a special UFA Sunday service.\(^\text{120}\) An applied approach to Christianity, as opposed to serious theological discussion, was surely more captivating for Alberta farmers given their preoccupation with social, political, and economic reform.

The social gospel provided support to farmers’ causes by framing an emerging agrarian revolt in Alberta in terms of a familiar Christian narrative: a David and Goliath

\(^{116}\) Ibid.
\(^{117}\) Ibid., 186.
\(^{118}\) Ibid., 187.
\(^{120}\) Voisey, 187.
battle between the disenfranchised and suffering farmer on the one hand and eastern
corporate interests representing greed and tyranny on the other. By doing so, religion
spoke to the daily realities of farmers and advocated for improvements through
cooperative action and political association. In this way, the social gospel transcended the
narrowness and increasingly unpopular prairie church sermon preoccupied with rules,
personal salvation, and intellectual theology. Its synergy with the UFA/UFWA not only
helped to build the farmers’ movement, but the union of the two created a more popular
Christian message throughout Alberta.

Alberta Farmers’ Protest and the Social Gospel

From 1908 to 1920, the population of Alberta quadrupled, and nearly sixty-five
percent of the population was rural.\textsuperscript{121} Agricultural settlement in the prairie provinces
represented a golden age for national growth. Nation-building based on agricultural
development and farming took on mythical conceptions among politicians and migrants
alike. Farms in the West were to become the “breadbasket for the world.”\textsuperscript{122} Despite
these mythic notions of riches flowing from farms in Alberta, the region remained
handicapped by national policies and tariffs that served the interests of big capitalists and
big government. For farmers, corporate greed and federal government policy created a
new kind of feudalism, or a plutocracy, based on the seizure of natural resources and the
monopolization of farmers’ labor.\textsuperscript{123} As well, essential infrastructure such as schools,
highways, and medical facilities remained underdeveloped relative to that in Eastern

\textsuperscript{121} Emery, xx.
\textsuperscript{122} Ibid.
\textsuperscript{123} Rennie, 7.
Canada. In the decades leading up until the First World War, farmers perceived themselves as alienated from federal and provincial government decision-making.\textsuperscript{124}

Amidst these hardships, prairie grain growers took up cooperative action on a large scale, according to historian Ian MacPherson.\textsuperscript{125} It was only natural that they should, suggests MacPherson. They had demonstrable power in an entire region; a generally shared experience of immigrating, homesteading, and struggle; a common challenge of dealing with few crops; and identifiable groups apparently exploiting them.\textsuperscript{126} The charges imposed by bankers, grain merchants, and manufacturers and the costs inflicted by the tariff frustrated and enraged farmers. A 1909 *Grain Growers Guide* editorial spoke to farmers’ frustration and their calls for greater cooperation as a tool to combat their perceived enemies:

The spirit of cooperation is in the air and is rapidly spreading throughout the West. Western Canadians have bowed to corporate rule nearly since the country was settled. The time for emancipation has come and there will need to be some able leaders to head the campaign. Cooperation is the only possible avenue of complete emancipation and the sooner the farmers settle themselves towards perfect cooperation the sooner they will begin to secure a fair reward for their toil.\textsuperscript{127}

Farmers believed that cooperation was the animating principle of all relations – between classes, churches, regions, nations, and the sexes.\textsuperscript{128} UFWA leader Margaret Gunn envisioned the substitution of a cooperative endeavor instead of competition as the

\begin{footnotesize}
\begin{itemize}
\item \textsuperscript{124} Ibid., 8.
\item \textsuperscript{126} Ibid., 10.
\item \textsuperscript{127} *Grain Growers’ Guide*, September 22, 1909, 13.
\item \textsuperscript{128} Rennie, 159.
\end{itemize}
\end{footnotesize}
dominating factor in society. Molded by Christian beliefs, “cooperation” was for farmers a fundamentally moral principle; its defining essence was “unselfishness,” which, according to Irene Parlby, was the only hope for the protection of farmers and the redemption of a political and economic system fraught with greed and competition. A Grain Growers’ Guide article from 1914 went so far as to assert that “cooperation is a religion pure and simple.” Farmers used this spiritual conception of cooperation to articulate their grievances and rally support for their movement.

At the same time, despite the UFA/UFWA’s rallying principle of cooperation, mass immigration, particularly from Eastern Europe, placed limits on cooperation and treating all farmers as one equal entity. Nativism likely motivated the UFA/UFWA to emphasize citizenship training in schools, as it was regarded as means of assimilating newcomers to become “good” Canadian citizens. But citizenship training can also be

129 Ibid., 159.
131 Emery, 10-1, and Howard Palmer, Patterns of Prejudice: A History of the Rise of Nativism in Alberta (Toronto: McClelland and Stewart Limited, 1985), 592. Emery shows that although a cooperative ethos emanated from Alberta politics in the 1920s, it did not necessarily treat all farmers equally. Eastern European immigrants in particular were met with a mixture of inclusiveness and hostility in Alberta at this time. As the immigrant population of the Canadian West rose from 26 to nearly 40% of the population between 1901-1911, concerns about foreigners and their very “low standards of morality and decency” were prevalent among many Christian leaders. For Principal J.W. Sparling of Wesley College, the foreigners represented a danger for which “we must educate and elevate the incoming multitudes or they will drag us and our children down to a lower level.” Also, because “aliens” were eligible for Canadian citizenship after three years of residence, immigrants, warned Reverend A.E. Smith, “gave the foreigners a controlling influence.” Thus, the UFA/UWFA’s effort to draw all farmers and Alberta citizens into the fold of collective association and action were resisted by other forces in society that worked to exclude some people, asserting that not all were equal. Indeed, the bulk of the UFA’s support was derived from regions of Alberta of primarily Anglo-Saxon Protestant backgrounds and less support was given to the UFA/UWFA in Eastern European-settled regions. On the other hand, Palmer highlights that it cannot be ignored that the UFA/UFWA delivered to the House of Commons the first MP of Ukrainian descent (in 1926) and that the UWFA demonstrated considerable concern for the welfare of immigrant families in prairie communities.
seen in the context of the UFA/UFWA’s attempt to garner support for their movement, specifically by increasing their membership.

Still, it is not surprising that farmers found in the social gospel a spiritual framework to address their political and economic oppression. UFA/UFWA politics and the social gospel worked towards a common end of implementing social justice and the Christian ideal of cooperation and democracy. This fusion of politics and religion allowed for the UFA/UFWA movement to gain broad appeal among an audience needing practical solutions to their immediate circumstances. The politics of the UFA became the new vessel by which religion restated its relevance for society.

The extent to which politics in Alberta intermingled with the social gospel is exemplified by how farm leaders and spiritual authorities became virtually indistinguishable from one another. For example, UFWA leader Leona Baritt argued that two-thirds of Alberta’s rural communities had no church service and that most others had irregular service. She suggested that the UFA/UFWA fill this gap by becoming a quasi-religious institution. Baritt noted that “we are trying to do the social work that the church has been unable to do…and to raise an ethical standard where the church has been unable to obtain a footing.” At local hall meetings organized by the UFWA, members prayed, sang hymns, and read Scripture, and sermons were often delivered on applied Christianity, sermons that celebrated the growing farmers’ movement from a distinctly religious viewpoint. In one of these sermons, Mr. Sheppard, a prominent UFA leader who

---

133 Grain Growers’ Guide, September 23, 1921, 7.
134 Ibid.
lived near Edmonton, argued that the UFA was practically a Christian institution.\textsuperscript{135} Referring to Ephesians 4 and 5, Sheppard went on to describe the community, the nation, and the whole earth as places where, “Christ being the head, we must all cooperate with, and in His spirit.”\textsuperscript{136}

Social gospel leaders such as Reverend Salem Bland demonstrated political leadership when he proposed the establishment of a new party led by farmers. His column, “The Deeper Life,” published in the widely read \textit{Grain Growers’ Guide}, the official publication of organized farmers, related resources of Christianity and in particular the social gospel to a broad spectrum of agrarian needs and aspirations.\textsuperscript{137} E.A. Partridge, preeminent leader of the social gospel and of the cooperative movement, made similar connections between religion and political organization of farmers when he claimed in the \textit{Grain Growers’ Guide} that it was necessary “to take your love of God…into politics.”\textsuperscript{138} Practical religion, he continued, is especially important for Election day until our legislative halls are purged of those who represent the most heartless and selfish instincts of the race.”\textsuperscript{139} Reverend Salem Bland proclaimed that it was the business of the church to profess the religion of Jesus, which “was in its inception a social gospel,” and to help erect a socialist Christian state, “sweeping away those existing conditions which throw a pall over the lives of the larger population of our

\end{itemize}
people.” This large population included huge numbers of farmers and a growing number of migrants to Alberta.

Historians regard Henry Wise Wood, president of the UFA from 1916 to 1931, as having been the UFA/UFWA’s spiritual leader. Wood, according to scholar W.L. Morton, was devoted to the Gospel according to Saint John. “John taught social reconstruction, and I am a disciple of John,” said Wood. His political work was informed by religion, although he was not a member of any one church. This, according to historian W.L. Morton, was an important aspect of his influence. It allowed Wood and the UFA/UFWA to deliver a message without religious sectarianism and theological dogma, thus in line with the social gospel’s populist, non-sectarian, and non-doctrinal approach.

Calls for a more pragmatic approach to theology were made directly by farmers in their official publication, the *Grain Growers’ Guide*. A 1910 article titled “Training Preachers to Meet Real Challenges” proclaimed that “the preacher’s role in society must change, given the condition that the farmer finds himself in today.” Theological schools, according to the article’s author, must train preachers for social work. He argues that perfection in society can be achieved only when the preacher and the schools of theology become the “makers and menders of men.” To this end, they must study social science to find solutions to improving society’s ills, including disease, poverty, and

---

144 Ibid.
intemperance. Preachers needed to improve the conditions in which men lived before the quest for personal and spiritual improvement could begin.

Leaders of both the UFA/UFWA and the social gospel movement took on political and social-reform activities. For farmers, spiritual leadership helped to unify the community by building bonds of “oneness,” drawing farmers together for protection and action.\(^{145}\) And for social gospel leaders, political leadership offered a new pulpit from which to Christianize society.

The Great War amplified organized farmers’ well-established pre-war grievances and re-invigorated their commitment to political and social reform, based on a Christian conception of cooperation. Farmers became increasingly agitated with federal leaders such as Robert Borden and Wilfrid Laurier, whose policies merely exacerbated farmers’ pre-war economic circumstances. In the early days of the War, a *Grain Growers’ Guide* stated emphatically that:

> the present serious condition now prevailing in the rural West is very largely due to the unjust burdens which these two gentlemen [Borden and Laurier], in their capacity of political leaders, have laid upon the shoulders of western people for the benefit of a small group of individuals in the financial centers of Quebec and Ontario.\(^{146}\)

For Canadian prairie farmers, the Great War created the transcontinental economy that the national policy had intended to create.\(^{147}\) Farmers were forced to ship their wheat eastward and were required by government to sell on an open market while buying farm

\(^{145}\) Rennie, 44.
\(^{146}\) *Grain Growers’ Guide*, July 29, 1914, 7.
equipment from manufacturers who remained insulated by a protective tariff. While the production of wheat increased during the war, farmers also accumulated unmanageable debt loads to expand production. Farmers blamed their aggravated economic situation and their region’s lack of industrialization and development upon the imperialist policies and greed of Eastern Canada, greed that had become worse owing to wartime demand and overproduction.

The war also accelerated the reform spirit and radicalism of Western Canadian farmers. The human sacrifice of war abroad amplified appeals for justice, democracy, and equality at home. As Nellie McClung argued, “if Canadian soldiers were giving their lives for liberty and justice in Flanders, was it not the duty of those who remained behind to see that these same things prevailed in Canada?” If the sacrifice was not to be wasted, reforms programs had to be implemented. Even Clifford Sifton, hardly an ardent reformer, recognized that the Great War made it necessary for both “Eastern and Western Canada to cast out everything that threatens its moral health.” Thus, reform initiatives such as prohibition took on militaristic and regenerative overtones. The cause itself was “warfare waged against ignorance, selfishness, darkness, and cruelty,” argued McClung. Another reform campaign aided by the Great War was the movement for women’s suffrage. Why, women asked, “could they not enjoy in Canada the same liberty for which their sons were fighting and dying for?”

153 Thompson, 107.
of democracy, should not the same democratic rights of millions of Canadian women be vindicated at the same time?\textsuperscript{154} Ironically, prior to 1914 the women’s movement was staunchly pacifist and regarded war as one of women’s greatest enemies. War was a scheme of masculine domination, one that denied women an effective voice in society.\textsuperscript{155} History, wrote Nellie McClung, has “shown the masculine aspect of war and has surrounded it with a false glory and has sought to throw the veil of glamour over its hideous face.”\textsuperscript{156} The war challenged these pacifist assumptions among many women’s groups, and the same spirit used to fight for democracy in Europe, they argued, could accomplish the purification of Western Canadian society.

Arguments made by the UFA/UFWA for creating a new kind of society based on cooperation, democracy, and equality were bolstered by the trauma Westerners experienced as a result of the First World War. The UFA/UFWA believed it was their duty to inaugurate this new society.\textsuperscript{157} Between 1914 and 1919, the UFA was stymied by governments’ and political parties’ preoccupation with the war and their continuance of national policies that exacerbated farmers’ deprived circumstances. In 1919, the UFA decided to allow direct UFA/UFWA political action, and it won a landslide victory in the Alberta Legislature in 1921.\textsuperscript{158}

The UFA/UWFA and Citizenship Training

While prohibition and the women’s suffragist movement have been well examined by historians as important expressions of the social gospel movement,\(^{159}\) the delivery of citizenship training by the UFA/UFWA in Alberta in the 1920s has received comparatively little attention. To establish a cooperative ethos in society, citizenship education was needed to transform the powerless citizens, farmers, into a group holding a strong collective voting power. One UFA/UWFA leader argued that education “is power...giving light, independence, and freedom. While lack of knowledge – ignorance – is weakness, darkness, dependence, and bondage.”\(^{160}\) Leading in the delivery of citizenship education were farmwomen of the UFWA.

Established in 1913, the women’s section of the UFA, was responsible for much of the delivery of citizenship education. A key emphasis of the UFWA was education rather than politics.\(^{161}\) The majority of rural schoolteachers were women, and they asserted their position as grassroots providers of citizenship education, essential in the alignment of UFA/UFWA and social gospel ideals.

UFA/UFWA unions throughout rural Alberta were the foundation of citizenship education. These unions were described as “schools of progress – the greatest little thinkeries you ever saw.”\(^{162}\) Here farmers secured educational information that would otherwise be out of their reach on subjects such as community relations, the law, cooperation, economics, the farm movement, and civics. Underlying these little thinkeries

\(^{159}\) See Richard Allen’s historiographical discussion in *The Social Passion*, 15.
\(^{160}\) Annual UFA Convention Minutes, Alberta Glenbow Archives, 1912, 9.
\(^{161}\) Rennie, 162.
\(^{162}\) Ibid.
and the information they made available were spiritual and moral undertones. Often presentations would be prefaced with a sermon to provide guidance towards a moral and political end.\footnote{Ibid.}

Through citizenship education based on literature, seminars, books, and debates, members learned to “express themselves clearly, defiantly, and gained invaluable training for future leadership in the province.”\footnote{Grain Growers’ Guide, December 10, 1919, 18.} Citizenship training provided “a continuous army of men and women trained to take up the responsibilities of leadership in the local communities and at the head of our organization.”\footnote{Grain Growers’ Guide, December 22, 1920, 23.} All of these educational activities were underscored with cooperative study, cooperative work, cooperative play, and spiritual values. Men and women, boys and girls, trained in this way, according to Margaret Gunn, were building “for the future of a cooperative community.”\footnote{Ibid., 24.}

Various educational partnerships were forged by the UFA/UFWA in order to deliver education in rural communities and to help build their cooperative movement. For example, the UFWA initiated an important relationship with the University of Alberta’s Extension Department, established in 1912. This department was the first in Canada to offer extension courses, non-agricultural in scope, and was formed to gain support for the university by showing its benefit for all Albertans – thus ensuring its survival. Since the department required public approval, its material had to be popular, and tied directly to the interests and needs of rural communities.\footnote{Ralph J. Clark, “A History of the Department of Extension at the University of Alberta, 1912-1956” (PhD thesis: University of Toronto, 1985), 115.} The content was not determined by elite
university leaders and professors alone; rather, it was developed, in part, by leaders of the UFWA, who requested materials relevant to farmers’ desire for political action in the province. In this way, the University of Alberta Extension Department gave farmers the broad education they wanted on a variety of subjects.

UFA/UFWA local unions were the “principal agency for serving the rural communities” with extension department materials.\textsuperscript{168} News, books, and debate materials on subjects such as history, geography, and rural conditions were loaned to the locals and used by the UFA/UFWA to learn about and protest issues of vital concern to their interests, such as the unequal political status of women. The fourteen most important packages that were requested by local UFA/UFWA unions in 1916, in order of preference, were on women’s suffrage, the war, rural life, the tariff, economics, debating, and cooperation.\textsuperscript{169} Department of Extension materials were used by the UFA/UFWA to help politicize and radicalize farmers for direct political action. The use of state-funded education by the UFA/UFWA points to the Alberta government’s direct involvement in building up the farmers’ movement.\textsuperscript{170} The ability of local UFA/UFWA leaders to shape the content and material provided by the department illustrates the grassroots strength of UFA/UFWA locals in constructing educational opportunities of vital importance to movement.

Another important educational tool for developing citizenship in rural communities was the annual Youth Conferences and their associated publication, \textit{The Voice of Youth}.

\textsuperscript{168} Ibid., 8-9.
\textsuperscript{169} Ibid., 114-17.
\textsuperscript{170} Rennie,167-68.
The objective of these initiatives, which were organized and delivered by the UFA/UFWA, was to strengthen a network of young people for political action. Conferences were held annually in Ottawa where representatives from every part of Canada would participate.171 Another key goal was to develop a Christian ethic in future leaders for the movement both provincially and nationally. These initiatives served as important channels for farmers to disseminate Christian ideals of citizenship. Developing the voice of youth in Alberta and in Canada, the UFA/UFWA built up a movement that worked to replace greed and competition with cooperation. In one Voice of Youth publication after the Great War, a writer claimed that cooperation “represents an attempt to put the Christian obligation into industry.”172 The author highlights that although the growth of the farmers’ movement arose from an economic context of exploited producers, namely farmers, the movement also “involves what is essentially a Christian principle.”173 He concluded that “the working together of people for mutual benefit…has a great attraction for those who are demanding the application of the Christian ethic to our diseased social order.”174

A primary goal for this author and for the youth conferences was to socialize workers and farmers with a Christian ethic that worked to replace greed and competition with cooperation and brotherhood. The author also makes a curious link between the competitive character of industry, Liberal governments, and the church. For him, “it is the Liberal who is afraid of rapid change and who, nine times out of ten, is a member of

172 Ibid.
173 Ibid.
174 Ibid.
these institutions were thus interpreted as custodians of the status quo, obstacles to change that the UFA/UFWA and social gospel worked to overcome. The grassroots approach of the social gospel and UFA/UFWA movements helped popularize the message of reform by circumventing formal institutions resistant to change. This grassroots approach was particularly useful in building up the UFA/UFWA movement prior to their ascendance to political power in Alberta in 1921 when they had little authority to make sweeping changes to the established order. A major purpose, then, of youth conferences, Department of Extension debate packages, and travelling libraries was to socialize farming communities towards a higher conception of citizenship than that available through traditional political parties, industry, and established churches.

Grassroots democratic political power by farmers also necessitated working knowledge of the political process. UFWA leaders felt especially that citizenship education was necessary for women given their lack of electoral and political experience. One UFWA member asked,

how were women to be educated to meet their responsibilities intelligently? Only by participating in public life and forming groups to discuss and consider matters of vital importance to them...here was the importance of training for citizenship training.176

It was only through learning how to participate in public life through forming groups to discuss public matters of vital importance that political action could bring in a new order. Henry Wise Wood described UFA/UFWA conventions and union meetings as “political

175 Ibid.
schools.” Here citizens learned of the political problems and the cooperative methods necessary to solve them. Wood promised that “if farmers attended every year they would develop an understanding of political affairs and a capacity for dealing with them a hundred times more rapidly than they ever had done before.” Extension Department learning materials requested by the UFWA and their political schooling initiatives delivered and accessed at a grassroots level also helped to build the farmers’ movement by increasing membership, particularly of women and youth. For the UFA/UFWA, “every additional member linked up with our great organization in another step towards success at the polls.” In this way, citizenship training served not only to prepare citizens for political action, leading up to and during the First World War, but it also served an important membership recruiting function by activating the voices of youth and women.

**The UFA in Power, 1921-1935**

Once the UFA formed the government in 1921, calls for the reform of formal public education, especially the subject of history, were made. The UFWA urged the UFA Executive to push the Alberta government to introduce curriculum that advanced “society towards a new form of social organization in which the principle of a struggle for private profit shall be displaced by the principles of equity, justice, mutual aid and social well-being.” These calls for reform, articulated at the grassroots level by the UFWA, were clearly heard by Department of Education officials. In 1924 the Department proposed a

---

177 *Grain Growers’ Guide*, May 7, 1919, 7.
178 Ibid.
new course in response to major social and political shifts that had occurred in Alberta over the previous twenty years.\textsuperscript{180} Margaret Ayelsworth, who wrote a thesis in 1936 regarding the revision committee work, argues that the UFWA played no small part in its development. She maintains that “a spirit of optimism pervaded the whole enterprise. The regeneration of the world was at hand, and all were eager to have a hand in framing the new course.”\textsuperscript{181}

A committee member in the development of a new program of study, Mrs. R.B. Gunn, insisted that a course was required to foster a spirit of service, truthfulness, courage, courtesy, and justice, a spirit that determines the value of a citizen in later life.\textsuperscript{182} Irene Parlby, minister without portfolio in the UFA government and a longtime activist in rural education, argued for the development of a course for Alberta that emphasized cooperation. Cooperation, she claimed,

\begin{quote}
was not only at the heart of an economic and political movement; it had its roots in the things of the spirit. Love, service, loyalty and honor are spiritual qualities that inform the cooperative movement and in time can transform a world made hideous by the competitive system, into a democracy of hope, justice and happiness for all.\textsuperscript{183}
\end{quote}

Mary Crawford, a rural Alberta schoolteacher whose thoughts were typical of the anti-war pacifist sentiments of the post-war period, criticized traditional history curriculum as dangerous and complicit in creating a violent citizenry that had taken the

\textsuperscript{180} Ibid., 42.
\textsuperscript{181} Ibid.
\textsuperscript{182} Ibid., 161.
\textsuperscript{183} Susan M. Gunn Letters, Gunn to Robinson, 1918, 285. Accession No. 83.507, Provincial Archives of Alberta.
world to war. She advocated for using the state’s control over school curriculum for the greater good of peace and cooperation. She argued that if “militaristic” regimes such as Napoleonic France and Prussia could mold youth according the state’s purpose, then why “should it be unreasonable to contend that …education could…establish a rule of love?”

Echoing this criticism was Margaret Gunn, then UFWA president. She emphasized the importance of citizenship training based on democratic and cooperative principles as a preventative measure against inequality and imposed tyranny by belligerent governments. In the development of democratic citizenship, “The seed of education will ultimately yield a harvest in the field of politics, though the grain may be slow in ripening.” She also criticized traditional history curriculum and its preferred style of teaching by way of regimented memorization of the facts of the British Empire. Such content and learning methods, Gunn argued, stifled the students’ ability to think for themselves and inhibited their ability to question authority. Instead, for Gunn, education should engender democratic citizenship by teaching pupils to question, speculate, and cooperate with each other. She criticized the existing history curriculum as something that glorified the conquests of imperial Britain and treated children as if they were “little jugs into which were to be poured the imperial gallons of facts.” This approach to learning history according to Gunn, destroyed the student’s ability to question and inquire.

---

184 See Thompson, 98.
187 Ibid.
188 Ibid.
into the reasons for the Great War and the post-war depression, and thus would continue the present system of greed, competition, and violence. For Gunn, history’s emphasis on British Imperial values was regressive and out of step with the post-war need for building a more democratic citizenry.

Margarett Gunn was not alone in her criticisms of an imperialist approach to writing Canadian history. Canadian historians such as Frank Underhill chastised those who overemphasized Canada’s Imperial connections with Great Britain and neglected the influence of French Canada and the United States on the nation’s development.\footnote{Carl Berger, \textit{The Writing of Canadian History: Aspects of English-Canadian Historical Writing Since 1900}. Sec. Ed. (Toronto: University of Toronto Press, 1986), 61.} Carl Berger claims that a new history or progressive history emerged after the First World War in the United States and came to influence a number of Canadian historians. Proponents of progressive history believed that in an age of reform history itself must be reformed. Interestingly, Berger uses the same words to describe the shift from an imperial to a more pragmatic history as those used by Alberta’s Department of Education in their introduction to social studies in 1935. Berger writes that it was necessary for historians “to subordinate the past to the needs of the present,” to concentrate on the nature and origins of contemporary problems and to broaden the scope of history to include social, economic, and intellectual problems of the common man.\footnote{Ibid.} For UFA/UFWA leaders, British Imperialism was the manifestation of the forces of greed, individualism, competition, and violence. They felt that Eastern Canadian Imperialism, a close derivative of British Imperialism, had alienated farmers from the fruits of their labor and had caused economic and political hardship in pre-war Alberta society. UFWA leaders
and numerous Canadian historians advanced the idea that only a pragmatic approach to history, one that would illuminate the struggles of the common man, would allow laborers and farmers to begin the quest to improve their circumstances.

Many UFWA leaders perceived history curriculum as outdated and poorly suited to Alberta’s shifting socio-political climate of the 1920s. The need for post-war reconstruction, and education’s potential role in serving that end, was echoed in the educational committee work of the UFWA, who in turn informed the UFA executive and Department of Education of their proposed ideas. Although no formal course replacement was proposed in 1924, the consensus was that traditional history curriculum poorly served Alberta’s post-war demands for social, political, and economic cooperation. Committee member Dr. Geneva Misner of the University of Alberta claimed that pre-war history curriculum was deficient because it was authored in a pre-war culture of imperialism and greed that had “culminated in the tragedy of WWI, a universal and crushing burden of debt and intolerable human suffering.”

Committee members were in agreement that pre-war history curriculum required reform. Although social studies had not yet been discussed as a formal replacement of history, its groundwork was laid out in the revision committee work of 1924. The need for an updated secondary course to reflect Alberta society’s desire to regenerate society through social, political, and economic cooperation was clearly articulated after the war.

The reform agenda of the UFA/UFWA movement was further stimulated by the Great Depression and encouraged the infusion of cooperative ideals into Alberta curriculum.

---

191 Ayelsworth, 144.
Regional and class loyalties already well established by the 1920s were deepened over the course of the Great Depression. Farmers in Alberta believed they were being exploited by Eastern Canadian corporate interests and doubly resented the organizations and people responsible for farmers’ impoverished condition, real or imagined, in these times of intense adversity.\textsuperscript{192} Thus, as historian Ian MacPherson argues, it was in the hinterland regions, including rural Alberta, where political and economic forms of cooperation flourished best and became more restless as the 1930s passed. It was also in the hinterlands and where restlessness inevitably nourished rural cooperative action.\textsuperscript{193} In 1931, one UFWA member claimed that “the political and economic system of today has its roots in the educational system of yesterday” and, “if we wish to see service instead of profit as the purpose of our industrial or commercial institutions then we should assist the youth in building up a mental structure to do that.”\textsuperscript{194} During an annual convention in 1934, the UFA/UFWA called for sweeping changes to citizenship education so that schools would “advance society towards a new form of social organization, where the principle(s) of ... equity, justice and social well being” replace competition.\textsuperscript{195}

Much of the foundation for social studies had already been laid by the UFA/UFWA during the 1920s. Cooperation and active political citizenship, the basis of citizenship training, became the hallmark of social studies curriculum in the 1930s. However, the open dialogue between UFWA leaders, the UFA Executive, and the Department of

\textsuperscript{192} MacPherson, 42.
\textsuperscript{193} Ibid.
\textsuperscript{194} “1931 Resolutions of the Annual Convention of the United Farmers of Alberta,” File 170D, Premiers Papers, Provincial Archives of Alberta.
Education came to an abrupt end. Curriculum design for social studies, the course that would replace secondary history curriculum, was taken over by an elite and select few, mostly highly educated men from the Department of Alberta Education and the Alberta Teachers Association (ATA). The agrarian movement that had pioneered citizenship training for its rural inhabitants and initiated the reform of history curriculum was usurped by curriculum builders in the mid-1930s. Social studies was used as a tool for legitimizing teaching as a profession. The religio-political movement of farmers and the grassroots delivery of citizenship training became formalized and institutionalized in the form of social studies by 1935.
CHAPTER THREE: THE FORMALIZATION PERIOD OF SOCIAL STUDIES

If teaching was to be deemed a profession, then “the teacher ought to have a say in what he must do, and how he must do it,” argued H.C. Newland, supervisor of Alberta Schools in the 1930s and chair of the committee responsible for the design of social studies in 1934-1936. Teachers asserted influence in curriculum design in the 1930s as a tool to elevate the status of their trade to a profession. The connection between curriculum design and teachers’ professional status became apparent in 1935. It was the year social studies was introduced and the year Premier William Aberhart recognized teaching as a formal profession by vesting power in the Alberta Teachers’ Association (ATA) to control teachers with rules of conduct, including their adherence to curriculum objectives set forth by the province.

Professional educators defended their right to control curriculum by claiming that they were “scientific experts” in the project of educating children. They obtained teaching expertise from graduate programs at Columbia and Chicago universities, leading centers of progressive education in the United States. A scientific approach to teaching allowed leading educators to replace subject experts, such as historians, with teaching experts to write curriculum. Ambitious Alberta educators embraced progressive education as a means to legitimize their authority in educational bureaucracy upon their return to the province. In this way, social studies can be understood as the lever by which

---

educators obtained professional status in Alberta. At the same time, this singular focus on the influence of the professional educator overlooks the work of rural school teachers.

While no concise history of the origins of social studies curriculum exists in Alberta, the few studies that address the subject overemphasize the role that a select cadre of “professional” elites played in its formulation between 1934 and 1935. Perpetuating the notion that social studies, a curricular manifestation of progressive education, was the achievement of the professional educator alone is historian R.S. Patterson, who argues that the “underlying philosophy of progressive education did not extend past a few professional educationalists.”

Historian John Chalmers similarly implies the exclusive role of professionals in the development of social studies when he describes Newland as a “one-man curriculum branch.”

While scholar Amy von Heyking works to correct this oversight in her recent publication regarding the contributions of rural teachers in curriculum development at the primary grade level, she continues to emphasize the exclusive role of elite educators such as W.D. McDougall in creating social studies at the secondary level. She suggests it was McDougall alone who created social studies after being asked by Supervisor of Schools H.C. Newland to draft an outline. I intend to show that curriculum reform at the primary and intermediate grades did not involve the separate spheres that historians such

---

200 John Chalmers, Schools in the Prairie Provinces: The Story of Public Education in Alberta (Toronto: University of Toronto Press, 1967), 82.
as von Heyking have alluded to. The enterprise approach to teaching and social studies, pioneered by Alberta’s Donalda Dickie, a rural teacher and Oxford graduate, occurred first at the elementary level and informed what McDougall later created for intermediate students.

The influence of H.C. Newland and W.D. McDougall is not contested in this chapter, but the notion that social studies was invented by a select few, or them alone, is. In the previous chapter, I argued that citizenship training, delivered by the United Farmers and Farm Women of Alberta (UFA/UFWA) in the 1920s, would become an essential feature of social studies in the 1930s. In this chapter I will continue to broaden understanding of the advent of progressive education and social studies in Alberta to include the pragmatic curriculum reforms initiated by rural school teachers in the 1920s. I will argue that these early practical initiatives, born of necessity, found expression in the formalized social studies of the 1930s. Von Heyking makes a similar point, namely, that teachers in rural communities pioneered teaching techniques that would become essential features of progressive education and social studies curriculum a decade later. I will examine how the professionalization of teaching worked to control the teaching force and formalize curriculum development, effectively placing progressive education and social studies in the hands of “professionals” only. In the professionalization process of the 1930s, teachers such as Donalda Dickie and Olive Fisher, both of whom were rural teachers and graduates of Oxford and Columbia universities respectively, were never considered professionals, thus concealing their involvement from contemporary historians. Ultimately, it was Dickie and Fisher who pioneered a new approach to learning, thereby
initiating the first social studies program at the elementary grade level. They also penned dozens of textbooks authorized for social studies curriculum.

The exertion of control by professionals over teachers in Alberta was enabled, in part, by the gendered nature of the teaching workforce. Nearly 70% of teachers in Alberta between 1911 and 1970 were female, and in rural communities this percentage was much higher. Leadership positions and professional authority, on the other hand, were nearly exclusively reserved for men. While progressive education, promoted as science, provided the promise of advancing a man’s career, it displaced the experiential knowledge and practical curricular innovations of women working in the field.

Just as church leaders and politicians in Alberta introduced pragmatic ways to deliver Christianity amidst challenging prairie conditions, so too did school teachers provide innovative ways to deliver curriculum in rural schools. Rural school teachers had to accommodate students’ low academic ability, toil through teacher shortages, and make due with a limited supply of teaching resources. Rural classroom instruction, characterized by cooperative student-centered activities that made use of alternative learning resources and materials, was not only a way to expand student learning beyond the narrow walls of the classroom; it was also a matter of survival in isolated rural communities. Although educational historian E.S. Patterson is likely correct that many school teachers did not comprehend the intellectual underpinnings of progressive education, they most certainly understood the challenges that traditional curriculum posed in rural communities and the necessity for adapting curriculum accordingly. An

examination of teacher and student memoirs sheds light on how curriculum was adapted by teachers and experienced by students, and both will be used to some extent in this chapter.

**Progressive Education, the Professional, and Social Studies**

Progressive education is a pedagogical movement that began in the late nineteenth century in both Europe and the United States as a reaction to the alleged narrowness and formalism of traditional education. The term “progressive” was engaged to distinguish this education from the traditional nineteenth-century curriculum, which was rooted in classical preparation for the university. By contrast, progressive education finds its roots in present experience.

The rejection of formalism in education at this time is reminiscent of the social gospel movement’s rejection of Christian orthodoxy and formality. Social gospel leaders, politicians, and progressive educators shared a common conviction that social reconstruction, amidst rapid industrialization, urbanization, international conflict, and economic inequality, all of which characterized the early decades of the twentieth century in North America, required democratic action in the present. Social gospel leaders proposed that the degenerative conditions that flowed from rapid change required the regeneration of society today. To this end, the social gospel infused various reform initiatives from prohibition initiatives to supporting organized Alberta farmers’ campaign

---

204 Ibid.
to replace greed and competition in society with cooperation and democracy.\textsuperscript{206}

Progressive education similarly worked to create a more democratic and cooperative order through public education. By replacing the top-down and authoritarian nature of traditional schooling with collaborative forms of teaching among students and teachers, democracy could be practiced, learned, and reproduced throughout society.\textsuperscript{207} And just as the social gospel dethroned the bible as the sole authority in society, so too did progressive education dethrone the textbook as the dominant authority in a classroom.

A key figure in the progressive education movement in the United States was John Dewey, who believed that learning should be active and that traditional schooling was far too restrictive. Children came to school to live in a community that gave them real experiences that fostered their capacity to contribute to society. To achieve this, students needed to be involved in real-life tasks and challenges that fostered democratic and cooperative living.

The larger ideals of progressive education, firmly rooted in the United States at the turn of the century, but not yet in Canada, were indeed consistent with the ambitions of the agrarian movement in Alberta during the 1920s and 1930s and would soon be taken up by visiting Alberta educators at American universities. Progressive education, as it was formally taught at leading American institutions, offered visiting Alberta educators the opportunity to return to their province upon graduation as established experts capable of asserting control over the teaching force and curriculum design.

\textsuperscript{207} Riley, 9
Dewey’s progressive approach to learning drew on many disciplines, including psychology, sociology, and economics. Progressive education, as it was taught by Dewey and at leading American schools, was grounded in science. Historian Doug Owram explores how many university faculties in North America employed a scientific approach after the Great War to legitimize their research and influence in society. Those eager to reform society and legitimize their authority to do so uttered the word “scientific” to ground their solutions in well-founded authority.

Albertans who attended Dewey’s lectures at Chicago University and Columbia College in New York embraced the idea that educational problems could be approached scientifically. Graduate students were also being groomed for leadership while attending these prominent schools, which was evident in the encouragement they received from Columbia professors. George McNally, Alberta School inspector in the 1930s, comments that, while he attended Columbia, professors singled out Alberta’s educational system as one of the most “old-fashioned” in North America. The influence of Columbia College in moulding progressively minded Albertans for leadership in Canada was particularly significant given the large Canadian contingent attending. Between 1923 and 1938, the total number of foreign students at Columbia’s Teacher College was roughly 3500, nearly half of which was Canadian.

---

While in the United States, Alberta educators were also exposed to an entirely new course that embraced the scientific and social concerns inherent in progressive education and especially social studies. Harold Rugg, Kilpatrick, and Edgar Dawson were among the most prominent American scholars of this subject and were highly influential with Alberta’s educational leadership.\textsuperscript{212} Dawson, a professor of history in New York, called for a more practical direction to the teaching of history, stating emphatically that it required progressively minded teachers to implement it. In his book, \textit{Teaching the Social Studies}, Dawson delivered a call to arms among teachers to take history curriculum out of the hands of historians and to direct it towards their own immediate classroom needs.\textsuperscript{213}

Professor Dawson argued that historians had failed to develop a vision and direction for delivering their work to students. Thus, it was the duty of progressive educators to develop a vision and direction on history’s behalf. For Dawson, “if the average historian insists on giving narrow and visionless definition to his subject, members of the teaching profession must find another term to describe their work in this field.”\textsuperscript{214} For Dawson, the deficit of traditional history was its poor use by academics in cultivating a more democratic social and political order. He envisioned an opportunity for progressive educators to mould history for the purpose of social and political regeneration.\textsuperscript{215} Dawson worked to empower teachers to articulate the value and role of history in the classroom and to define a broader scope for its use, namely, to emphasize peace, tolerance, and democracy among students.

\textsuperscript{212} Von Heyking, \textit{Creating Citizens}, 64.
\textsuperscript{214} Ibid.
\textsuperscript{215} Ibid., xi.
Of course, classroom needs were informed to a significant extent by the community and region in which curriculum was delivered. Here was the genius of social studies. The content of social studies could be adapted to the local environment, while its larger structure was framed by the popular rhetoric of progressive education. North Americans and Europeans shared a common reaction to the negative consequences of industrialization, urbanization, and competition around the turn of the century. They embraced and promoted progressive reforms designed to improve modern industrial society through educational, spiritual, and political changes.\textsuperscript{216} Drawing on Marshall McLuhan’s concept of the medium and the message,\textsuperscript{217} I suggest that progressive education and the social gospel were the popular and widely received mediums of the day, while social studies was the message or content of that medium that required local input tailored to particular regional circumstances. While social studies was indeed devised in the United States and not Alberta, its content and form in Alberta came to reflect this province’s particular educational environment and social and political attitudes in the 1920s and 1930s. Progressive education, touted as science at American universities allowed graduating Albertans to return to the province and begin to affirm control over teachers and curriculum design by claiming they had attained scientific and expert training in progressive education. These “expert educators” were part of the formalization stage of social studies. The practical innovations of rural schoolteachers and the grassroots movement in Alberta had created fertile ground for educational reform

and opportunities for experts to capitalize on these shifting social and political conditions as a means to advance their own careers.

The “Arrival” Storyline of Progressive Education and Social Studies to Alberta

A comprehensive examination of the transition from history to social studies curriculum in Alberta, or the professionalization of teaching in the province, has yet to be conducted. The following are the few key secondary and primary sources that do exist on the roots of social studies and the professionalization of teaching in the province. They include John Chalmers’ *The Story of Public Education in Alberta*,\(^{218}\) R.S. Patterson’s PhD thesis, “The Establishment of Progressive Education in Alberta,”\(^ {219}\) and W.D. McDougall’s personal papers, titled “Curriculum builders in Alberta between 1902-1945.”\(^ {220}\) All these works were written between 1965 and 1970. Clearly they are dated, but because little has recently been written on the subject of professionalization of teaching in Alberta or on the advent of social studies except for Amy von Heyking’s 1996 PhD dissertation on Modernizing Alberta’s Curriculum), these sources tend to perpetuate a narrow understanding of the origins of social studies.

A predominant view among the above-mentioned sources is that progressive education arrived in Alberta in 1935 from the United States. But this “arrival” storyline ignores the involvement of teachers in the field and the extent to which progressive education and social studies functioned as wedge to separate teachers from professionals.

\(^{218}\) Chalmers, 18.
The establishment of progressive education and its connection to professionalizing teaching by Alberta’s predominantly male leadership was not a gender-neutral or a benign process. Asserting control over the implementation of progressive education justified men’s leadership positions and demonstrated their control over the teaching force.

For W.D. McDougall, a key figure in the development of social studies in the 1930s, asserting control over curriculum also meant recording the story of his involvement in the process on paper. He made clear in his “Autobiographical Notes on the Development of Social Studies” that he alone wrote social studies curriculum. He claims that “although I did not realize at the time…social studies had its birth” when “H.C. Newland asked me to elaborate on the structure” of this course. He continues that he (McDougall) began to “elaborate on a project that consumed every moment of my free time.”221 In every secondary source that discusses the roots of social studies in subsequent years, McDougall’s autobiographical notes are consulted, and his contention that social studies was his invention is essentially repeated by scholars. Later in this chapter, I will show that this assertion is inaccurate.

In *The Story of Public Education in Alberta*, historian John Chalmers similarly emphasizes the role of the few, primarily male educational leaders, such as McDougall in curriculum development in Alberta. Conversely, he presents teachers as passive subordinates to professional authority, incapable of altering curriculum or teaching

methods on their own terms. His book segregates the modernization of Alberta’s education system into two distinct phases of development. The first was, as Chalmers refers to it, the pioneer phase.\textsuperscript{222} This period includes the early decades of the twentieth century when women were presented as pioneer teachers, brave instructors of the lonely one-room school house. Chalmers describes this pioneer phase in paternalistic and romantic hues, describing female rural school teachers as “magnificent and dignified creatures,” “stately in their shirt waist dresses…long hair piled magnificently on their heads under picture hats.”\textsuperscript{223} The second phase was the arrival from American universities such as H.C. Newland and McDougall, who began the process of implementing progressive education in 1934 through curriculum committee revisions.\textsuperscript{224} What is neglected in Chalmers’ historical account of progressive education in Alberta in the 1930s is that rural teachers were active agents of change in teaching methods and in curriculum design. Instead, he presents female teachers as passive pioneers of the rural school house, delivered from primitive practices by the progressive educator, a professional male figure.

While educational leadership in Alberta was exposed to progressive education and social studies in an American context, Alberta school teachers were in the field grappling with the realities of an out-dated curriculum poorly suited to shifting rural school dynamics.

\textsuperscript{222} Chalmers, 7.  
\textsuperscript{223} Ibid., 12.  
\textsuperscript{224} Ibid., 82-101.
Teachers Respond to Rural School Conditions

In 1910, nearly 70% of Albertans lived in rural communities. Most Albertans were educated only to the eighth grade, while only a small minority, primarily those intending to continue to university or become teachers, continued to high school. In most cases, students that completed grades one through eight returned to farming. In the early decades of the twentieth century, access to high schools in Alberta was limited. Most high schools were only in major cities, and the curriculum they delivered was primarily academic, reflecting the needs of a relatively narrow segment of the population.

However, between 1920 and 1934 school attendance nearly doubled. The growth in high school attendance was particularly dramatic, rising from 20,000 to over 30,000 in just ten years. This increase was largely a result of older students returning to high school because of few employment opportunities in the midst of economic depression. Scholar Margaret Ayelworth also notes that Alberta classrooms overflowed in the late 1920s and 1930s as a result of improved physical access to schools, made possible by the UFA/UFWA. Between 1921 and 1935, the UFA government improved highways, thus giving better access to previously isolated schools. Also, scholarship opportunities for rural students wishing to continue on to high school were initiated by the UFWA.

225 Chalmers, 42.
226 Ibid., 42-63.
228 Chalmers, 50.
However, increased enrolment created problems for rural teachers. Chief among these was the growing numbers of students with relatively weak academic ability. Compounding this issue was that curriculum in the 1920s and early 1930s was primarily academic, with few vocational or technical options.\textsuperscript{230} As educational historian Neil Sutherland argues, a formal academic approach to curriculum prevailed throughout Canadian schools in the early decades of the twentieth century and was characterized by memory work and drill. “It was a system based on teachers talking and students listening, a system that discouraged independent thought, a system that provided no opportunity to be creative.”\textsuperscript{231} Historian John Chalmers similarly describes curriculum in Alberta at this time as “academic and bookish,” whereby in memorization was deemed integral to students’ success.\textsuperscript{232}

In the midst of growing numbers of students attending schools, including many weaker academic students, both teachers and officials lamented the growing number of “dull” students, identifying large proportions of pupils as “retarded” in their educational development.\textsuperscript{233} Scholar Margaret Ayelsworth claims that some teachers grappling with disparities in student abilities during the 1920s and 1930s described these shifts in the following manner: “Nearly 70\% of students do not belong to that social class which considers school and more advanced education a matter of social necessity. Many

\textsuperscript{232} Chalmers, 106.
\textsuperscript{233} Ibid., 213.
students neither have the native ability, nor the desire to learn…academic subjects.”²³⁴

The combination of academic curriculum and increasing numbers of students with lower than average academic aptitude resulted in high failure rates on provincial examinations. In fact, nearly 50% of students working towards a high school diploma between 1920 and 1930 failed.²³⁵

Provincial examinations at the secondary level (intermediate and high school) were rigorous and included three-hour written tests on composition and grammar, arithmetic, Milton and Shakespeare, Tennyson and prose, trigonometry, physics, Horace and Cicero, Latin Grammar and prose, and constitutional and industrial history.²³⁶ The University of Alberta appears to have had tremendous influence over high school standards and examinations. Textbooks, curriculum, and exam standards were written almost exclusively by University of Alberta professors for the Department of Alberta Education. This tight-knit relationship between the University of Alberta and secondary school curriculum characterized Alberta’s secondary educational system throughout the early decades of the twentieth-century. The dominant feature of secondary education in Alberta at this time was the setting of standards and curriculum by an authority outside of the school system itself.²³⁷ In 1929, Minister of Education Perren Baker exclaimed, “Without a doubt we are the most examined people in Canada and perhaps the world.”²³⁸

²³⁴ Ayelsworth, 17.
²³⁵ Chalmers, 194.
²³⁶ Ibid., 222.
²³⁷ Ibid., 210.
²³⁸ Ibid., 185.
It was not until 1913 with the passing of the federal Agricultural Assistance Act that provinces were encouraged by grants to promote agricultural, vocational, and technical forms of education in high school.\textsuperscript{239} With this federally sponsored initiative, some high schools in the early 1920s adjusted their narrow diploma schemes for normal school and university entrance to include agricultural and industrial high school diplomas. But despite the Department’s recommendations for these expanded programs, many school boards dismissed the recommendation, largely because of costs associated with offering vocational and technical training, and continued to stress university and normal school entrance.\textsuperscript{240} And even if students had the option of vocational training, albeit in a limited number of schools, the majority of students arduously worked towards a high school matriculation for university or normal school entrance. Historian John Chalmers suggests the reason was because of the perceived social and economic status to be gained by obtaining this more academic diploma. He claims, in a rather patronizing tone, that “the matriculation program was a first choice for every self-respecting, middle – class Albertan, rural or urban in the 1920s.”\textsuperscript{241} Thus, high school students, regardless of interest or aptitude, had little choice in the 1920s and 1930s beyond normal school and university matriculation.

Higher student enrolment, however, was not met with a corresponding increase in the supply of teachers or resources. Teacher shortages, inadequate teacher training, and a limited supply of textbooks plagued Alberta’s rural schools in the 1920s and 1930s. In annual reviews Alberta’s Department of Education regularly criticized teachers’

\textsuperscript{239} Ibid., 205.
\textsuperscript{240} Chalmers, 110.
\textsuperscript{241} Ibid., 204.
instruction and their limited supply of resources to adequately teach students during these decades.\textsuperscript{242} In times of teacher shortages it was difficult for the Department to justify a more extensive program for training teachers. Thus, teachers were fast-tracked in a four-week program instead of the usual eight-week program.\textsuperscript{243} Regardless of the length of program, it seems that few teachers felt prepared for teaching in isolated rural school rooms. A series of oral interviews with rural school teachers in Saskatchewan in the 1920s offers some insight as to how Alberta’s rural teachers may have also experienced the inadequacies of teacher training. Teacher Hilda Rennie could not recall “learning anything practical” in her teacher training. Instruction at normal school consisted of classes in reading, writing, and arithmetic, and, according to Rennie, there were no method courses on preparing a teacher to teach a particular subject, and there was no practice in teaching in a rural setting.\textsuperscript{244}

As a cost-saving measure, some school boards dealt with increased student enrolments by simply increasing the sizes of existing classrooms, thus shifting the responsibility onto teachers to deal with varying student abilities. Another cost-saving method was to squeeze multiple grades into a single classroom. In an interview with a rural teacher in Alberta in the 1920s, Doris Mae recalls that rural classrooms were

\textsuperscript{242} Department of Education, \textit{Annual Review}, 1927, pg. 22. See also, \textit{Annual Reviews} for 1928, 1932.
\textsuperscript{243} John Chalmers, 88.
composed of students of various grades and that it was the job of the teacher to plan for each group at the same time.\textsuperscript{245}

Cooperative learning strategies and project-based activities using available resources, such as newspapers and magazines, were among the myriad ways teachers overcame these challenges. Many of these techniques, borne out of necessity, were essentially echoed by the new curriculum released by professionals in 1935. For predominantly female teachers of rural schools, adapting curriculum was a practical matter, while for Alberta’s educational leadership, overhauling curriculum was a means of asserting authority over the teaching force and curriculum development – key to the professionalization of teaching.

As historians Don Wilson and Paul Stortz demonstrate in their examination of rural school teachers in north-central British Columbia in the 1920s, rural teachers were active and innovative in their delivery of curriculum amidst the challenges they faced. They argue that teachers exerted a degree of autonomy and independence in curriculum delivery owing to their relative isolation.\textsuperscript{246} Teachers’ control over curriculum, in the midst of isolation, is a recurring theme in the memoirs of rural teachers in Alberta and Saskatchewan. Yet historians overlook the initiatives that took place in these school settings, suggesting instead that they continued to teach in unchanging ways until professional educators delivered them from turmoil with new curriculum and progressive teaching practices. But as teacher memoirs, oral interviews, and Wilson’s and Stortz’s

\textsuperscript{245} Chalmers, 88.
examination demonstrates, rural teachers were adapting their methods to their local circumstances long before progressive education formally arrived in the 1930s. In this way, rural teachers can be seen as active agents of change in their trade.

Critiques of the academic nature of secondary curriculum in Alberta and demands to make curriculum more practical to rural students did not go unnoticed by UFWA leaders or rural school teachers. (Often UFWA leaders were also school teachers.) Making curriculum more practical for rural youth and adopting more pragmatic teaching methods was the subject of numerous articles in the *Grain Growers’ Guide*, the official publication of the UFA/UFWA. For example, in 1920 a rural school teacher, Mary Crawford, argued “that the era of general education is passing away.” The study of classics, such as Latin and history, were deemed unsuitable to the practical needs of farmers. The curriculum needed to move from the “abstract to the constructive.” Another article in the same publication described how rural school teachers were deviating from academic curriculum and making it constructive. The article includes the accomplishments of rural teachers such as Ms. Wyman, who claimed that the existing curriculum “contained nothing that could be put to practical use in their rural students’ everyday lives.” Wyman took progressive steps in rural school houses to improve this situation. According to Wyman, children wanted to learn by doing things rather than to repeat what others had done. She set up committee work for students to take charge of their learning and to improve the material conditions of the school. Students of Ms. Wyman profiled their own paintings and poetry throughout the room and applied their

---

248 Ibid.
mathematical and scientific learning towards the construction of school gardens.\textsuperscript{250} These initiatives applied learning in a cooperative fashion and taught youth that they could take charge of their own learning and the conditions in which they learned. Indeed, these ideas were in line with strands of progressive education that would be formally introduced in Alberta decades later.

Teachers’ and students’ memoirs in Alberta and British Columbia from the 1920s and 1930s indicate some of the ways in which rural teachers pragmatically adapted curriculum in light of limited resources, inadequate training, and large classrooms with diverse student needs. Although some of these memoirs are based on teachers’ experience in other provinces, it is likely that many of Alberta’s rural teachers acted in similar ways. Teacher Hazel McKenzie claims that her Lethbridge school circumvented a lack of teaching resources by utilizing \textit{National Geographic} magazines for research projects. “That box of material bailed me out time after time,” claimed this teacher.\textsuperscript{251} For teachers dealing with students from multiple grades, one adaptation was to organize the whole group around a single theme that all students could work on at the same time. Common themes used by rural school teachers included “Indians and Eskimos” and “Taking a Trip to Europe.”\textsuperscript{252} Penelope Stephenson’s study of rural school teachers in the Okanagan Valley in the 1920s claims that “rural teachers learned to utilize the natural resources on their schools’ doorstep to provide interesting lessons for pupils.”\textsuperscript{253} Roberta Volker remembered her experience in a rural school at Wood Lake with her teacher

Margaret Campbell. She remembers a unit on pioneer life: “We used pioneer tools to build and float a raft one week. In a science class we went on nature finds to see wild orchids growing near the school and acorns gathered by squirrels for winter. Our teacher had the ability to make every lesson come alive.”

Volker remembers that “we all came away doing well in math because of her love of the subject and the fun projects she would create to make real life experience for us.”

Rural teachers also seemed capable of creating relevant history lessons for their students. Mildred Rasmussen remembered projects she developed that required her pupils in Dickson, Alberta, to interview their parents in order to write a history of the Danish community in the area. Gordon Little, a former student in the Alberta community of Hither during the inter war years, describes how his instructor divided the six intermediate grade students into two teams to debate the topic: “Resolved, that Japan is a threat to the British and American possessions in the Pacific.”

Students worked on the debate at school and at home, gathering newspapers where they could find them. Some teachers also ordered special maps and early war broadcast news to prepare students for the debate. Thus, theme-based activities utilizing available resources were employed by rural teachers as practical measures to overcome classrooms with multiple-graded students and limited supply of formal teaching materials such as textbooks. School teacher Edith Van Kleek’s published memoirs speak to teachers’ pragmatism in the 1920s

255 Ibid.  
256 Ibid., 104.  
257 Ibid., 107.  
258 Ibid.
and 1930s. Her memoirs are aptly titled, *The Way things Were*. Because of shortages of teaching materials, Van Kleek encouraged students to use what they could find, including dictionaries and encyclopaedias – anything that could develop students’ ability to research and think.

These practical innovations were consistent with what progressive education professionals in the 1930s would call “child-centered learning,” “discovery-based learning,” and “constructivist” approaches to teaching. These approaches emphasized the need for teaching and content to become more practical and applicable to the everyday life experience of students.

Leading intellectuals such as John Dewey disseminated these progressive ideas from American universities such as Columbia in New York and Chicago University. This is not to say that all rural teachers in Alberta were unaware of such pedagogical innovations emanating from United States in the 1920s. Some had read John Dewey’s widely circulated book, *The School and Society*, and in the exceptional cases of Donald Dickie and Olive Fisher, had attended Columbia to educate themselves in the methods and philosophy of progressive education.

But for the average rural school teacher, adapting teaching practices was a practical matter of survival and not a pedagogical or intellectual exercise. A series of oral interviews from the 1970s conducted at the University of Saskatchewan with practicing rural school teachers from the 1920s confirms this assumption. The interviewer asked a number of former teachers if they had

---

259 Ibid., 102.
260 Ibid.
referred to themselves as “progressive educators.” The most common response to this question was that they “did not know what this word meant.” They emphasized that what they had done in the classroom was a matter of necessity. Scholar Dianne Miller goes further, claiming that rural school teachers did not need to read John Dewey to alter their teaching methods. Rather they understood the impoverished conditions in which they operated and made practical adaptations.

By the early 1930s, the Department of Education outlined key problems that plagued Alberta’s schools which were already well-known to the rural school teacher. The department identified the problem of teacher shortages, lack of teaching materials, the inability of students to access high school programming, and high failure rates on provincial exams, and it concluded that the existing academic curriculum was largely irrelevant to many rural students. One solution proposed by the UFA government to resolve the issue plaguing Alberta’s schools was to defer to an “expert” curriculum committee which would rewrite school curriculum with the intention of “lightening the academic” nature of the programs of study.

In charge of supervising the entire re-working of primary, middle-school, and secondary education in 1935 was Dr. H.C. Newland, a Ph.D. graduate of Chicago University and the Alberta Teachers’ Alliance President between 1920-1922. Dr. Newland dedicated much of his effort to introducing an entirely new course that could

---

266 Chalmers, 194.
infuse curriculum and teaching with strands of progressive education emanating from leading American universities.

**Professionalization as the Masculinization of Teaching in Alberta**

To put teaching on par with other professions and to obtain a greater degree of control over teaching conditions and curriculum, Hubert C. Newland worked to increase organization among teachers and publicize their arguments for professionalization. A key tool in this endeavour was establishing the Alberta Teachers’ Alliance in 1918, precursor to the Alberta Teachers’ Association.\(^{268}\) He outlined the following as major objectives of the collective teacher organization: raise the status of teaching in order to secure better salaries; obtain greater teacher representation on curricular committees; and improve professional qualifications for teachers by securing funding for post-graduate training in education.\(^{269}\) However, the benefits of collective teacher organization were not allocated equally across gender lines. For example, Donalda Dicker and Olive Fisher, both female teachers who obtained graduate training abroad, were not granted funding for their studies as their male counterparts were.\(^{270}\) While the *ATA Magazine* served the function of promoting the teaching profession, the *Grain Growers’ Guide* continued to be a forum for populist discussion of educational reform. The *ATA Magazine* featured mostly male contributors, while educational forums in the *Grain Growers’ Guide* were primarily authored women.

\(^{269}\) Ibid., 22.

\(^{270}\) Coulter, 687.
As mentioned earlier, between 1911 and 1970, over 70% of Alberta’s teaching force was female, and in rural communities this number was higher.\textsuperscript{271} Mary Kinnear provides two explanations for the overrepresentation of women in rural schools. First, in the early twentieth century there existed few paid opportunities for women in the labour market other than teaching, and, second, few men wanted to work in isolated communities for relatively low wages.\textsuperscript{272} Kinnear also points out a number of gender role assumptions, typical of the early twentieth century, that informed men’s and women’s career paths. For example, men would enter a profession assuming they would not have to work in other occupations to support themselves or their families. As the “normal breadwinner,” a man needed to earn a respectable, even a superior, living for himself and his family.\textsuperscript{273} Teaching in the 1910s and 1920 was a poorly paid position and not a career that a man could follow to maintain the status of a “normal breadwinner.”

Conversely, the assumption for women in the early decades of the twentieth century was that they would manage the home, children, and their husbands’ emotional well-being. Because of this assumption that women were caregivers in the home, women were also deemed well-suited to teach children, perceived by many as an extension of motherhood.\textsuperscript{274} Amidst these early twentieth-century gender roles, the expectation of women was that they were not supposed to be ambitious beyond the bounds of their family and certainly not for themselves. Thus, according to Kinnear, a woman could never be considered an actively engaged person in her workplace and most certainly

\textsuperscript{271} Kinnear, 180.
\textsuperscript{272} Ibid., 150.
\textsuperscript{273} Ibid.
\textsuperscript{274} Dianne Miller, “Telling Tales in and Out of School,” 16.
could not be considered a professional.\footnote{Ibid.} In the sources available on the development of curriculum and professionalization in Alberta, women teachers are presented as merely symbolic of the private sphere of the home, incapable of fulfilling public roles as agents of institutional and political change. Because these gender roles dictated that only men could be professionals and women maternal caregivers, social studies continues to be framed as the achievement of men. Absent from this predominant view is the role of the practitioners, female rural school teachers who altered teaching methods, thereby contributing to curriculum reform.

The official publication of the ATA, \textit{The Alberta Teachers’ Alliance Magazine}, established by Newland in 1920, rallied support by publicizing the efforts, progress, and achievements of educators who raised the collective status of teachers in society. Throughout the 1920s the magazine, under the editorship of Newland, produced indulgent political rhetoric. In fact, scholar Patricia Obviate, author of the “Educational Contributions of H.C. Newland,” claims the \textit{Magazine} was Newland’s instrument of propaganda in how it made emotional appeals to its readers.\footnote{Oviatt, 12.} The front page of the first published issue of the \textit{ATA Magazine} in 1920 reads in Latin, “Magistri Neque Servi, or “masters not slaves.”\footnote{\textit{Alberta Teachers’ Alliance (ATA) Magazine}, 1 (1920): 1.} Newland certainly benefitted personally from his ambitious involvement with the professionalization of teaching in Alberta, as he rose meteorically in Alberta’s educational ranks from high school teacher to educational scholar, obtaining
a PhD from Chicago’s graduate school of Education in the 1920s. He also served as ATA president and, in 1935, became Schools Supervisor for the Department of Education.\textsuperscript{278}

Just as the lawyer or doctor controlled aspects of his trade, so too did teachers need to control their trade, stated an \textit{ATA Magazine} article from 1920, and this involved asserting control over the teaching force and curriculum design.\textsuperscript{279} The act of professionalizing teaching was analogous to the masculinization of teaching, at least at the level of creating leadership and bureaucratic positions in Alberta education. Teachers, a majority of whom were female, were merely practitioners or an extension of bureaucratic control.

The masculinization of teaching in Alberta certainly squares with the literature available on the subject. For example, men dominated the administration of the \textit{ATA Magazine}, dedicated to the cause of professionalization. The \textit{Magazine} regularly featured jubilant articles on male appointments to positions of authority in the ATA or Department of Education. One \textit{ATA Magazine} article, from 1935, regarding the election victory of Premier Aberhart, a former school teacher himself, reads as a call to arms among male teachers to engage politically and demand professional recognition by their government. “Teachers have received less recognition for their work than other classes. The Premier himself had to leave the classroom to get recognition, and in a few months succeeded in having the highest award conferred upon him.”\textsuperscript{280} The success story of Aberhart is presented as an inspiration to teachers, particularly men, to affirm themselves in

\textsuperscript{278} Oviatt, 15.
\textsuperscript{279} \textit{ATA Magazine}, 1 (1920): 3.
\textsuperscript{280} \textit{ATA Magazine} (1935): 15.
As will be outlined below, men asserted themselves in curriculum design and textbook writing, but primarily at the level of committee leadership and supervision. But the actual work involved in writing curriculum and textbooks was left to women such as Olive Fisher and Donalda Dickie. The author suggests a political calling for teachers and equates their work with that of the politician. “Teachers must demand…. professional status, similar to that enjoyed by lawyers and doctors.” The *ATA Magazine* and its content reflect a predominantly male perspective, preoccupied with establishing authority and leadership in the design of curriculum and control over teaching in the province. Also, in the early 1930s, as the depression shrank the labour market across the Canadian Prairies, calls for men to assume teaching positions held by women throughout the nation were vocalized by education officials. A Saskatchewan Department of Education official suggested that the country’s unemployment problems could be solved if the “55,000 lady teachers in Canada were eliminated from their positions, making way for men who are walking the streets.” While this radical proposal was never implemented, many leaders of Alberta’s education system travelled to the United States in hopes of advancing their careers and legitimizing their authority in curriculum design.

The ways in which progressive education was internalized by men and women attending graduate school in the United States may have differed considering the job prospects available to them upon their return to Alberta. Appointments to leadership and

---

281 Ibid.
282 Ibid.
other lofty positions awaited men, while women such as Donalda Dickie and Olive Fisher, who also obtained advanced degrees from Columbia, returned to the only employment option available to them, teaching in rural communities. In this way, Dickie and Fisher may have been more concerned with the social implications of progressive education than the professional implications. An interview with W. D. McDougall, also a student of Columbia University, confirms this notion. He claims that a number of graduates of Columbia, including Donalda Dickie, were “more closely associated with the social aspects of Alberta’s agrarian movement” and were “highly motivated by the social implications inherent in progressive education.”

Beyond McDougall: The Contributions of Dickie and Fisher

If female teachers were to be denied opportunities to lead and secure formal positions of authority, some would shape education in other ways, including in textbook design and curriculum committee work. Donalda Dickie was an Alberta rural school teacher, a normal school instructor, a Columbia and Oxford scholar, and the recipient of a PhD in history at the University of Toronto in 1929. Earning a PhD made her one of only six women to be conferred with a University of Toronto PhD in history prior to 1960. Despite her stellar academic record, she was never considered for a post in a history department. No doubt this was because the hiring of new faculty was done informally by department chairs seeking "good men." As Donald Wright argues, “Sexism not only protected the status of history as a masculine discipline but protected the academic labour

284 “Interview with W.D. McDougall and R.S. Patterson on reform to Alberta education in the 1930s,” 3. University of Alberta Archives, Accession no. 69-29, 3/1, File 1, Box 4.
285 Ibid., 677.
286 Ibid., 680.
market for men.”\textsuperscript{287} Although it is possible that Dickie did not wish to teach at a university and never sought a position, the aversion to female professors in history departments in general suggests more than personal preference was at work. Perhaps, as scholar Rebecca Coulter suggests, Dickie was motivated to overcome overt sexism by achieving exceptional academic excellence.\textsuperscript{288}

In any case, gender pushed Dickie to the margins of male-dominated authority, leaving her to employ a strategy of “practical action.”\textsuperscript{289} Admittedly, Donalda Dickie is an exceptional figure in Alberta’s educational history. But her situation as a practitioner with influence upon curriculum matters despite a lack of professional status was common to many other rural teachers. As demonstrated earlier in this chapter, rural teachers “got things done” as a matter of survival. While getting things done certainly benefited rural school communities, it was not a tactic that could be used to advance a women’s career, especially given the rigid gender roles typical of the period. However, both Dickie and Fisher acted as liaisons between educational authority and practical matters in the field. As established teachers in rural Alberta and as progressive education experts, Dickie and Fisher straddled two worlds. As progressive education experts they played a key role in implementing the theories of progressive education in an intelligible way to teachers. At the same time, Dickie and Fisher also ensured that Alberta’s agrarian movement’s cooperative and democratic values found tangible expression in curriculum reform.

\textsuperscript{287} Donald A. Wright, \textit{The Professionalization of History in English Canada} (Toronto: University of Toronto Press, 2005), 31.
\textsuperscript{288} Coulter, 695.
\textsuperscript{289} Ibid.
When Dickie returned to Canada from Oxford in 1917, she resumed her teaching post at Camrose Normal School, one of three of Alberta’s teaching preparations schools. Here she found the history textbooks used by Alberta students to be “literally incomprehensible to most...young readers.” As a result, Dickie began writing and publishing student textbooks that would be used until the 1960s. If she were denied the opportunity to lead from a formal position of authority, she would shape education in another way: by promoting a more practical reading of history along with a child-centered approach to teaching through textbook writing intended for history and its successor, social studies.

Dickie, a rural school teacher herself, realized that teachers had few resources to rely upon other than a textbook. She also understood that the textbook shaped the ways in which teachers taught. If history textbooks focused on the facts of history, with particular attention to dates and events, then teachers, she claimed, would follow suit by demanding memorization from their students. Furthermore, because the majority of students did not complete high school in the early decades of the twentieth century, what they learned in the primary grades was recognized by Dickie as particularly important in shaping the political consciousness and notions of citizenship among Alberta’s youth. Dickie’s involvement in textbook design and curriculum writing ensured that the implementation of progressive education would be firmly connected to rural communities’ need for practical educational reforms. Thus, Alberta’s agrarian movement, determined to elevate the social and political consciousness of rural students, and the process of

---

290 Ibid., 679.
professionalizing teaching, came together though the work of Dickie and Fisher, who worked as practicing teachers in rural Alberta and as progressive education experts.

Alberta’s educational authorities, specifically Fred McNally, the Provincial Supervisor of School in 1934, recognized Dickie’s proven ability for producing teaching and student materials. McNally invited Dickie into the curriculum writing process in 1934. Dickie’s proven expertise in writing textbooks for teachers and students moved her closer to the center of male-dominated authority. There is no indication from the primary or secondary record that she was seen as a threat to the existing relations of power. It would have been difficult for Dickie to be considered a threat, given that she was never appointed to a prominent position of authority or ever referred to as a professional in the primary record. Instead, Dickie is referred to only as a teacher, albeit a very capable one, at the Camrose Normal School.

McNally, like Dickie, attended Columbia’s graduate school, but admits that he “found John Dewey’s lectures incomprehensible.” Possibly because of his confusion regarding practical implementation, he invited Dickie to speak at a conference of school inspectors about the methods of progressive education. Well received by the inspectors, Dickie was assigned to the task of drafting a curriculum that reflected strands of progressive education. While the committee work was supervised by H.C. Newland, much of the actual work was accomplished by two women: Dr. Dickie, and Olive Fisher, a Normal

---

292 Ibid.
293 See “Donalda Dickie,” Accession No: 69-29, 3/1-5, Boxes 4-8, University of Alberta Archives.
School instructor in Calgary, also a PhD graduate of Columbia. Central to the plan for this committee was to create an interdisciplinary, child-centered, activity-based curriculum for the primary through to the high school levels. Dickie envisioned this approach as “the cooperative achievement of a social purpose that a teacher presents to her class with a view to having them use it as an experience in intelligent social behaviour.”

Perhaps because of Dickie’s and Fisher’s experience as practicing rural teachers and progressive educational experts, they were better positioned than others to translate theory into practice. Scholar Rebecca Coulter argues that Dickie was always interested in using education to promote social improvement and thought that this could be best achieved by offering students active, purposeful learning activities designed to prepare them for democratic citizenship.

W.D. McDougall’s unpublished memoirs, *Social Studies in Alberta,*” reflects a clear desire to highlight his independence in authoring social studies in the province. He claims that social studies curriculum was without “precedence,” bestowing him alone with the “overwhelming task” of creating a new course. He writes that “social studies had its birth in Alberta” when, in 1935, H.C. Newland invited “me to elaborate on ideas for a new course at the secondary (intermediate and high school) school level.” McDougall claims that from this date forward he was to “live, breath, and sleep social studies.”

---

296 Rebecca Coulter, 685.

and high school grades. I do contest, however, historians’ tendency to celebrate McDougall’s independence in writing social studies without reference to the work of others, including Donalda Dickie, Olive Fisher, or rural Alberta school teachers. A singular focus on McDougall also disconnects social studies’ development from the religio-political environment in Alberta, led by the UFA government, that enabled curriculum writers such as McDougall to participate in the first instance. My objective in this chapter has been to put McDougall’s singular role in writing social studies curriculum into a wider context.

While H.C. Newland oversaw the revision and writing of curriculum at the elementary and secondary grades in Alberta between 1934 and 1936, including social studies, the actual work was delegated to others. At the elementary level, Donalda Dickie, Olive Fisher, and William Hay were responsible for writing a new program of studies, which included the introduction of social studies in 1935. In the following two years, McDougall introduced social studies at the intermediate and high school levels. Therefore, the elementary program of studies, which included social studies, represents the very first attempt to formalize and infuse progressive education into Alberta’s curriculum. The elementary program involved teaching around “purposeful activities” that “revolved around central themes” or “enterprises.” Enterprise education involved a chosen theme such as “Foods,” and students would draw upon various disciplines such as health and science to explore the chosen theme. The enterprise program also included activities such as organizing a student council or investigating safety rules in

---

301 Von Heyking, “Implementing Progressive Education in Alberta’s Rural Schools,” 95.
302 Von Heyking, Creating Citizens, 71.
communities. The point was that students were to be active investigators and researchers of problems that they confronted in their communities, and they were to draw upon multiple disciplines to solve them. A list of community resources, books, and magazines was included in the program of studies that teachers and students could utilize.  

The integration of content was also key to the enterprise approach. The fusion of history, geography, and civics – social studies – reflected this integration. It encouraged students to see how history, geography and civics were interrelated and useful to think about when enquiring into a theme such as “government and law.” History, geography, and civics were not the only subjects that were integrated for the purpose of exploring broad themes. Science and health, literature and art, were similarly combined. Other subjects that were integrated were not given new titles. The enterprise approach was to engender appreciation for complexity as opposed to being strictly informational.  While some educational experts expressed concern that the quality of curriculum and instruction would suffer, the elementary program was positively received by parents, students, and the general public. In five elementary schools in which this progressive reform, including social studies, was piloted in 1935, the results and reactions of pupils and parents was recorded: “children are more keenly interested in their work; cooperation rather than envy-engendering competition tends to make schools happier places for all.”

303 Ibid.
305 Ibid.
The enterprise approach to education offered rural school teachers relief from two key problems. For teachers with students from multiple grades in their classroom, the enterprise method provided a single theme which could be taught to all students regardless of grade, and students could draw from relevant material to address the theme. Also, teachers could utilize supplies and resources that were at their doorsteps for theme-based activities rather than being tied to a single textbook (that they may not even possess) to guide the learning of specific material. In these ways, Dickie’s and Fisher’s elementary curriculum represents the first formal attempt to deal with the problems of rural school teachers. At the same time, the enterprise approach merely formalized what many rural school teachers had already discovered in their isolated conditions, years before formalization occurred.

Social studies and the enterprise approach to education at the elementary level thus replaced the tradition of drill and memorization with activities, projects, and problems to be collaboratively worked on by pupils. It instilled the notion of cooperation and inquiry, rather than conclusions dictated by the teacher or textbooks.307 The lack of general opposition to the enterprise approach, including social studies, points to the fact that social studies was not entirely revolutionary or without precedence, as Mr. McDougall and other historians suggest.

Although Newland asked McDougall to write social studies curriculum independently in 1936, it was widely and publically discussed at the Edmonton and Calgary educational clubs from 1933-1935, dismissing that which Dickie, Fisher, and McDougall were privy to.

to. The extent to which Dickie, Fisher, and McDougall collaborated on social studies at the elementary level is unclear. What is certain, however, is that social studies was not introduced at the junior and senior high levels until after a review of the elementary enterprise curriculum was done by a subcommittee established by Newland in 1935. It was after this review that Newland appointed McDougall to author social studies at the secondary levels, independent of collaboration. Clearly, an examination of Dickie’s and Fisher’s progressive reforms at the elementary level, including social studies, served, to some extent, as a benchmark for what McDougall would devise at the secondary grade levels. Based on McDougall’s work, there is a clear continuity of ideas and objectives flowing between social studies at the elementary and secondary levels. More than likely, McDougall borrowed from the elementary experiment. The links, however, between the elementary enterprise curriculum and social studies at the secondary level were largely ignored by McDougall and have been ignored by historians.

In a forty-page report written in 1965, “Curriculum Builders in Alberta 1902-1945,” McDougall inserts a miniscule three-page document by Dickie and Fisher on their curriculum writing involvement at the elementary levels, but distances their work from his own. In his prefacing remarks to their report, he discredits its factual basis at the outset, implying its inaccuracy. He writes that their report “was written twenty years after the event without the writers having access to documentary materials,” ignoring the fact

310 Ibid.
that his reports and memoirs were written thirty years after the fact.\textsuperscript{311} McDougall notes that he had penciled in corrections of the supposed errors. One change is particularly significant, considering the existence of circumscribed gender roles separating professionals from practitioners along gender lines. Newland’s official title, “Alberta Schools Inspector,” is absent in Dickie’s and Fisher’s report, but was penciled in by McDougall,\textsuperscript{312} perhaps to emphasize that Dickie and Fisher’s work was accomplished under his authority and not collaboratively as their report may have suggested without this inclusion.

In his report, McDougall also disregards the expertise of Dickie and Fisher as leading progressive educators, both of whom possessed PhDs from leading American centers of progressive education. At this time, McDougall possessed only a Master’s degree in education from the University of Alberta, which may have compelled McDougall to distinguish himself from the Dickie and Fisher based on gender norms that preserved the designation “professional” for men only.\textsuperscript{313} McDougall compliments Dickie and Fisher, commenting that “elementary education in Alberta appreciates the contribution to education by these two distinguished teachers.”\textsuperscript{314} The short document that follows narrowly focuses on the efforts made by Dickie and Fisher to infuse classrooms with practical activities as a means to relieve teachers of the difficulties confronting rural schoolteachers. This selective and short reference to Dickie’s and Fisher’s work

\textsuperscript{311} Ibid., pg. 11.
\textsuperscript{312} Ibid., 2.
\textsuperscript{313} R.S. Patterson, “The Implementation of Progressive Education in Canada,” in \textit{Essays on Canadian Education}, 81.
\textsuperscript{314} McDougall, “Curriculum Builders in Alberta Education 1902-1945,” 3.
demonstrates McDougall’s attempt to frame both women as merely practitioners in the
field, thus ignoring their role in formalizing progressive education in Alberta.

Surely, McDougall was not alone in appropriating social studies as his own invention.
It is likely that H.C. Newland, who appointed McDougall to write the curriculum,
reflected Newland’s desire to ensure that the development of social studies was credited
as an achievement of professionals – men – as a means to justify their influence and
authority in Alberta’s Education Department. A shared and collaborative project between
teachers in the field and professionals would likely tarnish the constructed myth that the
professional delivered the Alberta educational environment from backwardness.

Social studies was not the invention of a single individual. The relgio-political
environment shaped by the UFA/UFWA instigated curriculum revision in the first
instance, rural school teachers were pioneers of what was to become progressive
education, and the role of teacher/progressive education experts such as Dickie and
Fisher was at the forefront of progressive education and social studies’ formalization in
Alberta schools. Echoes of each of these developments and contributors can be heard
when reading the forward in one of the first social studies textbooks authorized for use in
Alberta, *The World of Today:*

The pupil of today is not living in an individualistic society. He is living in a society where men must work together, where men must pool their knowledge and experience if the crucial problems of today and tomorrow are to be coped with successfully. It becomes the duty of the school to furnish the pupil with a variety of experiences in group living. The school must assume responsibility for meeting the particular needs of each pupil in order that he may
thereby be better equipped to contribute to the successful functioning of the social group to which he belongs.\textsuperscript{315}

Alberta’s farm movement, rural school teachers’ innovations as a result of shifting social dynamics, the precedent-setting elementary curriculum of Dickie and Fisher, and the masculinization of the teaching profession in Alberta, all contributed to the advent of social studies. It was not the invention of a single man.

\textsuperscript{315} McDougall and Gilbert Patterson, \textit{The World of Today} (Toronto: Ryerson Press, 1937), 38.
CHAPTER FOUR: CITIZENSHIP TRAINING AND SOCIAL STUDIES: 
THE FULLFILLMENT OF THE UFA/UFWA’S COOPERTIVE MOVEMENT

In the previous three chapters I have attempted to place the origins of social studies into a wider context than has been provided by historians to date. In this chapter, I will examine Department of Education’s files as well as history and social studies textbooks, authorized for use in Alberta classrooms between 1880 and 1960, to determine how the shift from history curriculum to social studies manifested itself at the level of prescribed instruction.

Social studies curriculum in Alberta can be understood as the fulfillment of the UFA/UFWA’s desire to create politically active citizens capable of transforming society according to their own cooperative and democratic values. The animating principle of the Alberta farmers’ movement amidst social, political, and economic adversity was cooperation.¹³¹ Alberta farmers believed they carried the burden of national growth without adequate compensation or political representation. John A. MacDonald’s National Policy, which effectively exploited the West for Eastern Canada’s benefit, was still in place in the early 1920s. For example, farmers in the West established a market for eastern manufactured farm equipment that was more expensive for them because of the national tariff. However, farmers were being forced to buy equipment protected by the tariff while not being afforded the same protection as Eastern manufacturers.¹³² At the same time, basic infrastructure such as highways and schools was undeveloped in the

---

¹³² Ibid., 43.
West compared to that in Eastern Canada’s urban centers.\textsuperscript{318} And to make matters worse, climactic drought ravaged the landscape of farmers during the 1920s and 1930s, turning crops into dust.\textsuperscript{319}

It was in this context that farmers wished to improve their immediate economic and political situation. But doing so required altering basic social attitudes. The UFA/UFWA believed that this could best be accomplished through education because an educated and involved citizenry would keep political leaders fixed on the interests of the people – interests informed by the movement itself.\textsuperscript{320} As discussed in previous chapters, various informal educational initiatives, such as the better farming trains and UFA/UFWA youth camps, served the UFA/UFWA’s objective of raising awareness regarding economic and political issues vital to farmers, while preparing citizens for active political duty in order to sustain the movement in the province and the nation at large.

Once the UFA/UFWA took direct political action and formed the provincial government in 1921, a more direct educational approach was employed. Now provincial curriculum would be used to align Alberta students with the active political duties of the cooperative UFA/UFWA movement.

History curriculum taught in Alberta before the Great War taught students to be passive citizens who absorbed British values. After the War, active political citizenship, based on Alberta’s cooperative experiment in group government, came to define post-war curriculum reform. In textbooks and curriculum documents, the concept of cooperation

\begin{flushleft}
\textsuperscript{318} Ibid.
\textsuperscript{319} Ibid., 44.
\end{flushleft}
frequently appeared as a social studies objective. But it was framed predominantly in the context of Alberta’ experience with cooperative organizations such as the Wheat Pool and the UFA/UFWA movement. This regional bias distinguishes social studies textbooks written in Alberta from those authored in other regions of Canada, particularly Ontario.

Citizenship training in the 1920s became the foundation of social studies in the 1930s. Citizenship training became a formalized public school course that replaced history curriculum at the elementary grade level in 1922, and emphasized the need for cultivating cooperative and politically active citizens through practical learning activities, which often replaced the memorization and regurgitation of facts. It is important to note, however, that citizenship and social studies did not liberate students from having values imposed on them by government authorities; rather, it replaced passive learning with active learning and replaced the learning of British values with the prescribed cooperative values of the UFA/UFWA.

How history curriculum was delivered in the classroom is difficult to know, but because textbooks were often the singular resource for students and teachers they represent a key window into the actual content and approach to teaching history. Values, symbols, memories, myths, and traditions can be teased out of books through an examination of the major themes and events that had to be covered in textbooks on Canadian history, according to historian Jose Igartua’s analysis of textbooks used in Ontario after the Second World War. Igartua shows how definitions of Canadian identity were transmitted to the next generation of Canadians through history textbooks used in schools, and he claims that textbooks represent authors’ attempt to fashion history and
ways of perceiving the world that they believed should be shared by society at large. On the other hand, a key difference between history curriculum and social studies was the latter’s dismissal of textbooks as the primary tool of instruction. As the Alberta Program of Studies introducing social studies in 1935 states, “the pupil’s textbook will be the community in which he lives.” This grassroots approach to curriculum; making the community the pivot around which curriculum revolved, was reminiscent of the social gospel movement’s tendency to dethrone the bible and religious doctrine as the main authorities, replacing them with active community service based on Christian ethics. Doing so allowed the principles of Christianity to expand beyond the confines of the church, finding practical application in social and political service in Alberta in the 1920s and 1930s. Similarly, with the advent of social studies, historical inquiry expanded beyond a student’s textbook and the narrow walls of a classroom, permeating social and political service in Alberta through active citizenship. As a result of this shift in focus away from a single textbook, various books and resources were used to teach social studies. The change from history to social studies in Alberta reflects the shifting social, political, and economic values in Alberta during the 1920s and 1930s and will be highlighted through textbook and educational document analysis.

Textbooks and provincial programs of study files reflect, as Iguarta suggests, authors’ attempt to fashion history and mould students in ways consistent with the authors’ beliefs. This is not to say that the authors of social studies textbooks and curriculum were UFA/UFWA leaders; they were written by leading educators such as Donalda Dickie and Jose E. Iguarta, The Other Quiet Revolution: National Identities in English Canada, 1945-71 (Vancouver: UBC Press, 2006), 63.

W.D. McDougall. But it was the UFA/UFWA who applied pressure on the Department of Education to include in school curriculum information about cooperation, as well as social, political, and economic issues particular to Alberta.\textsuperscript{323} Thus, the authors of social studies curriculum and the textbooks they authored cannot be entirely separated from the larger movement that instigated reform. Social studies is accurately understood as the fulfillment of the UFA/UFWA’s desire to shape citizens for active social and political duty.

**Imperial History in Alberta Prior to WWI**

It is important to note that although education was a provincial responsibility, as defined in Section 93 of the British North America Act (BNA), history curriculum prior to WWI in English-Canada was intensely nationalistic and imperial.\textsuperscript{324} Inspiring patriotism for the nation based on British imperial values is something historian Carl Berger has identified as Canadian imperialism.\textsuperscript{325} Curriculum writers and textbook authors depicted a glowing future for Canada, but one solidly grounded within the British Empire. Prior to the First World War, Canadian nationalism and pro-British imperialism were two sides of the same coin. A textbook used throughout Canada for teaching history, titled *Canadian Civics*, captures the essence of pre-war Canadian nationalism. The book’s author, J.S. Jenkins, stated that “the word colony we do not like, and we

\textsuperscript{323} “UFA Annual Conference Resolutions, 1931,” File 170C, Premiers’ Papers, Provincial Archives Alberta.

usually speak of ourselves as a ‘nation.’ Some object to the name ‘nation’ because it
ordinarily means an ‘independent nation’ or ‘sovereign state,’ and we do not claim to be
that, but desire to be part of the Empire.’ A Canadian nationalism based on the idea of
pride and imperial membership was something challenged after the war by farmers. They
interpreted British imperialism as an instigator of greed, violence, and competition. It was
these forces, according to western farmers, that had reduced them to political and
economic subservience.

A national and imperial orientation to history curriculum reflected, in part, the
nation’s demographic, particularly that of the oldest and largest English-Canadian
province, Ontario. According to Canadian census data in 1881, 80% of the population of
Ontario was of British stock, that is, English, Irish, Scottish and Welsh. By 1931 this
number had dropped to 75%, a result of increased immigration from Eastern European
countries and the United States. Critics and the Department of Education in Ontario
were visibly concerned about immigration from non-British countries, fuelling their
campaign to use history to establish loyalty to Canada and the British Empire. George
Wrong, one of Canada’s first professional historians, articulated concern for the
“daunting task of assimilating the vast hoard of newcomers” from continental Europe.
While few historians openly subscribed to the fashionable Edwardian theory of racial
degeneration, these pre-war textbook authors were clear about racial assumptions.
They rarely intimated that Eastern Europeans or Americans had sullied Canada’s British

326 Larry A. Glassford, “Citizenship Literacy and National Self Identity: The Historical Impact of
Curriculum and Textbooks in Shaping the Character of Ontario,” in Active History.ca,

328 Glassford.
heritage, but instead focused on groups such as the French and First Nations as groups incapable of advancing the material and political development of Canada. For example, in *The Canadian West*, authorized for use in Ontario and Alberta schools, Alexander McIntyre asks a series of rhetorical questions regarding why the “Indian” chose not to develop the material and resource potential of the land, thus leaving it up to the British to exploit. McIntyre asks:

Why did the Indian not tame the wild animals about him? Why did he not cultivate plants? Why did he not make greater use of the metals found in the country? Has he [Indian] done any good then? He [Indian] was only a worker in stone and in bone, and these cannot be compared with the iron and steel of today.

The author proceeds to celebrate British fur traders, fisherman, railway men, and politicians as the generators of progress. For these authors, British ethnicity was inherently progressive, while non-British groups in Canada were backwards and incapable of advancing Canada to her true potential.

Like Ontario’s history curriculum prior to WWI, Alberta’s program for history reinforced Canada’s connection to Britain through textbooks that emphasized the material benefits that flowed from the advance of British civilization. Also, because Canadian regional markets for textbooks were too small for publishers to offer province-specific textbooks, those published in Ontario were essentially English-Canadian texts, used by provincial education departments throughout the country, including Alberta.

---

330 John Gray, *Fun tomorrow: Learning to be a Publisher and Much Else* (Toronto: Macmillan, 1978), 16.
It is also important to note that Alberta’s ethnic makeup was becoming increasingly diverse, even more so than Ontario’s, as a result of mass immigration before the outbreak of war. The influx of newcomers to Alberta highlighted for some the need to assimilate immigrants. In 1911, Alberta was overwhelmingly made up of new immigrants; only 20 per cent of the population was actually Alberta-born.332 Almost half the population was made up of German, Scandinavian, and Eastern European minorities.333 Political leaders, clergymen, and educators had to come to grips with fact that Alberta’s population was indeed ethnically diverse. Most Anglo-Albertans, including many clergymen, politicians, and educators, agreed that European immigrants were in need of an intensive “Canadianization” policy.334 The focal point for all those concerned with assimilating immigrants in Alberta, according to historian Howard Palmer, was the school system.335

Prior to the war, the goal of the Alberta school system was Anglo-conformity. The values to be inculcated by the schools and the curriculum were those of British-Canadian nationalism, citizenship, and the Protestant work ethic.336 The Department of Education in Alberta claimed that for students of history “the state should ultimately emerge as the highest of human institutions and loyalty to the state as the first virtue of the citizen.”337

History, Alberta’s Department of Education continued, “was the most important subject

in developing citizens; it was through the study of history that students would identify
themselves as Canadians and as members of the British Empire.\textsuperscript{338}

Textbooks authored at the turn of the century and used in Ontario and Alberta schools
before the war emphasized stories of discovery, order, and progress – accomplishments
intrinsically tied to the apparent racial superiority of the British. For example, William’s
Swinton’s \textit{Outlines of the World’s History} asks readers to consider, “What have been the
great steps in human progress – the discoveries, social and political changes, advances in
thought and skills, that have carried forward civilization and the ‘betterment of man’s
estate’; and what is the series of events that has brought the world up to its present
standard of enlightenment and knowledge?\textsuperscript{339}” The answers to these questions are found
in his detailed descriptions of improvements to education, transportation, industry, and
politics brought about under British rule.

Historical textbooks also presented a largely teleological interpretation of historical
events. Scholar Herbert Butterfield in his 1931 \textit{Whig Interpretation of History} criticized
this approach to writing history.\textsuperscript{340} Butterfield argues that the tendency among historians,
to draw straight lines between historical events, charting an unbroken narrative of
progress that results in the present, is rooted in the turn-of-the-century conviction that the
era of progress brought about under Queen Victoria’s reign was exceptional.\textsuperscript{341} This
narrative of continual progress was seen as a direct result of British monarchical rule,

\begin{footnotes}
\footnotetext{338}{Ibid.}

\end{footnotes}
claims historian Carl Berger, and the spokesmen for this certitude included early Canadian historians.\textsuperscript{342} George Wrong, one of Canada’s first professional historians, wrote textbooks for grade-school students of history, depicting Canada as a peaceful and progressive march from colonial status to responsible government.\textsuperscript{343} This progressive trajectory, Wrong claims, was best learned by paying close attention to the facts.\textsuperscript{344}

Despite their insistence on the importance of learning the facts of the past, historians did not hesitate to make strong moral judgments about those facts in order to shape character and conduct among Canadian students. For example, W.D. Lighthall, a late nineteenth-century Canadian historian, claimed “the seeds of English-Canadian progress were deliberately sewn by strong and intelligent men, who brought with them those principles and customs, acquired through centuries by their island forefathers, that their descendants still cherish as their most precious heritage.”\textsuperscript{345} Consistent with the kind of history being written in the early twentieth century, historian George Wrong incorporated a moralistic and empirical approach to history, claiming the historian’s role was guarding truth and also using truth to express appropriate “standards of conduct and character.”\textsuperscript{346}

An important standard of conduct was loyalty among citizens to Britain. Pre-war history texts condemned those who were disloyal to the British Crown. For example, the rebellions of 1870 and 1885 were dismissed as outright treasonous by authors A.B. Buckley and W.J. Robertson in their text, \textit{A High School History of England and

Canada.\textsuperscript{347} Both stressed that Louis Riel had “captured men loyal to Canada,” including “Thomas Scott, a brave, outspoken loyal subject.”\textsuperscript{348} They described the Métis Rebellion of 1885 as a “treasonous and barbaric act,” while celebrating the British forces, which fought with “valour, bravery, and allegiance to the Crown.”\textsuperscript{349} The British conquest over the French was described as a welcome change from the “fatherly despotism” and corruption, which, according to W.H.P Clement, had plagued French colonial administration and was the reason for the British victory.\textsuperscript{350} D.M. Duncan goes further, suggesting the conquest was a development welcomed by the French, liberating them from political backwardness, and he claims the French “became reconciled to the change which had taken place.”\textsuperscript{351}

Canada, according to these pre-war textbooks, should be defined by its relationship with the British Empire. If students somehow missed this point in books, the physical classroom environment reinforced the same message. One schoolteacher described his Edmonton classroom in 1909 in the following manner:

On the end, facing the door is a picture of King and Queen, with neat little Union Jacks and Canadian Flags, surmounting each to loyalty by association...on one side are life-sized portraits of Shakespeare and Milton to inspire admiration and appreciation of our literary inheritance.\textsuperscript{352}

A shared belief among provincial educational authorities and historians who wrote textbooks and historical curriculum prior to WWI was that learning the facts of history cultivated one’s intellectual and moral character. Knowing the key facts of British history and Canada’s role in it would engender British character and respectability. In the introduction to *The History of the Dominion of Canada*, E.M. Sims and G.M. Wrong claim that a “simple narration of events” would enable students to engender the notion of unfettered progress associated with the advance of British civilization.\(^{353}\) Historian George Stanley recalled this approach to history lessons as a grade-school student in Calgary, noting that it “involved copying notes off the blackboard and repeating them verbatim on the examination.”\(^{354}\)

In a speech to the American Historical Society in 1898, historian George Wrong claimed that “not enough class time was devoted to instruction in history and that textbooks were inferior in quality.”\(^{355}\) Wrong’s criticism was directed primarily at amateur historians who authored numerous historical textbooks used in grade school throughout Canada before the turn of the century. Wrong and many other university historians worked to professionalize the writing of Canadian history as a means to secure work for themselves, argues historian Donald Wright.\(^{356}\) Their successful efforts in professionalizing the writing of history in English Canada resulted in a flurry of textbook writing by historians intended for secondary schools, following the turn of the century.

and up until the Great War.\textsuperscript{357} Provincial authorities of education in Alberta supported professional historians’ work at this time, claiming that it was they “who are best in a position in society to provide expert status to both teachers and students.”\textsuperscript{358} In classrooms, textbooks became the dominant voice whereby teachers recited facts from the books and students memorized them until the exam. This led one Alberta school inspector in 1915 to report that history instruction “loaded the pupils’ memories with bald facts” recited from the textbook, leading to boredom among most students.\textsuperscript{359}

History textbooks, authored largely by eastern Canadian historians, remained the singular authority for historical instruction in Alberta schools until the late 1920s. Students’ adoption of the facts of history, which meant learning about British superiority and its innate ability to spawn material progress, would lead to what department officials in Alberta called “good character” and the “right ideals of citizenship.” The good citizen was one that knew the facts of the British Empire and absorbed them consciously or unconsciously as their own, claimed J.J. Tilley, who authored training manuals for teachers prior to the war. For him, and early historians such as Wrong, “history abounds in examples of courage, patriotism, devotion to duty…in short all of those higher qualities which ennoble mankind.” For Tilley, when the student properly considers these qualities, the mind will be led to form the correct judgments and will influence the character of the student.\textsuperscript{360}

\textsuperscript{358} Alberta Department of Education, Program of Studies, 1912, quoted in Ibid., 9.
\textsuperscript{359} Alberta Department of Education, \textit{Annual Report of the Alberta Department of Education}, 1907, 43.
Ken Osborne, an expert on history and social studies curriculum in Canada, has pointed out that this passive view of citizenship training was typical of the pre-war textbooks used for history curriculum. He argues that “citizenship education at this time was seen in prophylactic terms, as a way of preventing the spread of political radicalism.”

Alberta adopted Ontario’s intellectual and political opinion that the bulwark against foreign influence and political radicalism was public education and that the active agent for establishing British loyalty and political harmony was history. Inculcating British values among Canadian youth, including increasing numbers of Eastern European and American immigrants, would presumably ensure Canada’s British heritage and political stability. It was not until the 1920s that Alberta exerted influence over curriculum design, challenging a national-imperial history curriculum deemed ill-suited to Alberta’s shifting social and political climate.

After the First World War, the UFA/UFWA mobilized the rural populace in order to foster the growth of its social-political movement. History curriculum and the method by which it was passively taught were targeted as out-dated and ineffective for dealing with contemporary political and economic conditions particular to Alberta. For example, the UFA Committee on Education claimed that the economic crisis of the 1930s stemmed from the educational system of years past. The passive nature of citizenship that had characterized the pre-war era, based on promoting British values, was replaced by active

social and political service in one’s community based on cooperative values moulded by the UFA/UFWA.

Citizenship Training after WWI

Historian Carl Berger argues that in the post-war atmosphere of reform, history itself was reformed to concentrate on the nature and origins of contemporary political and economic problems of the common man – the problems of the individual and not the British empire.364 In 1921, the year the UFA took power, the Alberta Department of Education recognized the importance of revising formal school curriculum to respond to the economic and political challenges facing the province. The cataclysmic events of the First World War, interpreted by the UFA/UFWA as evidence of a world made hideous by competition, imperialism, and greed, spawned the idea among educationalists and textbook authors in Alberta that harmony, tolerance, and cooperation must be learned and fostered in formal school curriculum.365 For UFA/UFWA leaders and educationalists alike, schools should no longer convince students of the material progress and harmony established by British civilization in Canada; rather, students were to be given the skills that would allow them to actively create political and economic stability. The pre-war narrative of progress, as it appeared in historical curriculum and textbooks authorized by Alberta’s Department of Education, was challenged by UFA/UFWA leaders and teachers.

In 1921, the year the UFA took power, the Department of Education undertook an extensive public opinion survey regarding Alberta’s school curriculum. Questionnaires

365 Rennie, 54.
were sent to a wide range of groups, such as the UFA and UFWA locals, women’s institutes, the Teachers’ Alliance, school boards, social clubs, and labor unions. The survey made apparent Albertans’ desire that education should “unite the public in a commitment to community service and social improvement... and should create a sense of group consciousness.”

This survey formed the basis for a major curriculum revision for the entire program of study for Alberta curriculum in 1922, as discussed in chapter two. But it is worth emphasizing again the electric atmosphere that surrounded this reform project, an atmosphere scholar Margaret Ayelsworth referred to as “spiritually charged.” Those involved in the project seemed to believe that the regeneration of the world was at hand. Indeed, many teachers and curriculum writers appeared to support a concept of citizenship that had much in common with the understanding of Christian service that was such an integral part of the social gospel. Teacher W.B. Poaps captured this Christian service sentiment in an *ATA Magazine* article in which he reminded fellow teachers that they cared for children’s souls, stressing that “the school should be a society with interests common to all, and it should promote, as no other agency can do, those altruistic virtues which are characteristic of a righteous people.”

The Department of Education committee in charge of the revision took this advice to heart. In its final report it emphasized “the urgent need for citizenship training...among the children of Alberta.”

---

367 Ibid.
The committee unanimously agreed, despite its diverse membership, that every effort must be made “to strengthen the school as a great agent for the development of virtuous self-reliant citizenship with right habits and right ideals.”\textsuperscript{370} Developing character through citizenship training was the ultimate purpose of schooling, and the committee recommended “using the material of the course in history for this purpose.”\textsuperscript{371}

Although social studies was not created by this 1921 revision committee, a new citizenship course was devised and replaced history at the elementary grade levels by 1922. This course would provide opportunities for elementary students to practice the specific virtues of citizenship, defined as helpfulness, sympathy, tolerance, justice, and fair play.\textsuperscript{372} The citizenship course objectives in grades I and II, as described by the Department of Education in 1922, were to “develop group consciousness.”\textsuperscript{373} It was the teacher’s duty to “provide suitable work-like activities in the classroom as a medium through which the citizenship experience obtained by children naturally in family and play-groups will take form and meaning in accordance with what is implied in living as an adult member of present-day organized communities, social and political.”\textsuperscript{374} Students were to “cultivate experience in organization” by participating in “pupil-group” discussions, debates, and competitions or by organizing the school’s Junior Red Cross or Junior Civics League activities.\textsuperscript{375}

\textsuperscript{370} Ibid.
\textsuperscript{371} Ibid.
\textsuperscript{372} Alberta Department of Education, Part I of the Course of Studies for the Elementary Schools of Alberta, English and Citizenship (Edmonton: King’s Printer, 1922), 128.
\textsuperscript{373} Ibid.
\textsuperscript{374} Ibid., 130.
\textsuperscript{375} Ibid., 138.
When historical content was introduced into the citizenship course it was used only in so far as it could inform how to live cooperatively “in social groups.”\textsuperscript{376} For example, the citizenship course objectives stated that when studying the fur-trade era of explorers, traders, and missionaries, teachers must emphasize how these groups built trade relationships and communities in new lands. The Alberta Program of Studies for 1922 instructs that Indian tribes, families, classrooms, and rural towns were to be examined as specific examples of the benefits of group organization.\textsuperscript{377} When incorporating historical content, teachers were directed to avoid the memorization of facts. Rather, students were to incorporate group activities alongside specific historical material that reinforced the benefits to be realized through cooperation.\textsuperscript{378}

The writers of Alberta’s citizenship course were highly educated teachers such as Fred McNally and Donalda Dickie. As discussed in the previous chapter, both graduated from leading centers of progressive education in the United States or Britain. In part, it was there that McNally and Dickie learned how classrooms could incorporate practical activities to unite the public in a commitment to community service and social improvement.\textsuperscript{379} At the same time, these authors did not act on their own accord. They were enabled, in part, by a UFA government eager to bring Alberta’s educational system in line with their own cooperative and democratic values.

Historian Jose Igurata’s analysis of historical textbooks in Ontario includes those that were published in Alberta by Donalda Dickie. However, he makes little mention of the

\textsuperscript{376} Ibid
\textsuperscript{377} Ibid.
\textsuperscript{378} Ibid.,140.
\textsuperscript{379} Von Heyking, Creating Citizens, 34.
differences between her books and those of earlier Ontarian authors. He acknowledges that Canadian history was depicted by Dickie in more positive terms, but suggests that her portrayal was not drastically different from the racial or Euro-centric judgments typical of earlier works.\textsuperscript{380} To be sure, Dickie, like her predecessors, did not refrain from declaring the superiority of British institutions. For example, she describes “Democracy as clearly a British invention and believed that French Canadians would enjoy the progress and economic prosperity brought about by the conquest.”\textsuperscript{381} But Iguarta misses the significance of the cooperative and democratic ethos that underscores Dickie’s re-imagining of Canada’s past. This tendency by Dickie is overt, not subtle, and is a significant departure from earlier writers. Her reinterpretation of Canadian history includes the introduction of citizenship training, consistent with what the UFA/UFWA had implemented in various informal ways to build their movement. Dickie’s interpretations also reveal a distinct Alberta bias, reflecting Alberta’s shifting social and political environment. Alberta’s curriculum writers implemented a formalized citizenship-training course based on social and political action deemed essential to the survival of the UFA/UFWA movement.

In over twenty textbooks, including the \textit{Dent Series Canadian History Readers}, Dickie described cooperation as intrinsic to all Canadian ethnic groups, emphasizing that it is the duty of Canadians to ensure that they continue into the future. The Department of Education in Alberta echoed this objective, identifying the following as a key objective of the new citizenship course: “students must learn mutual understanding, tolerance and

\begin{flushright}
\textsuperscript{380} Iguarta, 66
\textsuperscript{381} Donalda Dickie, \textit{The Great Adventure: An Illustrated History of Canada for Young Canadians} (Toronto: J.M. Dent and Sons, 1950), 12.
\end{flushright}
cooperation, as the unity and prosperity of our common country depend upon it.” The impulse to create unity throughout Canada was spurred on by fears over the division between French and English exposed by the war, motivating educators and historians alike to deal more kindly with French, English, and Aboriginal Canadians. Historian Carl Berger has identified the tendency among historians in the 1920s to establish a sense of unity and cooperation in their interpretations of Canadian history. Renowned Canadian historian, Arthur Lower, for example, worked to develop a sense of national community among Canadians, united by unspoken assumptions such as the stable bonds that unite a family. Lower identifies cooperation as the most powerful motive for action among men from which the greatest benefits flow. Berger also notes that Lower’s inclination towards cooperation and national unity prompted his interest in the League for Social Reconstruction and in the ideals of the Cooperative Commonwealth Federation, a federal political party founded in Calgary in 1932 by prominent UFA/UFWA leaders such as William Irvine. At the same time, historians such as Lower did not go as far as Dickie in suggesting that examples of cooperation in Canada’s past should be a guiding principle for Canadian citizens in the future.

*When Canada was Young*, published in 1922, Dickie emphasizes commonalities between French and English Canadians, highlighting their unity in purpose in pursuing common social and economic objectives. For example, Dickie describes the life of early French settlers in Quebec as analogous to farmers in western Canada. Quebec settlers,

---

384 Ibid., 112.
she claims, toiled through isolation and climactic hardships, as famers in the West had. Also, habitant homes in Quebec were of a similar condition and familiar to those in the West, explains Dickie. They contained families similar in size to those in every other part of the country, and just like the English Canadians, French Canadians took Sunday off for church.  

Dickie describes French habitants and English settlers as sharing common economic aims such as the fur trade and agriculture. She describes how the North-West Company and the Hudson’s Bay Company merged successfully and peacefully because of shared objectives to cooperatively develop the fur trade industry. Dickie’s romantic interpretation of Ukrainians, Chinese, Finns, and First Nations as inherently cooperative was less an historical revision of the past as it was a guide for action in the future. Dickie is emphatic throughout her textbooks that active cooperation between groups is a condition upon which social improvement for all can be realized. If cooperation was the animating principle of the UFA/UFWA, it was also the dominant theme in textbooks authored in Alberta for use in citizenship training classes.

Dickie also criticized historical events that lacked cooperation between groups. While her book, The Great Adventure, published in 1950, was released after the period being examined in this section, it illustrates Dickie’s tendency in her earlier works to emphasize cooperation as an historical truth that should be engendered by students. In this textbook, she argues that Aboriginals have not always been treated well and

---

386 Ibid., 101-104
387 Dickie, The Great Adventure, 110.
identifies a lack of cooperation between government and First Nations as the primary cause. She criticizes the Canadian government’s unilateral actions as unwise and maintains that they created “many difficulties and problems for Indians, problems which have not yet been met successfully.”

Dickie also condemns the Canadian government’s trial and execution of the Métis leader Louis Riel without consideration for Metis claims to cultural preservation. In conjunction with her critical assessment, Dickie establishes a cooperative path forward between Aboriginal and Anglo-Canadians by citing examples of profitable cooperative action between these two groups. She describes how a woman from a Mohawk settlement in Ontario worked out an agreement with English settlers to prohibit alcohol in order to remedy what Mohawk women claimed was the degeneration of their men by the white man’s drink. Dickie provides a vignette of a British settler, who corresponded with the Mohawk regarding their request and agreed to communicate with his government regarding prohibition, a request she claims was agreed to.

Dickie also establishes parallels between Anglo-Canadian and Aboriginal forms of social and political organization. She claims that First Nations peoples have enjoyed “the products that flow from cooperation” and that most Aboriginal groups “did all things cooperatively and so had the comfort of company in hardship.” Dickie points out that “the natural products of the tribe’s hunting ground belonged to all in common...the hunter shared his game with all.” Dickie also claims that the “Red Men were democratic.”

Each chose a leader, according to Dickie, “but the others followed him only when they thought his plan was good.” She states that tribes were governed by councils of leading men, drawing parallels with British concepts of responsible government.

Textbooks authorized for use in Alberta’s citizenship course, but produced in Ontario, did not emphasize cooperation and common cultural pursuits among Canada’s ethnic groups with the same frequency or emphasis as Dickie. For example, while W.L. Grant’s *The History of Canada For High Schools* showed a more sympathetic stance towards French Canadians and Aboriginals than texts produced before the war it still maintains a tone of condemnation. Grant suggests that blame for the Riel Rebellion should be distributed more evenly, but insists Riel was rash, vain, and deserving of his fate. Grant also acknowledges the contributions of French exploration, discovery, and culture in Canada, but reaffirms that British rule was fair and welcomed by most French Canadians. Alberta’s curriculum designers who devised Alberta’s citizenship training course to replace history, and Dickie who reimagined Canadian history as inherently cooperative, were far more bold and explicit than writers in other provinces in adjusting curriculum and textbooks to reflect the shifting social and political climate of their province in the 1920s.

**The Advent of Social Studies in 1935**

Just as Alberta and Ontario drew selectively upon British history to instill the “right” ideals of citizenship before the war, so too did Alberta draw upon rosy and cooperative

---

394 Ibid, 17.
interpretations of Canadian history after the war. It was this spirited era of educational reform in Alberta’s history that led to the introduction of social studies in 1935.

The new citizenship course that emerged in Alberta elementary schools in 1922, described as intrinsically cooperative, demanded that teachers promote activities that reinforced the values of cooperation in their classrooms and communities. The tendency of history to be downgraded as secondary to the priority of training students in cooperative behavior was a phenomenon that accelerated in the 1930s, the years of the Great Depression. For example, in 1931 a UFA/UFWA Conference Convention agreed unanimously to pressure the Department of Education to introduce “a special course on cooperation … in schools, and requested that high school teachers be given “a better understanding of the principles underlying our experiment in democratic government, with a view to gaining a more sympathetic attitude on the part of teachers towards this effort.” The UFA/UFWA argued that school curriculum must “advance society towards a new form of social organization in which competition and individualism be replaced by the principles of equity, justice and social well-being.”

The Department of Education responded to UFA/UFWA’s demands by producing social studies curriculum, which eventually replaced history at all grade levels in Alberta by 1937. Curriculum writers and textbook authors such as H.C. Newland and W.D. McDougall echoed the appeals of the UFA/UFWA for a new course. McDougall

---

399 Alberta Department of Education, Program of Studies for Secondary Level, 1937.
proclaimed that “in the midst of a world-wide depression and in a period when the war drums were again throbbing in Europe, it did not seem realistic to study the problems of ancient Egypt, Greece and Rome.” And H.C. Newland, the supervisor of the committee that created social studies at the secondary level, concluded that “The present aura of despair caused by the depression required action in the present based on cooperative and democratic principles.”

Social studies curriculum embodied the citizenship training that emerged in Alberta curriculum during the 1922 school revision by subordinating a study of the past to the need for cultivating cooperative citizens in the present. To this end, social studies integrated individual subjects such as history, civics, and geography under the banner of social studies. The point was that learning the facts from various disciplines “must be integrated by a social purpose…and be ready for future” use than are isolated facts, argued Dickie in her teacher manual on progressive education, *The Enterprise in Theory and Practice*, which was the foundation for teaching social studies curriculum. Dickie claimed that subject matter is supplementary and secondary to the need for social training, which is intended to provide experience in living and working together cooperatively.

*The Enterprise in Theory and Practice*, Dickie highlights the potential of schools to meet the aspirations of the UFA/UFWA movement to create politically active and

400 W.D. McDougall, *In and Out of the Classroom, 1914-1964*, unpublished manuscript in McDougall Papers, University of Alberta Archives.

engaged citizens. The rural school, argues Dickie, is ideal for training in social adjustment.\textsuperscript{403} For her, “the classroom is composed of various age groups, mental abilities and interests and tastes. Thus it produces the same elements and presents many of the same problems as those arising in adult groups.”\textsuperscript{404} She believed that an opportunity existed in classrooms for learning that dependence on each other is good for all, and she concluded that “the rural school classroom can be built into a close-knit model community in which each is loyal to all, a nucleus of cooperation.”\textsuperscript{405}

The Department of Education in Alberta agreed with Dickie regarding the use of the classroom as a training ground for moulding social behaviour. As of the mid-1920s, promotion to a higher-grade level was based on a “credit” system, whereby one credit equalled a certain amount of instructional time. This meant that students could no longer successfully complete courses by simply writing the departmental examination.\textsuperscript{406} Students were required to be in the classroom for instruction. With the introduction of the credit system, students presumably experienced important cooperative learning activities to a greater extent than before. The newly devised credit system reinforced the importance of the classroom as an incubator for creating social change, and it was supported by the UFA/UFWA government and by textbook authors such as Donalda Dickie.

Social Studies Textbooks

It is interesting to note two key differences between social studies textbooks penned in Alberta versus those published in the United States or Ontario. For example, in The History of Canada for High Schools, authored in Ontario, or R.O. Hughes’ The Making of Today’s World, the concept of cooperation is not employed with nearly the same frequency as it is in Alberta textbooks. In fact, when examining the index of these non-Alberta books, cooperation is cited only in the context of the League of Nations after the First World War. In Dickie’s and McDougall’s books, the term is cited in over 40 separate instances and almost always in association with Alberta’s political and economic experience. Based on this experience, Alberta’s version of cooperation is promoted as the basis upon which solutions to national and international conflict could be resolved.407

Another distinguishing feature of Alberta textbooks versus those published in Ontario and the United States was the academic background of the authors. Alberta’s social studies textbook authors, such as Dickie and McDougall, were, first and foremost, progressive educators and teachers in rural communities, not historians. They envisioned, as Dickie suggests, education as a tool for moulding social behaviour.408 Eschewing their newly obtained professional status in 1935, they devised social studies curriculum and wrote textbooks with the goal of creating cooperative and democratic citizens.

Highlighting the extent to which the populist agrarian notion of cooperation had been adopted by the professional educational establishment in Alberta, a 1936 ATA Magazine

article claimed that “the accomplishment of educational engineering...[is] comparable in social importance to those great feats of mechanical engineering of which the present age is justly so proud.”  

The science of teaching was left to progressive educators, and their laboratory was the social studies classroom.

Textbooks published outside of Alberta and authored primarily by historians did not share the same enthusiasm for creating cooperative and democratic citizens as progressive educators demonstrated. They remained committed to traditional conventions of history. For example, R.O. Hughes, a professor of history in New York, writes in his preface to *The Making of Today’s World* that history “gives to us an acquaintance with the past, enabling us to think about the problems of today.”  

Similarly, Canadian historian George Brown envisioned history as an endeavour of appreciation. The study of history, according to Brown, enables us to appreciate the progress Canada has made from the past up until the present. In *Building the Canadian Nation*, Brown claims that students must learn to appreciate the historical output of eminent Canadian historians, and he gives explicit examples of eminent historians, including Donald Creighton and W.L. Morton. For Brown, history is not something that can be used for solving contemporary problems as social studies authors in Alberta envisioned. Rather, “history should be used to seek truth by discovering the facts of about events.”

Alberta’s social studies textbooks concerned themselves less with teaching the facts of history and more with the use of history to guide students towards active political service.

---

411 George Brown, 2.
412 Ibid.
Because many social studies textbooks were written by Albertans, it should not be surprising that these texts made clear Alberta’s particular political and economic grievances. For example, W.D. McDougall, together with a representative from the publisher Ryerson Press, Gilbert Patterson, present Alberta’s regional complaints in a particularly provocative manner in *Our Empire and its Neighbors*. The book equates Canada’s prairie provinces with the agricultural South of the United States before the Civil War.\(^{413}\) The authors suggest that Canada’s agricultural regions have been negatively affected by tariffs supporting industrial producers of the East, tariffs that have placed financial burdens upon Western farmers. The authors then ask students to consider, would “Canada be better off today if there had been no tariff barrier to trade between Canada and the United States during the past fifty years?”\(^{414}\) Despite the supposedly open-ended question, the authors make Alberta’s position on the issue abundantly clear. They claim that Eastern manufacturers pressured the Canadian government to place heavy customs on goods arriving from abroad, thus raising the price on products that were much needed by western farmers. The author states that the Canadian government could regulate prices on implements of production that were necessary for farmers, but had made no attempt to do so. McDougall and Patterson summarize this exploitative practice as the “economic imperialism of the East over the West,” which has “caused a great deal of discontent throughout Alberta, but because the population of the province is

\(^{413}\) W.D. McDougall and Gilbert Patterson, *Our Empire and its Neighbors* (Toronto: Ryerson Press, 1937), 236.

\(^{414}\) Ibid.
small, it has not very many members in the Dominion Parliament, and the East continues to control the government.”

To overcome the eastern subjugation of the Alberta farmer, direct political action and economic cooperation were presented as the primary solutions for Albertans. For example, in *The World of Today*, McDougall and Patterson claim that “when the farmer feels he is being exploited, he always expresses his resentment in two distinct ways: by entering politics directly to control government, which will regulate business more in the interests of the producer, and by developing his own cooperative selling and buying organization.” For example, the Alberta Wheat Pool (AWP), established in 1923, allowed farmers to pool their grain, sell it at opportune times, and share equally in the profits. The AWP would end the exploitation of farmers, they believed, by business and banking interests, who benefitted most from high grain prices, leaving farmers with little to none of the profits. Thus, farming cooperatives such as the AWP served to reduce the power of capital and elevated the role of farmers in the production, selling, and distribution of grain. McDougall and Patterson clearly guide students to realize the benefits of cooperation, as they are asked to list the “beneficial changes… as a result of the farmer’s political and economic movement.”

Alberta’s textbook authors, like many UFA/UFWA leaders, were also willing to consider particularly radical measures to alleviate the economic woes plaguing the

416 MacPherson, 35.
417 Ibid.
418 McDougall and Patterson, *The World of Today*, 147.
province during the Great Depression, as evidenced in the following statement.

McDougall argues that:

some people feel that the capitalist (competitive) system is out of date in this modern world, and should be modified or replaced entirely by a system better fitted to deal with the problems of today. Three of these plans are especially interesting: the Communist (as in Russia), the C.C.F. and Social Credit.\(^{419}\)

The author asks students to “be careful in judging Russia, and consider which lessons Canada might learn from the Russian experience.\(^{420}\) McDougall’s consideration for various forms of state intervention leads directly into an endorsement for the efficacy of state involvement and a clear rejection of rugged individualism. He argues it is the duty of a society to provide support to those unemployed:

But perhaps the commonest and most heart breaking of all the causes of poverty are lack of employment. There are few things more terrible than the situation of an honest, able-bodied, and hardworking man, with a family dependent on him, who cannot make a living because, through no fault of his own, he cannot find employment. To provide for such victims of misfortune and to try to prevent their misfortune is the plain duty of society.\(^{421}\)

Donalda Dickie similarly supported government intervention based on a higher conception of politics, a belief influenced, in part, by the social gospel’s commitment to social welfare. In her textbook *The Great Adventure*, she criticizes rugged individualism and competition between persons as regressive and refers specifically to Alberta’s experience with cooperative forms of government, claiming that once “farmers and

\(^{419}\) Ibid.
\(^{420}\) Ibid., 321
\(^{421}\) Ibid., 303.
churches who had quarrelled for centuries began to cooperate” society functioned for the betterment of the larger community. She sites three political parties in Alberta that embodied this cooperative ethos that defined the political atmosphere of Alberta in the 1920s and 1930s: the UFA, The Social Credit, and the C.C.F., parties made up of people who believed that politics must assume greater responsibility for the welfare of Canadians and a better distribution of Canada’s natural resources.

In the Great Adventure, Dickie provides historical context to the roots of Alberta’s flare for political and economic innovation relative to Eastern Canada. She claims that Western Canada developed its own unique social, political, and economic institutions, independent of those of Eastern Canada, because of European and American immigrants “who had no loyalty to nation or province, as was the case in Eastern Canada.” She argues that Western Canada is thus, much less province-minded than Eastern Canada, and, supports her claim by citing American-born Henry Wise Wood, who became the president of the UFA, and a founder of the Alberta Wheat Pool. For Dickie the cooperative association of farmers, led by Wood, raised the prices of wheat that farmers laboured for, protecting the interests of farmers against corporate exploitation. Dickie then generalizes this cooperative experience of farmers in Alberta to society at large, claiming that “forming a cooperative society works much the same way as a wheat pool; its ultimate aim is raising the quality of life for all members.”

422 Dickie, The Great Adventure, 393.
423 Ibid., 404.
424 Ibid., 394.
425 Ibid.
426 Ibid.
an example of how political and economic problems of the inter-war years could be successfully addressed.

Alberta textbook writers’ proclivity for expounding the virtues of cooperation led them to consider past enemies of Canada with tolerance. For example, in *The World Of Today*, McDougall and Patterson acknowledge that the First World War was the fault of all the Great Powers and not just one nation.\(^{427}\) Furthermore, the authors claim that the harsh conditions of the Paris Peace Treaty of 1919 placed an unfair burden upon the German people. For these authors, tolerance and cooperation went hand in hand and were values necessary if international peace was to be maintained. For Donalda Dickie, students must learn the power of co-operation through activities in the classroom. The way to accomplish this, according to her, was that students must be provided with opportunities for experience in cooperation. To this end, teachers would facilitate discussion, student inquiry, and group projects that taught students how to cooperate with one another and improve the lot not only of the individual but also of the entire group. Furthermore, teachers helped students organize committee work and student councils as prescribed in the Alberta program of studies guide for Social Studies in 1935.\(^{428}\) The goal was to develop in students those skills necessary for living cooperatively and peacefully with each other.

Alberta’s social studies curriculum and related textbooks were criticized inside and outside of the province. For example, McDougall’s sympathetic treatment of Germany

---

\(^{428}\) Alberta Department of Education, “Program of Studies for Social Studies for the Primary Level” (Edmonton: King’s Printer, 1935), 2.
and communist Russia resulted in public scrutiny. In the 1939 municipal election, independent candidate E.H. Starr held McDougall’s book up as an example of the “propaganda being taught in Alberta schools under the title of social studies.” Other critics demanded the withdrawal of the text, *The World of Today*, because of its “leftist tendencies” and apparent justification for the Nazi regime, pointing to McDougall’s assertion that “the harsh peace treaty of 1919 punished the Germans too severely.”

Although Alberta School Inspector H.C. Newland and W.D. McDougall defended *The World Of Today*, arguing that social studies must “raise controversial issues and it is the great value of education in a democratic society that such issues can be raised,” the public and government pressure demanded the textbook be revised. A committee was set up to revise their work, and not surprisingly McDougall was not invited to participate. The Committee concluded, “The text tended to disparage Canada’s political and economic system too severely.”

Alberta’s Department of Education appears to have reacted to mounting public criticism over Alberta’s controversial curriculum and textbooks in the interwar years by using books published in the United States and Ontario that were indeed less sympathetic than McDougall’s textbook regarding Germany. For example, in *The Making of Today’s World*, R.O. Hughes assigns responsibility for the First World War to the Germans and her allies “who will never admit [that it was they] who were entirely responsible for

---

430 Ibid.
432 Committee on Social Studies, December 2, 1939. Premiers Papers, File 740b, Provincial Archives of Alberta.
It is interesting to note that after this criticism the Department of Education in Alberta significantly increased the number of textbooks authorized outside of the province, drawing heavily on those published in the United States. This decision may suggest an attempt by Alberta Education to temper public criticism of Alberta textbooks by providing alternative points of view from authors outside the province.\(^{434}\)

Regional differences in school curriculum and textbooks also gained national attention though the Committee for the Study of Canadian History Textbooks of the Canada and Newfoundland Education Associations in 1943 and through a Senate debate on a National History Curriculum in 1944. Both the Committee and the Senate debate expressed concern about differences in content between textbooks authorized throughout the country, calling for a pan-Canadian curriculum that emphasized consistency in agreed-upon facts by leading national and professional historians. During the Federal Senate debate on history textbooks, a number of senators singled out school teachers for creating history that was “sometimes bad and sometimes false and created too many quarrels and too much friction.”\(^{435}\) The solution, according to Liberal Senator Athanese David, was to have professional historians oversee textbooks authorized for grade schools. It was only they, argued David, who could agree on the “truth of history” and avoid regional biases.\(^{436}\)

---

\(^{433}\) R.O. Hughes, 736.

\(^{436}\) Ibid.
least at the level of established facts. Criticism of David’s motion came in a statement that asserted it “matters little what is contained in a textbook since the atmosphere and interpretation is derived from the classroom.” A teacher from Manitoba echoed this statement, claiming “it would be undesirable to prescribe one textbook for the nation given that modern teachers are getting away from the old idea that one text is the bible.”

Despite criticism directed at social studies and Alberta textbooks, these controversial statements capture the very essence of Alberta’s social studies curriculum. Alberta teachers and curriculum writers were less concerned with historians’ preoccupations with debating the nature of factual history and more with the potential of these facts to encourage active political citizenship based on cooperative values. As H.C. Newland claimed, teachers were not historians; they were “evangelists for democracy and social engineers.” As progressive educators, they possessed the scientific know-how and established provincial authority based on this knowledge to realize a higher social objective for education than historians articulated. In fact, social studies allowed teachers to emancipate themselves and their students from the paralyzing hold of history by using social studies to promote active social and political citizenship.

The aura of despair caused by WWI followed by the Depression required action in the present based on cooperation and democratic principles. Citizenship training, the driving force of social studies curriculum, provided students with skills for cooperation and

437 Ibid.
438 Ibid.
439 Ibid.
tolerance that could be used as the basis for social activism in the future. The importance of active citizenship and nurturing social responsibility among youth, as prescribed by the UFA/UFWA throughout their reign in the provincial Legislature, was fully realized by 1937. Social studies was implemented at all grade levels in Alberta’s schools by this time.\textsuperscript{441} Alberta’s Department of Education emphatically stated in 1942 that “training for citizenship in a democracy, or in other words, training for social responsibility, is one of the most important, if not the most important objective, of the high school curriculum.”\textsuperscript{442}

Alberta’s students were no longer led to a discovery of who they were through the veneration of British history; rather cooperation, as presented by the UFA/UFWA’s social/political movement, textbook authors, and curriculum writers, would enable students to actively participate in social, political, and economic regeneration after the trauma of the First World War and into the Great Depression.

\textsuperscript{442} Alberta Department of Education, Annual Report, 1942, 14.
CONCLUSION

Alberta witnessed unprecedented social, political, and economic change during the 1920s and 1930s. The cataclysmic events of the First War followed by the Great Depression hastened what farmers saw as the wholesale degeneration of their rural environment and strengthened their sense of political alienation from established centers of power. Against this backdrop, school curriculum faced drastic changes. With the advent of social studies, active political citizenship replaced the passive nature of historical curriculum by 1935. Gone was a study of the past, or at least the memorization and regurgitation of gallons of imperial facts by students. Instead, students of social studies in Alberta were taught that active political citizenship was necessary for establishing a more cooperative, democratic, peaceful, and equitable future. Indeed, these principles were the pillars of organized farmers in Alberta. They were also seen as necessary for improving a political and economic order made hideous by war, greed, and competition.

The social gospel movement concerned itself with problems similar to those articulated by organized farmers, and both worked to apply Christian ethics to social, economic, and political issues. The Christian principles of cooperation and democracy infused the UFA/UFWA movement and their educational initiatives, including their delivery of citizenship training by various formal and informal means. Through citizenship training, rural citizens learned that their political and Christian responsibilities were one and the same – to establish a cooperative ethos in society.

---

Social studies is part of the legacy initiated by the UFA/UFWA. As I have shown, the principles of the farmers’ movement, namely, cooperation and active political citizenship, were deeply embedded in the citizenship training delivered by farmers throughout rural communities. This training became an essential feature of social studies in the 1930s. At the same time, I have argued that social studies was not the invention of the UFA/UFWA alone and involved a larger cast of characters than has been accounted for by historians to date.

Rural teachers, mostly women, met the challenges of overcrowded school houses with practical and innovative approaches to curriculum and teaching methods. It has been central to my argument that their pragmatic innovations were consistent with what professionals would call progressive education years later. The professionalization of teaching involved the assertion of control over grassroots developments in education by professional educators who were eager to elevate their status in provincial bureaucracy, which was, significantly, male-dominated. And while male bureaucrats such as H.C. Newland oversaw committees responsible for developing social studies, much of the curriculum and textbook writing was left to prominent female educators such as Donalda Dickie and Olive Fisher.

I have argued that social studies emerged as the religio-political movement of the UFA/UFWA gained momentum and influence over Alberta education in the 1920s, as UFWA leaders and rural teachers pioneered innovative and practical approaches to teaching and learning, and as the professionalization of teaching ultimately formalized changes to curriculum in teaching in the 1930s.
Because of the close allegiance between organized farmers in Alberta, Saskatchewan, Manitoba, and Ontario, an examination of the conditions giving rise to social studies in Alberta may be similar to those in other provinces. The extent to which social studies was born out of similar circumstances throughout Canada would be an interesting line of inquiry to further pursue. Also, the Americanization of Canadian education should be further analyzed given the high proportion of early Canadian professional educators who attended leading American institutes of progressive education. And given that Alberta’s program of studies for 1935 credits the state of Virginia as producing an early template for social studies in North America, the American application of these same ideas should be compared and contrasted to the Canadian context to fully understand the conditions under which they emerged.

Finally, and perhaps most interestingly to me as an avenue for further research, is examining how the advent of social studies coincided with the emergence of third parties in both provincial and federal politics in Canada. The United Farmers of Alberta, Saskatchewan, Manitoba, and Ontario each adopted social studies around the same time frame, and a major national party, the Cooperative Commonwealth Federation (CCF), composed of radical farm elements, emerged at the federal level (and would later become the NDP). While neither the UFA nor the CCF exist as political parties any longer, their central tenants of cooperation and direct political challenge to Conservatives and

---

Liberals continue to persist in political parties such as the New Democratic Party (NDP). In this way social studies might have strengthened support for third party ideals that continue to permeate Alberta society specifically and Canadian society in general. An important area of research remains to be completed as to the extent and effectiveness of this permeation.

McClung, Nellie. *In Times Like These*. Toronto: University of Toronto Press, 1915.

Today, with three generations – Baby Boomers, Generation X, and Millennials – working side by side within the workforce, differences, miscommunications, and every day annoyances take place (Glass, 2007). These three generations, each shaped by different life experiences and defining moments in history, share an office environment and bring different expectations as well as distinct approaches to work and communication (Lee Hecht Harrison, 2007). Solutions to these intergenerational conflicts include education regarding generational differences and preferences, instituting mentoring programs and training opportunities, having a trusted organizational culture where different perspectives are valued and creating personality assessments to aid in team building, because teamwork is the key to reducing generational conflict (Deyoe & Fox, 2012).

This study considers the impact of the built environment on different generations, the effectiveness of employees’ interactions, and communications while intending to encourage the awareness of generational differences as well as the value and the impact people have on the built environment. This starts by informing design profession, business organizations, and students prior to them entering the workplace.

As the oldest generation in the workplace, Baby Boomers expect to work at least part time in their retirement years. Their eventual retirement will inflict the largest brain drain ever experienced by corporate America (Lee Hecht Harrison, 2007). This brain drain, also called the human capital flight, will result in corporations losing valuable technical skills and knowledge. The next generations are smaller in size, have limited professional experience, and organizational knowledge and transferring the knowledge that will be needed for future business success must be a priority (Gordon, 2007). Researching each generation and today’s office environment provides a framework for discussing the current workforce and evolving workplace as well as pursuing practices that will leverage both collective and personal knowledge within the organization as well as the best qualities of each generation.

This study presented a prototype office design for the multigenerational workforce that may aid in intergenerational knowledge transfer. The principal investigator conducted behavioral mapping through visual observations in a local professional services office. Behavioral mapping “seeks to identify the uses of space as a factor in ongoing behavior” by recording the activity that is taking place and the location of the activity (Ittelson et al., 1974, p. 232). These observations focused on the interactions between members of different generations. The activities observed were categorized into observational groups reflecting the demonstrated behaviors. The categories are based on Gensler’s four work modes – focus, collaborate, learn, and socialize.

Focus group interviews of each generation followed the observations to uncover common themes within each work mode. Work mode locations and responses to the built environment were compared to assess the qualitative aspects of the workforce’s behaviors, interactions, and utilization of workspace among employees. The results of this data underscore the importance of intergenerational knowledge transfer and the integration of the multigenerational workforce’s needs and preferences when formulating criteria for designing an office space. The research component of this study produced valuable qualitative data for the use of identifying emergent themes presented during the research study. This research study disseminates the collected qualitative data through applied design options and solutions for each of the four work modes.

This study applied information from a review of the literature, the application of observational studies, and valuable insight from focus group interviews to develop a prototype workplace design that placed the need for transferring knowledge between employees as ideal. With the emphasis of this study about the members of the multigenerational workforce and the workplace, it is essential to understand the needs of the generations and implementing a workplace design that aids in intergenerational relationships, communication, and collaboration. The design of today’s office environment facilitates intergenerational knowledge transfer by constructing areas where employees interact, build trust, and form relationships.
Cultivating Social Justice Preservice Teachers through Critical Practices and Anti-Bias Curriculum

Maggie Beddow, Ph.D.
College of Education
California State University, Sacramento
6000 J Street

beddow@csus.edu

Abstract

In 2013 the Southern Poverty Law Center’s educational project, Teaching Tolerance, developed an online resource called Perspectives for A Diverse America in response to demands for a comprehensive anti-bias curriculum. The Perspectives program focuses on literacy instruction for K-12 teachers that is aligned to the Common Core Standards, while providing educators a conceptual framework and continuum of tools for engagement in anti-bias, multicultural and social justice education. One of its key components is the Critical Practices Anti-Bias Framework and standards that are organized into four domains: Identity, Diversity, Justice and Action. Perspectives’ tools and resources include diverse central texts and anthologies, strategies, and tasks that support educators in creating curriculum lessons and units. This paper will focus on an ongoing research study initiated in response to Teaching Tolerance’s call for faculty in teacher education to participate in an evaluation that examines how they are using the Perspectives curricula and tools in their courses to prepare future teachers. As a faculty member from a social justice-oriented teacher training university, I will begin a preliminary discussion on how I implemented the Perspectives anti-bias curriculum with my colleague in a collaborative elementary foundations/pedagogy course as a way to cultivate future teachers with an educational philosophy rooted in social justice principles. I will focus on discussing how I will capture and provide snapshots of the implementation process including an overview of the curricular road map and some of the instructional approaches, materials, and artifacts that were produced over the past three years. In the final report, I will weave in personal perspectives and anecdotal accounts from a small sampling of preservice teachers, and will conclude by discussing guidance for future research.
Introduction and Context

In 2009, the National Council for the Accreditation of Teacher Education (NCATE) abruptly removed the phrase “social justice” from its standards due to pressure from groups that felt it was politically biased and ambiguous (Heybach, 2009). This action took many teacher educators by surprise but despite NCATE’s change, Standard 4: Diversity continues to require that preservice teachers receive some form of training and experiences that draws from multicultural and global perspectives to help them understand how to work with diverse populations (NCATE, 2008). Thus, it continues to be the responsibility of teacher preparation programs to design programs that provide opportunities for candidates to learn how to become competent practitioners who implement culturally relevant curricula that promote equity in the teaching and learning process to meet the needs of diverse student populations.

Over the years, many seminal researchers and practitioners have defined multicultural education – albeit with multiple conceptual definitions and explanations. For example, multicultural education has been framed by numerous researchers with the idea of furthering the understanding of best practices for teaching diverse populations (Banks, 1979; Banks & McGee, 2001; Gay, 2000; Grant & Sleeter, 2009; Nieto, 1996; Sleeter, 2008). Others have framed the paradigm of multicultural education through practices related to cultural responsiveness (Cazden & Leggett, 1981; Gibson, 1976), and culturally relevant pedagogy (Ladson-Billings, 1995; Sleeter, C., 2008). In addition to their research on multicultural education models or approaches, Grant and Sleeter (2009) have developed multicultural lesson plan models that are found in their Turning on Learning: Five Approaches for Multicultural Teaching Plans for Race, Class, Gender and Disability textbook which are very useful lesson planning tools.

According to Young Ah Lee (2011, p. 15), “The assumptions we develop from our own experiences influence the way we understand the world (Schwandt, 2000). In turn, these understandings influence the ways we learn and teach.” As a teacher educator, my own deeply-rooted teaching philosophy and experiences were shaped by the teacher preparation program where I teach today, which has been grounded in social justice principles. California State University, Sacramento’s College of Education’s TEACHing for Change vision statement, as seen below, is the tenet that serves as our overarching principle of the teacher preparation program and one that embodies my own educational philosophy and teachings.

**TEACHing for Change**
T = Transformative Teaching, Learning and Leadership Roles
E = Equity and Social Justice
A = Active Civic Engagement
C = Collaboration and Communication
H = Human Capital and Diversity

From my own personal experiences, many of our preservice teachers at the university where I teach encounter great struggles and at times, discomfort in conceptualizing how and why to adapt curriculum from a multicultural/social justice perspective. My interest in the Teaching Tolerance Perspectives for a Diverse America program began in the fall semester of 2013 when I was charged to teach my 90 preservice teachers about how to create multicultural/social justice lessons. I had taught this topic for a number of years, and had already developed numerous
lectures and culturally relevant assignments for my students, grounded in multicultural education theories and research, but as always, I wanted to be current on my knowledge related to multicultural education curriculum.

Hence, in late 2013, while in the course of doing a search for recent scholarly research on multicultural curriculum to refine and update my lectures, I stumbled upon the Teaching Tolerance *Perspectives for a Diverse America* curriculum which had just been uploaded to the Teaching Tolerance website that same month (tolerance.org). I was already familiar with Louise Derman-Sparks’ research on anti-bias curriculum in early childhood (1989), but was not aware of the Teaching Tolerance *Perspectives* curriculum which was principally grounded in her scholarly research on socio-emotional learning and young children’s views on diversity. *Perspectives* was a groundbreaking program which was officially launching in early 2014, and one of its major underlying theories is the notion that texts can generate empathy in readers, while building understanding and awareness of diverse experiences.

I explored the *Perspectives* website further and learned that Teaching Tolerance was sponsoring a sponsored two-day professional development training in January 2014 at the Museum of Tolerance in Los Angeles, California, and I quickly recruited my colleague and 16 of my 90 preservice teachers to attend (the training was being held during the university’s break so it was a voluntary event.) We were introduced to the professional development training on *Perspectives* that was contextualized through a tour of the museum’s exhibits that focused on the Holocaust and other historical oppressive events. After extensive debriefings and reflections, we were then provided opportunities to navigate the K-12 online resources and tools such as the anthology of diverse central texts and essential questions, teaching strategies, and tasks. By the end of the two-day training, each participant had developed sample grade-level lessons and units that promote multiculturalism, social justice, empathy, and equity in schools. It was a powerful experience for each participant and we were eager to share what we had learned with our faculty colleagues and preservice students in the spring 2014 semester.

**Purpose of the Study**

In November 2015, I was contacted by the Teaching Tolerance program evaluator to participate in a two-year study to learn about my use of the *Perspectives* materials and how they were being used by my students, and ways to improve the program for a better fit in a variety of teacher preparation classes. I had already collected artifacts from my preservice students in the 2014-15 year, and was eager to have my 2015-16 cohort of preservice students participate in this program. I then decided to initiate a study to explore and capture a snapshot of how the *Perspectives* curriculum was integrated into our preservice course, with a focus on ways that a sampling of approximately 200 preservice teacher candidate participants - over a three-year period - were trained and implemented this culturally responsive curriculum for elementary students in lower performing schools.

The preliminary results will indicate that *Perspectives* helped cultivate preservice teachers into understanding social justice principles, while also supporting them in creating and implementing multicultural/social justice lessons, based on training and guidance received in the foundations/pedagogy course.
Research Objectives

This study is grounded in anti-bias curriculum research conducted by Louise Derman-Sparks (1989) and the theoretical concepts of “practice of freedom” framed by Paulo Freire (1993). It draws from a 2013-14 evaluation of the Teaching Tolerance Perspectives from a Diverse America curriculum and is guided by the author’s experiences as a participant in an ongoing Teaching Tolerance study of teacher educators using the Perspectives tools in their teaching. This paper is guided by the following two research goals and objectives.

- How are the Perspectives for a Diverse America curricular tools used in a teacher preparation program?
- In what ways does the Perspectives for a Diverse America curriculum support preservice teacher candidates to become social justice educators?

Proposed Methodology

Qualitative and quantitative data were collected at multiple points. A case study approach was used to capture the details and nuances of the ways that two teacher educators and a sampling of the 200 preservice teacher candidates used the Perspectives curriculum tools. These preliminary findings were presented in a poster session at the university’s conference on multicultural education in February 2014. The presentation was entitled “Social Justice Curriculum Roadmap: Teaching Tolerance Anti-Bias Framework and Perspectives.” It provided a roadmap for teaching social justice in K-12 classrooms using the Teaching Tolerance Anti-Bias Framework tool, Perspectives for a Diverse America. Artifacts were collected and analyzed, including surveys, lesson plans, and instructional materials. Survey results were validated and analyzed to glean a clear interpretation and representation of the responses.

Expected Outcomes and Conclusion

The data set collection is in the final stages of analysis and should be completed after collecting the final data in May 2017. It is expected that this study will show that through guided instruction, preservice teacher candidates are able to utilize critical practices and the Perspectives tools to develop multicultural and social justice-oriented curricula that promote academic improvement and socio-cultural learning.

Participants focused on a small sampling of preservice teachers enrolled in a foundations/pedagogy course at a social justice-oriented teacher preparation program in California. Data sources include excerpts from lessons plans and responses to surveys.

It is expected that the final survey results and artifact analysis will indicate that the Perspectives curriculum and tools will support preservice teachers in facilitating transfer of content knowledge from multicultural theory into practice, through the engagement of the Perspectives tools and resources as a way to develop lessons that promote a deeper understanding and connection to multicultural and diversity issues from a local and global perspective. As a result, I will argue that the Perspectives curricula should be a more widely used as a powerful tool in teacher education programs.

Abstract

In Japan, wind instrument music is prospering in elementary and secondary education. There are many wind orchestras, includes brass bands in schools.

In the performance of the wind instrument music, each player needs to pay attentions to not only musical scales and rhythms but also difference of musical interval among other players. Instructors of the wind instrument music evaluate the quality of the performance based on these elements. Though most of the accomplished instructors have the sophisticated evaluation criteria through their long experiences, in so far as basic ensemble such as harmony training, the quality of the evaluation criteria is common among most of all instructors.

However, it is difficult to provide appropriately skills training to players including beginners in the school wind orchestra because the accomplished instructors are not deployed to all schools. In this time, we propose a harmony training support system for wind instrument music as a new way of teaching methods. This system can support harmony training for instructors and players of the wind instrument music based on calculating difference of frequency of music sound in order to evaluate and improve their performances and qualities.

In the presentation, after having clarified issues of the instructors and wind orchestras in Japanese schools, we will show a developed prototype system and the results of experiments to confirm effectiveness of the system.
Using Virtual Reality to Enhance Curricula and Learning

Curriculum, Research, and Development

Paper Session

This paper explores what is happening with the infusion of VR techniques and applications into the field of education to include k-12 and higher education. It explores how Virtual reality can enhance curricula and learning.

Using Virtual Reality Techniques to Enhance Curriculum and Learning

George Beckwith, Ed. D.
National University.
La Jolla, California
September, 2016
Abstract

A student in the highly rich technology world of today not only has become a social media expert and participant in utilizing photos and videos but is exposed in addition to a variety of challenging visual experiences such as ultra-high definition 3D images and motion. These can be curriculum maximizers assisting students in learning complex concepts more quickly and more thoroughly thus retaining what they learn longer enabling them to utilize the learning outcomes for a larger portion of their lives. While researchers are still verifying just how effective these technology tools can be for enhancing curriculum and the student experience (early indications are positive) technology advances continue to add tools to the mix. The latest one breaking on the scene and the classroom, which can incorporate all the previous tools, is “virtual reality.” The use of VR (virtual reality) has long been used in the military and aviation to provide dangerous and difficult simulations to train and educate people without jeopardizing their health and lives. More recently VR has been used successfully in the field of professional development to include managers, instructors, coaches and therapists (http://www.techcrunch.com Sep 14, 2016). The use of VR in k-12 schools and higher education is just beginning to take off as numerous technology companies such as zSpace, Alchemy, and Immersive VR Education are developing VR-based education curricula packages for the classroom (http://www.techcrunch.com). This paper explores what is happening with the infusion of VR techniques and applications into the field of education to include k-12 and higher education. It reviews how effective (on ineffective) such techniques have been and discusses the challenges of implementing VR techniques in regard to obtaining VR equipment, software and funding as well as acceptance by educators, students, and parents.
The Empowerment and Inclusion of Adjunct Faculty: A Case Study

Hans Chun, Ed.D.
Assistant Professor
Chaminade University
3140 Waialae Avenue
Honolulu, HI 96816 USA
hanschun@live.com

Dr. Chun is currently an Assistant Professor and Director of Educational Leadership program at Chaminade University. Previously, he worked as an Adjunct Faculty at Chaminade University. He has earned a B.A. in Sport Sciences; an M.A. in Communication and a Ed.D. in Educational Administration and Leadership from the University of the Pacific. His research agenda includes focuses on crisis planning and management in higher education and in educational administration and leadership.

Jace Hargis, Ph.D.
Director, Center for Teaching and Learning
University of California, San Diego
La Jolla, CA 92093 USA
jace.hargis@gmail.com

Dr. Hargis is currently the Director of the Center for Teaching and Learning at the University of California, San Diego. His prior positions include a College Director in Abu Dhabi, UAE; an Associate Provost of Faculty Development, Assessment and Research and Professor in Honolulu; an Assistant Provost of Faculty Development and Associate Professor in northern California; and a Director of Faculty Development and Assistant Professor in Florida. He has authored a textbook, an anthology and published over 100 academic articles as well as offered hundreds of academic presentations. He has earned a B.S. in Oceanography from Florida Institute of Technology; an M.S. in Environmental Engineering Sciences and a Ph.D. in Science Education from the University of Florida. Dr. Hargis' research agenda focuses on how people learn while integrating appropriate, relevant and meaningful instructional technologies.

Abstract
A case study of how one university in the Pacific formed an Adjunct Faculty Advisory Team (AFAT) for the purpose of representation by having an official body to speak on their behalf, assist with training and professional development, and help foster an inclusive setting with the institution. The impetus was having the support of the Associate Provost for the university who oversaw the Faculty Center and was the facilitator for several Action Teams, including AFAT. The team met frequently and quickly identified priorities. Major successes were found in the area of communication; input; inclusion; and disposition. This was possible due to having an advisory team with a formal capacity to initiate and bring forth proposals, have a voice in the governing process, and the effective support of a key member in the university administration. This paper documents the initiatives, implementation and assessment of the initial year's effort to enhance adjunct faculty opportunities and empowerment for teaching and learning.

Key Words: Adjunct Faculty, Faculty Development, Communication, Faculty Governance
Introduction

At many institutions of higher education, the number of adjunct faculty continues to increase steadily as does their reliance on them to teach our increasing enrollment. Soon the majority of teaching in higher education will be adjuncts (Komos, 2013). Fruscione (2014) found that adjuncts now make up more than 70 percent of higher education faculty in many institutions. However, many adjunct faculty report not feeling that they are a part of the academic organization and not being recognized as a source for knowledge and help (Dolan, 2011). Several universities have seen adjunct faculty begin to discuss these issues, which have resulted in the formation of groups, programs and even unions.

The Associate Provost has oversight of the university’s Faculty Center for Teaching and Learning and was the facilitator for several Action Teams, including AFAT, along with the Teaching and Learning Advisory Board (Think Tank) and an Assessment Advisory Team (AAT). In the fall of 2015, the Faculty Center for Teaching and Learning at a university located in the Pacific, developed an Adjunct Faculty Advisory Team (AFAT). The impetus for the advisory team was to bring representation for adjunct faculty employed by the university and to help create an environment of inclusiveness. The team met frequently and quickly identified priorities, some of which included updating the list of adjuncts teaching for the university, changing the adjunct email address to eliminate ‘adjunct’ and having it standardized with the rest of the university faculty email address system, securing a seat on the Faculty Senate represented by the Chair of AFAT, and creating an adjunct faculty development day - all of which were realized.

This paper is a case study documenting the initiatives, implementation and assessment of the initial year’s effort of AFAT. Major successes were found in the area of communication; input; inclusion; and disposition. Action meetings were held twice a month, as opposed to typically monthly committee meetings. The goal was open discussion, although there was a hyperfocus on action. Each team member left the meeting with an action item and at the beginning of each subsequent, the action items were updated, tracked and benchmarked. Topics actioned during the gatherings included Adjunct Classification; Adjunct Email Address; Adjunct Faculty representative on the Faculty Senate and representative on the Faculty Senate Handbook Committee; Adjunct Faculty attendance at Faculty Retreats and the ability to join Faculty Development Events.

Literature Review

Adjunct Faculty

Colleges and universities benefit from continuing employment of their best adjuncts, who are familiar with the institution, can develop their teaching skills, and administrators can promote a positive work environment to retain. However, institutions often fall short in supporting adjunct faculty (Hoyt, 2012). “The overall perception was that an adjunct instructor was a non-entity within the faculty body and was not well known to management” (Dolan, 2011, p.70). “Institutions of higher education desire quality adjuncts, yet fail to invest in their adjuncts to produce that quality” (Morton, 2012, p.396).

Administrators can help promote faculty loyalty and intent to stay by monitoring job satisfaction of not only full-time faculty, but adjunct faculty as well (Hoyt, 2012). As institutions of higher education increasingly use adjuncts, it is key to attract and retain qualified faculty against the competition (Dolan, 2011). Other ways Hoyt (2012) found to improve adjunct faculty work environment included training, a website with information for adjuncts, and better communication. Dolan (2011) discussed that many adjuncts favored opportunities to increase knowledge through workshops, seminars, social events and other activities that would help foster a stronger sense of community with peers and administrators.
Faculty Development

Adjunct faculty have mixed reviews of the teaching and professional development support provided by their institution (Yakoboski, 2016). As adjunct faculty are no longer used on an occasional basis in higher education, adjuncts play a critical role in teaching students in higher education (Langen, 2011). Development of adjunct faculty is not considered a priority at many institutions, but offering an orientation and professional development opportunities should be encouraged to increase their involvement with staff and support services and time on campus (Datray, Saxon, & Martirosyan, 2014). “Our hope is that higher education institutions will consider their responsibility in development of quality adjunct faculty and embrace the adjunct as a positive contributor to the institution” (Morton, 2012, p.396).

Datray, Saxon, & Martirosyan (2014) recommend providing training for new adjunct faculty, professional development opportunities, assign adjunct faculty to mentors, provide institutional resources and include adjunct faculty in resourcing and strategic initiatives, encourage and support the use of diverse instructional techniques, integrate adjunct faculty in the institutional mainstream, consider the needs and contributions of adjunct faculty when engaging in course redesign initiatives. Morton (2012) discusses the importance of a facilitator to bring about a mentoring program for adjuncts that can expand teaching and classroom skills. However, some institutions lack the vision, management, or funds to have such a program for adjuncts.

Following Ernest Boyer’s (1990) landmark book, Scholarship Reconsidered, faculty development became a more frequent topic of discussion in the university. In this book, Boyer suggested additional ways, beyond the traditional scholarship of discovery to view scholarship in ways of integration, application and the scholarship of teaching and learning (SoTL). Grabowsky and Hargis (2016) found that time was a major issue for faculty development, as competing obligations required additional prioritization, organization, and alignment of appropriate scholarship, which could include SoTL. Hargis and Gilbertson (2010) found that quality, and timely faculty development plays a significant role in new faculty orientation, and subsequent mentoring of new faculty into a collegial environment that supports aligning research with instruction. Yee, and Hargis (2012) identified key attributes to quality faculty development, which included how to create sustainable relationships with faculty through a new model informed by emotional intelligence. The focus on creating relationships was a key attribute for this approach on creating a venue for a broader, more frequent adjunct faculty voice to the Faculty Senate and administration. Faculty Senates can be bureaucratic and indecisive, where frequently a few vocal members can halt progress. Ensuring that an adjunct faculty is a member and in the room can be one way to help the senate maintain awareness of critical issues of teaching load, quality and sustainability, which should be a major role of faculty governance.

Faculty Governance

At colleges and universities in the United States, about 70 percent of faculty are off the tenure track. As such, adjuncts are making themselves more visible and push for roles in governance. Although tenured faculty are in the minority, they are still the power brokers (June, 2012). Overall, adjuncts are largely excluded from Faculty Senates. In a study that examined 105 research universities, about two-thirds had adjuncts off-limits to Faculty Senates. A small minority of universities had Faculty Senate's open to any adjunct faculty (Schmidt, 2013). Adjuncts expressed a strong need to become better informed on a range of institutional matters and clear communication. When there is a lack of communication between administrators and adjunct faculty, a sense of isolation increases (Dolan, 2011). At Saint Joseph’s University, an adjunct association was formed to address the concerns of adjuncts. The executive committee of the association met with the provost and was able to get raises for adjuncts and grant funds to attend a conference if presenting a paper. The adjunct association also requested the Faculty
Senate to allow for participation in faculty governance (June, 2012).

Methods
This study was conducted at a private small liberal arts university in the Pacific. The participants for this case study were six adjunct faculty out of about 100 adjunct faculty, two male and four female faculty with years of experience between 5-27 and mixed cultural identity differences. Data was collected during the 2015-16 academic year. The design is a qualitative case-study using meeting minutes, questionnaires, action items and discussions as assessment and measurement tools.

Procedures
The key attributes for gathering useful data included consistency of meetings, documentation of outcomes and connecting the stakeholders (faculty, adjunct, administration and personnel) on a regular basis. The process for accomplishing this included regular meetings and setting action items with aggressive timelines. The Faculty Center personnel assisted in logistics, continuity, research and brainstorming. The AFAT Chair and Associate Provost met regularly to ensure a consistent message, and both were committed to aggressive movement on issues, which had been historically neglected. All documentation was collected using Google Documents and made available to the academic community for review and input.

Results
There were four major data collection instruments: Meeting Minutes; Action Items; Questionnaires; and Discussions.

Meeting Minutes and Action Items
I. Adjunct Faculty Advisory Team (AFAT) Agenda Items November 17, 2015.
   1. Adjunct Classification. Potential to simplify to one classification: Adjunct Faculty. Discuss how this may affect those who have benefits such as health care as they are categorized as a Senior Lecturer, etc.
      Action Item: The Chair will send a memorandum or meet with the Executive Director of Compliance and Personnel Services for clarification.

   2. Adjunct Email Address request to be consistent with faculty/staff.
      Action Item: AFAT to draft proposal to the Dean of Information Technologies and Support Services, who can discuss with the Provost.

   3. AFAT Representative at Faculty Senate. Recently, Faculty Senate emails are now being sent to adjuncts as well. This has been a positive step in keeping us “in the loop and in the know.” We are also faculty and should be in the loop. Having a member from AFAT to represent adjuncts at Faculty Senate meetings would be helpful in allowing adjuncts to have a voice and to be informed on matters concerning faculty.
      Action Item: Associate Provost can bring this to the attention of the Faculty Senate (FS) President.

   4. Adjunct Faculty Representative on the Handbook Committee.
      Action Item: The Associate Provost has discussed with Faculty Senate President, who agreed in principle on this topic and will take to the Steering Committee on their next meeting, December 2.

   5. Faculty Retreats. Discuss process and logistics of attending faculty retreats and/or create Adjunct Faculty Retreats (Celebrations).
Action Item: The Associate Provost and AFAT Chair will create a proposal for the Provost review.

6. Adjunct Faculty Development (FD) Events. Suggest that we discuss FD events and other community building events, such as a reception before a university athletic event possibly basketball and then attending the game.

   Action Item: Revisit the results of the May 2015 Adjunct Needs Assessment and discuss other workshop topics to create and offer for the spring term. Also, create a schedule for community building events.

II. Adjunct Faculty Advisory Team (AFAT) Agenda Items January 26, 2016

1. Adjunct Classification. Report on final determination of adjunct classification and title after meeting with Compliance.

   Action Items:
   a. What is an “adjunct?” Definition used is what's in the handbook. “Adjunct faculty” is the official title for pay scale.
   b. Classified as two or less classes. If you teach more than two courses, then the health benefits will begin. Should you not teach during the summer, you will need to re-enroll for health benefits once you are teaching more than two classes again.
   c. Discussion as to whether or not Continuing Education credits count toward adjuncts’ two course load. Chair to ask Executive Director of Compliance and Personnel Services for clarification regarding credits counting.

2. Adjunct Email Address. Update AFAT on latest news regarding changing @adjunct.university.edu email to @university.edu email.

   a. By summer they should be able to migrate the information from existing emails over to new “@university.edu” accounts.

   Action Item: The Information Technology Dean needs to receive final approval, but everything on logistics is ready. He will be meeting with approvers this week.

3. AFAT Representative at Faculty Senate. AFAT Chair has been approved to be a voting member at the Faculty Senate. Updates will be provided from the last several meetings.

   a. Chair of AFAT can be a voting member in Faculty Senate. The motion went forward in Faculty Senate, and almost unanimous approval (2 faculty out of 100 voted against).
   b. Chair has attended past three Faculty Senate meetings.
   c. What is the step to disseminating Faculty Senate information to all adjuncts?

   Action Item: Check with Faculty Senate President on determining how Adjunct Faculty receives information.

4. AFAT Representative on Steering Committee.

   a. Chair proposed a Motion: Chair to put in a formal request to join the Handbook Committee. Seconded by AFAT member. No discussion.

5. Adjunct Faculty Development Events. Discuss an activity for the adjuncts for Spring Semester.

   Action Items:
   a. Recreate the Faculty Retreat “Celebration” for the adjunct faculty. Targeting March 5 (first choice), March 12 (second choice), or April 16. Administrative Assistant will look into scheduling as soon as the meeting is finished. Once a date is confirmed, a “save the date” invitation for faculty will be sent out.
b. Schedule Celebrate event for a Saturday when all the classrooms are available.
c. Contact the department admins asking them to send invites to all their adjunct faculty. Additionally, we need to find a creative way to get people engaged/invited/eager to join via AFAT outreach.
d. Topics that might be engaging for faculty: humanizing online learning; active learning methods online; how students function, etc.
e. Chair motion to formally plan adjunct celebration event. AFAT member seconded the motion tentatively for March 5.

6. Discussion on any other topics.
   Action Items:
   a. Shared the aggregated results from the Adjunct Faculty Needs Assessment surveys collected by member. The data is available in the AFAT Google Drive Folder.
   b. Chair to talk to IT Dean to see if there is a means of aggregating adjunct contact information somewhere (on Portal, perhaps?).

III. Adjunct Faculty Advisory Team (AFAT) Meeting March 15, 2016
1. Thank you for the successful inaugural Celebrate Teaching and Learning event.
   a. Associate Provost has talked to Provost about the potential of allowing adjunct faculty to attend the Retreat, and is open to the idea.
   b. Traditionally, the Faculty Retreat is held on the second or third day of fall semester; second or third day for the spring.
   c. AFAT member made a motion to combine the Adjunct Faculty Retreat/Celebration with the [full-time] Faculty Retreat. Chair seconded.
   d. Discussion: Hold an Adjunct Celebrate on the Saturday following the Faculty Retreat as a Plan B. It would be wise to partner with the staff working on adjunct contracts to advertise the event. Vote to approve was unanimous.

2. Analyze Data Summary
   Action Items: Orientation of Adjunct Faculty. Invite new adjunct faculty to apply for 20 seats to the New Faculty Orientation (NFO).

3. Visionary
   a. AFAT share what they have accomplished so far.
   b. Structure of the advisory team and Chair’s joining of Faculty Senate steering committee.

4. Starting subgroups of the AFAT
   a. Faculty Retreat/Celebrate for Adjunct Faculty
   b. First semester family day

5. Acknowledging Adjunct Faculty: certificate of excellence, pins, etc.
   a. Acknowledgment may be more of a department/division initiative.
   b. AFAT member motioned that Chair submit a proposal to Deans requesting they adopt a recognition system for their adjunct faculty.
   c. The Faculty Center can assist with acknowledging adjunct faculty for other forms of participation (e.g. workshop presentations, advisory teams, etc.)

6. Business cards: useful marketing tool, especially for increasing student enrollment.
   a. Chair will forward inquiry on policy to each Dean, copying their AFAT member to
ask on the policy for business cards. From there we can talk about submitting a formal proposal requesting that they provide business cards.

b. AFAT member motioned to have the Chair email the Dean’s asking about their policy for adjunct faculty business cards.

7. Create action items, i.e, next Celebrate?
   A. Adjunct Family Day
      a. Potluck adjunct celebrate: social day to get to know one another, including full-time faculty.
      b. Reserve the lawn in front of the library and under the tents.
      c. Events for the children. Potentially connect with Campus Administration for support with the children activities. Provost agreed this would be a good event for the end of the semester.
   
   B. Malasada May Day for Families: opportunity to welcome the new Administration, and to share the university values.

8. Identify strategy to secure AFAT team members from non-representative Divisions
   a. Adjunct Celebration sign-in sheet uploaded to AFAT folder to help identify potential AFAT recruits.

9. Discuss other initiatives (i.e., business cards, adjunct workshops...)
   a. Business cards are brought up at the Dean level.

10. Provost visit to update next steps
    a. Thanks to the team
    b. Continued support for the AFAT

**Questionnaire**

Celebrate Adjunct Faculty Day: Assessment and Data Analysis

A day to “Celebrate Teaching and Learning” (Seal & Hargis, 2012) was organized for full-time faculty in lieu of the Faculty Retreat in January 2016. A similar Celebration was created for Adjunct Faculty on Saturday, March 5, 2016 from 9:00 am to 2:30 pm, which was a faculty driven event to showcase the exemplar instructional methods currently used by adjunct faculty. For these active sessions, faculty facilitators translated their current effective instructional practices into ‘quick 40 minute chats’ with a focus to engage participants in an active discussion. The goal was not to share a complete framework of methods, but more to begin the conversation, which could further foster collaboration and rhetoric on teaching and learning around the campus. The sessions included:

- Virtual Worlds and Library Resources
- Assessment and Rubrics
- Syllabus Redesign
- Active Learning Methods
- How I Learn Best by Student Panelists
- Appropriate, Relevant and Meaningful Educational Technology
- Effective Practices for Online Teaching
- Scholarship of Teaching and Learning (SoTL)

A hard copy assessment was provided at the end of the day, as well as a link to a Google form provided to everyone afterwards via email. The following represents the items and results (n=15; Likert 1-10, 10 representing very high).
1. How engaged did you feel at this faculty development event?
   Ave = 9.4/10; SD = 0.986

2. What part of the day’s events facilitated your development best?
   Active Learning (5); SoTL (3); All (2); Syllabus (2); Lunch discussion; Virtual Worlds; Student; Collaborating; Energy

3. Please share suggestions on how we can continue to improve our events.
   Keep doing them each semester (2); Saturdays are good; Focus on techniques related to how to teach well; Let’s do this again; More classes on technology; Excellent, this is much needed; How to form a community to collaborate on publishing; Expand on Active Learning; The sessions that showed and shared actual applications and resources available to us were helpful; How to use Canvas; Rooms are too cold; Please continue to post more videos on the adjunct resources page with new teaching methods/experiences.

4. Please share your evaluation of the food provided for this event.
   Ave = 9.6/10; SD = 0.737

5. Which session or sessions benefited you the most?
   All (4); SoTL (4); Active learning (4); Library (2); Syllabus (2); Effective practices for online; Students; Learning about AFAT

6. Which session or sessions were the least helpful to you?
   None (6); Assessment and Rubrics; Active learning (too much focus on technology); Virtual worlds; History of adjuncts

7. Share ideas from today's event that you will be able to integrate into your courses.
   All (3); SoTL (3); Plickers (2), Library database (2); Zoom; Student's income; Rubric chart on outcomes alignment; Bloom’s taxonomy; Tech gut may not be able to use them all; Second Life; Flipping the class; Syllabus redesign.

8. Overall, please assess the quality of this faculty development event.
   Ave = 9.5/10; SD = 0.834

9. What topic(s) would you like to see at our next event?
   Educational Technology (3); Filming lectures; Peer review; How to stimulate meaningful discussion without technology; How to teach effectively; Teaching with limited technology resources; New teaching methods; Assessment; Collaboration among faculty; Green Screen video technology.

The Faculty Center for Teaching and Learning included adjunct faculty in each one of their offering, sending emails to them when events were scheduled and posting a special link on their webpage for adjunct faculty. Specifically, adjuncts were welcome at the summer week long Backward Redesign Courses (Wiggins & McTighe, 1998), of which the Chair of AFAT attended both sessions, significantly redesigning two different courses (Hargis, et al, 2016).

**Discussion and Conclusion**

The Adjunct Faculty Advisory Team (AFAT) brought a voice for adjuncts in an official capacity, assist with professional development, and help foster an inclusive setting with the institution. This was possible due to having an advisory team with a formal capacity to initiate
and bring forth proposals, have a voice in the governing process, and the effective support of a
key member in the university administration. The impetus was having the support of the
Associate Provost for the university who oversaw the Faculty Center and was the facilitator for
several Action Teams, including AFAT. The Faculty Center at the university became a
tremendous resource for adjunct faculty by having an open invitation to all workshops and
professional development activities. The center also developed and maintained a dedicated
page on the university website for adjunct faculty resources and information for new hires.
Adjuncts that do not have office space were welcomed to use the space at the Faculty Center.
The relationship with the Associate Provost overseeing the Faculty Center and the support staff
became instrumental in the formation and backing of AFAT.

Inaugural AFAT Meeting

The Associate Provost serving as the facilitator and the Chair for AFAT spent the
months leading up to this inaugural meeting with recruiting other adjuncts willing to serve on the
team and brainstorming several of the initial agenda items. The goal was to have at least one
adjunct member representing a division in the university. Once an adequate representation was
met, the timing was right to hold the inaugural meeting.

The inaugural meeting of AFAT took place on November 17, 2015 and an ambitious
agenda was discussed as having priority to adjuncts at the university and turned into action
items. One of the key items discussed was with regards to adjunct classification. There was
confusion over what the official title was as there were varying terminologies used. The faculty
handbook was clear that part-time faculty are designated by the title of adjunct faculty. However,
seemed there were other terms used. Therefore, AFAT decided on making an action item to
send a memorandum or meet with the Executive Director of Compliance and Personnel 
Services asking for clarification of the official term for part-time faculty.

Another item discussed was a passionate one brought forth by the Chair with regards to
eliminating the term adjunct from the university email address [jane.doe@adjunct.university.edu]
and have it consistent with full-time faculty and staff [jane.doe@university.edu]. The reasoning
was there should be no distinction to the students that a faculty member is full-time or an
adjunct. The AFAT decided to draft a proposal to the Dean of Information Technologies and
Support Services to seek if it would be possible to have the email address for adjuncts
consistent with the rest of the campus.

The AFAT wanted to address the role of adjuncts in the faculty governance at the
university. Adjuncts have been invited to attend the Faculty Senate meetings, but not as a
voting member. At the start of the academic year, the President of the Faculty Senate added the
emails of adjuncts to receive Faculty Senate emails. This was a much appreciated gesture as it
allowed adjuncts to be kept “in the loop.” However, AFAT felt a need to have a voice in the
Faculty Senate. After discussion during the meeting about finding the right balance that could be
deemed acceptable by various stakeholders, it was decided to propose having an adjunct
selected by AFAT to be a representative and voting member in the Faculty Senate. This adjunct
would be able to report back to AFAT on topics and issues discussed at the Faculty Senate. It
would also allow adjuncts to have a voice in bringing forth proposals, address concerns, and
have a vote in the Faculty Senate. As an action item, AFAT agreed to request the Associate
Provost to bring this request to the President of the Faculty Senate and decide how best to
proceed ahead.

Full-time faculty are required to attend the retreats held before the start of Fall and
Spring semesters. Adjuncts do not have this requirement and are excluded from attending the
faculty retreats. During the meeting, it was brought to the attention of AFAT by the Associate
Provost that there were about 400 adjuncts according to a spreadsheet provided by the
Personnel Department compared with a little over 100 full-time faculty at the university. This
was a surprise to the members of AFAT as the number of adjuncts seemed way too high. It was
realized that if the administration was using the current number, the logistics of inviting adjuncts to a retreat would be daunting as well as other events. The members of the AFAT team reviewed the list and realized that many of the names were adjuncts that were no longer active as teaching at the university for several years or more. Therefore, it was decided that the AFAT team would work to finding the true number of adjuncts at the university. Members of the team broke the list down and would take it to their respective division Dean or administrative assistant for verification on which adjuncts have been active in teaching for the university. This was a priority to know the accurate number as it would factor on the feasibility of being included in university events or a separate function for adjuncts.

The suggestion was made during the inaugural meeting to brainstorm events that can help with adjunct faculty development and community building. The need for adjuncts to know they are connected and a part of the university and to interact with their fellow peers was a top priority for AFAT. It was decided to develop workshop topics to help with faculty development for adjuncts and what events would help with community building.

Subsequent Meetings

The following meetings throughout the year maintained enthusiasm and a clear focus on action items which consistently produced a result. With regards to adjunct classification, the Chair was able to meet with the Executive Director of Compliance and Personnel Services who was recently hired at the university and was currently performing a thorough review of university policies. It was clarified that all adjuncts are classified by the title of adjunct faculty. Any other titles used for adjunct faculty were not official. What was of interest from the meeting was the information that if an adjunct taught more than two courses a semester, then he/she would qualify for health benefits. This would be a rare occurrence as adjuncts are usually teaching two or less courses a semester, but this information was important to relay to all the adjuncts through AFAT.

After the inaugural meeting, the Chair of AFAT sent a memo to the Dean of Information Technologies and Support Services regarding adjunct email addresses. The Dean was supportive of the request and mentioned that the logistics was not an issue to make the update. The Dean received final approval from the Provost and all adjunct emails were migrated from @adjunct.university.edu to @university.edu.

The President of the Faculty Senate accepted the request to bring forth the motion to allow one adjunct faculty member assigned by AFAT to be allowed as a voting member in the Faculty Senate. It was decided that whoever holds the Chair of AFAT would serve as the adjunct member at the Faculty Senate should the motion pass. The Chair of AFAT was invited to the final Faculty Senate meeting of the semester to speak on behalf of the motion that was brought forth to the body. The motion passed and the Chair of AFAT was able to vote on other items during that Faculty Senate meeting. It was a milestone moment of faculty governance by having the adjuncts represented with a vote in the Faculty Senate.

After working on verifying the current number of active adjunct faculty members, there were a little over 100 and presented at the meeting. This new number reflected verification with each university division and the updated list was provided to the administration. The ratio of full-time faculty to adjunct faculty was almost one to one. With this important and accurate information, the AFAT team passed a motion to proceed ahead with planning an event for March 5, 2016, that would serve as an adjunct faculty retreat, provide faculty development workshops, and allow community building.

Celebrate Adjunct Faculty Day

One of the many significant successes was the creation of a “Celebrate Adjunct Faculty Day,” held on March 5, 2016 and had a strong showing of attendees. The support of the staff at the Faculty Center was instrumental with helping to plan the logistics of the event. The event
was held on campus with breakfast and lunch provided and an opportunity to interact with their peers. Full-time faculty members provided their support for adjuncts and the event by volunteering their time as facilitators of the active sessions held throughout the day. The sessions included: Virtual Worlds, Assessment & Rubrics, Library Resources, Syllabus Redesign, Active Learning Methods, Student Panel Session On How Best Students Learn, Scholarship of Teaching and Learning, Effective Practices for Online Teaching, Update From AFAT, and Appropriate, Relevant and Meaningful Educational Technology. During the Update From AFAT session, the adjuncts in attendance were briefed with the outcomes of several agenda items. They were extremely pleased to hear that the university email address will no longer contain adjunct and be consistent with the rest of the faculty and staff.

AFAT met on March 15, 2016 to do a recap of the event. An emphasis was placed to continue the momentum with planning for future events. The evaluation results from the attendees were presented during the meeting. Overall, the attendees expressed strong satisfaction for the event and the content covered. Most importantly, the attendees felt a stronger sense of connection to the university and knowing that they are valued.

Conclusion
The formation of an official body to represent adjuncts within the university organizational structure and the backing of one high-level administration official were vital in achieving the major successes in a short span of time.

Further Work
This paper illustrates what is possible for adjuncts through organizing a formal team in the university organizational structure. The literature showed that at one other university, there were successes with actions items as was also found with the university discussed in this paper. Continued efforts are needed to build upon and sustain AFAT to be a permanent fixture at the university. In the second year of AFAT, there was a transition to a new chair and continued representation for adjuncts at the Faculty Senate as a voting member. A second Adjunct Faculty Celebration Day took place in the fall of 2016 with workshops and activities to assist adjuncts, continuing the work that starting the previous academic school year. More work needs to be done to help adjuncts with representation at universities.

A Study on the Use of Company Structure in STEM Group Activities at Junior High Schools

Jidong Huang, Amerika Bernal, Ye Lu, John Jackson, John Kuscera, Pradeep Nair, Amy Cox-petersen

California State University, Fullerton

Abstract:

STEM-Inc is a 3-year NSF ITEST (Innovative Technology Experiences for Students and Teachers) project designed as an after-school program targeting 7th and 8th graders from Junior High schools, especially those from traditionally underrepresented groups. This project creates a mini technology business 'incubator' in an afterschool program at the Anaheim Union High School District (AUHSD). The project focuses on getting the students involved in exciting real-world projects that involve Engineering and Computer Science (ECS) subjects, business concepts and entrepreneurship practices. Junior-high school students participating in STEM-Inc work in groups to complete their ECS design projects. Each group is led by a student peer leader; and everyone in the group has a designated business role similar to those seen in a real company. Accordingly, both formative and summative evaluation was used to assess the student learning outcomes; and positive outcomes had been observed in preliminary research results.

1. Introduction

The STEM-Inc program sets out to inspire and encourage middle school students to pursue STEM related fields. By utilizing a company like structure in the classroom, students of different interests engaged in developing projects closely associated with the real-world. From developing applications that have the capability of saving individuals’ money on their electricity bills, to developing a partially functioning robotic arm that can pick up dog feces in a backyard, students utilized their critical thinking and problem solving skills to tackle real world problems. In addition, the STEM-Inc program sought out to break down the natural mental barriers of “I am not good enough” by having students understand the pathway of many successful entrepreneurs like Elon Musk and Steve Jobs. A pathway that is made up of hard work, failures, perseverance and persistence. In hopes to develop the students critical thinking abilities, preserve their creative thinking and improve upon their communication skills, the program mirrored the real world and inspired young minds to contribute to the advancement of humanity. Data reflected in this paper are from the first two years the program has been in place. The program objectives are as follows:
Goal 1: To engage diverse junior high students in engineering and computer science by familiarizing them with relevant career and business/entrepreneurial opportunities.

Goal 2: To help diverse students develop career-readiness skills in engineering and computer science.

Goal 3: To expand teachers’ understanding of engineering and computer science career opportunities and the skills students will require to pursue them.

2. Program Description

STEM-Inc., an afterschool program that exposes Junior High School students from traditionally underrepresented groups, to engineering concepts and entrepreneurship practices. Throughout the school year, participating students are mentored by engineering and business students from the California State University of Fullerton (CSUF), and teachers from the AUHSD. In small groups, students brainstorm and research problems within their community or a least developed country in order to find a feasible solution. Upon approval of the CSUF mentors, students work diligently to develop a partially functioning prototype and a business plan of their ideas. By the end of the school year, students showcase their projects and put their acquired business skills to the test and try to convince people that their idea is worth investing in. Engineering topics and activities that were covered are: 3d design, 3d printing, circuitry design, Arduino, MIT app inventor and how to program a robotic car to perform certain tasks. Simultaneously, students were exposed to entrepreneurship practices through a series of interactive workshops that focused on lean startup methodology, traditional venture creation, design thinking, go to market strategies, financial planning and fast pitch communication skills. The two hour long after school program was implemented across four Junior High Schools within the AUHSD.

3. Methodology

Participants

To test the veracity of this pedagogic framework, the use of a longitudinal study was implemented. Comprehensive surveys were used to measure the students’ attitude towards STEM in general and more specifically their attitudes regarding to how STEM is related to their futures, including potential career choices, using Likert-scale questions. The surveys were administered at the beginning and end of the school year. Students that were surveyed in year one and two, expressed greater interest in STEM fields at the end of the school year. Currently, year one and two surveys have been completed and year 3 surveys are currently being
administered. Additionally, personal observations of the CSUF mentors and evaluators have been documented for years one and two. The design and development research study integrates mixed methods using both quantitative and qualitative approaches to evaluate goals one to three.

Population Served Across Four Junior High School’s

STEM-Inc., in 2015-2016 had a higher proportion of Black and Latino students in comparison to the 2014-2015 school year (Figure 1). These differences are reflected below by the 51% Latino students in the Traditional group and 10% Black students in the Lean group in the current school year. STEM-Inc. is increasingly recruiting students from historically underrepresented groups in STEM careers. 48% of STEM-Inc. student participants identified as Black or Latino in Year 2, compared to 30% in year 1. 49% also identified as female in Year 2, compared to 32% of student participants in Year 1. STEM-Inc is making an effort to keep recruiting and retaining students from traditionally underrepresented populations. In Year 2, seventy percent of students identified as Hispanic or Latino. In addition, a higher portion of female students participated in Year 2 as compared to Year 1.

![Figure 1. Race/ethnicity of STEM-Inc. student participants, by year and treatment group](image)

Group Activities and Student Roles

Students throughout the year worked in small groups that emulated a start-up like environment. Students, with the help of their mentors and teachers developed partially functioning prototypes of their ideas and a business plan. Throughout the school year students engaged in several interactive activities that aimed to improve their self-efficacy. Activities introduced were: fast pitch events, design thinking workshops, prototype development workshops and workshops that were designed to reduce student fear of failure. Research in Year 2 showed that students fear of failure did not significantly change throughout the school year. In addition, students took on executive roles such as CEO, Chief Engineer, CFO, CMO; and delegated work amongst
themselves. This company like structure proved to be a huge success both in Year 1 and Year 2 of the program and many students now aspire to be engineers and business owners.

**Purpose of a student Peer Leader in STEM-Inc.**

Mid way throughout the year, the program identified eight student peer leaders from each school that have consistently shown abilities to lead a team. The students were trained in the areas of project management, time management and conflict resolution. In addition, students were encouraged to manage their own teams and make decisions that is critical for their success. From survey results one student reported “I learned how to be a more effective group member,” on their contributions. Other students reported learning “how to communicate with my group members and cooperate.” “It showed me how to work with people more appropriately”; “I learned about leadership”; and “I learned how to contribute to others and not care what people think about you”. Overall students reported “greatly benefiting” from the leadership training.

From fall to spring in year two of the program, student peer leaders significantly improved their management of time and resources (M diff=.53, p<.05) as well as listening to others (M diff=.69, p<.05, Figure 2). Peer leaders were asked to rate their agreement to 6 leadership items based on the 21st Century Skills rubric and according to a Likert scale where 1= “Strongly Disagree” and 5= “Strongly Agree”.

Engineering Activities Introduced

3D Printing

The 3D printing hands-on learning plays a critical role in the program. Not only does it allow for students to imagine and design objects utilizing Sketchup, but they learn how to print a tangible object as well. This is a project-based learning approach that has been successful in helping students design rapid prototypes of their ideas and testing them on the end user.

Visual Programming on Android

Visual programming is taught by demonstrating sample functional blocks including commands, logic, variables and more; and creating sample applications using MIT App Inventor. At this stage, in-depth coverage of computational thinking skills, including logic building, command sequencing, variables and parameters were taught by the mentors to the student participants through learn-by-doing methods. When the majority of the student participants were able to handle those sample Apps on their own, the curriculum then moves on to a Mobile App design contest, in which students worked in groups to design a Mobile App using their own ideas. In this stage, it’s mostly student self-driven with mentors just providing technical supports when needed.

C-Coding Program

In order to make C-coding fun and interactive for students at this age group, they have been instructed to learn C-coding through the programming of a robot. The robotic kits, Arduino-based Robotics Shield Kits from Parallax are used in STEM-Inc. These kits are beginner-friendly; and no prior programming experience is necessary to work on these kits. The platform for C-code to drive the robot is an Arduino microcontroller. Arduino is an open-source prototyping platform based on easy-to-use hardware and software. It provides students with a fundamental understanding of C programming as well as exposure to technologies in real-world.

Using samples from Parallax, students were taught by the mentors how to assemble the kits and integrate various electronic components including some sensors, for example distance, temperature and motion sensors, onto the kit to make robots function in different ways. Working in groups, the students then learned about basic programming in C to complete different tasks on the robot including driving/navigating the robot on its own; and instructing the robot to follow lines and avoid obstacles on the way through the use of sensors. Through practicing per mentor’s guidance, students also learned about the basics of C-programming, including syntax, logic-building, task-planning and variables and parameterizations.
**Engineering Outcome**

Seventy-nine percent of students reported that they had an increased interest in STEM activities then in comparison to their interest before the program (Figure 3). Sixty-nine percent of students also reported they are now more effective in solving science and math problems than prior to the program.

![Figure 2. Student self-report of change in STEM interest and science/math problem solving as a result of STEM-Inc. activities](image)

**Business Activities Introduced**

Throughout the program students engaged in interactive workshops that taught the fundamentals of the business world. Topics of workshops introduced are as follows.

**Lean Startup Methodology**

The lean startup methodology is a formal process that is widely used by several successful entrepreneurs. This process consists of a constant user feedback loop that allows entrepreneurs to identify areas of improvement early on in the development phase. Students across all schools engaged in activities that helped them identify problems within their community, find a solution, either through a product or service, and obtain feedback on their ideas from end users to determine if their proposed product or services meets the needs of the user. By receiving constant feedback throughout each step of development cycle, students were able to identify whether or not their idea would be profitable.
**Design Thinking**

Design thinking is a five-step cycle, that is very like lean methodology. It utilizes constant feedback from the end user to determine whether or not the product or service developed meets the users needs. Students learned how to make working prototypes of their ideas utilizing the knowledge acquired from engineering concepts.

**Fast Pitch Communication**

Fast pitch communication skills teach the fundamentals of communicating a business idea fast and effectively under 60 seconds. This form of communication has impacted the middle school students positively according to pre and post survey results. Student gained confidence in their ability to communicate in front of an audience and some even reported taking this form of communication into their presentations.

**Financial Planning**

Students learned how to financially plan the cost of their idea utilizing excel spread sheets. As a team, students tracked the cost of the parts being used for their idea, marketing budget and with this information, they calculated their projected profit or losses.

**Team Building/Management**

After attending leadership training, students learned how to effectively manage and work in teams. Students took on executive roles such as chief financial officer, chief marketing officer, chief technical officer and chief executive officer to gain an understanding of how companies operate. From observations, we have found that students were very enthusiastic about their roles and were more motivated to learn.

**Business Outcomes**

The program staff asked students to complete an 8-item self-assessment at the end of the program year regarding their degree of agreement to learning business/entrepreneurship skills from STEM-Inc. activities. Teachers also completed a similar assessment on students but for the whole classroom (i.e., one assessment for all-students). On a scale from 1=“Strongly Disagree” to 5=“Strongly Agree,” students agreed to have learned most business/entrepreneurial skills (Means ranged from 3.7 to 4.1; Figure 4).
4. Findings

Compiled research has been evaluated and compiled by Arroyo Research Services, an external evaluator. Below is a summary of findings for Year 1 and Year 2 of the STEM-Inc. program.

a) STEM-Inc. is increasingly recruiting students from historically underrepresented groups in STEM careers.

b) Forty-eight percent of STEM-Inc. student participants identified as Black or Latino in Year 2, compared to 30% in Year 1. Forty-nine percent also identified as female in Year 2, compared to 32% of student participants in Year 1.

c) Participants were generally satisfied with and benefitted from program activities. Around 90% of student participants were satisfied or very satisfied with the afterschool and fieldtrip activities.

d) College mentors and teachers agreed that fall professional development activities enhanced their content knowledge, teaching skills, and professional growth to some extent.

e) 79% of participants agreed or strongly agreed that they experienced a greater interest in STEM activities over the course of the program.
f) STEM-Inc. is developing ECS career-readiness skills among participating students, per self-report.

g) STEM-Inc. training and after school sessions are increasing teacher confidence with ECS concepts.

5. Acknowledgements

The research in this paper was supported by an ITEST grant from National Science Foundation with grant number DRL #1433851. In addition, the authors would like to thank all project staff including the AUHSD teachers and CSUF college student mentors, and our project evaluator: Arroyo Research Services for their contributions to this research.

ABSTRACT

This study aims to capture a deeper understanding of the phenomenon that the school administrators experience within the first year of being transitioned out of the classroom and into the administrative office. Although the transition from teacher to administrator would seem to be just a straightforward change in roles and responsibilities, studies have shown that the transition is more than a change in the physical location of office or a change in the position title. The transition would mean a discontinuity of the teacher’s life inside the classroom and the beginning of a new life in the administration office.

Although it may seem logical for a faculty member to move out of the classroom and become a school administrator, the transition to the administrative post, according to the literatures reviewed, may not always be a smooth and easy ride as it requires new ways of thinking, communicating, behaving, emoting, and seeing the educational world and one’s place in it. But given the need to field effective and efficient administrators to manage the operations of the schools, and that the best source of school administrator-talents are the incumbent faculty members, the ability of the teachers to successfully transition to the administrative post within the first year of movement between offices is becoming a concern of the school management. To address this concern, there is a need to surface how the administrators lived through their experience of the transition, and then be able to make sense of that experience through an interpretative account of what it means for the school administrators to transition in their particular and unique transition contexts. As such, the study hopes to determine the answers to its
main question: *What is the essence of the transition experience of school administrators from teaching?*

The study employs an Interpretative Phenomenological Analysis (IPA) to reveal the lived experience of the teachers transitioning to administrative posts. IPA’s primary goal is to investigate so as to understand what it is like to experience the phenomenon from the point of view of the participants.

IPA’s approach is *phenomenological* in that it involves detailed examination of the participant’s life-world. It attempts to explore personal experience and is concerned with an individual’s personal perception or account of an object or event. The analytical process in IPA is often described in terms of a *double hermeneutic* or dual interpretation process because firstly, the participants make meaning of their world, and secondly, the researcher tries to decode the participants’ meaning making. IPA relies upon the principle of *idiography* - an in-depth analysis of single cases and examining individual perspectives of study participants, taken in their own unique contexts.

The study engages 5 full-time administrators, from 5 different schools, with no prior experience in administration. They have been moved out of teaching, and are currently functioning as administrators for less than a year, to date.
Through the use of semi-structured, in-depth, one-on-one interviews, the researcher will generate rich, detailed, and first-hand descriptions of how individuals are experiencing the transition as the phenomenon, enabling the researcher to conduct an in-depth exploration of the lived experiences of the participants, and acquire the participants’ accurate account of how they make sense of their experience.

For the purpose of this study, the researcher composed an interview schedule that covers three main topic areas: 1) Description of the Transition; 2) Experience of the Transition, and 3) How Transition Fits in with the Participant’s Life. The questions will elicit the sensory perceptions, mental phenomena (thought, memories, associations, fantasies), and individual interpretations of the participants about the phenomenon.

IPA aims to give evidence to the participants’ making sense of the phenomenon being investigated, at the same time, document the researcher’s sense making. In general, IPA offers a set of flexible guidelines in a form of analytic stages, which this researcher intends to adapt, in order to unfold an analysis of the study.

Forewarned by the literatures about the complex and time-consuming activity that the data analysis method of the IPA framework may bring, this researcher has have also been made aware by the same readings that the data analysis methods can be an inspiring activity as the researcher immerse herself in the data and try to step into the participants’ shoes as far as
possible. To achieve this state, the following stages of data analysis will be conducted to usher the expected results of the study:

**1st Stage: Multiple Reading and Making Notes:**

By reading through the transcripts of the interview and listening to the audio recording a number of times, the researcher will immerse himself in the data to provide him with new insights. The researcher’s notes, observations and reflections will focus on the following: Content; Context; Initial interpretative comments; Comments on personal reflexivity; Distinctive phrases and emotional responses.

**2nd Stage: Transforming Notes into emergent Themes**

The aim of this stage is to transform the notes into emerging themes. The researcher will formulate concise phrase at a slightly higher level of abstraction which may refer to a more psychological conceptualization.

**3rd Stage: Seeking Relationships and Clustering Themes**

This stages involves looking for connections between emerging themes, grouping them together according to conceptual similarities, and providing each cluster with a descriptive label. The researcher will develop a final list of clustered themes which may comprise of numerous superordinate themes and subthemes.
4th Stage: Writing Up an IPA Study

This narrative account of the study will involve taking the identified themes and write them up one by one which will include both the participant’s account of his experience in his own words, and the interpretative commentary of the researcher. The narrative account may engage several levels of interpretation, from low-level interpretation of data to a highly detailed, interpretative and theoretical level, that may generate new insights.

The Conclusion:

The narrative account will be followed by a discussion section which relates the identified themes to existing literature. Reflections on the research will be included in the section, as well as comments on implications of the study, its limitations, and ideas for future development.
A Phenomenological Study on

The Lived Experience of Teacher’s Transition to Administrative Posts

Introduction and Background

The demand for people to lead and manage educational institutions is increasing as the need to educate the youth in the Philippines become progressively more important for everyone. Filipinos, especially the start-up families who are moving to newly developed communities, want their children to have access to schools where their children will be educated and prepared for the future.

According to the 2012 Census of Philippine Business and Industry report on Private Education for Establishment, as released by the Philippine Statistics Authority on November 2014, and posted at https://psa.gov.ph/content/2012-census-philippine-business-and-industry-private-education-establishment-all-employment#sthash.EaX70BeE.dpuf, there are 13,921 private educational institutions that are established nationwide, of which 67.4% are schools operating on the basic education level, while 18.4% are offering higher education level, and 14.1% are other education services and educational support. While the report shows that more than half of the total number of private educational institutions are already focused on the basic education level offering pre-school, primary/elementary education, and secondary education, there is still a need to provide more schools in order to house 24 million K-12 students (DepEd’s school enrollment statistics, December 2015). In addition, ICEF Monitor, a dedicated market
intelligence resource for the international education industry, featured in their 2013 report posted at http://monitor.icef.com/2013/08/philippines-creates-opportunities-in-overhaul-of-k-12-education-system/ that the basic educational landscape is expected to expand further as the demand for access in education gets higher. Specifically, the report highlighted the Philippine Government’s 10 point education agenda where 2 out of the 10 point agenda focused on building more schools and expanding government assistance to private education in order to address the severe overcrowding in Philippine schools and the shortage of classrooms. In fact, the same report stressed that DepEd’s Public Private Partnership for School Infrastructure Project (PSIP) will give schools the physical space they need and “provide the private sector the business opportunity to invest in the design, construction and maintenance of classrooms.” This strong positive outlook in the private education industry - to grow and expand by establishing educational institutions across the nation - presents a challenge in recruiting and staffing, not only its faculty members, but more so, its administrative team who will administer and manage the newly established schools in its day-to-day operations.

There are a number of source areas where to recruit qualified candidates for a teaching position, and they can easily be accessed. However, finding qualified school administrators is becoming increasingly difficult (Clifford, 2012; Palm, 2006). There are several reasons for the increasing difficulties to source and place qualified school administrators to administer and manage the schools, but undeniably one effective source of school administrator-talents are the school teachers who are willing to be moved out of the academic department, and assume a post in the school administration office. With this recruitment and placement strategy at hand, the school’s challenge now shifts from sourcing school administrator-talents elsewhere to
transitional the willingly teachers to the school administrative posts, and let them be part of the team to administer and manage the school operations.

For the purpose of this study, the school administrative posts are identified to be the functional positions in the school operations such as: school superintendent, principal, assistant principal, district school officer, site campus or school director, registrar, institutional (external/internal) affairs officer, marketing officer, human resources officer, and other named positions under the administrative set-up of a school. The position is performed by an incumbent administrator on a full-time administrative capacity for one year or less, and no longer has any teaching load assignments.

Transitioning from a teaching position to an administrative post would mean a discontinuity of the teacher’s life inside the classroom and the beginning of a new life in the administration office. The move will require new skills, behaviors and attitudes as the administrator assumes the functional post in office. This transition point in the work-life of a school administrator is what this researcher intends to examine.

Although, there are no publicly available studies regarding the school administrators who made the direct transition from being a teacher, previous researches, articles, and journals on the topic area of change and transition were considered to provide context and frame of reference to this study.
Literature Review

Ideally, a successful tenured teacher moves up naturally and smoothly to become a school administrator without really going through much transition challenges, primarily because he has the understanding of the issues that impacts the students’ school life. He also has the working knowledge of the factors that will improve the learning environment that is needed by the students to achieve their academic goals, as well as the growth and developmental needs of the teachers (Palm, 2006). In such an ideal world, one where the schools are not seen as a business unit, the teachers transitioning to the school leadership role believes that all they need to progress in their career is to teach well. They also believe that they do not have to leave behind their faculty mindset, that they still are faculty members - they think and behave like faculty members, they present themselves and are accepted by other faculty as colleagues, and they assume that they can easily return to full-time faculty status when the administrative stint has been completed (Palm, 2006; Griffith, 2006). On the other hand, Armstrong (2009) highlighted that the promotion from teaching to a school administrative function represents a significant milestone within the personal and professional landscape of the administrator. And although the move is often seen as the logical career pathway to be at the management level, it carries different meaning for the individuals and their institutions as well:

On the Personal Level. A movement from one position to another is often an exciting period which marks the successful culmination of years of teaching and preparation. Armstrong (2009) emphasized that the career move of the school administrator signals that his aspirations and
ambitions have been accomplished, dreams have been fulfilled, hard work and loyalty have been rewarded, and a promising future is in the horizon.

However, while becoming an educator is one of the most rewarding and challenging experience for those called to the profession, assuming the position of a school administrator can be a heady experience – true for anyone assuming a career advancement (Wilhelm, 2011). The movement from one position to another would mean letting go of the old ways, the old identity of being a teacher, and embracing the new identity of being a school administrator (Bridges, 2003).

**On the Professional Level.** According to Armstrong (2004), the transition from teacher to school administrator signals an elevation within the professional hierarchy. The teacher’s leadership skills have been recognized, increased professional status have been granted, and access to the corridors of power and influence are imminent.

As the teacher makes a conscious decision to make the move out of the faculty room and into the administrative office, he will find himself in the web of transitioning roles from managing a classroom and the number of students in it, to managing a number of classrooms with hundreds of students in it. But Armstrong (2009) highlighted that with the power and influence the administrator has been granted with, he is expected to manage the school operations and make things happen through, and with, the people.
On the Institutional Level. Armstrong (2004) also pointed out that the transition, the career move from teaching to administering and managing, represents the official stamp of approval for the school administrator to gain access in the inner working world of administration.

As part of the administration team, the school administrator will have a “bird’s eye view” of the institution’s operation. He will be exposed with qualified, advance, information which will help him manage the issues and challenges of the school operations. Armed with the business perspective of the school operations, the school administrator is expected to lead and manage the school’s operation to its maximum potential (Armstrong, 2004).

Planned Change

Transitioning from a teaching position to an administrative post would mean a discontinuity of the teacher’s life inside the classroom and the beginning of a new life in the administration office. This move will require new set of skills, behaviors and attitudes as the administrator assumes the functional post in office. More specifically, the administrator will have to change his ways of thinking, communicating, behaving, emoting, and seeing the educational world and his place in it (Armstrong, 2014; Bond & Naughton, 2011; Armstrong, 2009; Griffith, 2006).

Change occurs as a process, which takes place both at the individual level and the organizational level (http://www.change-management.com/tutorial-7-principles-mod8.htm). Change is a common thread in the lives of every individual, and it also runs through all organizations regardless of its industry, size and age. (https://www.mindtools.com/pages/article/newPPM_94.htm). Change is always present. It is inevitable. It is constant. It is dynamic. Our world is changing fast, and so is our lives at work,
in the community, or even at home. Understanding the process of change enables a person to make the necessary transition needed to make a successful change (Harrington & Terry, 2003; Johnson, 2002).

William Bridges (2003), a leading author on change and transition, clearly distinguished change from transition. He defined change as situational and can be planned, like moving to a new site, having a new boss, or assuming a new work role. Whereas, transition is a psychological process of letting go of the past and taking up new set of behaviors and ways of thinking. According to Bridges (2003), Change is external. It can be imposed from the outside. Transition is internal to the individual. It is about the process by which the individual approaches change – how he deals with it, how he responds to it, how he adapts to it. Our responses to change are affected by the situations that is governing our lives – what needs we have or what our experiences have been (Harrington & Terry, 2003). These change triggering situations will always imply the need to alter or modify an individual’s behavior so as to be able to face the challenges needed to make a successful change (Harrington & Terry, 2003, Bridges, 2003, Bond & Naughton, 2011, Johnson, 2003; Lundin, Paul & Christensen, 2000). To this thought, Bridges (2003) emphasized the distinction between change and transition by saying that “unless transition occurs, change will not work”.

The process of change is complex since it involves alteration and modification of behaviors. But Kurt Lewin, a physicist as well as social scientist, explained his theory of planned change using the analogy of changing the shape of a block of ice. His model is one of the cornerstone models for understanding organizational change which was developed back in the 1940s, and
still holds true today. His model, as presented in Figure 1, is known as the Unfreezing – Change – Refreezing, which refers to the three-stage change process he describes.

**Figure 1: Kurt Lewin’s Process of Planned Change**

![Diagram of the Unfreezing - Change - Refreezing process]

Understanding why the change must take place signals the beginning of a successful change process. As Lewin put it, "Motivation for change must be generated before change can occur". The following details each stage of the planned challenge (Harrington & Terry, 2003; [https://www.mindtools.com/pages/article/newPPM_94.htm](https://www.mindtools.com/pages/article/newPPM_94.htm)):

1st Stage: Unfreeze

- This first stage of change involves preparing to accept that change is necessary, which involves break down the existing mindset before building up a new way of operating.
- Key to this is developing a compelling message showing why the existing way of doing things cannot continue. These show that things have to change in a way that everyone can understand.
Unfreezing is necessary because before any change can occur, the people must believe the change is needed.

2nd Stage: Change

- After the uncertainty created in the unfreeze stage, the change stage is where people begin to resolve their uncertainty and look for new ways to do things. People start to believe and act in ways that support the new direction.
- The transition from unfreeze to change does not happen overnight. People take time to embrace the new direction and participate proactively in the change.
- It is during this 2nd stage of change that transition occurs. It is the period where the individual has to let go of the past, accomplishing endings of the previous state, so as to make room in accepting new beginnings.
- As the individual goes through this stage, he will experience many effects. Some may be expected and anticipated by the individual, but some effects may not be expected. Nevertheless, the individual copes with and adapts to change in their own unique ways.

- **Elizabeth Kubler-Ross**, as discussed by John Adams, John Hayes and Barrie Hopson (1976) presented a related change model that focuses on how the individual copes and adapts to the effects of change, and the issues that he faces throughout his personal transition. This model is known as the **Transition Curve**, presented in **Figure 3**, and will be discussed later in this chapter.
3<sup>rd</sup> Stage: Refreeze

- When the changes are taking shape and people have embraced the new ways of working, the organization is ready to refreeze. The outward signs of the refreeze are a stable organization chart, consistent job descriptions, and so on.

- The refreeze stage also needs to help people and the organization internalize or institutionalize the changes. This means making sure that the changes are used all the time; and that they are incorporated into everyday business.

- With a new sense of stability, employees feel confident and comfortable with the new ways of working.

Role Transition

*Role* is referred to as the function assumed by a person in a particular situation (Harrington & Terry, 2003). Each member in an organization occupies a specific position which relates to other positions in the organization. In the organization every person is expected to behave in a particular manner while performing a specific role. A *role* is a set of connected behaviors, rights, obligations, beliefs, and standards as conceptualized by actors in the organization (Kumar, Kaur, & Kalra, 2013). A person is said to have grown and developed into the role soon as he learns to adapt to the expectations of the job. Particularly, if he performs his functions more than what he is expected to deliver; he has displayed the knowledge and expertise required of the job; and if he displays the behaviors that are inherent to the role he is performing. With all the displayed Knowledge, Skills, Attitudes and Habits (KASH) on the job, the individual is said to have developed his competence needed to effectively function the specific role he has been assigned with (Harrington & Terry, 2003; Kumar, Kaur, & Kalra, 2013).
When organizations change in response to the business needs called for by its operations, it becomes inevitable that the role of people in the organization are also called for to change.

*Role Change* consists of adding up functions into the current role, expanding the scope of the role, dropping an old role, or modifying the behaviors associated with the role. (Harrington & Terry, 2003). On the other hand, a transition of roles may also be called for. According to Harrington & Terry (2003), *Role Transition* “refers to a passage or a shift from one place to another or from one role to another”. This move indicates a period of change, oftentimes it is triggered by a major change in the organization leading to the need to let go of some skill sets and abilities, and then acquire a new set of KASH – new way of thinking, behaving, emoting, and communicating.

**The Roles of the Teacher vis-à-vis the Roles of the School Administrator**

Many journal articles and studies have focused on the role transition of the teacher to a school administrator: Griffith (2006); Palm (2006); Armstrong (2009), Borba (2009); Smith, Rollins & Smith (2011); Bond & Naughton (2011); White (2012); Armstrong (2014). Most of these articles and studies have examined the teachers’ motivation to move from one job role to another; the administrator’s passages and processes or phases that they go through when they move to a new role; the strategies needed to be successful on the job; the coaching needed in managing transitions; and the support and development needed to make the incumbent effective on the job. In all of these articles and studies, the underlying premise that was magnified is that a good teacher will make a good school administrator (Palm, 2006; Borba, 2009; Armstrong, 2014). However, it can also be gleaned from these articles and studies that the roles and responsibilities of the teacher are very different from the roles and responsibilities of a school
TEACHERS’ TRANSITION TO ADMINISTRATIVE POSTS

administrator and therefore, the practice of their new role will bring all sorts of new revelations and change perspectives which they are unprepared for (Palm, 2006).

According to Armstrong (2009), the school administrator who come from the structured teaching environment, oriented with defined tasks, work relationships, and the predictability of a prescribed work hours are generally unprepared for the amorphous nature of their administrative role and the variety of conflicting expectations and tasks that surrounds it. Table 1 details the roles and responsibilities of the teacher vis-à-vis that of the school administrator as posted in the job profile sites.

**Assist with Student Behavior Management**

- Responsible for meeting with teachers and parents to help keep students' behavior under control.
- Make rules and procedures that cover the entire school as well as behavior plans for individual students who regularly cause trouble.
- Help design programs to keeps schools safe and free of drugs and alcohol.

**Other Responsibilities**

- Works with school committees, including academic boards, governing bodies and task groups;
- Assists with recruitment, public or alumni relations and marketing activities;
• Play the role of evaluators, constantly assessing students' abilities through formal and informal assessments, providing suggestions for improvement and assigning grades.

**Student Interaction**

- Interacts with students.
- Leaders in the classroom and in the school, earning the respect of students and setting a positive example.
- Disciplinarians, doling out fair and consistent punishments to students who break the rules.
- Shows concern for students.
- Has the power to build up or tear down a student's self-esteem and make a student's day or ruin it in an instant.
- Fills in the role of a counselor, a surrogate parent, a nutritionist and

• Administers the 'student lifecycle' from registration or admission to graduation or leaving;
• Provides administrative support to an academic team of lecturers, tutors or teachers;
• Drafts and interprets regulations and deals with queries and complaints procedures;
• Coordinates examination and assessment processes;
• Maintains high levels of quality assurance, including course evaluation and course approval procedures;
• Use information systems and prepare reports and statistics for internal and external use;
• participate in the development of future information systems;
• Contribute to policy and planning;
• Manage budgets and ensure financial systems are followed;
• Purchase goods and equipment, and process invoices;
• Supervise other administrative staff;
someone who has the best interests of every child at heart.

**Other Responsibilities**

- Chaperones at school functions and coaches of school sports.
- Monitors at lunch and recess and serve as fundraisers for field trips and school supplies.
- Plays the role of interior designer, making sure their classrooms are set up to support learning and act as artists when they update their bulletin boards and other displays.
- Liaise with other administrative staff, academic colleagues, teachers and students;
- Communicate with partner institutions, other institutions, external agencies, government departments and prospective students;
- Organize and facilitate a variety of educational or social activities.

**The Transition Challenge**

Although the transition from teacher to school leader would seem to be just a straightforward change in roles and responsibilities, Watkins (2014) and Armstrong (2009) discussed that the transition is more than a change in the physical location of office or work place, nor is it just a change in the position title. They noted that role transitions are demanding as it requires new ways of thinking, communicating, behaving, emoting, and seeing the educational world and one’s place in it.
Kane and Barbaro (2015); Watkins (2014); and Wilhelm (2011) pronounced in their writings that although it may seem logical for a faculty member to move out of the faculty room and become a school administrator, the transition to the administrative post may not always be a smooth and easy ride as it takes a lot of time and energy from the school administrator to make the shift in roles than they are expected to. In fact, the studies of Bond and Naughton (2011), as published in the *International Coaching Psychology Review*, stressed that transition into a new role, specifically the change from a technical functional role to an administrative or a management role, which involves moving away from a role that emphasizes functional competence and moving to one that requires a broader mix of technical, interpersonal, and political skills and activities, can be extremely challenging to navigate. As a result, some administrators are at risk of destabilization and derailment, which may involve failure in the transition phase. It may even spell the end of a promising career. In fact, change and transition expert William Bridges (2003) underscored that the high failure rate of change in individuals to a new post may be attributed to the individual members’ inabilities to make the psychological adjustments. The same was highlighted by Kane and Barbaro (2015) as they cautioned to note that transitions are major events affecting every member of the school community, such that a poorly handled transition may greatly affect both the school community’s morale, as well as the individual’s personal motivation.

The school administrator is expected to advance into the administrative function and be effective on the job the moment he has been appointed, or he has voluntarily accepted the assignment of the administrative post. Everyone in the school organization – the school board, the peers, the school faculty and staff – expects the school administrator to make an impact on
the job within the first few months into the new role. Kane and Barbaro (2015) suggests that the transition process of the school administrator is to be within the first quarter of being in the position. Bond and Naughton (2011) underscored on their studies they have conducted on managing transitions, which was anchored on DDI’s (Development Dimensions International) Selection Forecast 20004-2005, suggested the timeframe of an individual to become fully functional in their new jobs is within 3 to 4 months. In addition, Watkins (2003) highlighted that an individual in a new job position needs 90 days to transition into the a new role. Although, the three-month time frame is not written in stone, the period should be a guide for the administrators to mark the important milestone they are expected to achieve while they are in transition. As they advance into the administrative role, the school administrator is expected to gain traction on his new job function (Watkins, 2003).

Phases of Transition

*Role Transition* happens when an individual moves or shifts from one role to another which entails a conscious ability to change the way one thinks and acts (Harrington & Terry, 2003). According to Bridges (2003), change is different from transition. He defines *change* as a “situational shift”, like moving to a new site, having a new boss, joining a new team, having a new role to perform. But he describes *transition* as “the process of letting go”. It is the process of ending the current reality, the previous identity, the old situation that the individual has before the change. Transition therefore, based on the context presented by Bridges (2003), acts as the link between the current and the desired state of the individual’s being. Transition is the way individuals come to terms with change.
The transition process was described in three phases by Bridges (2003), and is presented in Figure 2.

**Figure 2: William Bridges’ Phases of Transition**

![Diagram of William Bridges’ Phases of Transition](source: Bridges (2003), Managing Transitions, Making the Most of Change)

**Phase 1: Ending, Losing, Letting Go**

The first phase of transition involves an ending where the individual faces the fact that he will have to leave behind his current state of being. This conscious decision to let go of the old situation will enable him to move and pick up the new situation.

Harrington & Terry (2003), expounded on Bridges’ ending phase of the transition highlighting four aspects of endings:

a. **Disengagement** – This aspect of the ending phase involves the separation of the individual from the familiar place within the social order. At this phase, the
individual is voluntarily or involuntarily disengaged from the activities, relationships, places, or roles that have been familiar and important to him.

b. **Disidentification** – This aspect highlights the individual’s loss of self-definition. This aspect is best described as the person goes through the process of finding out who he is now. The old identity overpowers the transition of the individual to the new identity as a result of having difficulty to let go of what he was before.

c. **Disenchantment** – This is the aspect where the individual realizes that his views and beliefs of the past are no longer real. The individual already recognizes that his old views of his situation may be sufficient in its time but may not be the case now.

d. **Disorientation** – This aspect of the ending underscores the lost and confused feeling that a person experiences when in transition. The individual feels that there is no reality in the events that are happening to him. He may feel that nothing feels right or the same as they used to.

**Phase 2: The Neutral Zone**

During this second phase, the individual feels that he is “in limbo”, a temporary state of emptiness or even a loss in-between his state of affairs. This is best described like how a trapeze artist who has to let go of her first swing, but not yet caught his second. He exist in a momentary suspension, in midair, between the past and the future (Harrington & Terry, 2003). At this period, where the past is gone but the predicted future has not yet arrived to replace it, is where the individual appears to be in a void but is actually contemplating important inner thoughts (Harrington & Terry, 2003).
Although the neutral zone may feel and seem to be a risky place to be in, a lot of opportunity may come into play because of the space that is left open for creativity and innovation that the individual can engage himself with. It is this in-between state where critical psychological realignment may take place in the individual’s innermost self.

Bridges (2003) presented the three functions of these phase and are expounded by Harrington & Terry, (2003):

1st Function – The individual gives in to the emptiness and does not try to escape it. He surrenders.

2nd Function – This phase gives opportunity for the individual to renew and recharge, and possibly redirect himself towards working out, in new creative ways, the acceptance and adaption of the mandated change.

3rd Function – Change in perspective. While it may seem that the neutral zone is a chaotic phase, the individual realizes that this is a temporary state. Just as the trapeze artist’s preparation and training tells him that the next swing will be a mere pause and a reach away, so as the learned skills and experience of the individual can help him accept that what comes next to all these seemingly chaotic and confusing events will come sooner or later. Understanding this function will provide reassurance to the individual that the neutral zone will end and that the change will take place.
Phase 3: Beginnings

The final phase of Bridges’ model for transition is called Beginnings. Bridges (2003) referred this phase as a psychological phenomenon. This phase takes place when the individual accepts the reality of change – he is ready to make a commitment to do things the new way and see himself as a new person.

Bridges (2003) differentiated start from beginning. He said that Start involve new situation. It takes place on a schedule as a result of a decision. Beginnings, on the other hand, involves new understanding, new values, new attitudes and new identities. It is the final phase of the transition process, but the timing of a beginning does not follow the implementation date of any decision. “Beginning follow the timing of the mind and the heart” of the individual who is going to start the change.

At this phase, individuals may feel relieved to have finished what had been a confusing or disturbing neutral zone, and they are just eager to settle into the new routine that change can provide. However, there is no clear path as to the time that can be pointed at to say that the new beginning is at hand. Instead, it happens when the transition process allows them to happen naturally. Transition is not subjected to anyone’s will (Bridges, 2003; Harrington & Terry, 2003). This is the reason why it is important to understand the transition process and where the people are, as they go through the journey, over time.
The Transition Curve

In the book *Transition: Understanding and Managing Personal Change* by John Adams, John Hayes and Barrie Hopson (1976), the authors highlighted that as people go through the transition phases, they experience a variety of emotional states. Transitions typically pass through the cycle of reasonably predictable stages, described in Figure 3. In each case, it is suggested that it will be necessary for the individual to work through all of the stages if the transition is to be successfully completed.

This change model, known as the Transition Curve developed by Elisabeth Kubler-Ross in 1969 (see Figure 3), and detailed by John Hayes and Peter Hyde, reflects the variations in the degree to which an individual feels as he goes through his transition process – coping and adapting to the change situation.

**Figure 3: The Transition Curve**

![The Transition Curve diagram](source-image)

**Source:** Barrie Hopson and John Adams (1976), *Towards an Understanding of Transition*
Immobilization

The initial phase of a transition is experienced by many people as a state of shock: of being overwhelmed, frozen, paralyzed, unable to reason, plan or act. There may be an initial expression of grief, anger or euphoria - hence the mood curve may go up or down. The intensity of this phase will be influenced by the degree of preparedness and the desirability of the transition - it will be greater for an unexpected, undesirable change.

Denial of Change

This phase is characterized by a retreat from the reality of the change. Negative changes may be denied or trivialized and attention may be displaced onto other more immediate but less important matters. Energy and activity are devoted to the known and the familiar. Positive changes may induce euphoria and an unwillingness to consider any possible negative consequences. Denial may be highly functional if it provides time to retreat from the reality of a crisis and allow our internal forces to regroup to later face the challenge. However, if maintained for long, denial inhibits the ability to deal with the reality of a change.

Incompetence

Eventually the reality of the change becomes apparent and this often provokes a feeling of frustration, and even depression. This is associated with feeling that the situation is beyond one’s control. The phase may be characterized by anger, sadness, withdrawal and confusion. This drop in mood occurs even in changes which were initially embraced enthusiastically when the practical difficulties are faced. It is in the depression phase therefore that the change really starts
to be experienced as stressful. If the change was a voluntary one, this may be the point at which the person gives up. In involuntary changes, the person may seek to leave the situation.

**Acceptance of Reality**

This phase involves accepting reality for what it is. It implies a clear “Letting Go” of the present or past. This may be experienced as a “little death” and often entails a process of mourning. It can help at this point to remember that the lowest ebb is the turn of the tide.

**Testing**

A more active, creative, experimental involvement in the new situation starts to take place. New ways of behaving and being are tried out. More energy is available but anger and irritability may be easily aroused if the new behavior is not successful. This phase may involve trial-and-error behavior or a more active cycle of experience-review-conclude-plan may be employed. As some patterns are found which seem to work, this phase gradually gives way to the next.

**Search for Meaning**

Out of the testing process come some new ways of being and behaving which are gradually adopted as new norms. At this stage, internalization occurs. The transition is complete when the changed behavior is now normal and unthinking and is the new natural order of things. Ideally the past has been left behind to an appropriate extent and NO “unfinished business” remains.
Integration

This is a more cognitive process involving reflecting on what all the activity and emotion has really meant. It is at this point that learning and personal growth from change may become apparent, which may benefit future transitions.

Conceptual Framework

According to Dai Williams, a chartered occupational psychologist, transition theory originated from the need to understand how people go through bereavement, family crisis, stress and depression. These theories were promoted by authors like Colin Parkes, Thomas Holmes and Richard Rahe, Elisabeth Kübler-Ross and others. By 1970 the US Peace Corps was using it for culture shock briefings to volunteers. Thereafter, Hopson & Adams (1976) recognized transition as a primary cause of stress. Schlossberg, Waters and Goodman (1995) developed its application to counselling. Bridges (1995) and others applied the concept of transition to organization change settings, with shorter stage models but describing essentially the same process.

With all these theories and models of transition that were presented by the different authors, one thing is apparent - transition is a journey that people go through, faced with challenges that they need to overcome, over a period of time. According to the journal articles and transition & change management authors, it is only when the people within the organization have made their own personal transitions can an organization truly reap the benefits of change (Bridges, 2003; Harrington & Terry, 2003; Johnso, 2002).
The primary focus of many organizations (including school organizations) today is to rethink business priorities, determine new approaches, implement process, move resources—especially human resources. However, despite the energy and the effort these organizations expend to determine how it can best achieve change, seldom do they consider the impact that the change has on the individual. Specifically, they fail to consider how their people (their most valuable resource in the organization) approach and adapt to change and how their acceptance and adaptation to change will create an impact on the organizational level (Harrington & Terry, 2003).

The concept of transition may be useful in capturing the journey—how the teacher approach and adapt to the challenges and issues that he goes through as he leave his old identity of being a teacher behind, and he then accepts his new identity as an administrator. Becoming aware of the individual’s concerns and issues during the period of transition may help the school management to propel change forward.

Figure 4 below presents the conceptual framework that this study will employ in gaining a deeper understanding of the transition journey that the administrator goes through, and what does the transition experience mean to him.
The Research Gap

A number of management books have been published highlighting and stressing on managing transition and change, and how it impacts the individual and the organization. Different transition theories have been formed to capture and describe how individuals go through their transition journey since these are associated with significant life events such as changes on the individual’s role or environment that require radical restructuring of the individual’s view of himself, and of his world.

On the other hand, there are a number of studies that focused on the transition of teachers to school administrator role. Most of these studies highlighted on their personal and professional perspectives of the transition; the impact of their transition to the school organization; the impact
of their transition out of the faculty; their school leadership identity; and the support and development needed for an effective transition. Despite all of these studies, there has been no study conducted on the lived experience of teachers’ transition to school administrative posts. It is the attempt of this study to fill in the gap and provide a better understanding of how teachers can transition successfully into the school administrative function.

**Problem Statement**

Given the need to field effective and efficient school administrators to manage and administer the operations of the schools that the education industry intends to aggressively establish, and that the best source of school administrator-talents are the incumbent faculty members, the ability of the teachers to successfully transition to the administrative post is becoming a concern of school management. In order to address this concern, there is a need to surface how the administrators lived through their experience of the transition from teaching to administering and managing the operations of the school, and then be able to make sense of the administrators’ lived experience through an interpretative account of what it means for the school administrators to go through the transition experience, in their particular and unique transition contexts. The context of the transition is of critical interest to this researcher in her quest to discover how school administrators can assume the position they have been moved into, so as to be able to advance the school’s operations at an optimal level. As such, the study hopes to determine the answers to its main question: *What is the essence of the transition experience of school administrators moving-in from teaching?*
Purpose of the Study

The purpose of this study is to capture a deeper understanding of the phenomenon, the lived experience of the school administrators, as they go through their personal transition experience within the first year of being assigned to the position. By gaining a better understanding of the school administrators’ process of transition, both the school management and the incumbent school administrator will be able to do a better plan and execute a successful transition process.

Significance of the Study

By gaining insights from the shared stories of the school administrators on their lived experiences, the study hopes to shed light for the school board and its management team to understand how the school administrators could successfully and completely transition into their administrative function, so as to be able to advance the school’s operations at an optimal level. In addition, this study hopes to contribute to the educational leadership and management studies by adding discussions and increasing the level of awareness of school organizations in managing and leading its most valuable resource - its people.
Methodology

Research Design

The study employs an Interpretative Phenomenological Analysis (IPA) to reveal the lived experience of the teachers transitioning to administrative posts. IPA’s primary goal is to investigate how participants make sense of their personal and social world. It draws upon the fundamental principles of *phenomenology, hermeneutics and idiography* (Pietkiewicz & Smith, 2012).

According to Smith and Osborn (2007), the approach is *phenomenological* in that it involves detailed examination of the participant’s life-world. It attempts to explore personal experience and is concerned with an individual’s personal perception or account of an object or event, as opposed to produce an objective statement of the object or event itself. Furthermore, Smith and Osborn (2007) emphasized that the research exercise is a dynamic process with having the researcher play an active role in the process as he tries to get close to the participant’s world to get an ‘insider’s view’ of the experience. But the authors also pointed out that one cannot directly and completely do this process since access to the participant’s world depends on, and is complicated by, the researcher’s own conceptions. However, through interpretative activity, the researchers will make sense of the participant’s world.

Phenomenology, developed by Edmund Husserl, is concerned with attending to the way things appear to the individuals through their experience and IPA aims to, according to Pietkiewicz & Smith (2012), identify the essential components of the phenomena or experiences which make them unique or distinguishable from others. By the use of eidetic reduction, the
researcher tries to recognize what essential components make a given phenomenon special or unique.

Pietkiewicz & Smith (2012) said that the analytical process in IPA is often described in terms of a *double hermeneutic* or dual interpretation process. This is because firstly, the participants make meaning of their world and secondly, the researcher tries to decode that meaning – make sense of the participants’ meaning making. This two-stage interpretation process directly connects to hermeneutics and the theories of interpretation (Smith and Osborn, 2007; Pietkiewicz & Smith, 2012). In other words, IPA is concerned with trying to understand what it is like to experience the phenomenon from point of view of the participants.

IPA relies upon *idiography*. Pietkiewicz & Smith (2012) defines idiography as “an in-depth analysis of single cases and examining individual perspectives of study participants, in their unique contexts”. They also highlighted that the fundamental principle behind the idiographic approach is to explore every single case, before producing any general statements. Detailing further on how IPA relies on idiography, Pietkiewicz & Smith (2012) offered the following points:

a. The researcher focuses on the particular rather than the universal.

b. The researcher can make specific statements about the study participants because the analysis is based upon a detailed case exploration.

c. The researcher will start with examining an individual and producing a case study or will move to an equally attentive exploration of the second case, and so on.

d. The researcher will move between important themes generated in the analysis and exemplify them with individual narratives (how particular individuals told their stories), comparing and contrasting them (i.e. showing similarities and differences).
Participants

Pietkiewicz & Smith (2012) stressed that the main concern of IPA is to give full appreciation to each of the participant’s account. For this reason, the IPA studies are strongly suggested to be conducted with small sample size participants. This will enable the researcher to spend time in each case, and be as detailed as possible in his case-by-case analysis. However, there were IPA studies that have been published with one, four, nine, fifteen participants. Larger sample size were noted as possible, but are not common. Nevertheless, IPA researchers are advised to rely on small sample size participants rather than a single individual case since having a small sample size gives opportunity for the researcher to examine similarities and differences between individuals. At the same time, the amount of data gathering is not overwhelming.

Pietkiewicz & Smith (2012) also cautioned the IPA researcher to concentrate more on the depth, rather than the breadth of the study, as a detailed analysis of a single case may be well justified if rich and meaningful data has been collected, which allows the researcher to present original problems, mechanism, or experiences. This will offer an opportunity to learn more about the individual, his responses to a specific situation, and consider connections between different aspects of the person’s account.

Although there is no rule as to how many participants should be included in the study, Pietkiewicz & Smith (2012) said that it generally depends on the following:

1. The depth of the analysis of a single case study; the degree of commitment to the case study level of analysis and reporting.
2. The richness of the individual cases

3. How the researcher wants to compare or contrast single cases

4. The pragmatic restrictions one is working under, which included time constraints and access to participants.

Furthermore, IPA researchers typically aim for a fairly homogeneous sample, this is so as to be able to analyze the similarities and differences of the participants that has been defined according to important variables. Therefore, with few participants targeted for the study, it is strongly suggested that they be selected purposively. This allows the researcher to find a defined group for whom the research problem has relevance and personal significance. (Pietkiewicz & Smith, 2012).

For the purpose of this study, the homogeneous group of 5 administrators coming from 5 different schools in the metropolis will be purposively selected based on the following conditions:

1. They have been directly moved out of the academic department, the teaching position.
2. They have no prior experience in any administrative job.
3. They now hold a post in the administrative office under a full-time capacity.
4. They have been performing the administrative function for at least 1 month to 1 year.
5. They no longer have any academic assignments to perform.
Instruments

IPA data may be obtained in different ways like personal account history, diaries, focus groups, letters or chat dialogues. But Smith & Osborn (2007) suggests that the best way to collect data for an IPA study (and the way most IPA studies have been conducted) is through the semi-structured, in-depth, one-on-one interviews. This form of interviewing allows the researcher and participant to engage in a dialogue where initial questions may be modified in the light of the participants’ responses, and the researcher is able to probe interesting and important areas which may arise in the course of the exchange by further questions.

With this flexible data collection instrument, the researcher will be able to generate rich, detailed, and first-hand descriptions of how individuals are experiencing transition as the phenomenon. This data collection instrument will enable the researcher to conduct an in-depth exploration of the lived experiences of the participants, and acquire the participants’ accurate account of how they make sense of their experience, in real time (Smith & Osborn, 2007).

Data Collection Methods

Smith & Osborn (2007) recommends that the researcher works up an interview schedule in advance in order to explicitly think about what the interview may cover. With an interview schedule at hand, the researcher will be able to think of difficulties that he may encounter in the course of the interaction he will have with the participant during the interview. Difficulties, as an example, may be in terms of word use, semantics, and sensitive topic areas. Having a schedule will allow the researcher to think through the probable difficulties in advance, and be able to find
ways on how to handle them. Also, having thought through in advance about how the interview process may proceed will allow the researcher to confidently face the participant and conduct the interview process with utmost attention, focus and concentration. Pietkiewicz & Smith (2012) offers the following guidelines for conducting the interview:

**The Researcher as the Investigator and Interviewer**

1. Must have developed good interviewing and listening skills, with the ability to ask open-ended questions free from hidden presumptions.

2. Should be able to build rapport and gain trust of the participants. A kind of “warm-up” discussion maybe necessary to reduce the participant’s tension and get him/her ready to discuss more sensitive and personal issues.

3. Prepare an interview schedule/plan in advance. This will be just a guide to facilitate a natural flow of conversation.

4. Should feel comfortable with moments of silence to allow both oneself and the participant to reflect on issues being discussed.

5. Must be sensitive to and tries to be aware of all verbal, non-verbal, and non-behavioral communications.

In addition, Pietkiewicz & Smith (2012) stressed that the duration of most IPA interviews is for at least one hour, but may take longer, depending on how the interview is progressing since the semi-structured form of interview allows the researcher to ask questions in a convenient order (which may differ from one interview to another). In IPA, it is necessary to audio record the interviews and produce a verbatim transcript of it.
For the purpose of this study, a detailed interview schedule covering three (3) main topic areas were composed which this researcher intends to use in gaining the participants’ account of their transition experience. See Table 2 for the schedule of research questions that will reflect on the three topic areas: *Description of the Transition; Effects on the Self/Identity, and Reactions to Transition.*

On formulating specific questions, Pietkiewicz & Smith (2012) suggested that questions suited for IPA study may concentrate on exploring the sensory perceptions, mental phenomena (thought, memories, associations, fantasies), and specifically individual interpretations. Also, that apart from open and expansive questions which encourage participants to talk at length, it may be also be convenient to have prompt questions which will be helpful for the participants who may find the questions to general or abstract.

**Table 2: Schedule of the Research Questions**

**MAIN RESEARCH QUESTION:**
*What is the essence of the transition experience of school administrators moving-in from teaching?*

**SPECIFIC RESEARCH INTERVIEW QUESTIONS**

<table>
<thead>
<tr>
<th>TOPIC AREAS</th>
<th>QUESTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A. INTRODUCTION</strong></td>
<td>1. Could you please tell me what do you do in your job?</td>
</tr>
<tr>
<td></td>
<td>2. How did you come to get this job?</td>
</tr>
<tr>
<td></td>
<td>3. Please tell me what administration means to you?</td>
</tr>
</tbody>
</table>
### B. DESCRIPTION OF THE TRANSITION

4. Please describe to me how you were when you were informed of your move from teaching to administration.
   - How did you feel?
   - What was going on in your mind?
   - What did you do?

5. Can you tell me about your experience when you moved out from the faculty room and in to the admin office?
   - What happened?
   - How did you feel?
   - What did you do?

6. Please describe to me what was your first day like in the administration office?
   - What was going in your mind?
   - How did you feel at that moment?

7. Can you picture to me what was your last day in the faculty room or the classroom like?
   - What was going in your mind during this period
   - Why is that so?
   - What did you do?

### C. EXPERIENCE OF THE TRANSITION

8. While you were being oriented of your role in administration, what were your reactions?
   - What was your first and subsequent reactions?
   - Why is that so?

9. How did you decide to go on with your days in the office?

10. How does your workdays spell-out now as compared to when you were teaching?

11. What are the main difference between your work days in teaching and your workdays in the administration office?

### D. HOW TRANSITION FITS IN WITH THE PARTICIPANT’S LIFE

12. How have you been since your move to the administration office?
   - How would you describe yourself as an administrator?

13. Can you please describe for me what a good day at work is like at the office?
   - What about a bad day at work, what is it like?
   - What do you do about it?

14. What do you think your boss thinks about how you do your job?

15. How do you think your life would be if you worked somewhere else?
Data Analysis Methods

IPA aims to give evidence to the participants’ making sense of the phenomenon being investigated, and at the same time document the researcher’s sense making (Pietkiewicz & Smith, 2012). In general, IPA offers a set of flexible guidelines in a form of analytic stages, which I intend to adapt, in order to unfold my analysis of the study. Forewarned by the literatures about the complex and time-consuming activity that the data analysis method of the IPA framework may bring, I have also been made aware by the same readings that the data analysis methods can be an inspiring activity as I immerse myself, as the researcher, in the data or in other words, try to step into the participants’ shoes as far as possible. Pietkiewicz & Smith (2012) detailed the following stages of analysis:

1st Stage: Multiple Reading and Making Notes

By reading through the transcripts and listening to the audio recording a number of times, the researcher may be able to immerse himself in the data, recall the atmosphere of the interview, and the setting in which it was conducted. Each reading and listening to the recording may provide some new insights. At this stage, the researcher can make notes about his observations and reflections about the interview experience or any other thoughts and comments of potential significance. The researcher’s notes may focus on the following:

1. Content (what is actually being discussed)

2. Context

3. Initial interpretative comments
4. Other comments associated with personal reflexivity (e.g. how might the personal characteristics of the interviewer, such as age, gender, social status, etc. affect the rapport with the participants).

5. Highlight distinctive phrases and emotional responses

2nd Stage: Transforming Notes Into emergent Themes

At this stage, the aim is to transform the notes into emerging themes. The researcher is expected to work more with his note, rather than with his transcript. The researcher tries to formulate a concise phrase at a slightly higher level of abstraction which may refer to a more psychological conceptualization. Nevertheless, this is still grounded in the particular detail of the participant’s account. At this stage, the transcript has been already annotated as a whole.

3rd Stage: Seeking Relationships and Clustering Themes

This stage involves looking for connections between emerging themes, grouping them together according to conceptual similarities, and providing each cluster with a descriptive label. In practice, the following steps are undertaken:

1. Compiling themes for the whole transcript
2. Looking for connections and clusters.
3. Some of the themes may be dropped at this stage, if they do not fit well with the emerging structure or because they have a weak evident base.
4. Development of a table or a final list of clustered themes which may comprise of numerous superordinate themes and subthemes.
4th Stage: Writing Up an IPA Study

This narrative account of the study usually involves taking the themes identified in the final table and writing them up one by one. Specifically, the following points will be undertaken in order to produce a full account of the study:

1. Each of the themes need to be described and exemplified with extracts from interviews, followed by analytic comments from authors.

2. The table of themes opens up into a persuasive account that explains to the reader the important experiential things that have been found during the process of analysis.

3. The final paper will include both the participant’s account of his experience in his own words, and the interpretative commentary of the researcher.

4. The narrative account may engage several levels of interpretation, from low-level interpretation of data to a highly detailed, interpretative and theoretical level, which may generate new insights.

5. The narrative account will then be followed by a discussion section which relates the identified themes to existing literature.

The Conclusion:

The narrative account will be followed by a discussion section which relates the identified themes to existing literature. Reflections on the research will be included in the section, as well as comments on implications of the study, its limitations, and ideas for future development.

Abstract

The main focus of this quantitative research study was to determine if differences exist between urban primary and secondary teachers’ knowledge and perceptions of cooperative learning. Cooperative learning is a researched based instructional strategy used in classrooms to improve student achievement in various subject areas. Studies support the utilization of cooperative learning in classrooms. However, additional research was needed to continue to improve achievement in mathematics for all students, including those attending schools in urban settings. An experimental research design was used to determine if differences exist between primary and secondary teachers’ knowledge and perceptions of cooperative learning. Conducting research on urban primary and secondary teachers will provide valuable information used to improve student achievement in mathematics by planning college courses for pre-service teachers as well as prepare workshops and in-service training sessions for practicing teachers to enhance teaching and learning in mathematics.

Data collection involved mathematics teachers completing an online survey. Data was divided into the following three sections: Demographic data on participants, the use of cooperative learning in classrooms, as well as teachers’ knowledge and perceptions of cooperative learning. A Likert scale was utilized to determine if differences exist between urban primary and secondary teachers’ levels of agreement/disagreement with cooperative learning statements.
Dedication

My journey has been and interesting and rewarding experience. The level of success I have experienced is due to the unconditional love and support of several exceptional individuals in my life. As with all of the blessings and accomplishments in my life, I would like to give God the glory, the honor and the praise. His hands have sheltered and kept me. This work would not have been possible without Him. My Husband, Ronnie Pope Sr. has been my rock. I want to thank you for supporting and encouraging me to remain focused during the blood, sweat and tears. You encouraged me to never give up, continue to pray, and let God do His work. I would like to thank my mother, JoAnn McCollough, who put her wants and needs aside to make sure my sisters and I had everything we needed to become self-sufficient women capable and prepared to do whatever our hearts desired. I would like to thank my father, Johnny Guy Staples, who signed financial aid papers so I could pursue my first college degree. Thanks for encouraging me to be all I could be. My children, Shynea, Dynia, Veronica and Ronnie Jr. have been present for every aspect of my educational journey. Thank you all for supporting and encouraging me to lead by example by remaining focused and finishing what I started no manner how long or challenging the journey. I love you all. Thanks to my extended family for supporting and encouraging me to finish what I started some eight years ago. I love you all. I would like to dedicate this dissertation to my grandchildren Jaden Michael and Kerrington Alexus. It is my desire that this work affect the field of education by enhancing teaching and learning. It is my quest to contribute to the knowledge and understanding teachers receive in order to influence the way they
teach, in order to meet the diverse educational needs of all children. “I can do all things through Christ who strengthens me”. –Philippians 4:13
Acknowledgments

Several individuals have supported, guided and mentored me during my educational journey. First, I would like to thank my doctoral mentor, Dr. Amy Williamson, who provided assistance and words of encouragement during challenging times. Next, I would like to thank my dissertation committee members, Dr. Carol Pasanen, and Dr. Pohl for allowing me to express my passion for teaching and learning and its impact on student achievement. Thanks to Dr. Regina Randall for allowing me to utilize her survey without hesitation. I would like to thank Delores Evans who saw characteristics of a great leader in me and encouraged me to leave the classroom to make a difference in the lives of students, teachers and administrators. additionally, I would like to thank Dr. Jonathan Brown, and Dr. Glenn Faircloth for reading my dissertation and providing constructive feedback that contributed to shaping various aspects of my study. Last but not least, I would like to thank the late Dr. Mary Howard, my mentor and professor at Central State University who provided support and guidance as I completed my Bachelor as well as Master of Education degrees. I respect and love you dearly. You hold a special place in my heart. You are truly missed.

CHAPTER 1. INTRODUCTION

Introduction to the Problem

The responsibility of educating students to their fullest potential is a daunting task for educators across the United States and abroad. Teachers must provide meaningful instruction that meets the diverse needs of students to equip them with the knowledge and skills necessary to become productive citizens, prepared to meet the challenges of the greater society and global world. James Schul (2011) states that teachers have at their disposal a plethora of instructional strategies that serve various purposes. Teachers utilize numerous instructional strategies in the classroom and are looking for additional research-based best practices that have been proven to meet the diverse needs of students. Studies were conducted to identify instructional strategies that have the greatest rate of success with increasing student achievement. One instructional strategy, if employed sensibly, holds much promise for meeting the diverse needs of students and increasing academic achievement is cooperative learning. Cooperative learning is one of the greatest success stories in the history of instructional innovation (Slavin, 1999).

The purpose of cooperative learning is to facilitate small groups of heterogeneous students working together to accomplish goals, solve problems or complete tasks and ultimately to perform alone (Kirk, 2001). Each member of a cooperative learning group is assigned a task and must share personal accountability and responsibility for the group’s success in order to make a group truly cooperative.
More than 1,200 cooperative learning studies have been conducted over the past 11 decades that support the claim that cooperative learning promotes achievement as well as other positive affective outcomes (Whicker, 1997). Few studies have focused on examining the differences between urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. Since cooperative learning is widely used in mathematics classrooms, there is a need to examine how it is utilized in classrooms in order to help teachers develop a clear understanding of how to effectively implement it into their lessons to improve student achievement in mathematics. This study was necessary because the existing body of research on cooperative learning has not determined if possible differences between urban primary and secondary mathematics teacher’s knowledge and perceptions of cooperative learning influence the levels of implementation in classrooms, which may adversely impact student achievement. Many teachers have heard of cooperative learning but may not have knowledge and a clear understanding of how to employ it in the classroom. Schul (2011) states that cooperative learning is often misunderstood by some teachers as just another form of collaborative group work. Cooperative learning differs from collaborative group work because it focuses on the key elements of responsibility and accountability to self and group members. Teachers must have a thorough understanding of cooperative learning in order to enhance student achievement in mathematics. Sutton and Krueger (2002) states that the most direct route to improve mathematics achievement for all students is through better teaching.

Few if any studies have been conducted to examine the differences that may exist between urban primary and secondary mathematics teachers’ knowledge and perceptions
of cooperative learning. In order to examine the differences, urban mathematics teachers were surveyed. This study was different from other cooperative learning studies because the focus was specifically on the knowledge and perceptions of urban mathematics teachers. Results obtained from this study filled a gap in existing research by providing insight for teacher instruction and professional development opportunities to aid colleges and universities with preparing courses for pre-service teachers. In addition, school districts will utilize the results to prepare workshops and in-services trainings for practicing teachers in order to align best practices related to cooperative learning at all grade levels to me the diverse needs of students.

**Background, Context, and Theoretical Framework**

Since cooperative learning is widely used in mathematics, a growing need exists to study how teachers utilize cooperative learning in classrooms. The study of this instructional strategy was imperative in mathematics because of its benefits to teaching and learning and the amount of pressure placed on teachers by the public for the academic performance of students. According to the Program for International Student Assessment (PISA), the United States ranks below average in mathematics among the world’s most developed countries. This ranking has made educational accountability a state and national concern, as well as a mantra of public education (Vogler, 2010). States are mandating testing to ensure high standards and accountability for the academic performance of public school students.

The National Council for Teachers of Mathematics (NCTM) created grade specific standards that are used across the United States to provide direction to help teachers to distinguish what concepts and skills students should learn while fulfilling
societal demands for teaching and learning mathematics. These demands and accountability measures place pressure on teachers to teach mathematics in a manner that encourages students to develop a deep understanding of concepts as well as be able to utilize mathematics in everyday life and in the workplace. Despite providing these clear and focused standards for mathematics, a majority of classrooms continue to fall short in implementation and direction especially in urban high poverty schools (McKinney, 2008). McKinney’s words support the notion that urban mathematics teachers might not fully understand how to effectively teach mathematics by utilizing instructional strategies proven to increase student achievement such as cooperative learning. Cooperative learning is a proven instructional strategy that can be utilized in classrooms to enhance student learning and achievement in mathematics.

The theoretical framework for this cooperative learning study was constructivism. The practice of constructivism requires individuals to connect prior and new knowledge as well as engage in classroom dialogue that is necessary for internalization and deep understanding (Vermette, 2001). Jean Piaget (1953), a constructivist supporter, believed that learning occurs when new ideas are connected to old ideas. Students construct knowledge and meaning from interactions between their experiences and their ideas. According to Lopata, Miller and Miller (2003), constructivist practices and interactive learning are conditions that facilitate effective cooperative learning implementation. Constructivism has become the underlying theme for many education reform movements, including utilizing cooperative learning as an instructional practice to enhance student achievement.
Statement of the Problem

It was not known how and to what degree the differences between urban primary and urban secondary teachers’ knowledge and perceptions of cooperative learning influence how it is utilized in mathematics classrooms. The differences between primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning can adversely impact how it is implemented in classrooms and student achievement in mathematics. Cooperative learning has been identified as a research based instructional strategy that is considered to have a high probability of enhancing student achievement for all students in all subject areas and at all grade levels (Marzano, 2001). Developers of cooperative learning include Robert Slavin (1988), David and Robert Johnson (2000), as well as Spencer Kagan (1989). These developers have unique methods for the implementation of cooperative learning and have conducted extensive research to examine its impact on student achievement. However, the existing body of knowledge has not determined if possible differences between urban primary (educating students 5-13 years of age) and urban secondary (educating students 14-18 years of age) mathematics teachers’ knowledge and perceptions of cooperative learning influence levels of implementation in classrooms as well as teaching and learning.

Purpose of the Study

Few if any studies have focused on identifying differences in urban mathematics teachers’ knowledge and perceptions of cooperative learning. The purpose of this study was to help pinpoint possible gaps in teachers’ knowledge and understanding of cooperative learning as well as identify perceptions held by teachers in order to create opportunities for them to recognize the benefits of utilizing cooperative learning as an
instructional strategy to enhance student learning in mathematics. A survey was conducted to identify differences in urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. By analyzing, what teachers think and know about cooperative learning, college courses for pre-service teachers as well as workshops and in-service training sessions can be planned for practicing teachers to enhance teaching and learning in mathematics. Researchers have concluded that the cooperative learning model was ranked first in teaching approaches that promote higher order thinking, problem solving, and achievement (Lin, 2006).

**Research Questions and Hypotheses**

The following research question led to the overall research and data collection for this cooperative learning study: What are the differences in the knowledge and perceptions of cooperative learning between urban primary mathematics teachers and urban secondary mathematics teachers? Secondary quantitative research questions are:

R1: What are the differences in the knowledge of the principles of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Null Hypothesis: There will be no differences in the knowledge of the principles of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Alternative Hypothesis: It is reasonable to conclude differences in the knowledge of the principles of cooperative learning exist between urban primary mathematics teachers and urban secondary mathematics teachers?
R2: What are the differences in knowledge of the role that teachers play in the utilization of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Null Hypothesis: There will be no differences in knowledge of the role that teachers play in the utilization of cooperative learning exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Alternative Hypothesis: It is reasonable to conclude differences in knowledge of the role that teachers play in the utilization of cooperative learning exist between urban primary mathematics teachers and urban secondary mathematics teachers?

R3: What are the differences in perceptions regarding use cooperative learning as an instructional strategy in classrooms with students that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Null Hypothesis: There will be no differences in perceptions regarding use cooperative learning as an instructional strategy in classrooms with students between urban primary mathematics teachers and urban secondary mathematics teachers?

Alternative Hypothesis: It is reasonable to conclude differences in perceptions regarding use cooperative learning as an instructional strategy in classrooms with students between urban primary mathematics teachers and urban secondary mathematics teachers?
R4: What are the differences in regards to the perceptions of the impact cooperative learning has on student achievement in classrooms that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

Null Hypothesis: There will be no differences in regards to the perceptions of the impact cooperative learning has on student achievement in classrooms between urban primary mathematics teachers and urban secondary mathematics teachers?

Alternative Hypothesis: It is reasonable to conclude differences in regards to the perceptions of the impact cooperative learning has on student achievement in classrooms between urban primary mathematics teachers and urban secondary mathematics teachers?

Rationale, Relevance, and Significance

Rationale

The rationale, relevance and significance of this cooperative learning study is discussed in this section. Research methods used for conducting the study, the need for the study, as well as how the research will contribute to the body of knowledge related to cooperative learning will be discussed.

This dissertation contributes to the body of knowledge related to the utilization of cooperative learning by enhancing teaching and learning, while promoting higher levels of student proficiency in mathematics. Researchers agree that cooperative learning has positive effects of on student achievement. Additionally, a rapidly growing numbers of educators are utilizing cooperative learning in classrooms (Slavin, 1996). The results from this study can be used to ease the confusion and disagreement as it relates to how teachers’ knowledge and perceptions of cooperative learning impact student achievement.
in mathematics. It was predicted that there are differences in knowledge and perceptions of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers. These differences can adversely impact teaching, learning and student achievement in mathematics.

Relevance

This study of cooperative learning is relevant to curriculum and instruction because its focus is on how students learn, the best way to educate students, and increasing student achievement in mathematics. The results from this study will enhance teachers’ knowledge base and implementation of cooperative learning in classrooms. When teachers have a clear understanding of how to utilize cooperative learning in the classroom, student achievement in mathematics will improve. In addition, school leaders and instructional specialist will have quantitative evidence of the effectiveness of cooperative learning as an instructional strategy that can be utilized to engage students in meaningful mathematics that can be used in and outside of classrooms. Furthermore, when teachers realize and are aware of the benefits of cooperative learning, perceptions may change toward its impact on student learning. Cooperative learning is considered to have a high probability of enhancing achievement for all students and is now utilized in schools and universities throughout the world in every subject area from preschool through graduate school and adult training programs (Marzano, 2001).

Significance

Robert Slavin (1996) conducted research on cooperative learning that focused on student team learning methods in middle school classrooms and secondary classrooms with an emphasis on student rewards for groups based on performance results. David and
Robert Johnson (2000) focused their research on cooperative learning, which highlights students working together as well as students working alone to discover its impact on student achievement. Spencer Kagan (1995) conducted research on cooperative learning structures that stress positive personal peer interactions that effect student learning. Few if any studies have focused on urban teachers’ knowledge and perceptions of cooperative learning. This study was conducted to support the enhancement of teaching and learning of mathematics in urban educational settings. Cooperative learning holds much promise for meeting the diverse needs of students, while increasing achievement in mathematics if thoroughly understood and implemented sensibly by teachers.

**Nature of the Study**

Extensive research has been conducted to examine how cooperative learning impacts student achievement at all grade levels and in all subject matter. However, there is an inadequate amount of research that focuses specifically on urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning and its impact student achievement. A non-experimental, causal-comparative research design was utilized to examine this phenomenon. A survey was the primary collection tool used for this study in order for the researcher to examine the differences between primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning and to analyze how the differences in knowledge and perceptions impact teaching and learning in mathematics. Conducting causal-comparative research seeks to explain differences between groups by examining differences in the experiences of group members (Lodico, 2010). This type of design is appropriate because it involves no direct manipulation of the independent variable and no treatment was provided for participants.
Additionally, the research design does not run into the same types of threats to internal and external validity as experimental designs. However, the lack of control over inessential variables could possibly sway participants’ responses.

**Definition of Terms**

There are terms, which are important to this study of cooperative learning. As such, the following terms are defined:

*Cooperative Learning*- A teaching strategy in which small groups or teams, comprised of students of different levels of ability, work together to accomplish shared goals and to maximize their own and each other’s learning (Sawyer, 2005).

*Knowledge*- understanding of subject matter (Kleickmann et. al, 2013)

*Perception*- the procedure or outcome of becoming conscious of items, unions, and events by way of the senses, that comprises activities like acknowledging, viewing, and discriminating (Goldstein, 2013).

*Urban School*- Generally large, high-density schools in metropolitan areas that serve a population subject to social, economic, and political disparities because of population mobility, diverse ethnic/cultural identity, low socioeconomic status, and/or limited language proficiency (Sachs, 2004).

*Mathematics*- A static discipline based on formulas taught in the school subjects of arithmetic, geometry, algebra, and calculus (Steen, 1991).

**Assumptions, Limitations, and Delimitations**

The assumptions, limitations and delimitations for this cooperative learning study are identified in this section.

**Assumptions**
The following assumptions were present with this study:

1. The participants will answer the questions truthfully.
2. The participants have varying levels of exposure to cooperative learning.
3. The participants have utilized cooperative learning in mathematics.
4. The participants have knowledge and understanding of cooperative learning.

**Limitations**

The following limitations are present for this study:

1. The number of individuals chosen to participate in the study was determined by the number of regular primary and secondary education mathematics teachers employed by the district which will limit generalizability since the number is not large considering larger urban school districts do exist, which could have yielded valuable data for the study.
2. The data collect from this study will be of benefit to teachers, principals, curriculum directors as well as colleges and universities. However, the data collected from this study will be somewhat limited because only one urban public school district was involved in the study. The limitation will limit generalizability because the results are not comparable to larger or smaller urban school districts.

**Delimitations**

The following delimitations are present for this study:

1. This study is confined to utilizing a survey to gather data on cooperative learning.
2. The sample group for this study will be drawn from, and limited to urban primary and secondary mathematics teachers.
3. The study is limited to one urban public school district in Ohio.
Organization of the Remainder of the Study

The remaining chapters for this study are organized as follows: Chapter 2 will begin with the researcher presenting, exploring, synthesizing and evaluating literature related to cooperative learning. The theoretical framework for the study will also be explained in this section. Chapter 3 presents the methodology used in the study, which will include the design of the study, description of the targeted population, instrumentation, the data collection process, as well as ethical concerns related to the study. Chapter 4 focuses on analyzing the data and objectively reporting the findings. Chapter five presents a summary of the findings including the conclusions drawn from the data presented in the previous chapter, discussion of the results as it relates to the literature, limitations, implication of the results for practice and recommendations for further research.
CHAPTER 2. LITERATURE REVIEW

Introduction to the Literature Review

In this section, pertinent literature related to cooperative learning and its impact on teaching and learning will be presented. A review of literature will also provide the rationale and support for utilizing cooperative learning in classrooms to improve student achievement in mathematics. The following topics will be examined in order to determine teachers’ knowledge and perceptions of cooperative learning and how their knowledge and perceptions impact teaching and learning: background on cooperative learning, constructivism, and how it supports cooperative learning, supporters of constructivism, constructivist learning in the classroom, researchers of cooperative learning, cooperative learning methods, elements of cooperative learning, benefits of cooperative learning, cooperative learning in mathematics as well as teacher knowledge, perceptions and understanding of cooperative learning.

The search for related literature was conducted through multiple sources from the Capella University Library databases, which include Sage, Academic Search Premier, ERIC, ProQuest Education Journals, PsycINFO, as well as Education Research Complete. Dissertations from ProQuest and ebooks from the ebrary were read and utilized as sources of information. Books related to particular theories, approaches and techniques will read and analyzed. The researcher also utilized Google Scholar to
identify books, journals and websites. All sources are correctly cited and referenced according to APA guidelines.

The objective of this research was to present research related to cooperative learning that can be used to alter teachers’ perceptions as well as improve their knowledge and understanding of cooperative learning. If it is determined that there are differences that exist between urban primary and urban secondary mathematics teachers’ knowledge and perceptions and understanding of cooperative learning that influence levels of implementation in classrooms as well as teaching and learning.

**Theoretical Framework**

The theoretical framework for this cooperative learning study constructivism. According to Brooks (1999), constructivism now has a face and name in the field of education which describes the central role that learners’ ever-transforming mental schemes play in their cognitive growth, constructivism powerfully informs educational practice. The following facets of constructivism will be discussed in this section of chapter two: theory of constructivism, cognitive constructivism, social constructivism, constructivist learning in the classroom.

**Constructivism**

Constructivism is a powerful model for explaining how knowledge is shaped and how pupils learn and is currently a topic of discussion in many schools as the best method for teaching and learning (Powell, 2009). This theory of learning has origins in philosophy and psychology. The research of Dewey and Vygotsky combined with Piaget’s work in developmental psychology led to the expansive approach of constructivism. The constructivist approach to teaching and learning involves putting
students at the center of learning by using their prior knowledge, to pose problems or situations that encourage critical thinking and understanding of big ideas and concepts, which will in turn refine one’s prior knowledge base. Constructivism is based on the assumption that children construct their realisms on how the world works from their experiences and mental development. Constructivist supporters Henderson & Gornik (2007) and Darling-Hammond & Bransford (2007) agree that learning is best accomplished by utilizing hands-on approaches, investigation, testing, and not being told what will transpire, but left to make own interpretations, findings and draw conclusions. According to Iran (1995), constructivism has become an attractive alternative to tradition educational practices because it holds promise to deliver higher levels of literacy, multiple forms of literacy, self-reliance, cooperation, problem-solving skills and satisfaction with school. Development of these skills can assist students in preparation for real-world challenges and experiences. Teachers and administrators seem to be pleased when they see students engaged and interested in learning. In order to help students to remain engaged in learning to improve intellectually, teachers have to know where students are in their current stage of knowledge of content so that learning opportunities are structured in order to allow students to create personal meaning when new information is presented to them.

Philosopher D.C. Phillips (1995) has identified the following three distinct roles related to constructivism that promote student learning:

1. The active learners: knowledge and understanding are actively attained.
2. The social learners: knowledge and understanding involves social construction.
3. The creative learners: knowledge and understanding is created or recreated.
Teachers can create learning opportunities that include each distinct role related to constructivism to cast learners in active roles to maximize their learning. Supporters of constructivism are searching for better ways to promote teaching and learning that encourages and supports active learning to impact student achievement. In reality, educators have control over what is taught but less control over what students learn because ultimately students control their own learning. This simple reality lies at the heart of the constructivist approach to education (Brooks, 1999). Therefore, educators have the important task of customizing their instruction to meet the diverse needs of students. In order to customize instruction, educators must have knowledge and understanding of the role they play to support student learning.

Two major forms of constructivism are utilized in the classroom: the first form is known as cognitive or individual constructivism that is contingent on Piaget’s theory. The second form is social constructivism, which is contingent on Vygotsky’s theory (Powell, 2009). These theories of learning are similar because they embrace inquiry-teaching approaches and support students in creating concepts based on building their existing knowledge. In order to effectively utilize constructivism, teachers need to understand these theories and become familiar with how to integrate constructivist instructional strategies and practices to improve teaching and learning.

**Cognitive Constructivism**

Cognitive constructivism is based on the work of developmental psychologist Jean Piaget. Piaget’s theory provides valuable insight into children’s interest, and what they are able to achieve during various stages of their development, and is based on discovery learning where students are able to construct knowledge that is meaningful
within an educational setting that supports the varying ways students learn. Cognitive constructivism provides a framework by which teachers can determine students’ current level of learning, then create an engaging learning environment in which children can construct their own knowledge and understanding of subject matter. Brooks (1999) states that engagement in meaningful work, initiated and mediated by skillful teachers, is the only high road to real thinking and learning. Teachers who have clear and thorough understanding of cognitive constructivism are aware of how students learn and can enhance their learning experiences. According to Orlich (2007), for intellectual growth to occur, teachers must provide students with key experiences or activities.

Social Constructivism

Social constructivism is a highly effective way of teaching that all students can profit from, since cooperation and social interaction are integrated (Powell, 2009). Social constructivism defines learning as socially shared cognition that is “co-constructed” within a community of participants (Green, 2002). Students are able to work cooperatively to share their knowledge and understanding of subject matter, which enhances student learning. Lev Vygotsky, the founding father of social constructivism believed that social interaction is an integral component of learning. He also believed that knowledge and development is a joint activity that allows children develop cognitive abilities in the context of socialization and education (Eren, 2013). This theory is based on the social interactions that students participate in inside the classroom to enhance the development of critical thinking skills. It is imperative for teachers to understand social constructivism and become familiar with how to incorporate it into practices in the classroom to promote social interaction in order to enhance student learning.
Constructivist Learning in the Classroom

In a constructivist classroom, teachers are aware of students’ understandings of concepts and are able to structure learning opportunities for students to enhance their understandings by providing information, posing questions, allowing students to conduct research and engaging students in inquiry learning opportunities designed to challenge the current views, beliefs and understanding they have. Brooks (1999) have identified five overarching principles apparent in constructivist classrooms.

1. Teachers seek and value their students’ point of view. When teachers seek to understand students’ thinking, they are able to create learning experiences that support the manner in which their students think and the pace that their students learn.

2. Classroom activities challenge students’ suppositions. Teachers can provide learning opportunities that either lead student to presume certain truths from their prior experiences or contradict with what they believe.

3. Teachers pose problems of emerging relevance. Constructivist teachers create opportunities for students to see the value in what they are learning by relating subject matter to real world experiences so that students have to opportunity to develop personal meaning.

4. Teachers build lessons around primary concepts and “big ideas”. Teachers present curriculum that allow students to grapple with the big ideas and determine for themselves information that requires further exploration.
5. Teachers assess student learning in the context of daily teaching. Constructivist teachers are able to assess student learning during instruction instead of view it as a separate from instruction.

These principles help teachers to think about teaching and learning in a way that is student-centered and encourages students to be active learners. To understand constructivism, educators must focus their attention on the learner (Brooks, 1999). No two students learn in the same manner. Therefore, teachers must be willing to provide quality instruction that meets the diverse needs of all students. Teachers should consider developing constructive habits of mind that moves constructivism toward becoming a part of daily instruction as well as a part of the culture of the classroom. The Constructivist Learning Theory underscores how current mental schemata are reshaped, expanded, and deepened on the basis of interactions with new learning. It calls for a pedagogy that is student-centered and engages learners actively in meaning-making activities that give form and shape to understandings and skills (Lee, 2003).

A constructivist framework challenges teachers to create environments in which they and their students are encouraged to think and explore (Brooks, 1999). The constructivist theory of learning has had widespread impact on various learning theories and instructional techniques utilized in classrooms, including cooperative learning. Cooperative learning is an instructional method that is student-centered and encourages active learning in order for students to construct understanding and meaning. Cooperative learning like constructivism also holds promise to improve student achievement in classrooms by encouraging cooperation and enhancing critical thinking skills through problem solving.
Constructivist Theorists

Constructivism is supported by literature and research conducted by philosophers, researchers, and theorists. The following individuals have influenced our thinking and practices related to teaching and learning as well as the manner in which constructivism is implemented and utilized in classrooms.

**John Dewey (1859-1952).** John Dewey was a philosopher, psychologist and educational reformer whose thoughts influenced the field of education as well as social reform. He believed that previous knowledge and experiences play a central role in the development of new understanding. He also believed that education should be based on the standard of learning through doing. Dewey is also known for starting a Laboratory School (Dewey School) in 1886, which assist him in trying out some of his ideas pertaining to learning and to focus on the development of pragmatism. Pragmatism consists of developing curriculum that is based on lessons that are combined with real-world experiences. Dewey desired for students to learn from hands-on experiences. His position on learning aligns with that of constructivism because learning is perceived as an active process, where knowledge is constructed, not acquired.

**Jean Piaget (1896-1980).** Jean Piaget, a Swiss developmental psychologist is known for his work pertaining to cognitive development, learning theories and genetic epistemology. His theory of constructivism is based on his belief that children gain knowledge and formulate meaning based on their experiences. Piaget believed that the most significant source of cognition is the children themselves. He also believed that two key components must exist for human beings to construct new knowledge. These components are assimilation and accommodation. Assimilation involves one
incorporating new experiences with old experiences, which causes the individual to develop new viewpoints, reconsider prior misconceptions, and assess prior thinking in order to modify previous perceptions. Accommodation requires one to restructure new experiences into the mental capacity that currently exist. Children must be willing to change their views or beliefs when new experiences do not align with their prior knowledge and understanding as well as modify and restructure their beliefs with the outcomes.

Piaget’s developmental stages theory assumes that humans develop intelligently in various overlapping stages. Piaget (1953) also identified four developmental stages that children transition through in order to construct knowledge and understanding: (1) Sensorimotor (zero to two years of age), at this stage, children begin to discover their environment through their senses, physical actions and language. (2) Pre-operational (two to seven) at this stage, children develop their own language but lack grasping thoughts of others. (3) Concrete-operational (seven to eleven), at this stage, a key growth point takes place in the brain where children move into logical development and begin to exchange intuitive thought with logical reasoning. (4) Formal-operational (eleven years of age to adulthood) at this stage, individuals will begin to use higher levels of thinking in order to solve problems. These well-known stages are recognized as a source for showing the progression and logical thinking of children (Powell, 2009). These stages allow educators to understand how children progressively move from the world of concrete objects to representational objects within their world.

**Lev Vygotsky (1896-1934).** Lev Vygotsky, a Russian psychologist is known for his study of sociocultural theory. Many instructional practices utilized in classrooms are
grounded in the Vygotskian theory. Vygotsky viewed learning as taking place through social interaction. Learning also plays a pivotal role in the development of cognition, which led him to develop his model of intellectual growth centered on the zone of proximal development and on patterns of social interaction (Vygotsky, 1962). The zone of proximal development is the difference between the intellectual level a child can reach on his or her own and the level he or she can potentially reach if aided by an expert peer or adult (Orlich, 2007). Zone of proximal development constitutes an area within which a child’s functions are in a state of development. Tomlinson (2000) states the educator’s job is to push the student into his or her zone of proximal development, coach for success with a task more complex than the student can manage alone, and thus push forward the area of independence. Vygotsky believed the state of development cannot be displayed independently by children because they have not yet been formed. However, if a child receives assistance from an adult or a peer that is more knowledgeable, then the functions can be exhibited because of the interaction with others. Vygotsky also believed that social interaction is the key to learning because as children are engaged in meaningful dialogue, they can think for themselves and internalize their ideas (Orlich, 2007).

Cooperative learning supports Vygotsky’s theory of social interaction because it encourages students to communicate and interact with one another to enhance their levels of comprehension, reasoning, and critical thinking that is needed for internalizing information. Research indicates that humans learn best when they collaborate with others and can actively process personally meaningful information (Lin, 2006).

**Jerome Bruner (1915- ).** Jerome Bruner is known as an influential educational scholar as well as one of the founding fathers of the constructivist theory. Bruner was
mainly interested in the cognitive development of children and identifying appropriate methods of education that would meet the diverse needs of students. In his book *The Process of Education* (1960), Bruner discussed his view pertaining to constructivism revealing he believes that learners actively construct their own knowledge based on the things they know presently and have known previously. He is an advocate of inquiry learning and teachers facilitating and guiding the learning of students in order to enhance their critical thinking skills. Bruner also stressed the importance of scaffolding basic ideas until students have developed a thorough understanding of the subject matter.

Bruner’s views on teaching and learning were heavily influenced by Piaget and Vyostsky and support the utilization of cooperative learning in classrooms because it too incorporates inquiry learning to enhance student achievement.

**Albert Bandura (1925- ).** Bandura is a psychologist known for his contribution to social cognitive theory and for orchestrating the transition between behaviorism and cognitive psychology. He is known as the father of social learning theory. Social learning theory is how people learning by observing others. Bandura stated, “Learning would be exceedingly laborious, not to mention hazardous, if people had to rely solely on the effects of their own actions to inform them what to do” (1977). Through his research on social learning, Bandura discovered behavior could be developed through direct experience or by witnessing the behavior of others. Models are an essential source for learning new behaviors and for attaining behavioral transformation in educational settings. Cooperative learning allows students to work cooperatively to teach each other as well as learn from each other in essence, modeling for each other to enhance learning.

**Review of the Research Literature and Methodological Literature**
The review of literature includes a comprehensive overview of literature published on cooperative learning. Topics incorporated in this chapter include a review of various learning style inventories utilized to identify preferred styles of learning of students, culturally responsive pedagogy to understand how the culture impact student learning, a review of instructional methods used in classrooms, including all facets of cooperative learning.

Cooperative learning is one of the most thoroughly researched of all instructional methods (Slavin, 1990). Other methods of instruction have also contributed to the enhancement of teaching and learning. In this section, these methods will be reviewed as well as factors that affect student learning.

**Review of Research on Cooperative Learning: Knowledge and Perceptions of Urban Primary and Secondary Mathematics Teachers.** A plethora of research has been conducted on cooperative learning and its impact on student achievement. Whicker (1997) states: more than 1200 studies have been conducted over the past 11 decades that support the claim that cooperative learning promotes student achievement as well as other positive affective outcomes. Despite the amount of research conducted, literature related to urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning are lacking.

**Learning Styles.** This section on learning styles a review of literature which include learning style inventories created by Dunn et. at ((1995), as well as Kolb (1995), and culturally responsive pedagogy.

A Learning style or preference is usually defined as the cognitive, affective, and physiological traits that students exhibit as they interact in the classroom environment.
Youngsters have established rules and techniques for attaining knowledge and demonstrating their abilities by the time they begin their formal educational career at the age of five. Gay (2000) believes students learn these cognitive processes via cultural socialization. However, these processes may be enhanced and become elaborate over time. Styles frequently differ with age, level of achievement, beliefs, global verses analytic processing choice, and gender (Shaughnessy, 1998). Gay (2000) believes ethnicity of students also plays an important role in their style of learning and has identified preferences for the following ethnic groups: African-American students will display a strong preference for learning in a group setting because of the values their culture places on communalism, working collaboratively to complete task, and social interaction with others. European-Americans prefer to work independently since their culture values competitiveness, individuality, and upward movement. Chinese as well as Japanese-American students’ cultures place value on family commitments and harmonious relations and prefer collectiveness as well as group-ness. They are also focused on individualism and very deductive in actual performance delivery. Cultural values of students may be a variable that can be used to justify why students process information differently and tend to solve problems in various ways. The learning styles model has aided to change the underachievement among special education and other poorly performing American students who attend urban, suburban, and rural schools (Burke, 2002). Consultants throughout the United States have reported statistically higher test scores or grade point averages for students whose teachers changed from traditional teaching to learning-style teaching at all levels and the U.S. Department of Education’s four-year investigation revealed that attending to students learning style was
one of the few strategies that had a positive impact on student achievement (Shaughnessy, 1998). Teachers can identify students’ learning styles by observing students in and outside of the classroom, but some characteristics are not noticeable, even to the most seasoned teacher. In order to receive precise information that is reliable and valid, an instrument that is also comprehensive and can diagnose the many traits related to learning styles, which can be used to impact student achievement. Numerous learning style instruments exist. However, the following comprehensive learning style instruments will be discussed in order to assist teachers with identifying learning style preferences of students: Dunn, Dunn and Price Learning Style Inventory (LSI), and Kolb Learning Style Model.

Dunn, Dunn and Price Learning Style Inventory. Dunn et al. (1995) define learning style as the way in which individuals begin to concentrate on, process, internalize, and retain new and difficult academic information. The Dunns’ further describe learning style as the manner in which twenty-one varying elements impact a person’s ability to master new and rigorous academic information and skills. No person possesses all twenty-one elements, but the elements that an individual does possess either obstruct or motivate that person’s level of achievement (Burke, 2002). The learning style inventory was developed through content and factors analysis and is use for identifying individual preferences for instruction, environments, methods, and resources for students in grades 3-12 (Dunn, 2009). This learning style model is based on the following theoretical assumptions:
• Learning style is a biological and developmental set of individual traits that makes providing the same instructional settings, approaches and resources effective for some students and ineffective for others.

• Most individuals have preferences for style of learning that differ drastically from those of other individuals.

• Individual preferences of instruction occur and the effect of accommodating these preferences can be measured.

• The stronger the individual’s preference, the more vital it is to offer well-matched instructional approaches.

• Acknowledging and tending to individual preferences in learning-style through well-matched instruction results in increased academic achievement and improvement in student attitudes toward learning.

• Students accomplish higher achievement levels when provided with responsive environments, resources, and instructional approaches.

• Most teachers can learn to utilize learning styles as the focal point of their instruction.

• Most students can learn to exploit their strongest learning style when approached with new or challenging subject matter.

• It is important for teachers to accommodate the learning style preferences of students who struggle academically (Dunn, 1995).

The learning style inventory focuses on identifying various grade-level procedures that allow analysis of particular conditions under which students prefer to learn. The Dunn instrument is easy to administer and teachers can easily interpret the
data, which is rated using a Likert scale and can be completed in a little more than 30 minutes.

**Kolb Learning Style Inventory.** The Kolb learning Style Inventory (LSI) is used assist individuals with identifying the way they learn based on experiences (Kolb & Kolb, 2005). This learning style inventory was created to fulfill the following purposes:

- To be utilized as an educational instrument to assist individuals’ wit understanding how they learn due to their experiences and their distinctive style of learning.
- To provide a research instrument for examining experiential learning theory and the traits of individual learning styles.

Kolb & Kolb (2005) also presents a cycle of four learning modes that include diverging, assimilating, converging and accommodating. The type of question that relates to each classification distinguishes these learning modes are “Why?” “What” “How” and “What if?”

**Diverging**- Individuals with this style of learning revel in viewing concrete situations from various standpoints and tend to enjoy collecting information. They are also interested in people and enjoy working in groups as well as examining various points of view of others (Kolb & Kolb, 2005).

**Assimilating**- Individuals with this style of learning can process a wide range of information and are more focused on abstract concepts and ideas. These individuals tend to explore careers in information and science as well as enjoy reading and lectures (Kolb & Kolb, 2005).
Converging- Individuals with this style of learning are great at discovering practical uses for theories and ideas. They are able to solve problems and make decisions by seeking suitable answers to questions or problems. These individuals tend to select careers in technology (Kolb & Kolb, 2005).

Accommodating- Individuals with this style of learning relish learning from “hands-on” as well as challenging experiences. They seek careers in marketing and sales and enjoy working with others, setting goals and utilizing unique methods for completing projects (Kolb & Kolb, 2005).

The Kolb model allows educators to teach students via the learning cycle to make certain all styles of learning are implemented and all questions have been answered for learners (Montgomery, 1998). When teachers are able to implement various styles of learning to meet the diverse needs of students, the opportunity to enhance student achievement may increase.

Culturally Responsive Pedagogy. Today’s classrooms are comprised of students varying in culture, language, as well as level of ability, which poses a challenge for teachers. In order to meet this challenge, teachers must employ not only theoretically sound but also culturally responsive pedagogy (Richards, 2007). To increase student achievement, teachers must construct a classroom environment where all students are received, supported, and provided the best opportunities to learn regardless of background. Culturally responsive teaching is defined as using the cultural characteristics, experiences, and perspectives of ethnically diverse students as conduits for teaching them more effectively (Gay, 2002). Culturally relevant teaching entails teachers possessing a thorough knowledge content and employing various representations
of knowledge that use students’ lived experiences to link new knowledge to home, community, and global settings (Jordan-Irvine, 2010). Effective teaching and learning that is student-centered is the focus in a culturally responsive classroom, where the gifts and talents of students are utilized to enhance student achievement. Culturally responsive pedagogy consists of three dimensions (Richards, 2007): (1) Institutional pertains to the leadership and its guidelines and standards. School leadership must make certain resources are allocated to promote culturally responsive teaching to meet the diverse needs of students. (2) Personal pertains to the cognitive and emotional practices teachers must engage in to become culturally responsive to students. Teachers must be willing to self-reflect to examine their attitudes and beliefs toward any cultural, language, or racial group in order to identify any biases that influence their value system that can impact methods of instruction utilized in the classroom. When teachers are impartial in their teaching and well informed about themselves and the students they serve, they can better respond to the needs of all their students (Richards, 2007). (3) Instructional includes lessons, approaches and materials that guide instruction by utilizing students’ language and culture to maximize student learning. According to Jordan-Irvine, culture is an important survival tactic that is transferred from generation to generation through enculturization and socialization, a type of road map that guides and shapes behavior (2010). Research indicates that student achievement will improve when students are taught through their own cultural and experiential filters (Gay, 2002).

Various instructional methods are used to enhance teaching and learning in classrooms. These instructional methods may be combined with cooperative learning to meet the diverse academic needs and interest of students. Differentiated instruction,
multiple intelligences, project-based learning, as well as all components of cooperative learning are included in this section.

**Differentiated Instruction.** Differentiated Instruction has received a lot of attention in teacher preparation programs, professional development sessions as well as educational conferences (Parsons, 2013). Differentiated instruction is a framework for teaching and learning in which the focus is on meeting the individual needs of students using effective instructional practices. Its primary goal is ensuring that teachers focus on processes and procedures that ensure effective learning for varied individuals (Tomlinson & Tighe, 2006). Differentiation is simply a teacher attending to the learning needs of a particular student or small group of students, rather than teaching a class as though all individuals in it were alike (Tomlinson, 2000). A growing body of research indicates positive results for full application of differentiated instruction in mixed-ability classrooms (Huebner, 2010).

**Focus of Differentiated Instruction.** Differentiated instruction centers on whom we teach, where we teach, and how we teach (Tomlinson & Tighe, 2006). This instructional model encourages teachers to focus on processes and procedures that support the various learning styles of students. Differentiated instruction focuses on instructional planning that is varied in nature and is designed to meet the diverse needs of learners.

The nucleus of differentiated instruction is flexibility in content, process, and product based on student strengths, needs, and learning styles (Levy, 2008). Therefore, it is imperative for teachers to have a deep understanding of the key curriculum elements in order to apply them in a manner that supports student learning.
**Content.** Content is what we teach to students. Authors Tomlinson and Allan state that “content consist of facts, concepts, generalizations or principles, attitudes, and skills related to subject, as well as materials that represent those elements” (p.7, 2000). Teachers are expected to teach students the same contents but may vary in the materials and means through which contents is taught. This is important because of the varying ability levels of students. Tomlinson suggest that differentiating content can be thought of two ways: teachers adapting what is taught students, and adapting or adjusting how students are given access to what they are expected to learn (2000). Therefore, teachers must be open minded and creative when designing instruction for student learning. For example, some students are working above grade level in mathematics and have mastered the state standard or his or her grade level. These students could be assigned a project that is somewhat rigorous. Differentiation in instruction that is more challenging is required for these students’ academic progress to move forward. Some students are working below grade level. These students may be successful in mathematics by working with manipulatives in order to move from concrete representations to abstract representations. Differentiated instruction allows for variation in content without losing sight of the curriculum to which all students are entitled (Levy, 2008, p. 161).

**Process.** Process focuses on how teaching occurs and how student learn. Process is the manner in which the student comes to understand or make sense of key facts concepts, generalizations, and skills related to the subject matter (Tomlinson, 2000). Teachers must select activities that accommodate the learning styles, interests and ability levels of students. Activities may include grouping students according to their interests, styles of learning or ability level to complete and assigned task. An additional example
of accommodating student learning may include the use of multiple intelligences, which allows students to complete tasks according to their specific mode of learning. Teachers can offer students choices about how they would like to demonstrate what they have learned. Assessing what student know and do not know helps to drive instruction. Assessment is continuous and closely linked to instruction (Tomlinson, 2000).

Product. The product is the way students show what they have learned. Teachers can assess students learning in a variety of ways. The key is making certain sound products are available to evaluate student learning according to goals of learning. For example, teachers can review a portfolio of student work that shows student progression of subject matter. Students can also give oral presentations; create posters, write a poem or a summary of what was learned. Whatever method chosen must match the learning style and ability level of students. A good product encourages students to reflect on their learning, apply what they have learned, expand on their understanding, and enhance their critical and creative thinking (Tomlinson, 2000).

Acknowledging Student Readiness, Interest and Learning Profiles. Students differ in three ways: readiness, interest and learning profile. These differences allow teachers to adjust instruction to support student leaning.

Readiness. Readiness is a student entry point relative to a particular understanding or skill (Tomlinson, 1999). To differentiate in accordance to student readiness, teachers must create assignments or opportunities for students to choose according to their ability level. Examples of how teachers can modify for student readiness include:

- Use of manipulatives of mathematical concepts.
• Modifying level of rigor to in order for student to complete the task.
• Modify the assignment according to student and experiences relate to the topic.
• Students who need encouragement to enhance their level of readiness may need the following types of modification can be used to successfully complete assignments:
• Aid in identifying gaps in learning in order to implement a plan to move students forward.
• Create task that are concrete in nature and require few steps to complete.
• Provide re-teaching opportunities to review concepts for deeper understanding.
• The pace of task is appropriate for student level of readiness.

Learning Profile. Learning profile helps to determine how students learn. There are numerous factors that play an important role in how students learn, which include intelligence preferences, gender, culture, or style of learning (Tomlinson, 1999). Teachers can differentiate in response to the learning profile of students in the following ways:

• Provide opportunities for group and independent work.
• Utilize Howard Gardner’s Multiple Intelligences for completion of task or projects.
• Appeal to the needs of students by presenting information through auditory, visual, and hands on methods.

Interest. Interest refers to a student’s enthusiasm or curiosity related to a topic. Teachers can differentiate in reaction to the curiosity of students by aligning key skills
and materials to support learning with curriculum topics. Teachers can modify to student interest in the following ways:

- Provide students with a variety of ways to research a topic.
- Provide students with choices to show what they know.
- Allow students to utilize many resources, materials and technology.

**Instructional Strategies that Support Differentiated Instruction.** Tomlinson and McTighe (2006) imply that “in effective classrooms, teachers consistently attend to at least four elements; whom they teach (students), where they teach (learning environment), what they teach (content), and how they teach (instruction) (p. 2). These four elements must coincide when planning various learning opportunities and choosing instructional strategies that contribute to student achievement. The following instructional practices can be utilized in the classrooms to differentiate instruction:

- Complex instruction-requires students to work cooperatively in small groups.
- Orbital studies-are independent studies of a topic that are then knowledge and skills are shared with the group.
- Interest center-are designed to encourage student exploration of topics of interest.
- Tiered task and projects-are designed to focus student learning on specific understanding and skills related to a topic while attending to the various ability levels of students.
- Learning contracts-is an agreement between the student and the teacher as it pertains to acquiring the knowledge and skills related to the standards.
- Portfolios-is a collection of student work that allows students to set learning goals and teachers to evaluate student learning.
These types of instructional practices make the implementation of differentiated instruction successful. Teachers must consistently provide high-quality curriculum and instruction to promote student achievement. This requires teachers to know what to differentiate (adjusting the curriculum according to the needs of students), how to differentiate (modification occurs in response to students’ readiness, interest or learning profile), and why is differentiation needed (reason for modifying student learning).

Tieso (2005) conducted a study of 31 mathematics teachers and 645 students and determined that differentiated instruction was effective for keeping high-ability students challenged in heterogeneous classrooms. In effective classrooms, teachers consistently attend to at least four elements: whom we teach, where they teach, what they teach, and how they teach (Tomlinson, 2006). Differentiated instruction aligns with the principles of constructivist learning theory because teachers seek and value their students’ point of view (Brooks, 1999). The points of view of students can be used to monitor student understanding and drive instruction for further teaching and learning. Assessment is also a focal point of the principles of constructivist theory. Teachers assess student learning in the context of daily teaching (Brooks, 1999). Daily assessment of student learning during instruction allows teachers to monitor student understanding and provided opportunities to redirect one’s instruction in order to meet the needs of diverse learners. Cooperative learning incorporates differentiated instruction in a manner that provide teachers with the opportunity to facilitate student learning while assessing student achievement in order to drive instruction. There is no one-size fits all model for differentiated instruction, which is dependent on students’ prior knowledge, ability levels as well as interests (Huebner, 2010). Utilizing the differentiated instruction model with
cooperative learning should include grouping students based on different criteria regarding their specific needs and the short-term goals of the teacher (Levy, 2008).

**Multiple Intelligences (MI).** The chief supporter of the multiple intelligences is Dr. Howard Gardner. Gardner and believed that intelligence is not fixed at birth but through appropriate learning experiences intelligence can be enhanced (Orlich, 2007). Gardner introduced the world to the multiple intelligences in 1983, which include eight distinctive ways that humans may display intelligence. Gardner believes that all human beings possess eight different intelligences that each person has a unique blend of intelligences and no two people have exactly the same profile of strengths and weaknesses with respect to intelligences (Vardin, 2003).

Spencer Kagan (1998) described MI theory as a powerful catalyst in education and can be used to meet the following three specific visions:

1. To match instruction with the ways students learn
2. To encourage students to stretch their abilities and develop all their intelligences to the best of their ability
3. To honor and appreciate how we are alike and how we are different.

Howard Gardner’s multiple intelligences makes its greatest contribution to education by suggesting that teachers expand their repertoire of techniques, tools, and strategies beyond the typical linguistic and logical ones predominantly used in U.S. classrooms (Lotan, 2006). Implication for school restructuring and classroom application include expanded teaching approaches, curricular revisions, and expanded student assessment (Lotan, 2006).
MI requires teachers to adjust their instructional strategies to meet students’ individual needs. The classroom teacher constantly changes methods of instruction that include moving from one intelligence to the next as well as possibly merging intelligences in a creative manner (Lotan, 2006). MI also provides the opportunity for teachers to create learning opportunities that reach past textbooks to promote learning as well as allow students to display evidence of learning.

Howard Gardner (2006) defined the various intelligence areas as follow:

- **Verbal linguistics intelligence** involves the mastery of language and people with this intelligence tend to think in words and have highly developed auditory skills.
- **Logical-Mathematical intelligence** consists of the ability to detect patterns, reason deductively, and to think logically.
- **Visual/Spatial intelligence** gives persons the ability to manipulate and create mental pictures in order to solve problems.
- **Bodily-kinesthetic intelligence** entails the ability to understand the world through movement. These individuals can use their bodies for distinctive purposes.
- **Musical intelligence** individuals utilize sound to its greatest extent. These individuals also have a firm understanding of pitch, rhythm, and tone.
- **Interpersonal intelligence** consists of having the ability to understand and interact with others by understanding one’s moods, feelings, motives as well as how they are smart.
- **Intrapersonal intelligence** consist ability to know and understand one’s own inner workings.
• Naturalist intelligence involves the ability to identify objects and put things into categories.

• Existential intelligence involves displaying the ability to pose or contemplate questions about life, death, and ultimate realities.

Author Thomas Armstrong (2003) emphasizes four points that should be considered regarding MI. First, each person possesses all eight intelligences and have varying ability in all of the intelligences. Second, the way in which the eight intelligences work together is unique to each individual, pending on his or her experiences. Third, most individuals fall somewhere between highly advanced in some intelligences, modestly advanced in others, and relatively weak in the remaining intelligences. Unfortunately, schools across the nation tend to utilize only two of the eight intelligences (Verbal-linguistic and Logical/mathematical). The remaining six intelligences are consciously depressed (discriminated against) by schooling (Orlich, 2007). Individuals who could possibly display their intelligence through other forms are not given the chance to show what they know. How we offer opportunities for students to build on their strengths have far-reaching effects on student achievement in classrooms (McClaskey, 1995). Teachers can incorporate MI with cooperative learning to enhance student learning by providing opportunities for students to understand how they learn and identify their dominant identified multiple intelligence and strengthen other intelligences.

Howard Gardner’s multiple intelligences focuses on identifying students’ area(s) of intelligence that can be utilized by teachers to form multi-intellectual ability cooperative learning groups that are heterogeneous to enhance student learning in mathematics.
**Project-Based Learning.** Project-Based Learning is an inventive method to learning that teaches students a host of approaches essential for student success in the twenty-first century. Students learn to be active-listeners, which allow them to become skilled communicators as well as advanced problem-solvers who work collaboratively with others to generate ideas. This approach to learning is student-driven where teachers supervises the development and approves each choice before the student begins their project (Bell, 2010). Most projects include the content areas of reading, writing, and mathematics. By completing a project, students develop a greater understanding of the content, experience deeper learning, and are motivated to learn.

The following phases occur in problem-based learning:

A. Students begin by utilizing an organizer to identify a probing question.

B. Students brainstorm to pinpoint the best method for their research as well as select materials that they will need in order to conduct their research.

C. Students will select the manner in which they will display what they have learned in the form of a project.

D. Students will identify a targeted audience with whom to share their project (Bell, 2010).

**Meeting the Diverse Needs of Students.** When cooperative learning environments are created with the focus of meeting the diverse needs of students, academic achievement will increase. Cooperative learning has proven to increase the academic achievement of students of all ability levels (Orlich, 2007). This is especially promising for students of color who in some cases perform below grade level. Research indicates that students of color benefit from the being a part of a cooperative learning
environment. African-American, Hispanic and Native-American students are social beings because of family traditions and their rich heritages. Vaughn (2007) suggests that students of color often have values, cognitive styles, and speech patterns that are different from those of their school’s dominant culture (p. 360). Teachers must carefully construct groups from various cultures; students are able to share thoughts, ideas and experiences with members in order to impact learning. Authors Schniedewind & Davidson (2000) states: “Effective heterogeneous cooperative groups allow students to learn to value diversity and the intelligences and perspective of others.” Teachers must use this valuable information to construct learning environments that allow students of color to share their strengths to help all members to excel academically.

**Background on Cooperative Learning.** Groups of individuals have been in existence for as long as the human race has been present on earth, working cooperatively to obtain goals. Celebrations then take place when group goals are successfully completed. These accomplishments support the notion that groups working cooperatively outdo individuals who work independently, especially when group members have different skill sets and areas of expertise that contribute to group accomplishing the goal or assigned task. Johnson and Johnson, experts in cooperative learning believe that it is obvious that groups outperform individuals, especially when performance requires multiple skills, judgments, and experiences (1999). Johnson and Johnson also believe that there is power to working in groups and support cooperative learning as an instructional method that can be utilized in classrooms to enhance teaching and learning. Cooperative learning is the term given to an instructional method that includes over 80 strategies, where students work together in small groups toward a
common goal (Nattiv, 1994). Johnson and Johnson (1994) describe cooperative learning as the instructional use of small groups through which students work together to maximize their own and each other’s learning. Numerous definitions for cooperative learning exist and several authors have defined cooperative learning in their writings. Authors Christopher Lopata, Kathleen Miller and Robert Miller (2003) defines cooperative learning as “an instructional technique designed to promote the academic and social development of students” (p.232). Author Winston Vaughn (2002) defines cooperative learning as “the instructional use of small heterogeneous groups of students who work together to maximize their own learning and each other’s learning” (p.359). The definition and interpretation of cooperative learning influence the manner in which it is implemented by teachers and its effect on student learning. Although researchers define cooperative learning differently, they all tend to agree that the goal and focus of cooperative learning is on student learning. This goal has been the focus of educators since the one room schoolhouse came into existence.

According to Slavin (1991), Small-scale laboratory research on cooperative learning dates back to the 1920s but research conducted in classrooms related to specific applications begin in the early 1970s. Since that time, cooperative learning has been utilized throughout the United States and abroad, and is of great interest to schools and school district because of its positive results related to teaching and learning in every subject area. Cooperative learning has successfully been utilized into classrooms for students of all ages and ability levels, ranging from kindergarten through college level where they complete a variety of task or projects related to an assortment of content areas (Marzano, 2001).
Research over the past two decades have concluded the relative effectiveness of cooperative learning methods promotes student achievement and social relations when compared to more traditional methods of instruction (Johnson et al., 1981). Cooperative learning also encourages the building of supportive relationships, good communication skills, and higher level of thinking abilities (Hilke, 1990). Students will need these essential skills when working with others in the workplace as well as for everyday living. One purpose of cooperative learning is to make each group member a stronger individual in his or her own right (Johnson et al., 1999).

Origins of cooperative learning date back to World War II when social theorist began forming cooperative learning groups after concluding that group work was more effective in value, quantity and overall production when compared to working alone. The cooperative learning movement advanced into the field of education when Joseph Lancaster and Andrew Bell utilized it in England and then brought the instructional method to the United States when the Lancastrian School opened in New York City in 1806. Various philosophers and psychologists from the 1930’s and 1940’s have also influenced how cooperative learning is utilized which, led to the work of David and Robert Johnson as well as other contributors to cooperative learning theory and how it is practiced in classrooms today. Cooperative learning was and continues to be used as a means to decrease competition in American schools while encouraging students to work cooperatively to help one another progress both academically and socially. Johnson, Johnson, & Stanne (2000) stated that cooperative learning strategies are generally utilized because they are based on theory, validated by research, and virtually any teacher can find a way to use cooperative learning methods that align with personal values and
beliefs. This unique instructional approach capitalizes on students’ need to interact with their peers, exercise ownership over their learning, and express their desires to achieve academically as well as socially (Slavin, 1996). Researchers conclude the cooperative learning model ranked first in teaching approaches that promote greater higher order thinking, problem solving, and achievement (Lin, 2006).

**Researchers of Cooperative Learning.** Numerous researchers have conducted extensive studies on cooperative learning. The following individuals have contributed to the development and implementation of this research-based instructional method.

**Morton Deutsch (1920-).** Morton Deutsch, an American social psychologist developed the theory for cooperation in the late 1940s then presented the Social Interdependence theory, which provides a foundation on which cooperative learning is built. Social interdependence theory to education has become one of the most successful and widespread applications of social and educational psychology to practice (Johnsons and Johnson, 2009). Deutsch introduced the social interdependence theory after discovering cooperative environments where individual success was dependent on the success of others resulted in positive communication between group members. These positive communication patterns resulted in higher productivity and the building of peer relationships.

**Robert Slavin.** Robert Slavin, an American psychologist is currently Director of the Center for Research and Reform in Education at John Hopkins University and part-time Professor at the Institute for Effective Education at the University of York in England. Slavin created his Success for All Educational Model after being approached by the Superintendent of Baltimore Schools for assistance with improving impoverished
success for All is a cooperative learning approach utilized to increase student achievement by allowing students to work in small groups to complete lessons structured around effective and active instruction. According to Slavin, used properly, cooperative learning is an exciting way for all kids to learn (2014).

**Shlomo Sharan.** Shlomo Sharan, Professor Emeritus in Education and Organization Psychology at the School of Education, Tel Aviv University (1966-2000). Sharan is known for his work with the cooperative learning method Group Investigation. Group investigation allow students to actively design what and how they will learn by creating cooperative groups according to shared interests in a subject based on a six-stage process. According to Sharan, group investigation is an effective organizational medium for encouraging and guiding students’ involvement in learning by allowing them to actively share in influencing the nature of events in their classroom (1989).

**David and Roger Johnson.** David and Roger Johnson, leading advocates of cooperative learning have conducted extensive research on the subject. The Johnson brothers are co-directors of the Cooperative Learning Center at the University of Minnesota and have held hundreds of workshops demonstrating cooperative learning strategies and in 1994 published five elements essential for effective group learning to improve teaching and learning in classrooms. David is a professor of educational psychology, specializing in social psychology at the University of Minnesota. Roger is professor of curriculum and instruction, specializing in science education, also at the University of Minnesota. According to Roger Johnson (1987), when teachers use cooperative learning they are provided with an assortment of outcomes which impacts achievement of students by developing critical thinking as well as long-term retention
when they are engaged in discussions and explaining their interpretation of subject matter to each other.

**Kagan Spencer.** Spencer Kagan, an American educational psychologist is known for creating the structural approach to cooperative learning, which can be used to teach any subject matter. Kagan has developed nearly 200 classroom “structures” which have various aims such as team building; focus on positive relationships, the sharing of information, enhancing critical thinking skills as well as enhancing communication skills. According to Kagan, each structure has its benefits and limits. To rely solely on any one structure is to limit the variety of experience of students and leave them less equipped for the kind of world they will be living in (1989).

**Principles of Cooperative Learning.** Cooperative learning ultimately entails the coordination of one’s efforts with the effort of others to accomplish a shared goal and complete the task (Kirk, 2001). Students must understand that working cooperatively requires all members to take ownership for helping each person in the group reach their level of academic achievement. Each student in the group must be dedicated to his or her own success as well as to the success of other group members. This commitment is at the heart of cooperative learning (Vaughn, 2002). The successful academic achievement of the entire group is dependent on each member’s willingness to teach and learn. One member cannot truly succeed unless everyone in the group succeeds. Therefore, each member is a valuable resource for the entire group. The group will not achieve academic success if one member fails to reach his or her achievement goals. Author Patricia McCracken (2005), states “group work is not complete until all members have mastered the content and all students are working toward the same goal” (p.11). To experience
success with the implementation of cooperative learning in the classroom and enhance student learning the following principles must be present:

**Positive Interdependence.** Positive interdependence links students together so no single student can succeed unless all group members succeed (Johnson & Johnson, 1994). Students must understand they will “sink or swim together.” In order to swim together, members of the group must be willing to work collaboratively. Additionally, each group member has two essential responsibilities: to learn the assigned material and to ensure that all members of their group learn the assigned material. According to Johnson & Johnson (1994), individual accountability is the key to ensuring that all group members are strengthened by learning cooperatively. When individual tasks are executed, the group will accomplish something beyond individual success.

Teachers must make certain two steps are implemented when forming positive interdependence in learning groups; 1) structure positive goal interdependence, 2) supplement and strengthen positive goal interdependence by adding resource, reward/celebration, role, identity, and other forms of interdependence (Johnson and Johnson, 1999).

Additionally, teachers must thoroughly understand assessing the performance of each member of the group as well as the group as a whole, and providing timely feedback enables the group as its members to recognize and celebrate accomplishments and to identify areas of needed improvement to strengthen the positive interdependence of the group. When positive goal interdependence is structured to occur consistently, the teacher and students will see it as a natural part of any lesson (Johnson & Johnson, 1994).
**Face-to-face Interaction.** Face-to-face interaction encourages members of the group to support and advance each other’s learning. Social support between students is an important component of cooperative learning. “Strong social support is characterized by high expectations, challenging work, strong effort, mutual respect, and assistance in achievement for almost all students” (Kemker, Barron & Harmes p. 308). Each member must feel free express his or her opinion and to pose questions related to their understanding or misunderstanding of subject matter without being mocked or demeaned by other members of the group. This requires the entire group to have respect for each other and to be valuable resources for those members who struggle with subject matter in order to move learning forward. Each member must be an advocate for the group and applaud the progress made toward meeting academic achievement goals of all members. Authors Johnson, Johnson & Holubec agree that members must believe that they all sink together or swim together. If one fails to meet their academic goal, they all fail to meet the group’s academic goal (1988). This principle provides students with opportunities to grow and develop in their understanding and acknowledgement of what it means to “have a sense of community” where we as humans are encouraged to contribute in some manner to make a difference so that we all can move towards accomplishing our goals which is a beneficial real-world experience.

**Individual Accountability.** In order for cooperative learning to be most effective, both group rewards and individual accountability must be present (Slavin, 1988). Group rewards along with individual accountability means that every student is rewarded only when others in his or her group also experiences success, which deters high achievers from taking over the assignment. Students must be accountable for their own learning by
working to their fullest potential. Although task may be somewhat challenging, students are expected to work hard to complete assigned task in a matter that demonstrates that learning has taken place. They must also work with members to help them understand subject matter and complete assign task. Students must reflect on their effort and progress made toward reaching achievement goals and their contributions toward supporting the academic achievement of the group. Cooperative learning promotes a learning community that encourages interdependence with individual accountability (McCracken, 2005).

**Social skills Development.** Building meaningful relationships and developing effective communication skills is associated with cooperative learning. Students regardless of ability level, race or ethnicity, are expected to assist each other by sharing their knowledge and resources, planning and completing task together, and sharing strategies that will promote students internalizing and retaining information. Students come from diverse backgrounds and have unique experiences that can contribute student learning. Researchers have discovered that cooperative learning encourages better relationships among students with special needs and varying races and ethnicities (Lin, 2006). When students are able to work cooperatively, they develop an appreciation for the likes and differences in themselves and others.

**Group Processing.** Group processing is the practice members utilize to make the most of their own and each other’s learning (Strahm, 2007). The purpose of group processing is to explain and enhance the efficiency of the members in contributing to the shared energy needed in order to achieve the goals of the group. According to Johnson (1987), benefits of group processing include:
A. Enables learning groups to focus on maintaining good working relationships among members.

B. Facilitates the learning of cooperative skills.

C. Ensures that members receive feedback on their participation.

D. Ensures that students think on the metacognitive as well as the cognitive level.

E. Provides the means to celebrate the success of the group and reinforce the positive behaviors of group members.

When students are exposed to and learn vital aspects of group processing, members are willing to provide leadership and work together to problem solve and come to consensus on ways to improve group processes when challenges arise within the group. Mills (2009) believes it is essential for teachers and students to pay attention to group dynamics and productivity. Additionally, group processing provides structure for group members to hold each other accountable for being responsible and skillful group members (Johnson, 1987).

In order for cooperative learning to be effective, each principle must be implemented appropriately including group processing. Therefore, Johnson and Johnson (1994) have encouraged teachers to be committed to doing the following:

A. Ensuring that each student and each group receives (and gives) feedback on the effectiveness of task work and teamwork.

B. Ensuring that students and groups analyze and reflect on the feedback they receive.

C. Help individuals and groups set goals for improving their work.

D. Encourage the celebration of member’s hard work and the group’s success.
Teachers must set aside time to allow students to reflect on their commitment to the group in order to identify areas that can strengthen group dynamics. Problems and resolutions of each group can be discussed with the entire class because the same issues may exist in other groups. This sharing opportunity may assist other groups with ways to solve problems. Authors Orlich, Harder, Callahan, Trevisian & Brown, encourage teachers to develop plans for engaging students in problem solving and conflict resolution (2007).

Types of Cooperative Learning Groups. To use cooperative learning effectively, one must know what is and is not a cooperative group (Johnson, Johnson, & Holubec, 1988). Three types of cooperative learning groups contribute to the enhancement of communication skills, tolerance and respect for individual differences, and student learning. They are formal, informal and cooperative based groups.

Formal Cooperative Learning Groups. Formal cooperative learning groups requires teachers to create educational opportunities for small groups of students to work collaboratively to teach particular content and to achieve specific learning goals. The duration of time spent together as a group ranges from one class period to several weeks. During this time, it is expected that students complete assigned task for learning and to make certain all group members thoroughly understand and complete the task as well.

When using formal cooperative learning groups, teachers are encouraged to: specify the objectives of the lesson, explain the task as well as stress the importance of positive interdependence, monitor students’ learning and assess students’ learning as well as aid students with processing how well their group is functioning (Johnson, Johnson & Holubec, 1988).
Informal Cooperative Learning Groups. Informal cooperative learning group (ad-hoc groups) interaction may last for a few minutes or until the end of a class period, depending on the learning activity. During this time, teachers are encouraged to lecture, model or show a video on subject matter being taught. Additionally, this time can be used for the teacher to: help students focus their attention on what is being learned, set the stage for conducive learning, set the expectations for the amount of information covered during a session, make certain students have time to learn and understand the content being taught, and provide closure at the end of an instructional session (Johnson, Johnson & Holubec, 1998). The teacher uses this time as a teachable moment for students because it occurs during instruction. During this time, teacher may review materials, goals and objectives that students are expected to master. Valuable data related to student learning may be collected while groups are working cooperatively. This information may be used to make changes in instruction to meet the needs of students.

Cooperative Based Groups. Cooperative based groups are heterogeneous in nature and membership may last for up to one school year. Members are expected to provide stability, encouragement, assistance and support for each other’s learning. This type of support influences student achievement regardless of content area of focus. Students are able to identify the strengths and weaknesses of group members, which in turn can be used to help each member achieve their academic goals because the strengths of group members are valuable resources that contribute to the achievement of all members.
There are three major purposes for using cooperative learning: to develop students’ social and communication skills, enhance tolerance and acceptance of diversity, and improve the academic achievement of students (Lin, 2006). Teachers must be mindful of the major purposes for using cooperative learning and provide opportunities for students to develop to their fullest potential regardless of the type of cooperative learning structure utilized in classrooms. An additional area of focus that is imperative to the success of cooperative learning in the classroom is the physical arrangement of groups. The physical arrangement gives clear messages about the teachers’ values and expectations for student behavior. Likewise, classroom design has been shown by research to affect student achievement, time on task and acoustics (Jolliffe, 2007).

**Cooperative Learning Structures.** Several structures are available to assist teachers with the utilization of cooperative learning. Teachers may use structures associated with cooperative learning to organize lessons that encourage social interaction between students in the classroom. The following well-known structures have proven successful in classrooms:

**Jigsaw.** Students are assigned to heterogeneous groups based on ability, gender and ethnicity. A project is assigned which requires each group member to become an expert on a specific topic. Students begin by working with members from other teams who are assigned the same topic. After becoming an expert on the topic, students then return to their groups to teach the topic. The group is then assessed on the topic for knowledge and understanding. Students may be assessed individually through the use of tests, quizzes or may receive their grade based on the average performance score of the group. This structure promotes positive interdependence because students understand
they are responsible for their own learning and the learning of group members. This responsibility can impact their achievement, which motivates them to work hard so all can achieve.

**Think-Pair-Share.** Students are given a topic to think about independently and then pair with another group member to discuss their thoughts, knowledge and understanding of the topic. The paired up students then share their thoughts with the entire class. This structure promotes face-to-face promotive by allowing students to support each other’s academic success by work together to complete learning tasks.

**Number Heads Together.** Students work in assigned groups to answer questions posed by the teacher. Before an answer can be given, students are required to put their heads together to develop a complete answer. This structure can be used as a review before a quiz or test is given. This structure also promotes positive interdependence because students understand that they are accountable to themselves and to their group for the mastery of information and aids with retaining information.

**Inside-Outside Circle.** This structure requires students to be teachers as well as learners. Students stand in two concentric circles. The inside circle faces outward and the outside circle faces inward. The teacher poses questions to students orally or via note cards. Students respond to questions and then rotate to the next partner. This structure promotes face-to-face interaction, which allows students to work directly with one another to share knowledge and understanding of subject matter. Completing this learning task as a group helps to enhance the academic achievement of all members.

**Co-op.** Students develop a project by working independently to complete assigned task that contributes to the group project. This project is shared with the entire
class and evaluated as one completed project by the teacher. This structure promotes positive interdependence because each group member is accountable for his or her portion of a project that is combined to complete the group project. Students may be evaluated independently or as a group.

Success for All. Success for All is an all-inclusive reform model for elementary schools that is now operating in more than 1,800 schools in 49 states, as well as in 5 foreign countries (Hurley, 2009). This model was designed to ensure the reading success of every student by applying the following instructional approaches in grades pre-kindergarten through sixth:

1. Individualized tutoring for students in the primary grades who experience difficulty with reading.

2. Offering of family support programs.

3. Professional development for educators that focus on the implementation of high quality program elements.

After completing first-grade, teachers use strategies adapted from Cooperative Learning Integrated Reading and Composition where students work cooperatively in small groups to complete activities focused on central ideas, summarization, language, reading, and creative writing (Hurley, 2001). A trademark of Success for All is well-structured materials for students, teacher guidebooks, assessment resources and other supplementary supports.

Group Investigation. Group Investigation is an effective instructional approach for encouraging as well as guiding students’ involvement in learning by allowing them to take an active role in planning an area of study with group members who have similar
interests. The group collaboratively plan out a strategy for conducting research on a particular topic, divide the work, synthesize and summarizes the work then present their finding to the entire class. In order to assess student learning in Group Investigation, the teacher evaluates students’ higher-level thinking pertaining to their area of study, the application of knowledge to new problems, the use of inferences, and the drawing of conclusions (Sharan, 1990).

These well-known structures support the five key principles of cooperative learning can contribute to student learning. Kirk (2001) states, “cooperatively structured classrooms contribute greatly to a positive class tone, as children’s needs are being fulfilled” (p. 34).

**Roles and Responsibilities of Group Members.** Cooperative learning includes assigning student specific roles and responsibilities within the group. These roles and responsibilities encourage accountability for self as well as for the group. Kirk (2001) states, “assigning roles ensures that no individual shirks his or her responsibility, as can happen in small group work” (p. 33). The following positions and responsibilities may be assigned to students:

1. **Leader:** Manager of the group and accountable for making sure all members adhere to the role and responsibilities related to their role.
2. **Recorder:** Documents group responses and records answers when the group reaches consensus.
3. **Encourager:** Encourages and praises the participation and efforts of all members.
4. **Checker:** Verifies that all members of the group agree with chosen method for solving problems and fully understand subject matter.
5. **Time Keeper**: Makes certain the group remains on task and adhere to time limits for completing assigned task.

Each student must understand that their particular role is important because it contributes to the group dynamics and promotes both positive interdependence and individual accountability

**Roles and Responsibilities of Teachers.** Key component of successful implementation of cooperative learning is the teacher. The teacher must hold a constructivist view of learning, which entails believing that all students are capable of learning regardless of ability level, race or gender. Teachers must provide opportunities for all students to develop critical thinking skills, collaborate, and problem solve.

Teachers are encouraged to receive training in order to have knowledge and understanding of cooperative learning for its successful implementation. Teachers’ knowledge and understanding of teaching practices and instructional methods that is utilized in classrooms should aid in the restructuring of information associated with cooperative learning in order to fit their style of teaching.

Cooperative learning emphasizes the crucial role of teachers in supervising group activities (Law, 2008). In order for students to reap the benefits of cooperative learning, teachers must be dedicated to its full implementation, which includes being immersed in activities with students. Teachers must constantly communicate high expectations for student achievement and take an active role in student learning. The following six actions taken by teachers can impact how cooperative learning impacts student learning:

1. While students are working collaboratively in groups, the teacher must move around the classroom to monitor group behavior.
2. Provide meaningful feedback to enhance group dynamics and student learning.
3. Ask probing questions to promote critical thinking.
4. Provide assistance but intervene only when necessary.
5. Evaluate group progress to determine if learning is occurring.
6. Hold groups accountable for competing and submitting assignments in a timely manner.

Kirk (2001) states, “the teacher’s role is one of observer and mediator, intervening by asking questions, encouraging students, suggesting possibilities on specific academic and social skills and providing feedback during group processing” (p.32).

Teacher should not assume that students automatically know how cooperative learning groups are to function effectively because many have not experienced working collaboratively or if they have been exposed to this instructional strategy have developed negative perceptions of it. Working collaboratively in groups is a skill that has to be taught by students as well as teachers (Gay, 2000). Using cooperative learning can be challenging for students and teachers. Some students may be resistant while others may attempt to avoid working collaboratively and taking ownership for completing their assigned task. According to Johnson (1999), there will be times when students will refuse to work cooperatively or will not understand how to help the group succeed. Teachers can resolve or eliminate these sorts of concerns by assigning each member of the group a specific role to play in the group.

Some teachers may not be comfortable with relinquishing some authority and classroom management when utilizing cooperative learning. The teacher can manage these concerns by building a learning environment that values collaboration and
community, which is consistently communicated and demonstrated by all learners. Teachers are encouraged to begin slowly with its implementation so students can gradually adjust and become comfortable and then skilled at learning cooperatively to enhance learning. Teachers must be willing to embrace the vision of good teaching as a process of “drawing out” rather than “stuffing in” knowledge and understanding of mathematics.

**Benefits of Cooperative Learning.** The widespread use of cooperative learning is due to its countless benefits for teaching and learning which has been unmistakably confirmed in the literature for more than 20 years (Nattiv, 1994). Research reveals cooperative learning can improve students’ academic and social skills, enhances students’ eagerness for knowledge, understanding and application; and willpower to achieve academic achievement (Orlich, 2007). Students are able to improve their skill set in all areas, making them well-rounded individuals who can make great contributions to school and society. Cooperative learning skills are the keystones to maintaining a stable family, a successful career, and a stable group of friends (Johnson, 1990). Cooperative learning has been proven to enhance the social skills of students, which is contributed to participating in group work. When students are encouraged to work cooperatively, they learn to manage conflicts while considering the and respecting the opinions of others. Enhancing the social skills of students may be particularly significant in adolescences, which is a period when the need to belong conflicts with the need to be recognized as an individual (Wood, 1987).

Research also suggests that cooperative learning is a valuable instructional strategy that encourages student to interact with one another and develop a positive mind-
set toward school. Cooperative learning has been associated with increases in students’ self-esteem, attending classes and remaining on task, satisfied with school and classes, and the drive to learn, as well as a reduction in dependency on the instructor (Whicker, 1997). One of the most significant benefits of cooperative learning has been the increase in positive intergroup relations. Researchers have repeatedly reported the improvement in race relations and acceptance of students who have been mainstreamed into classes (Whicker, 1997). This interaction between students promotes understanding and tolerance for others from different backgrounds. Therefore, students are allowed to build character when they are afforded opportunities to compare ideals with reality in their own lives and in the lives of those around them (Haberman, 2010).

An additional benefit of cooperative learning is how it enhances the critical thinking and problem solving abilities of students, which in turn improves their levels of achievement. According to Lin (2006), “when students used major components of cooperative learning by practicing their new learning or teaching it to others, or apply their learning immediately, they were able to retain seventy-five Percent to ninety Percent of the material after 24 hours” (p. 35).

Authors Orlich, Harder, Callahan, Trevisan & Brown (2007) list additional benefits of cooperative learning;

1. Improvement of comprehension of basic academic content;
2. Reinforcement of social skills;
3. Student decision making allowed;
4. Creation of active learning environment;
5. Boost student self-esteem;
6. Celebration of diverse learning styles;
7. Promotion of student responsibility; and
8. Focus on success for everyone.

These additional benefits of cooperative learning and its influence on students’ social interaction, personal growth and development; and academic achievement, makes its use in classrooms worthwhile, meaningful and rewarding for students and teachers. Lopata (2003) states research continues to support the use of cooperative learning as a means to encourage academic and social growth.

**Cooperative Learning and Gifted Students.** Most teachers acknowledge the benefits of cooperative learning on low and middle achieving students. However, research has also confirmed the benefits cooperative learning has on high achieving students. David and Robert Johnson have conducted several studies comparing the achievement of high, middle and low achieving students in cooperative learning. Johnson (1990) note the following benefits for high achieving students:

A. When working in heterogeneous groups, scores on retention test are higher verses high achievers participating in competitive or individualistic learning environments.

B. The quality of reasoning strategies used by high achievers were higher when working in cooperative groups.

C. The enhancement of cognitive processes when involved in conversations encompassing talking through and explaining material and concepts.

D. The development of collaborative skills and friendships with peers.
E. The development of leadership, communication, conflict management, and decision-making skills needed for success in future career opportunities.

**Mathematics in Urban Schools.** Students of color make up a large portion of pupils in the U.S. educational system. Many of them struggle to meet satisfactory achievement levels in core content areas, which include mathematics (Cross, 2012). High rates of unsatisfactory competency in mathematics for students of color has caused many educators to reconsider their approach to educating students to afford them all the opportunity to experience quality mathematics instruction that promotes academic success. The National Council of Teachers of Mathematics (NCTM), an international professional organization committed to quality in the teaching and learning of mathematics called for a surge in emphasis on teaching and learning of mathematics (McKinney, 2009). This organization has presented an aspiring vision of a demanding, high-quality mathematics-learning environment with a clear and all-inclusive goal to encourage dialogue and efforts for the enhancement of mathematics education and mathematical proficiency for students in grades Pre-K-grade 12. NCTM presented the Principles and Standards for School Mathematics (PSSM), which included six fundamental principles that describe specific components that are essential for creating a quality mathematics-learning environment. These specific components include:

1. **Equity**- Quality in mathematics education necessitates equity-high expectations and strong backing for all learners.

2. **Curriculum**- A curriculum is more than an assortment of lessons: it must be comprehensible, concentrated on essential mathematics, and well-articulated across all grades.
3. **Teaching**- Operative mathematics teaching entails understanding what students know and need to learn and then challenging and supporting them to learn it well.

4. **Learning**- Students must learn mathematics with understanding, progressively constructing new knowledge from experience and prior knowledge.

5. **Assessment**- Assessment must support the learning of significant mathematics and provide valuable information to instructor as well as learners.

6. **Technology**- Technology is crucial in teaching and learning mathematics; it impacts the mathematics that is taught and increases students’ learning (McKinney, 2009).

These principles emphasize problem solving, critical thinking, and conceptual understanding which make-up the essential components of a quality mathematics education program. In order to ensure these essential components are implemented to create a quality mathematics program, there must be a focus on equity. Cross (2012) defines equity as providing fair distribution and access to the physical, intellectual, and technological resources that contribute to learning. This distribution of resources should available to schools, students, teachers, to promote and support quality instruction in mathematics that impact student learning. Unfortunately, a great share of classrooms continues to fall short of putting into practice quality instruction in mathematics, especially urban high poverty schools in spite of the clear direction of goals and standards set forth by NCTM (McKinney, 2009). Berry conducted research that documented disparities in achievement levels for African-American students, as well as other ethnic groups. Mathematics instruction for urban students often puts emphasis on detached concepts, mathematics jargon out of context, following direct steps, and answering
questions without explanation. Many mathematics students spend much of their time on basic computation instead of being engaged in rich mathematical problem-solving experiences.

McKinney (2009) conducted a study that involved examining the mathematics pedagogical as well as instructional skills of sixty-four teachers who teach seventh and eighth grade students in high-poverty middle schools. Results reveal that teachers utilized a variety of instructional strategies, but lecture, drill and practice, and teacher-directed instruction continue to rule many high-poverty classrooms. Ladson-Billings (1997) discussed the impact of these practices on student achievement by referring to it as the “pedagogy of poverty”. The pedagogy of poverty consists of 14 teaching acts or routines which include the following: giving information, asking questions, giving directions, making assignments, monitoring seatwork, reviewing assignments, giving tests, reviewing tests, reviewing tests, assigning homework, reviewing homework, settling disputes, punishing noncompliance, marking papers, and giving grade (Haberman, 2010).

Other researchers have reported similar observations about the trend for Black students getting more old-style, drill-based instruction focused on basic computation skills (Lubienski, 2002). Tomlinson states educators are mainly restricted when the single or major pedagogical strategy utilized is teacher-centered (2000). The lack of utilizing varying strategies in classrooms contribute to the evidence of disparities in mathematics achievement that continues to exist in assessment results, enrollment numbers in higher-level courses as well as in distribution of resources in American
schools (Berry, 2003). Mathematical knowledge and skills are essential for daily living in an increasingly global economy.

The National Assessment of Educational Progress (NAEP) collects mathematics assessment data on students in grades four, eight and twelve. NAEP data is also utilized to identify variables such as socioeconomic status, school policies, allocation of human and material resources, and classroom instructional practices that may account for gaps in mathematics assessment results. According to the 1996 NAEP assessment, 4 Percent of African-American eighth grade students scored at or above the level of proficient, 24 Percent performed at the basic level of proficiency, and 72 Percent performed below the level of basic. According to 2000 NAEP assessment results, 6 Percent of African-American eighth grade students scored at or above the level of proficient, 27 Percent performed at the basic level of proficiency, and 68 Percent performed below the level of basic (Braswell et al. 2001). It is evident that African-American eighth grade students made marginal gains. However, the gaps between African-American and white students continue to remain comparatively unchanged. The National Research Council (1989) believes much of the failure in school mathematics is contributed to a tradition of teaching that does not correlate to the way most students learn.

Researchers of mathematics education have given some attention to gaps in mathematics achievement, but with limited quantity and depth (Lubienski & Bowen, 2000). Research results related to the utilization of cooperative learning can be used to close achievement gaps in mathematics.

**Cooperative Learning and Mathematics Achievement.** Cooperative learning in mathematics has been an area of interest for educators and researchers because of its
impact on student achievement. A multitude of studies have been conducted to examine cooperative learning’s impact on student achievement and to provide support for this instructional strategy. The National Council of Teachers of Mathematics (NCTM, 1989) advocates cooperative learning because “small groups provide a forum in which students ask questions, discuss ideas, make mistakes, learn to listen to others’ ideas, offer constructive criticism, and summarize their discoveries in writing” (p. 79). Cooperative learning aligns with the teaching of mathematics because of the following benefits of learning mathematics in small groups:

- Small groups provide a medium for students to ask questions discuss ideas, make errors, learn to listen to the ideas of others, and give constructive criticism.
- Small groups offer opportunities for all students to experience success in mathematics by interacting to learn concepts and enhance problem-solving techniques.
- Small groups are suited for learning mathematics because solutions can be proposed which offers occasions for students to persuade each other through logic.
- Small groups provide opportunities for students to share various methods of solving a problem then discuss the merits of different solutions.
- Small groups encourage students to master computational techniques and basic facts by playing games and solving puzzles related to mathematics (Davidson, 1990).
Slavin (1996) conducted a study of third and fourth grade students in which cooperative learning methods were used. Results indicate all students in the experimental group acquired noteworthy increases in mathematics. Duren and Cherrington (1992) conducted a similar study with students enrolled in mathematics courses designated for higher-grade levels and reported results suggesting that cooperative learning supports achievement. Duren and Cherrington conducted an additional study involving seventh and eighth grade pre-algebra student who used cooperative learning strategies. Their results indicate that these students scored higher than the controlled group and they retained the information for a longer period of time (1992). Researchers Thomas and Sherman also reported students obtaining higher achievement gains among ninth and tenth grade students who were enrolled in general mathematics courses that utilized cooperative learning as an instructional strategy verses performing independently (1986).

Treisman (1990) created the Mathematics Workshop Program (MWP) then conducted a study with Latino and African American students at the University of California at Berkley pertaining to cooperative learning in mathematics. His findings on the achievement data of 646 students suggest that when given the opportunity to work cooperatively in groups to help each other find solutions, understand the principles and ideas on which problems are based on, and share strategies for finding solutions and determining proofs for problems, students achieved high grades in calculus.

Slavin and Karweit (1984) conducted cooperative learning research on 9th grade students enrolled in a general mathematics course. These students significantly outperformed who studied course material independently.
The findings from these studies support the benefits of utilizing cooperative learning and can be used to assist teachers with accomplishing a number of goals simultaneously including raising the achievement levels of all students, building positive relationships among students, as well as giving students experiences they need for healthy social, psychological, and cognitive development (Johnson and Johnson, 1994).

The majority of cooperative learning research has occurred in the lower grades. Although few studies have focused on the effectiveness of cooperative learning at the secondary level, research has led researchers to predict that students utilizing cooperative learning would obtain higher levels of achievement verses students who worked independently (Whicker, 2001). Therefore, the implementation of cooperative learning can possibly enhance student achievement in mathematics as they transition from primary through secondary schooling with the knowledge and skills needed to successfully complete advance mathematics courses preparing them for college and career. In spite of growth in the use of cooperative learning, there are concerns about the quality of methods used to implement cooperative learning. Notably, Slavin (1999) voiced his concern with teachers utilizing in-formal versions of the cooperative learning model which lack the use of group goals and individual accountability. It is imperative that teachers effectively use all elements to promote the implementation of cooperative learning.

**Teacher Knowledge and Understanding of Cooperative Learning.** In order to implement for cooperative learning effectively to enhance student achievement, teachers must have knowledge and understanding of this instructional strategy. The effectiveness of cooperative learning has been well documented in literature. Despite the amount of research conducted in support of cooperative learning, specifics of its application in
classrooms are limited. Few studies have examined how teachers’ knowledge and understanding of cooperative learning affects student achievement. Antil et al (1998) conducted research to examine what extent elementary teachers utilized cooperative learning. Survey results indicate 93% of teachers reported using cooperative learning but a few were using cooperative learning in a structured manner. Researchers concluded that teachers recognized the virtues of cooperative learning but failed to implement the practices according to the suggested model thereby, modifying the practices in a way that is not consistent with structures related to cooperative learning.

Borko et al. (1989) conducted a study to look at the differences in instructional practices between exemplar and non-expert teachers. Results suggest that exemplar teachers utilize more effective instructional methods and demonstrated more progressive pedagogical understanding than non-expert teachers.

Lopata et al. (2003) conducted a study to examine the degree to which exemplar teachers reported using cooperative learning versus the degree to which they would prefer to use this method as well as the relative use of each element of cooperative learning. Results indicated that teachers who were exposed to cooperative learning through professional development demonstrated a smaller gap between actual and preferred use of cooperative learning in classrooms than those teachers who were not exposed to cooperative learning through professional development.

These studies look at the use of cooperative learning by teachers, but did not discuss its actual application, including the five essential elements of cooperative learning.
**Teachers’ Perceptions of Cooperative Learning.** It is imperative to consider teachers’ perceptions of cooperative learning as an instructional method because of its impact on student learning. Gilles and Boyle (2008) conducted a study, which focused on teachers’ perceptions of cooperative learning. The following six categories emerged from the data examined by researchers: teamwork, group composition, structure, self-efficacy, social skills, and helping behaviors.

**Teamwork.** Teachers acknowledged the importance of building teams because of the support students provide to each other while working cooperatively.

**Group Composition.** Teachers understood the importance of group composition and variables that can affect student learning which include: randomly assigning students to groups, allowing friends to work together if they genuinely focused on learning, mixed gender groups, group size, and mixed-ability grouping. When creating groups, teachers must consider each of these variables to meet the diverse needs of students in order to move learning forward.

**Structure.** Structuring groups is an important aspect of cooperative learning. Teachers acknowledge that students must understand and accept the fact that all were to contribute and hold a significant role in all team members learning as well as accept responsibility for assigned task. If these responsibilities were met, all group members would share the benefits.

**Self-efficacy.** Teachers believe that encouraging students to have a sense of achievement is important but they must also understand that learning is valued and achievement go together because of effort and shown by personal improvement, verses to comparing self to others.
**Social Skills.** All teachers involved in the study acknowledged the importance of teaching students how to communicate effectively in order to work together cooperatively. Students may not have interpersonal skills. Therefore, it is necessary to teach this skill set in order to promote effective cooperation.

**Helping Behaviors.** Teachers acknowledge the benefits of students helping each other. When students work cooperatively, they have the opportunity to hold meaningful discussions by listening to what each other has to say, valuing the opinions and ideas of each other.

Gilles and Boyle (2008) believe that understanding teachers’ perceptions of cooperative learning as a pedagogical practice will help to determine its implementation in classrooms. Teachers’ perception data can be used to create professional development opportunities for teachers to thoroughly understand each cooperative learning principle and how to best utilize it in the classroom to enhance teaching and learning.

**Review of Methodological Issues**

Research related to teachers’ knowledge and perceptions of cooperative learning is somewhat limited. However, studies that do exist have largely been qualitative. Mulryan (1994) conducted a qualitative study to examine students’ and teachers’ perceptions of small-group instruction related to cooperative learning. Taped individual interviews were conducted and anecdotal notes were written as students worked cooperatively in groups. Students and teachers were interviewed at the beginning of the study and after the observational section of the study. Study results revealed collaboration and sharing were the most important aspects of cooperative learning.
Teacher’s stated that cooperative learning gave students the opportunity to learn from one another and share ideas in a non-threatening setting.

Jones and Caston (2004) conducted a qualitative study to examine how cooperative learning improved the academic achievement of elementary African-American males in grades 3 through 6. The researchers conducted individual face-to-face interviews over a 3-month period with 16 students. Each student was interview on 6 separate occasions for approximately 30 minutes each. All interview sessions were audio recorded. Study results reveal the majority of students preferred to learn by working in groups with minimal teacher interaction. The majority of the students also preferred completing class projects and other assigned task in groups.

Ding et al. (2007) conducted a study to examine ways in which teachers used cooperative learning in mathematic classrooms. A qualitative method was used to explore teacher intervention focusing specifically on the cognitive processes of students. The researchers utilized videotaping as the primary source for data collection in which 6 teachers used cooperative learning to teach mathematics focused on Connected Mathematics text: Bits and Pieces I. Results revealed that the differences in teacher intervention value scores disclosed that not all teachers were good at promoting students’ independent thinking.

Gilles and Boyle (2008) conducted a qualitative study to examine teachers’ perceptions of cooperative learning. Seven teachers participated in the study in which they agreed to be videotaped twice while using cooperative learning in their classroom. Each teacher was video-taped for 45 minutes during each session. Semi structured interviews were conducted with teachers at the end of the school year in order to gauge
their perceptions of utilizing cooperative learning in the classroom. Study results indicate that teachers acknowledge when students are provided the opportunity to work cooperatively, valuable learning takes place. Meaningful discussions take place and students learn to value the opinions and ideas one another.

Although research related to teachers’ knowledge and perceptions of cooperative learning have largely been qualitative, there are disadvantages to using this research method especially when they involve conducting interviews or observations. Lodico (2010) identified five disadvantages to using qualitative research:

1. Most interviewers meet face to face with participants, so when confidentiality is guaranteed, participants may be hesitant to reveal sensitive information.
2. Interviews require a large amount of time to administer.
3. Interviews typically involve small samples.
4. Conducting observations require a large amount of time to collect data
5. Summarizing and examining data is time consuming and complex.

Quantitative research related to teachers’ knowledge and perceptions of cooperative learning is somewhat limited. Lopata et al. (2003) conducted a study in which a survey was utilized (5-point, Likert-type scale) to examine the degree to which exemplar instructors reported using cooperative learning verses the degree to which they preferred to use this instructional method. Participants included exemplar instructors from suburban elementary, and middle schools in New York State. Survey results revealed that exemplar instructors’ actual utilization of cooperative learning fell considerably beneath the level at which they would desire to be implementing cooperative learning.
Dr. Randall (2003) completed her dissertation on the differences in knowledge and perceptions of cooperative learning between urban elementary teachers assigned to neighborhood schools and schools of choice. A non-experimental, casual comparative design was utilized for the study. The primary data collection tool used was a survey. The results revealed that no statistically significant differences in the use of cooperative learning, knowledge and attitudes between teachers in schools of choice and neighborhood schools.

A quantitative study was conducted to examine teachers’ knowledge and perceptions of cooperative learning. There are several advantages to conducting a quantitative study, specifically if it involves the utilization of surveys. First, surveys will be administered anonymously to large sums of individuals in a short amount of time. Second, since participant’s identity is anonymous, responses to statements are typically true. Third, responses are brief and easy to summarize (Lodico, 2010).

Studies conducted by Lopata et al. (2003) and Dr. Randall (2003) align with the research design chosen for this study because they seek to explain differences in order to draw conclusions. This type of design is appropriate because it does not necessitate direct manipulation of the independent variable and no treatment is provided to the participants. Also, this research design does not run into the same types of threats to internal and external validity as experimental designs.

Synthesis of Research Findings

In this section, research findings are synthesized in order to present a holistic understanding of this cooperative learning study. Synthesis of the research findings will
allow readers to understand the review of literature and conclusions related to cooperative learning.

Various studies have been conducted to examine teachers’ perceptions of cooperative learning. The majority of research methods used to conduct these studies have been qualitative. Mulryan (1994) conducted a qualitative study where teacher interviews were taped. Results from this study indicate teacher believe cooperative learning has a positive impact on student achievement. Jones and Caston (2004) conducted a qualitative study utilizing face-to-face interviews with students as the data collection tool. Results revealed students preferred to learn by working collaboratively with peers. Ding et. al (2007) also conducted a qualitative study where teachers were observed in the classroom. Study results show not all teachers were good at promoting students to think independently. Gilles and Boyle (2008) conducted a qualitative cooperative learning study in which teachers were video-taped. Study results suggest teachers acknowledge valuable learning takes place when cooperative learning is the instructional method utilized in classrooms.

In order to conduct the stated qualitative studies, researchers selected observations, and face-to-face interviews with participants that are video-taped or audio recorded as their primary sources for collecting data. Creswell (2009) states that observing participants gives the researcher a first-hand experience with participants and unusual aspects can be noticed during the observation. Nevertheless, observations can be somewhat limiting because the researcher may be seen as invasive and may not have good attending and observing skills. Creswell (2008) believes data collecting from conducting interviews can be suitable when participants cannot be directly observed. An
additional advantage of conducting interviews is the researcher controls the line of questioning presented to participants. On the other hand, according to Creswell (2009), disadvantages associated with conducting interviews include bias responses from participants because of the presence of the researcher and information that is indirect is filtered through the views of interviewees. Audio-visual materials may be an unobtrusive way of collecting, allowing participants to share their reality related to cooperative learning. Nonetheless, data collected from audio-visual materials may be difficult to interpret and the presence of an observer may be disruptive and affect participants’ responses (Creswell, 2008).

A non-experimental, causal-comparative research design was used for this cooperative learning study. A survey was the data collect tool used for this study. According to Leedy (2005), one major advantage to utilizing a survey to collect data is that participants can respond to questions with assurance that their responses will be anonymous, and so they may be more truthful than they would be in a personal interview. However, specifying all questions in advance eliminates the opportunity to pose additional questions that could shed further light on this cooperative learning study.

Critique of Previous Research. Researchers have conducted extensive cooperative learning studies that have focused on a plethora of topics, which continues to affect how teachers instruct and how students of varying ages and ability levels learn. Various quantitative and qualitative methods have been used to conducted studies on cooperative learning and its impact on student achievement in mathematics. Quasi-experimental research, which is a quantitative method of research were primarily used to compare students who studied in cooperative learning groups (experimental group) to
students who studied independently (control group) to examine student achievement results. According to Creswell (2009), experimental research strives to determine if a specific treatment influences an outcome.

Researchers conducted cooperative learning research that focused specifically on student achievement in mathematics by utilizing the quasi-experimental design. Madden and Slavin (1983) studied third and fourth grade students enrolled in a math course. Duren and Cherrington (1992) conducted research on 7th and 8th grade pre-algebra students, Slavin and Karweit (1984) conducted research on 9th grade students enrolled in a general mathematics course, Thomas and Sherman (1986) utilized the quasi-experimental research to study 9th and 10th grade students who studied general mathematics. Researchers who use quasi-experiments do not have control over assignment of individual students to conditions but can randomly assign whole groups of students to different treatments (Lodico, 2010). These researchers also typically pretest groups prior to the treatment to ensure they do not differ on the dependent variable. There are several threats to validity when using quasi-experimental research. Internal threats include experimental procedures, treatments, as well as participant’s history, maturation, regression, selection and mortality that threaten the researcher’s ability to draw correct inferences from the data (Creswell, 2009). Potential external threats must be identified to minimize any threats.

Gilles and Boyle (2008) conducted a qualitative study on teachers’ perceptions of cooperative learning. Teachers were taped using cooperative learning in their classroom during two 45-minute sessions. Semi-structured interviews were also conducted with teachers at the end of the school year to gauge their perceptions of employing cooperative
learning in the classroom. Ding et al. (2007) conducted a qualitative study to examine ways in which teachers used cooperative learning in mathematic classrooms videotaping was the primary source for data collection. Jones and Caston (2004) also conducted a qualitative study to examine how cooperative learning improved the academic achievement of elementary African-American males in grades 3 through 6. Each student was interview on 6 separate occasions for approximately 30 minutes each. All interview sessions were audio recorded. Although videotaping and audio recording has its advantages, there are some disadvantages associated with its usage. For example, the researcher may influence the collected data by imposing personal meaning of the phenomenon on participants. In addition, teachers as well as students may not display authentic behavior when they are aware that taping is occurring, which makes the validity of the research tool questionable. There are also some disadvantages to conducting interviews. Interviews provide only information “filtered” through the views of the interviewers. Also, the presence of the researcher can affect how the interviewee responds to questions. Additionally, responses from interviewee may not be articulate, perceptive, or clear (Creswell, 2008).

A survey was utilized to examine teachers’ knowledge and perceptions of cooperative learning. Participants completed an online survey. The confidentiality of the participants’ responses were preserved and helps to ensure that no one except for the researcher has access to survey information. In addition, participants are more likely to be genuine with their responses since their identity is unknown and the researcher is not present to influence participants’ behavior or to imposing personal meaning of the
phenomenon on participants, which increases the reliability and validity of the research tool.

Chapter 2 Summary

Cooperative learning is a research based instructional strategy that has proven to develop students' development of effective interpersonal and communication skills, increase tolerance and acceptance of diversity, and improve academic achievement. This instructional strategy came to existence in the early 1970s and continues to be utilized in classrooms across the nation and world because of its ability to impact teaching and learning.

A key element of cooperative learning is its focus on collaboration to promote the achievement of students as individuals and as a group. The successful academic achievement of the entire group is dependent on each member’s willingness to become teachers and learners. This willingness is at the heart of cooperative learning (Vaughn, 2002).

Positive interdependence, face-to-face interaction, individual accountability, social skills development and group processing are the five distinctive characteristics of cooperative learning that contribute to the overall development of students. Lin (2006) states: “humans learn best when they collaborate with others and actively process personally meaningful information” (p.35).

Teachers and students play important roles for the successful implementation of cooperative learning. Teachers must hold a constructivist view of learning, which includes believing that all students are capable of learning, and provide opportunities for the development of critical thinking skills, incorporate ways for students to collaborate
with peers in order to solve problems. Students must be accountable for their particular role in the group because each role contributes to the success of the group. These roles promote positive interdependence and individual accountability which will help students to become responsible contributing members of society outside of the classroom.

A plethora of cooperative learning structures exists and contributes to student development and achievement. These structures aid teachers with creating learning environments that meet the diverse needs of students regardless of achievement level, race or creed. Teachers must strategically place students into heterogeneous groups in order for them to receive all the benefits of cooperative learning. Authors Nancy Schniedewind and Davidson (2000), states: “effective heterogeneous cooperative groups allow students to learn to value diversity and the intelligences and perspective of others” (p. 27).

Cooperative learning has proven to be an effective instructional method and can contribute to the growth and development of students by preparing and tooling them with skills needed to become self-sufficient contributing members of school and society. Schools who are searching for proven methods of instruction should consider utilizing cooperative learning to improve student achievement by meeting the diverse needs of all learners.

Researchers have conducted countless studies on various aspects of cooperative learning which has influenced how teachers teach and how students learn. Results from various studies confirm the use of cooperative learning strategies result in improvements in student achievement and in other areas of student development.
CHAPTER 3. METHODOLOGY

Introduction to Chapter 3

It was not known how and to what degree the differences between urban primary and urban secondary teachers’ knowledge and perceptions of cooperative learning influence how it is utilized in mathematics classrooms. The differences between primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning can adversely impact levels of implementation in classrooms and student achievement in mathematics. Cooperative learning has been identified as a research based instructional strategy that is considered to have a high probability of enhancing student achievement for all students in all subject areas and at all grade levels (Marzano, 2001). Developers of cooperative learning include Robert Slavin (1988), David and Robert Johnson (1987), as well as Spencer Kagan (1989). These individuals have unique methods for implementing cooperative learning, and have conducted extensive research to examine its impact on student achievement. However, the existing body of knowledge has not determined if possible differences between urban primary and urban secondary mathematics teachers’ knowledge and perceptions of cooperative learning influence levels of implementation in classrooms as well as teaching and learning.

Purpose of the Study

Few if any studies have focused on identifying differences that may exist between urban primary and secondary mathematics teachers’ knowledge and perceptions of
cooperative learning. The purpose of this study was to help pinpoint possible gaps in urban teachers’ knowledge and understanding of cooperative learning as well as identify perceptions held by teachers in order to create opportunities for them to recognize the benefits of utilizing cooperative learning as an instructional strategy to enhance student learning in mathematics. A survey was used to identify the difference in urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. By analyzing what teachers think and know about cooperative learning, college courses for pre-service teachers as well as workshops and in-service training sessions can be planned for practicing teachers to enhance teaching and learning in mathematics.

Researchers have concluded that the cooperative learning model ranked first in teaching approaches that promote higher order thinking, problem solving, and achievement (Lin, 2006).

**Research Questions and Hypotheses**

The following research question led to the overall research and data collection for this cooperative learning study: What differences exist between urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning?

The following secondary research questions and related hypothesis were tested in this study:

R1. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

Null Hypothesis: There will be no differences in the knowledge of the principles of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers?
R2. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

Null Hypothesis: There will be no differences in knowledge of the role that teachers play in the utilization of cooperative learning exist between urban primary mathematics teachers and urban secondary mathematics teachers?

R3. What differences exist between urban primary and mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

Null Hypothesis: There will be no differences in perceptions regarding use cooperative learning as an instructional strategy in classrooms with students between urban primary mathematics teachers and urban secondary mathematics teachers?

R4. What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

Null Hypothesis: There will be no differences in regards to the perceptions of the impact cooperative learning has on student achievement in classrooms between urban primary mathematics teachers and urban secondary mathematics teachers?

Research Design

A non-experimental, causal-comparative research design was used to examine the differences between urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning, and to analyze how these differences impact teaching and learning in classrooms. Conducting causal-comparative research seeks to explain
differences between groups by examining the differences in the experiences of group members (Lodico, 2010). Additionally, participants in causal-comparative research already belong to groups based on their past experiences, and the researcher selects participants from these preexisting groups. The rationale for using this methodology is that hypotheses or theories can be tested to examine the relationship between two variables. In this study, the variables are urban primary teachers and urban secondary teachers’ knowledge and perceptions of cooperative learning. Creswell (2009) states variables are related to answer a research question. This type of design is appropriated for this study because it involves no direct manipulation of the independent variable and no treatment is provided to participants. Additionally, causal-comparative research does not run into the same types of threats to internal and external validity as experimental designs. However, the researcher lacks control over inessential variables that could impact the responses of participants.

**Target Population, Sampling Method, and Related Procedures**

**Target Population**

The target population section for this study includes participant information including sampling methods used, sample size, setting of the study, and recruitment methods used to select participants.

The population for this study were primary and secondary urban mathematics teachers employed in a central Ohio school district. Random sampling was used for this study.

**Sampling Method**
Urban primary and secondary mathematics teachers were chosen to participate in this study through random sampling. Random sampling is a technique or tool that produces essentially a mini-version of the initial population (Lodico, 2010). Random sampling is conducted in a manner that provides every person in the population with an equal and independent chance of being selected. An electronic spreadsheet supplied by Microsoft Works was utilized to select participants because it contains a built in function that will automatically generate random numbers each time the application is recalculated.

Sample Size

The urban district chosen for this study employs 380 certified (K-12) mathematics teachers (according to district human resources representative). One hundred-ninety mathematics teachers were selected for this study because it is half of the total population of mathematics teachers. Distribution was limited to the number of urban primary and secondary mathematics teachers employed in the surveyed district.

Setting

This city is the 15th largest city in the United States and home to more than 780,000 individuals. According to the US Census Bureau, Caucasians account for 61.5% of the city’s population. Other ethnicities include African-Americans (28%), Hispanic or Latinos (5.6%), Asians (4.1 %), and Native Americans (0.1%).

Major employers include Nationwide Insurance, Ohio Health, JP Morgan Chase, The State of Ohio and The Ohio State University, which is the largest employer. Although various employment sectors provide opportunities for advancement, 22.4% of the population lives below the poverty level according to the US Census Bureau. In order
to provide opportunities for upward mobility and decrease the level of poverty in the city, a plethora of educational institutions are accessible. Educational institutions available to residents include two-year community colleges, four-year institutions as well as technical institutions.

The district for this study is the largest school district in Ohio and is responsible for providing a quality education that meets the diverse needs of its more than 53,000 students in 109 schools. African-Americans comprise of 56.05% of the district’s student population. Other ethnic groups include Caucasians (26%), Hispanic (8.90%), Multi-Racial (5.50%), Asian (3.03%) and American Indian/Native Alaskan (0.2%). The district’s student population is 79% economically disadvantaged.

According to the Ohio Department of Education (2013), 3,770 teachers are employed by the school district and all have obtained a Bachelor’s Degree and 79% of them hold a Master’s Degree. Nearly 99.4% of core academic subjects are taught by properly certified high quality educators. The district also has 119 National Board Certified teachers.

**Recruitment**

A study on urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning was conducted. Permission to conduct the study was granted by the school district’s Office of Performance and Strategic Initiatives to conduct the study and was granted access to the Infinite Campus database, which listed all district employees, work assignments, and locations. In order to recruit participants, building principals were contacted to determine a feasible time to meet briefly with mathematics teachers to discuss the purpose of the study, address teacher concerns and obtain consent
to participate in the study. During this meeting, participant email addresses were also obtained so the survey can be completed electronically. Participants were then contacted via email to invite them to participate in the study, give website to complete the study and specify start and closing dates for completion of the survey. Emails were sent bi-weekly to consistently encourage participants to complete the survey. The names of teachers who chose to not to be involved in the study were removed from the list of possible participants. No incentives were offered to participants.

In order to draw conclusions from survey data, it was predetermined that thirty-three Percent (63) of surveys sent to participants had to be returned. A total of sixty-four surveys were returned.

**Instrumentation**

The researcher used an instrument developed by Dr. Randall (2003) who used the survey for her dissertation on the differences in knowledge and perceptions in cooperative education completed via Wayne State University, Detroit, Michigan. Dr. Randall’s survey was utilized since the study takes place in an urban educational setting. Few if any studies have focused specifically on teachers’ perceptions of cooperative learning who teach in urban settings. Dr. Randall’s study aligns with this cooperative learning study because it also focused on teachers’ perceptions of cooperative learning in an urban educational setting. The survey entitled Cooperative Learning Survey was used to measure the following:

1. Teacher perceptions toward cooperative learning
2. Teacher perceptions of student learning outcomes
3. Teacher use of cooperative learning
4. Teacher knowledge of cooperative learning principles
5. Teacher’s role in cooperative learning
6. Teacher characteristics (demographics)

The instrument comprised of three sections. The first section included private information as well as professional abilities. The second section focused specifically on the extent in which cooperative learning is utilized in classrooms, including the amount of time and the number of days per week students worked cooperatively in groups. The third section encompasses statements to gather information related specifically to teachers’ perceptions of cooperative learning, cooperative learning’s impact on student achievement, and teachers’ knowledge of cooperative learning. Items in this section will be measured using a 5-point Likert scale.

Data Collection

Prior to collecting data, IRB approval was obtained to conduct the study and was granted permission to conduct the study. A letter of introduction was then provided to district principals outlining the intent of the study, targeted participants and data collecting procedures. A meeting took place with mathematics teachers to discuss the purpose of the study, addressed concerns, received consent from participants as well as obtained email addresses so the survey could be completed electronically. In this approach, participants log on to a computer, used the internet or website to locate then download the questionnaire, completes the questionnaire and sends the completed questionnaire back to the researcher (Creswell, 2008). Participants received an email message that described in detail the purpose of the study, date to access the survey, deadline to complete the survey, and web address to complete the survey. All
participants preferred to complete the survey electronically. Therefore, providing paper surveys was unwarranted. Survey Monkey was utilized so all data was sent to a specific place for collection and analysis. According to Creswell (2008), electronic data collection provides an easy and quick manner of collecting data.

In order to format the data for analysis, the researcher utilized an electronic spreadsheet. According to Leedy et al. (2005), the beauty of electronic spreadsheets is that once you enter data into them, the software can quickly and easily make desired calculations. The data was then stored on a computer, so data could be retrieved by using a related keyword. Leedy et al. (2005) stated data can be sorted quickly and in multiple ways. Computerizing data offers a broad range of techniques for data management. The researcher utilized a flash drive as a backup measure to preserve data which was stored in a safe location.

**Operationalization of Variables**

The constructs that were measured for this study were urban teachers’ knowledge of cooperative learning and urban teachers’ perceptions of cooperative learning. Constructs are hypothetical concepts which are typically developed from a theoretical framework and are presumed to be real characteristics that cannot be seen (ex: intelligence, motivation, self-esteem) but can influence educational outcomes (Lodico, 2010). These constructs (knowledge and perceptions) are also known as variables when they are measured in educational research. Variables are defined as attributes, qualities, and characteristics of persons, groups, settings or institutions, such as gender, social skills, socioeconomic status, exclusiveness or achievement (Lodico, 2010). Urban teachers’ knowledge of cooperative learning and urban teachers’ perceptions of
cooperative learning are the dependent variables for this study. A dependent variable is often some form of human behavior and is influenced by, and to some extent depends on, the independent variable (Leedy, 2005). Knowledge is defined as the understanding gained by actual experience (Merriam Webster, 2004) Perception is defined as an act or result of perceiving (Merriam Webster, 2004). Cooperative learning is the independent variable in this study. Independent variable is an attribute characteristic that influences or affects an outcome or dependent variable (Creswell, 2008). Cooperative learning: is a teaching strategy in which small groups or teams, comprised of students of different levels of ability, work together to accomplish shared goals and to maximize their own and each other’s learning (Sawyer, 2005).

Data was collected pertaining to urban teachers’ knowledge and teachers’ perceptions of cooperative learning by utilizing a survey that was completed electronically via Survey Monkey. The data was then entered into a computer file for analysis using SPSS Windows software. In order to measure the impact the dependent variables have on the independent variable, a survey was used. Table 4-1 displays the six subscales and item numbers included in the survey in order to accurately measure teachers’ knowledge and perceptions of cooperative learning.

Four guiding questions were developed that aligned with items presented in the survey to measure the differences in knowledge and perceptions of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers. The guiding questions related to the dependent variables (teachers’ knowledge and perceptions), the independent variable (cooperative), and methods used to measure each are as follow:

R1. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

One-way Multivariate analysis of variance was used to determine if differences exist between urban primary mathematics teachers and urban secondary mathematics teachers on subscales, which measured their knowledge of principles of cooperative learning. If there was a substantial difference statistically on the
omnibus T-test, the univariate T-test was studied to determine the area of knowledge on cooperative learning principles contributed to the substantial difference. The mean scores were compared in order to determine which teacher group’s scores are substantially dissimilar on the subscale measuring cooperative learning principles.

R2. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

A T-test for two independent samples procedures was used to determine if differences exist between urban primary mathematics teachers and urban secondary mathematics teachers on subscales measuring knowledge of the role that teachers play in the utilization of cooperative learning.

R3. What differences exist between urban primary and mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

A T-test for two independent samples procedures was used to determine if differences exist between urban primary mathematics teachers and urban secondary mathematics teachers on subscales measuring perceptions regarding using cooperative learning as an instructional strategy in classrooms with students.

R4. What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?
A T-test for two independent samples procedures was used to determine if differences exist between urban primary mathematics teachers and urban secondary mathematics teachers on subscales measuring perceptions pertaining to the impact cooperative learning has on student achievement.

**Data Analysis Procedures**

Survey data was entered into a computer file for analysis using SPSS Windows, version 17.0 (SPSS, 2008). The data analysis was divided into three sections. The first section focused on demographic data about the participants. The data was analyzed to create cross tabulations and measures of central tendency using SPSS software. How teachers utilized cooperative learning in their classrooms is presented independently. In this section, a 5.0 Likert scale was used to sort and analyze the data. The data collected in the final section of the survey was analyzed using one-way multivariate analysis of variance, and t-tests for two independent samples using SPSS software to address the posed research questions for the study. Multivariate analysis is a method of testing for differences between the dependent variable due to the independent variables (Leedy et al., 2005). Four research questions will be utilized for this study. All questions were addressed using inferential statistical analyses with all decisions on the statistical significance of the findings made using an alpha level of .05.

**Limitations of the Research Design**

A causal-comparative research design was used for this study which included using a survey to gather data. This research design presents the following limitations:

1. Results are suggestive of possible causal relationships but clear cause-and-effect statements should be avoided.
2. Participant responses will reflect their reading and writing skills and, perhaps their misinterpretation of one or more questions.

3. Researcher does not have control over the independent variables, making statements of causality more difficult.

4. There is typically a low survey return rate because the majority of people fail to complete the survey (Lodico, 2010).

**Internal Validity**

A study is considered internally valid when the results or outcome of the study can be attributed to the experimental treatment and not an extraneous variable (Lodico, 2010). In order to maintain internal validity, a previously approved instrument was used for the study, and developed guiding questions that pertain specifically to teachers’ knowledge and perceptions of cooperative learning.

**External Validity**

External validity is the degree to which the results are generalized beyond the sample used for the study (Lodico, 2010). The sample for this study are urban primary and secondary mathematics teachers, which the results can be generalized. In order to maintain external validity in the study, participants who were employed by the chosen school district were selected for this study. Additionally, selected participants were currently teaching mathematics in primary or secondary classrooms.

**Expected Findings**

Few studies are available related to urban teacher knowledge of cooperative learning principles. Authors Sparapani et al. (1997) stated little is known about how practicing teachers have gained their knowledge and understanding of cooperative
learning or how it is utilized in classrooms. Studies specifically related to the differences between primary and secondary urban mathematic teachers’ knowledge and perceptions of cooperative learning have not been found. Although research has not been found, the results from this study will validate that there are differences between urban primary mathematics teachers and urban secondary mathematics teachers’ knowledge, understanding and perceptions of cooperative learning. The reason for these differences is in how the knowledge of cooperative learning was obtained. According to the study conducted by Sparapani et al. (1997), teachers gained their knowledge of cooperative learning practices through a variety of methods, which included course work, workshops colleagues, and extensive reading. The method in which teachers gained their knowledge of cooperative learning practices may influence their knowledge, understanding and implementation of cooperative learning. The data analysis pertaining to the research questions would verify there are differences that exist between urban primary mathematics and secondary urban mathematics teachers’ knowledge and perceptions of cooperative learning. The actual differences would identify when the data analysis was completed.

**Ethical Issues**

In order to ensure appropriate steps were taken to ethically protect the rights of participants, a proposal was submitted to the Institutional Review Board (IRB) prior to conducting the study. The following ethical concerns were addressed: First, the nature of the proposed study was discussed. Second, the researcher addressed how the identities of study participants would be protected. In order to protect participant identities, the researcher assigned a number to each participant instead of using formal names.
Participants who were uncomfortable completing the survey online were given the survey in paper form. Next, to protect data confidentiality during the collection process, an electronic spread sheet was used to format the data. The data was stored on a computer so information could be retrieved by using a specific password. A flash drive was used as a back-up measure to preserve data which was stored in a secure location. All data will be destroyed seven years after publication date. The proposal was approved by the IRB committee after all ethical concerns were addressed. Finally, findings from survey were published in the researcher’s dissertation. Also, findings were submitted in a written report to the school district in which the study took place.

**Researcher's Position Statement**

The academic, financial, or other special interests will not compromise the objectivity of the study, including its design, how the study is conducted, and how findings are reported.

**Conflict of Interest Assessment.**

The researcher does not have personal interests or financial interests related to the study. Incentives were not offered to participants for completing the survey.

**Position Statement.**

The researcher does not have personal relationships with participants in the study. Therefore, developing a plan to eliminate or manage potential conflict of interest is unwarranted.

**Ethical Issues in the Study**

The IRB approval for this study and the processes and procedures in place minimizes potential ethical issues. In order to maintain the integrity and objectivity of
the study, the research adhered to all practices including protecting participants, collecting and safeguarding the data, as well as ensuring conflict of interest is non-existing.

Chapter 3 Summary

The purpose of this study was to identify possible gaps in urban primary and urban secondary mathematics teachers’ knowledge, understanding, and perceptions of cooperative learning. The differences that may exist between urban primary and secondary mathematics teachers’ can adversely impact levels of implementation in classrooms and student achievement in mathematics. Conducting a study on urban primary and secondary teachers’ knowledge and perceptions of cooperative learning will yield valuable information that can be used in the field of education to create college courses for pre-service teachers as well as develop workshops and in-service training sessions to enhance teaching and learning in mathematics. In order to conduct a study that would provide meaningful data that can impact the field of education as well as teaching and learning in mathematics, the researcher chose to use a non-experimental, causal-comparative research design. Causal-comparative research seeks to explain differences between groups by examining the differences in the experiences of group members (Lodico, 2010). This type of design is appropriated for this study because it involves no direct manipulation of the independent variable and no treatment is provided to participants. Additionally, causal-comparative research does not run into the same types of threats to internal and external validity as experimental designs. Additionally, participants in causal-comparative research already belong to groups based on their past experiences, and the researcher selects participants from these preexisting groups.
Teaching mathematics to students in an urban school district is the commonality that links teachers for this study.

Purposeful sampling was used to recruit urban primary and secondary teachers for this study. The researcher used an electronic spreadsheet to randomly select participants. The researcher selected 190 mathematics teachers which was the sample size for the study. The names of teachers who declined to be involved in the study were removed from the researcher’s list of potential participants.

After obtaining IRB approval to conduct the study and permission was granted from the school district, building principals were contacted to schedule time to meet with mathematics teachers to discuss the purpose of the study, address teacher concerns, obtain permission from participants who agreed to participate in study, as well as obtain email addresses so the survey could be completed electronically via Survey Monkey. According to Creswell (2008), electronic data collection provides an easy and quick manner of collecting data. The survey included three sections to categorize the data. Sections include teacher demographics, utilization of cooperative learning, and teacher knowledge and perceptions.

SPSS Windows software was used to enter collected data for analysis. According to Leedy et al. (2005), the beauty of electronic spreadsheets is that once you enter data into them, the software can quickly and easily make desired calculations. Data was then stored on a computer and could be retrieved via password. The researcher used a flash drive to back-up data.

Collected data was divided into the following three sections to gain knowledge pertaining to the study and for effective analysis of the study:
1. Participant demographics
2. The utilization of cooperative learning in classrooms
3. Urban teachers’ knowledge and perceptions of cooperative learning.

Research questions developed by the researcher align with the research problem and items presented in the survey. The following research questions and related hypotheses are also used to analyze and measure the dependent variables (teachers’ knowledge and perceptions) and the independent variable (cooperative) for this study:

1. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

2. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

3. What differences exist between urban primary and mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

4. What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

In order to analyze and measure urban primary and secondary teachers’ knowledge and perceptions of cooperative learning, the following methods were utilized: (A) cross tabulations and measures of central tendency (demographic data), (B) One-way Multivariate analysis of variance (knowledge of cooperative learning principles), and (C) t-test for two independent samples procedures (perceptions of cooperative learning).
Ethical issues must be identified and resolved to ensure the study is not compromised due to the lack of participant protection, data collection methods, safeguarding of data, and protection against personal interests.

It is imperative that all processes procedures for this study are followed to ensure data results from this study can influence the field of education by equipping teachers with knowledge and skills that can enhance the manner in which instruction is employed to improve student achievement in mathematics across the nation.
CHAPTER 4. DATA ANALYSIS AND RESULTS

Introduction

The focus of chapter four is to present the findings of the data analyses that were utilized to address the research questions related to urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. A non-experimental, causal-comparative research design was used for this study. This research design was used because hypotheses or theories can be tested to examine the relationship between two variables (Creswell, 2009). In this study, the variables are urban primary teachers and urban secondary teachers’ knowledge and perceptions of cooperative learning.

The chapter is divided into three sections to accurately measure teachers’ knowledge and perceptions of cooperative learning. The first section consists of demographic characteristics that compare urban primary teachers and urban secondary teachers using descriptive statistics. The second section consists of a summary of the results of the study. The third section addresses the research questions using inferential statistical analyses. The following research questions and related hypotheses were generated to guide this cooperative learning study:

R1. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?
Null Hypothesis: There will be no differences in the knowledge of the principles of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers?

R2. What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

Null Hypothesis: There will be no differences in knowledge of the role that teachers play in the utilization of cooperative learning exist between urban primary mathematics teachers and urban secondary mathematics teachers?

R3. What differences exist between urban primary and mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

Null Hypothesis: There will be no differences in perceptions regarding use cooperative learning as an instructional strategy in classrooms with students between urban primary mathematics teachers and urban secondary mathematics teachers?

R4. What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

Null Hypothesis: There will be no differences in regards to the perceptions of the impact cooperative learning has on student achievement in classrooms between urban primary mathematics teachers and urban secondary mathematics teachers?

The purpose of is study was to pinpoint possible gaps in urban primary and secondary teachers’ knowledge and perceptions of cooperative learning to create
opportunities for them to recognize the benefits of utilizing cooperative learning as an instructional strategy to improve student achievement in mathematics.

**Description of the Sample**

The school district in which the data was collected was an urban public school district in Central Ohio. The school district is responsible for educating more than 53,000 students in 109 schools. African-Americans comprise of 56.05% of the district’s student population. Other ethnic groups include Caucasians (26%), Hispanic (8.90%), Multi-Racial (5.50%), Asian (3.03%), and American Indian/Native Alaskan (0.2%). The district’s student population is 79% economically disadvantaged (Ohio Department of Education, 2013).

A total of 190 surveys were sent to urban primary and secondary teachers. Of this number, 64 surveys were completed for a response rate of 33.6%. Ninety-three (49%) of the surveys were sent to urban primary teachers and ninety-seven (51%) were sent to urban secondary teachers. Urban teachers completed a total of 64 surveys. Of the surveys completed, 24 (38%) were returned from urban primary teachers and 40 (62%) were returned from urban secondary teachers. Characteristics of the sample were built-in into the survey to include gender, age, marital status, and ethnicity. Additionally, significant sample data related to education level and teaching experience is also included in the survey.

**Gender of Participants**

Table 4.1 represents the gender of participants. Forty-nine (76.6%) females participated in the survey. The number of males who participated in the study was fifteen (23.40%), which was significantly lower than the females who participated in the study.

Age of Participants

Table 4.2 represents the age of participants. The largest group of teachers was in the 36 to 45 age range with nineteen (29.7%) participants. There were five (7.8%) participants who were 25 and under age range. There were sixteen (25%) participants in the 26 to 35 age range. Fifteen (23.4%) individuals made up the 46 to 55 age group. There were nine (14.1%) participate in the 56 and over age range.

Educational Level

Table 4.5 represents the educational levels of participants. Teachers were asked to indicate their level of education. Fifteen (23.4%) participants held bachelor degrees. The largest group of participants held master’s degrees, which were forty-four (68.8%) participants. One participant (1.6%) reported obtaining a doctoral degree and one (1.6%) participant reported holding an educational specialist degree. Three (4.7%) participants chose other but did not specify an educational level.

Certification

Table 4.6 represents the certification of participants. Fourteen (21.9%) secondary teachers reported they held a high school continuing certification. Seventeen (26.6%) teachers indicated they currently hold a high school renewal of provisional certificate. Seven (10.9%) individuals make up the group of participants with elementary continuing certifications. One (1.6%) teacher held an elementary permanent certificate as well as one (1.6%) individual who held an elementary renewal of provisional certificate. Three
(4.7%) teachers reported they hold middle school continuing certificates, four (6.3%) who hold permanent middle school certificates and one (1.6%) who holds a middle school provisional certificate. Four (6.3%) individuals reported other. These teachers did not provide additional explanation for their selection of other as their certification type.

115
Summary of the Results

The methodology used for this research on cooperative learning was a non-experimental, causal-comparative research design. Conducting causal-comparative research seeks to explain differences between groups by examining the differences in the experiences of group members (Lodico, 2010). In addition, participants in causal-comparative research already belong to groups based on their past experiences; the rationale for using this methodology is that hypotheses or theories can be tested to examine the relationship between two variables. The variables for this study are primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning.

The following four research questions guided the study. All questions are presented below with results from the data analysis.

Research Question 1

What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

A multivariate analysis of variance (MANOVA) was used to determine if differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning.

Five subscales were included in the survey along with specific statements in which teachers responded to according to a Likert scale. The results of teacher responses were used to measure their knowledge of the following principles: positive interdependence, group processing, face-to-face interaction, individual accountability, social and small group skills. Results of this analysis did not point to substantial differences in urban primary and secondary mathematics teachers’ overall knowledge of
cooperative learning principles. Therefore, the null hypothesis for question one is retained.

**Research Question 2**

What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

Urban primary and secondary mathematics teachers’ perceptions of the role they play in the implementation of cooperative learning were compared by utilizing a two-sample t-test. Data analysis indicated the majority of urban primary (33%) and secondary (47%) mathematics teachers agreed that students would always know how they would be evaluated. Two (4%) primary teachers and five (11%) secondary teachers indicated that they disagreed with the statement. Two (5%) secondary teachers indicated they were unsure about the statement.

The majority of primary (27%) teachers and secondary (53%) teachers replied that they did not agree that there is one best method of assigning students to groups. Three (7%) primary teachers and four (9%) secondary teachers strongly disagreed with the statement. Two (4%) primary teachers agreed that there is one best method of assigning students to groups. No secondary teachers agreed with this statement.

Most primary (30%) and secondary (43%) teachers agreed that cooperative learning might involve intergroup cooperation. One primary (2%) teacher and four (9%) secondary teachers disagreed with the statement. Two (5%) primary and one (2%) secondary teacher strongly believed cooperative learning might involve intergroup
cooperation. One (2%) primary and three (7%) secondary teachers were unsure about the
statement.

Twenty-seven percent of urban primary and 32% of secondary teachers disagreed
with the statement: “the physical arrangements of cooperative learning groups were
important”. Two (5%) primary and seven (16%) agree with the statement. Two (5%)
primary and three (7%) secondary teachers strongly disagreed with the statement. Three
(7%) secondary teachers were unsure.

Many primary (27%) and secondary (47%) mathematics teachers agree that
academic objectives for groups should be specified before the beginning of the lesson.
Eight (18%) teachers of whom four (9%) were primary and four (9%) were secondary
teachers strongly agreed with the statement. One (2%) secondary teacher disagreed with
the statement. In addition, one (2%) primary and two (4%) secondary teachers indicated
they were unsure.

Sixteen (36%) secondary teachers believed it is important to utilize the criteria-
 referenced system compared to nine (20%) primary teachers. Nine teachers (one (2%)
primary and eight (18%) secondary) indicated they did not agree with the statement. Six
(13%) primary and 3 (7%) secondary teachers indicated they were unsure.

The two sample independent t-test results did not reveal significant differences
between primary and secondary teachers’ overall perceptions of role that teachers play in
the utilization of cooperative learning. Therefore, the null hypothesis for question two is
retained.

Research Question 3
What differences exist between urban primary and secondary mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

Urban primary and secondary mathematics teachers’ perceptions regarding using cooperative learning as an instructional strategy in classrooms with students were compared by utilizing a two-sample t-test.

Data analysis indicated that the majority of primary (20%) and secondary (33%) mathematics teachers agreed cooperative learning benefits all students. Two (4%) primary teachers indicated they strongly agreed with the statement. Nine (20%) teachers of whom two (4%) were primary and seven (16%) were secondary teachers disagreed with the statement. Three (7%) primary and one (2%) secondary teacher indicated they strongly disagreed with the statement. Six (15%) teachers (one (2%) primary and five (11%) secondary) indicated they were unsure if cooperative learning benefits all students.

An examination of the data gathered from responses to statement 28 indicate the majority of teachers (nineteen (43%) of whom 10 (23%) were primary teachers and nine (20%) were secondary teachers) agreed students achieved more when they utilized cooperative learning. Two (5%) secondary teachers indicated they strongly agreed with the statement. Five (11%) teachers of whom one (2%) were primary and four (9%) were secondary teachers disagreed with the statement. One (2%) primary and one (2%) secondary teacher indicated they strongly disagreed with the statement. Sixteen (36%) teachers (5 (11%) primary and 11 (25%) secondary) indicated they were unsure if students achieved more when they utilize cooperative learning.

Data analysis showed that the majority of primary (27%) and secondary (48%) mathematics teachers were in agreement with the statement, “the way teachers structure
goals determine how students interact”. Two (5%) primary teachers indicated they strongly agreed with the statement. Nine (20%) teachers of whom two (4%) were primary and seven (16%) were secondary teachers disagreed with the statement. One (2%) primary and two (5%) secondary teacher indicated they disagreed with the statement. A total of six (14%) teachers (three (7%) primary and three (7%) secondary) indicated they were unsure if the way teachers structure goals determine how students interact.

A review of data collected from teacher responses determined that the majority of teachers (55%) of whom ten (22%) were primary and fifteen (33%) were secondary teachers agreed with the statement affective outcomes are determined by the way teacher structures student interaction. Two (4%) secondary teachers indicated they strongly agreed with the statement. Two (4%) secondary teachers disagreed with the statement. Sixteen (36%) teachers (seven (16%) primary and nine (20%) secondary) indicated they were unsure if affective outcomes are determined by the way teacher structures student interaction

The bulk of teachers (54%) of whom eight (18%) were primary and sixteen (36%) were secondary teachers agreed with the statement a major determinant of cognitive outcomes is student interaction patterns. One (2%) secondary teacher strongly agreed with the statement. One (2%) primary teacher strongly disagreed with the statement. Twenty-two (50%) teachers (11 (25%) primary and eleven (25%) secondary) indicated they were unsure if statement a major determinant of cognitive outcomes is student interaction patterns.
An examination of the data indicates a large percentage of teachers (60%) of whom 10 (22%) were primary and seventeen (38%) were secondary teachers agreed with the statement students achieve more working together than working alone. Two (4%) primary teachers and one (2%) secondary teacher strongly agreed with the statement. One (2%) primary teacher and two (4%) secondary teachers disagreed with the statement. One (2%) primary teacher strongly disagreed with the statement. Eleven (25%) teachers (three (7%) primary and eight (18%) secondary) indicated they were unsure if students achieve more working together than working alone. Data results indicate no differences exist between urban primary and secondary mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy.

A two-sample t-test was used to compare urban primary and secondary teachers’ perceptions of using cooperative learning as an instructional strategy. Results from the two-sample t-test indicate most teachers agree that student achievement increases when cooperative learning is utilized as an instructional strategy. The majority of teachers also agree they play an important role in structuring goals for student interaction when using cooperative learning. The way teachers structure goals for student interaction will determine how students interact, which can adversely impact student levels of achievement. Furthermore, the bulk of teachers also agree that students achieve more working together than working alone. Therefore, the null hypothesis for question three is retained.

Research Question 4
What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

Urban primary and secondary mathematics teachers’ attitude regarding the impact cooperative learning has on student achievement were compared by utilizing a two-sample t-test.

Teachers were asked to respond to statement 22 which states: “my students are more motivated when I structure my class in cooperative groups”. Of the 45 participants who responded to the statement, nine (20%) of primary teachers and nine (20%) secondary teachers agreed with the statement. Three (7%) primary teachers strongly agreed with the statement. Six (13%) secondary teachers and two (4%) primary teachers disagreed with the statement. One (2%) secondary and one (2%) primary teacher strongly disagreed with the statement. Additionally, twelve (27%) secondary teachers and two (4%) primary teachers indicated they were unsure about the statement.

Results from examined data related to statement 25 show the majority of teachers (42%) of whom ten (22%) were primary teachers and nine (20%) were secondary teachers agreed that cooperative learning has positive effects on classroom discipline. One (2%) primary teachers strongly agreed with the statement. Six (13%) teachers (one (2%) primary teachers and five (11%) secondary teachers disagreed with the statement. One primary (2%) teacher strongly disagreed with the statement. Seven (16%) teachers (three (7%) primary and four (9%) secondary) indicated they were unsure if cooperative learning has positive effects on classroom discipline.
Data analysis indicate a significant number of teachers (44%) of whom nine (20%) were primary teachers and eleven (24%) were secondary teachers agreed that cooperative learning leads to more positive outcomes than competitive learning situations. One (2%) primary teachers and one (2%) secondary teacher strongly agreed with the statement. Six (13%) secondary teachers disagreed with the statement. One primary (2%) teacher strongly disagreed with the statement. Sixteen (35%) respondents, which include six (13%) primary and ten (22%) secondary teachers indicated they were unsure if cooperative learning leads to more positive outcomes than competitive learning situations.

The majority of teachers (53%) of whom nine (20%) were primary teachers and fifteen (33%) were secondary teachers agreed that students are more supportive of each other because of their use of cooperative learning. One (2%) primary teacher and one (2%) secondary teacher strongly agreed with the statement. Three (7%) secondary teachers disagreed with the statement. One primary (2%) teacher strongly disagreed with the statement. Fifteen (33%) teachers of which six (13%) were primary and nine (20%) were secondary indicated they were unsure if students are more supportive of each other because of their use of cooperative learning.

A large percent of teachers (73%) of whom ten (23%) were primary teachers and twenty-two (50%) were secondary teachers agreed that cooperative learning affects student’s self-esteem. One (3%) primary teachers strongly agreed with the statement. One (3%) secondary teacher disagreed with the statement. Ten (23%) teachers (six (14%) primary and 4 (9%) secondary) indicated they were unsure if cooperative learning affects student’s self-esteem.
A large number of teachers who completed the survey (58%) of whom nine (20%) were primary teachers and seventeen (38%) were secondary teachers agreed that using cooperative learning has helped weaker students feel more accepted. Two (4%) primary teachers and one (2%) secondary teacher strongly agreed with the statement. One (2%) primary teacher and four (9%) secondary teachers disagreed with the statement. Eleven (24%) teachers (five (11%) primary and six (13%) secondary) indicated they were unsure if using cooperative learning has helped weaker students feel more accepted.

A review of the statistics shows the majority of teachers (50%) of whom nine (21%) were primary teachers and seventeen (39%) were secondary teachers agreed that cooperative learning has helped to develop more positive attitudes toward learning in their classroom. One (2%) primary teachers and one (2%) secondary teacher strongly agreed with the statement. Three (7%) secondary teachers disagreed with the statement. Twelve (28%) teachers (6 (14%) primary and 6 (14%) secondary) indicated they were unsure if cooperative learning has assist in developing more positive attitudes toward learning in their classroom.

Teachers who participated in the study (72%) of whom fifteen (34%) were primary teachers and seventeen (38%) were secondary teachers agreed students know how to collaborate to solve a problem. Three (7%) secondary teachers disagreed with the statement. One (2%) primary teacher strongly disagreed with the statement. Eight (18%) teachers (one (2%) primary and seven (16%) secondary) indicated they were unsure if students know how to collaborate to solve a problem.

Fifty-four percent of teachers agreed that gifted students benefit when cooperative learning is utilized in the classroom. However, 16% of secondary teachers disagreed
with the statement. One primary teacher strongly disagreed with the statement. Twenty-eight percent of all teachers surveyed indicated they were unsure if gifted students benefit when cooperative learning is utilized in the classroom. Differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement. There are no differences between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement.

Two-sample t-test results revealed the majority of teachers agree that students are motivated when structured in cooperative learning groups, which has positive effects on classroom discipline. The majority of teachers also agree that cooperative learning leads to more positive outcomes including supporting each other and helping struggling students achieve as well as feel more accepted by peers, resulting in the development of positive attitudes toward learning. Furthermore, the bulk of participants agree that students know how to collaborate to solve a problem when using cooperative learning, which is beneficial to all students, including gifted students. Therefore, the null hypothesis for question four is retained.

**Detailed Analysis**

A survey was the instrument used to collect data for this study. The survey was divided into three sections to accurately measure teachers’ knowledge and perceptions of cooperative learning. The first section consists of demographic characteristics that compare urban primary and secondary teachers using descriptive statistics. The second
section comprises of descriptive statistics of the study’s variables. The final section addresses the research question using inferential statistical analyses.

Subscale statements were built-into the survey for participants to respond to using a Likert scale in order provide meaningful data related to urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. The findings from the examination of data are organized and presented below by research question.

**Research Question 1**

What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

A multivariate analysis of variance (MANOVA) was used to determine if differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning.

Five subscales were included in the survey along with specific statements in which teachers responded to according to a Likert scale. The results of teacher responses were used to measure their knowledge of the following principles: positive interdependence, group processing, face-to-face interaction, individual accountability, social and small group skills. An analysis of urban primary (3.60) and secondary (3.34) mathematics teachers’ overall knowledge of cooperative learning principles did not reveal substantial differences. Although the data revealed significant differences in how urban primary and secondary teachers’ responded to statements related to cooperative learning principles.

A t-test for two independent samples was conducted to analyze data from research questions 2-4 to determine if differences exist between urban primary and secondary
teachers concerning their knowledge of the role they play in the cooperative learning environment; their perceptions regarding the use cooperative learning as an instructional strategy; and their perceptions regarding the impact cooperative learning has on student achievement?

**Research Question 2**

What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

Six statements were included in the survey to evaluate statistical differences in the mean scores of primary and secondary mathematics teachers’ responses to research question 2. The results are presented in Table 4-17.

Teachers’ responses to statement 31 (students always know how they will be evaluated before the lesson begins) uncovered a mean of 3.76 for primary teachers and a mean score of 3.57 for secondary teachers. When the two groups are compared, there is a mean score difference of 0.19. The difference in mean scores was not considerably different. Analysis of the data indicates the majority of urban primary (33%) and secondary (47%) agreed students would always know how they would be evaluated.
The mean scores for teacher reactions to statement 32 yield results that were not significantly different relating to the statement: “There is one best method of assigning students to groups”. Primary teachers obtained a mean of 2.05 while secondary teachers produce a mean score of 1.85. There was a mean score difference of 0.2 between the two groups. Seventy-three Percent of all respondents did not agree that there is one best method of assigning students to groups.

There was a difference in the mean scores of urban primary (3.94) and secondary (3.62) teachers from statement 34, which states: “In my class, cooperative learning may involve intergroup cooperation”, which resulted in a mean score difference of 0.32. Seventy-three percent of all teachers agreed that cooperative learning might involve intergroup cooperation.

Primary and secondary teachers’ response to statement 51 uncovered a mean score difference of 0.48, indicating a notable difference exist between the two groups relating to the statement, “The physical arrangement of cooperative learning groups is not important”. Responses from primary teachers resulted in a mean score of 2.12 compared to the mean score 2.60 for secondary teachers. Fifty-nine percent of all teachers surveyed replied they disagreed with the statement. However, 16% of secondary teachers indicated they agreed with the statement compared to 5% of primary teachers. Additionally, 7% of secondary teachers also indicated they were unsure about the statement.

Teacher responses to statement 55 indicate many primary (27%) and secondary (47%) mathematics teachers agree with the statement, “academic objectives for groups should be specified before the beginning of the lesson.” A mean score of 4.17 was calculated for primary teachers compared to mean score of 4.0 for secondary teachers.
When the two groups are compared, there is a mean score difference of 0.17. The difference in mean scores is not significant.

“I evaluate cooperative learning groups with a criteria-referenced system” is associated with statement 57. Data results from the responses of teachers uncovered a mean score of 3.35 for urban primary teachers and mean score of 3.21 for secondary teachers. The mean score difference of 0.14 indicates there is not a significant different in how primary and secondary teachers feel about evaluating cooperative learning groups with a criteria-referenced system.

Results from the six statements used as a part of the survey to measure teachers’ knowledge and perceptions of the role of they play in the cooperative learning environment yield an average mean score of 3.22 for primary teachers and an average mean score of 3.14 for secondary teachers. The difference in mean scores is 0.08 indicating no significant difference in responses among primary and secondary teachers’ related to the knowledge of the role that teachers play in the utilization of cooperative learning.

**Research Question 3**

What differences exist between urban primary and secondary mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

The teacher survey included six statements specifically to evaluate the statistical difference in the mean score between primary and secondary teachers’ responses to question 3. The results are shown in table 4-3.

Teacher replied to statement 19. Their responses revealed a mean score of 3.29 for primary teachers and a mean score of 3.21 for secondary teachers. When the data from the two groups were closely examined, there was a mean score difference of 0.08 which is not considerably different.

Primary teachers who replied to statement 28 produced a mean score of 3.41 and secondary teachers uncovered a mean of 3.25. The teacher groups produced a mean score difference of 0.16, indicating a slight difference exist in regards to the statement: “Students achieve more when cooperative learning is utilized as an instructional strategy”. It is worthy to note that sixteen (36%) teachers (5 (11%) primary and 11 (25%) secondary) indicated they were unsure if students achieved more when they utilize cooperative learning.

A statistical analysis of teachers’ response to statement 50 revealed a mean score of 3.82 for secondary teachers and a mean score of 3.68 for primary teachers for the statement: “the way teachers structure goals determine how students interact”. When the two groups were compared, the difference in the mean score is 0.14, showing a slim difference exist.

Statement 56 responses from primary teachers revealed a mean of 3.58 and a total score of 3.60 for secondary teachers. When the two groups are compared, the
dissimilarity in the mean score is 0.02 suggesting that no significant difference exist in teachers’ response to the statement: “affective outcomes are determined by the way the teacher structures student interaction”.

Primary teachers’ answers to statement 59 resulted in a mean score of 3.18 while secondary teachers’ obtained a mean of 3.64. The two groups of teachers’ responses to the statement produced a mean score difference of 0.46, signifying a significant difference exists between primary and secondary teachers’ response to the statement: “A major determinant of cognitive outcomes is student interaction patterns”. Primary teachers do not believe students interaction patterns are as much a determinant of cognitive outcomes as secondary teachers. Additionally, analysis of the data showed fifty Percent of teachers selected unsure in response to the statement (25% primary and 25% of secondary teachers).

Results from teacher’s responses to statement 61 uncovered a mean of 3.64 for urban primary teachers and a mean of 3.60 for secondary teachers. The two groups uncovered a mean score of 0.04. When compared, no significant difference exists between primary and secondary teachers’ response to the statement: “my students achieve more working together than working alone”.

The six statements were used to gather data to measure teachers’ perceptions regarding the utilization of cooperative learning as an instructional strategy in classrooms. Results disclosed an overall mean score of 3.46 for primary teachers and 3.52 for secondary teachers, indicating no significant difference exists amongst primary and secondary teachers’ perceptions regarding using cooperative learning as an
instructional strategy in classrooms with students. However, urban primary and secondary teachers’ responses to statement 59 were significantly different.

**Research Question 4**

What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

Built-in the survey were nine statements geared explicitly to evaluate the statistical difference in the mean score between primary and secondary teachers’ responses to question four. The results are revealed in table 4-4.

A mean score of 3.64 was discovered from results related to statement 22 for primary teachers and a mean score of 3.03 for secondary teachers. There was a mean score difference of 0.61 when the two groups were compared, which indicates a significant different exist between primary and secondary teachers’ perceptions related to
the statement: “My students are more motivated when I structure my class in cooperative learning groups”.

Primary teachers’ response to statement 25 resulted in a mean score of 3.64 for and a mean score of 3.14 for secondary teachers. A mean score difference of 0.50 was uncovered when the two groups were compared, signifying primary and secondary teachers hold different perceptions on the statement: “Cooperative learning has positive effects on classroom discipline”.

Results from teacher replies to statement 37 uncovered a mean score of 3.52 for primary teachers and a mean score of 3.25 for secondary teachers. When comparing the two groups, there is a mean score difference of 0.27, indicating a slight difference exist between primary and secondary teachers’ response to the statement: “Cooperative learning leads to more positive outcomes than competitive learning situations”.

Statement 38 results revealed a mean score of 3.52 for primary teachers and a mean score of 3.5 for secondary teachers, indicating no significant difference exist between primary and secondary teachers’ response to the statement: “My students are more supportive of each other because I use cooperative learning”.

A mean score of 3.70 for primary teachers and a mean score of 3.77 for secondary teachers found after teachers responded to statement 42, which revealed a difference of 0.7, indicating no significant difference between primary and secondary teachers’ responses to the statement: “Cooperative learning affects my students’ self-esteem”.

Teachers’ responses to statement 44 exposed a mean score of 3.70 for primary teachers and a mean score of 3.53 for secondary teachers. A difference of 0.17 was found, signifying a slight difference exist between primary and secondary teachers’
response to the statement: “Using cooperative learning has helped weaker students in my class feel more accepted”.

Statistical analysis of survey data shows a mean score of 3.52 for primary teachers for statement 47 and a mean score of 3.59 for secondary teachers related to the results from the statement: “Cooperative learning has helped to develop more positive attitudes toward learning in my classroom”. The difference of 0.07 in the mean score suggests no significant difference exist between primary and secondary teachers’ response.

Teachers’ reactions to statement 58 resulted in a mean score of 3.76 for primary teachers and a mean score of 3.51 for secondary teachers. The mean score difference of 0.25 exists, resulting in a minor difference between primary and secondary teachers’ response to the statement: “My students know how to collaborate to solve a problem.”

Teachers’ response to statement 60 resulted in a significant mean score difference (0.65) between primary and secondary teachers. Primary teacher’s responses resulted in a mean of 3.82 while secondary teacher’s responses resulted in a mean score of 3.17. Data also revealed 16% of secondary teachers disagreed with the statement “Gifted students in my class benefit when I use cooperative learning”. One primary teacher strongly disagreed with this statement. Additionally, 28% of all participants replied they were unsure about the statement.

Nine statements were included in the survey to measure teachers’ attitudes pertaining to the impact cooperative learning has on student achievement with students. Overall results uncovered a mean score of 3.64 for primary teachers and 3.38 for secondary teachers, signifying a slight difference (0.26) exist between primary and
secondary teachers’ perceptions related to the impact cooperative learning has on student achievement in mathematics.

Chapter 4 Summary

This chapter revealed the data analysis of data collected from surveys completed by primary and secondary mathematics teachers related to their knowledge and perceptions of cooperative learning. Chapter four included data related to the demographics of study participants as well as describe the findings of the study in order to focus on the primary question: What are the differences in the knowledge of the principles of cooperative learning that exist between urban primary mathematics teachers and urban secondary mathematics teachers? The subscale questions were also analyzed in order to explain and expand on data that relates the teachers’ knowledge and perceptions of cooperative learning.

SPSS software was utilized to perform the statistical analyses and determine if there were significant differences exist between primary and secondary teachers’ knowledge and perceptions of cooperative learning.

Chapter 5 will include a summary of the study by discussing the findings, limitations and conclusion. Recommendations for future research will also be included with implications of this research on current and future studies related to primary and secondary teachers’ knowledge and perceptions of cooperative learning in mathematics.
CHAPTER 5. CONCLUSIONS AND DISCUSSION

Introduction

The purpose of this study was to examine the differences between urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. Additionally, this study was conducted to pinpoint possible gaps in order to provide professional development opportunities to enhance teaching and learning in mathematics utilizing cooperative learning as an instructional method. A non-experimental, causal-comparative research design was used for this study. Conducting causal-comparative research seeks to explain differences between groups by examining the differences in the experiences of group members (Lodico, 2010). Additionally, participants in causal-comparative research already belong to groups based on their experiences, and the researcher selects participants from these preexisting groups. Urban primary and secondary mathematics teachers were the selected groups for this study.

Chapter 5 is the conclusion of the quantitative study that investigated urban primary and urban secondary mathematics teachers’ knowledge and perceptions of cooperative learning. The researcher will summarize and discuss the findings, as well as the results as it relates to the literature, identify the limitations and provide a conclusion for this study. Recommendations for future research will also be included with implications on existing and forthcoming studies related to urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning.

Summary of the Results
The purpose of this study was to examine the differences between urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning.

Participants were asked to complete an online survey by responding to statements ranked according to a 5- point Likert-scale, which was used to measure the difference between urban primary and urban secondary teachers’ knowledge and perceptions of cooperative learning. The data was then examined to draw conclusions in order to present the findings. The findings of the study will be summarized and discussed according to the four research questions which guided this cooperative learning study.

**Research Question 1**

What differences exist between urban primary and secondary mathematics teachers’ knowledge of the principles of cooperative learning?

Embedded into the survey were statements specifically related to the five principles of cooperative learning: The principles are positive interdependence, group processing, face-to-face interaction, individual accountability, and social and small group skills.

Data analysis of urban primary (3.60) and secondary (3.34) mathematics teachers’ overall knowledge of cooperative learning principles did not reveal significant differences (0.26). However, further examination of the data revealed significant differences in urban primary and secondary teachers’ responses to specific principles of cooperative learning statements.

Findings from the data analysis indicated a slight difference (0.29) in the overall mean score between urban (3.37) primary and (3.08) secondary teachers’ responses to the positive interdependence principle. The greatest difference in the mean score (0.82)
between the groups was statement 27 which states, “My students are assigned roles in their cooperative learning groups”. Secondary (36%) teachers disagreed with the statement compared to primary (9%) teachers, indicating that a large number of secondary teachers do not assign their students to roles while in cooperative learning groups.

The principle of group processing findings resulted in an overall mean difference of 0.54 between urban primary (3.47) teachers and secondary (2.93) which is significant. Likewise, there was a noteworthy difference in how urban primary (3.35) and secondary (2.39) teacher responded to statement 26 which is resulted in a mean score difference of 0.96 related to the statement, “My students have learned procedures to analyze how well their groups are functioning”. Forty percent of urban secondary teachers disagree with the statement indicating they have not focused on teaching their students techniques to evaluate how well their groups are functioning. Additionally, sixteen percent of secondary teachers indicated they were unsure of the statement. However, twenty-one percent of primary teachers agreed that their students were taught procedures to evaluate how well their groups are functioning with nine percent indicating they were unsure.

Responses to the face-to-face interaction principle displayed an overall mean difference of 0.28, suggesting a slight difference exist between urban primary (3.71) and secondary (3.43) teachers. The response with the greatest gap between the two groups was statement 53, which states, “All my students give and receive explanations when they work in cooperative groups”. The findings resulted in a mean score of 4.0 for urban primary teachers and a mean score of 3.39 for secondary teachers which is a mean score difference of 0.61. Fourteen percent of secondary teachers disagreed with the statement
indicating they do not focus on students giving and receiving explanations when working cooperatively in groups. Additionally, fourteen percent of secondary teachers replied that they were unsure about the statement.

Teachers were asked to respond to statement related to the individual accountability principle. An analysis of the data did not reveal significant differences in the overall mean scores of urban primary (3.84) and secondary (3.81) teachers.

Social and small group skills were the final principle analyzed to determine if differences exist in the knowledge of urban primary and secondary teachers. Data results revealed no significant difference in the overall mean scores of urban primary (3.64) and secondary (3.52) mathematics teachers.

The group processing principle of cooperative learning revealed the largest difference in mean scores between urban primary and secondary mathematics teachers. Of the four statements related to group processing, statement 26 revealed the largest difference in responses between urban primary and secondary teachers, indicating the majority of secondary teachers did not believe it was imperative to teach students procedures to analyze how well their groups were functioning. Positive independence and face-to-face interaction principles of cooperative learning showed minor differences between the two groups. Although, there were noteworthy differences in how the groups of teachers responded to specific statements related to the two principles. Data results related to social and small group skills and individual accountability did not reveal significant differences between the responses of urban primary and secondary teachers. Therefore, the null hypothesis for research question one is retained.

Research Question 2
What differences exist between urban primary and secondary mathematics teachers’ knowledge of the role teacher’s play in the utilization of cooperative learning in the classroom?

Urban primary and secondary mathematics teachers’ perceptions of the role they play in the implementation of cooperative learning were compared by utilizing a two-sample t-test. The findings from the data analysis of the six statements teachers’ responded to suggest no significant differences (0.08) exist between urban primary mathematics teachers and urban secondary mathematics teachers’ knowledge of the role they play in the utilization of cooperative learning. However, an analysis of teachers’ responses to one statement revealed a noteworthy difference in the mean score when comparing the two groups. Results from statement 51, “The physical arrangement of cooperative learning groups is not important” also revealed a striking difference in the mean score when data analysis from the groups of teachers was examined. A mean score of 2.12 was revealed for primary teachers and a mean score of 2.60 was revealed for secondary teachers. This mean score difference of 0.48 indicate primary teachers focused to a substantial degree on the physical arrangement of the class when utilizing cooperative learning during mathematics compared to secondary teachers.

Therefore, the null hypothesis for research question two is retained.

**Research Question 3**

What differences exist between urban primary and secondary mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy?

Six statements were examined to measure teachers’ perceptions regarding their utilization of cooperative learning as an instructional strategy in classrooms. The overall
mean score difference of 0.06 suggest no significant difference exists amongst primary and secondary teachers. However, the examination of data revealed a significant difference in the mean scores of urban primary and secondary teachers in regards to statement 59. Teachers responded to the statement, “A major determinant of cognitive outcomes is student interaction patterns”. Primary teacher’s responses resulted in a mean score of 3.18 while secondary teacher’s mean score was 3.54, resulting in a mean score difference of 0.46. Secondary teachers agreed largely that student interaction patterns are a major determinant of cognitive outcomes when compared to primary teachers. It is also interesting to note the analysis of data also revealed 50% of all teachers (25% of primary and 25% of secondary teachers) replied they were unsure of the statement. Data results indicate no differences exist between urban primary and secondary mathematics teachers’ perceptions regarding the use cooperative learning as an instructional strategy. Therefore, the null hypothesis for research question three is retained

**Research Question 4**

What differences exist between urban primary and urban secondary mathematics teachers’ perceptions regarding the impact cooperative learning has on student achievement?

Nine statements were embedded into the survey to examine then measure the statistical differences in mean scores of urban primary and secondary teachers’ perceptions of cooperative learning’s impact on student achievement. Data analysis revealed a mean score difference of 0.26, which is slightly significant. However, the analysis of data uncovered a significant difference between how teachers’ responded to
statement 60 (gifted students in my class benefit when I use cooperative learning)
resulting in the largest mean score difference (0.65) between primary and secondary
teachers related to their perceptions of cooperative learning’s impact on student
achievement. Primary teacher’s responses resulted in a mean of 3.82 while secondary
teacher’s responses resulted in a mean score of 3.17. One primary teacher strongly
disagreed with this statement. However, 16% of urban secondary teachers disagreed with
the statement signaling that many secondary teachers do not believe cooperative learning
has benefited gifted students. The findings also revealed 28% of all respondents replied
they were unsure if cooperative learning has benefited gifted students.

There are no differences between urban primary and urban secondary
mathematics teachers’ perceptions regarding the impact cooperative learning has on
student achievement. Therefore, the null hypothesis for research question four is retained

**Discussion of the Results**

Utilizing the emergent themes gathered from the analysis of data, the researcher
will discuss the results of this cooperative learning study. Based on the findings, no
significant differences exist between urban primary and secondary teachers’ overall
knowledge and perceptions of cooperative learning according to mean score results.
However, results show significant differences exist between urban primary and secondary
teachers’ responses to statements related to specific cooperative learning principles. The
lack in differences between the two groups of teachers may result from the manner in
which cooperative learning training was taught as well as the area(s) of emphasis during
training. The majority of teachers (62.5%) reported receiving cooperative learning
training by completing a college course. However, limited studies have focused
specifically on the principles of cooperative learning, which may adversely influence teachers’ knowledge, and perceptions of cooperative learning, which may in turn influence how it is implemented in classrooms to increase student achievement in mathematics.

Findings revealed the group processing principle presented the largest difference in the responses of urban primary and secondary teachers, which suggest there is a clear distinction between urban primary and secondary teachers’ knowledge and thorough understanding of group processing. This lack of knowledge and comprehensive understanding of group processing can influence the effectiveness of the implementation of cooperative learning and its effect on student achievement.

Significant differences also exist between urban primary and secondary teachers’ responses to positive interdependence statements. Findings suggest a significant portion of surveyed secondary teachers do not recognize the need for assigning students roles when working cooperatively in groups. Excluding this element of cooperative learning can also affect group effectiveness as well as student achievement in mathematics.

No significant difference exists between urban primary and secondary mathematics teachers’ mean score pertaining to their knowledge of the role they play in the utilization of cooperative learning. Yet there was a notable difference in urban primary and secondary teachers’ responses related to the physical arrangement of cooperative learning groups. Findings reveal a notable percentage of secondary teachers accept as true the physical arrangement of cooperative learning groups is not of great importance. The physical arrangement may not have been an area of focus for teachers during their cooperative learning training. Therefore, may not be an area of focus for
teachers. The lack of focus on the physical arrangement of cooperative learning groups can effect student time on task, which will in turn affect student achievement. The physical arrangement can give a clear message about the teachers’ values and expectations for student behavior.

In addition, the following conclusions were made based on the findings. Significant differences exist between urban primary and secondary mathematics teachers’ responses in regards to the impact cooperative learning has on the achievement of gifted students. The perceptions held by teachers may be due to the lack in understanding of how cooperative learning benefits all students. This lack in understanding may be caused by the cooperative learning training completed by teachers.

In conclusion, it appears that urban primary and secondary teachers have knowledge and experience related to cooperative learning. It also appears that both groups of teachers have utilized cooperative learning to some extent with students. The findings also reveal teachers may not have a clear understanding of the principles of cooperative learning as well as the role they play in the utilization and implementation of cooperative learning, which may adversely influence student achievement in mathematics.

**Discussion of the Results in Relation to the Literature**

Cooperative learning is the instructional use of small groups. All cooperative learning methods share the idea that students work together to learn and are responsible for one another’s learning as well as their own (Slavin, 1996). This instructional strategy aligns with constructivism, a powerful theory model that has origins in philosophy and psychology. Constructivism in learning is founded on the assumption that learning is an
active process in which children construct new ideas or concepts based on their current
and past knowledge. The constructivist framework challenges teachers to create learning
environments in which teachers and their students are encouraged to think and explore
(Brooks, 1999).

A study was conducted to examine if differences exist between urban primary and
secondary mathematics teachers’ knowledge and perceptions of cooperative learning and
how identified differences influence teaching and learning in the classroom. Cooperative
learning emphasizes the crucial role of teachers in supervising group activities (Law
2008). The study’s findings did not identify significant differences exist between urban
primary and secondary teachers’ overall knowledge and perceptions of cooperative
learning. However, differences in how urban primary and secondary mathematics
teachers responded to specific statements related to the principles of cooperative learning
exist. Slavin (1999) voiced his concerns pertaining to the quality of cooperative learning
methods used in classrooms. He noted in his studies of teachers’ use of cooperative
learning, most are using unconventional forms of the model, typically lacking group
goals and individual accountability. Findings from data collect from this study yield
similar results. Group processing principle presented a difference in the responses of
urban primary and secondary teachers. The lack of knowledge and understanding of
group processing can influence the effectiveness of the implementation of cooperative
learning and impact student achievement in mathematics. According to Millis (2009), it
is essential for teachers and students to pay attention to group dynamics and productivity
to help students learn how to lead, as well as make certain all members contribute by
sharing ideas that are heard and received by all.
Differences also exist between urban primary and secondary teachers’ responses to positive interdependence statements. Many secondary teachers do not recognize the need for assigning students roles when working cooperatively in groups. Assigning roles and responsibilities to students encourage accountability for self as well as for the group. Kirk (2001) states, “assigning roles ensures that no individual shirks his or her responsibility, as can happen in small group work” (p. 33).

The physical arrangement of cooperative learning groups also presented differences between urban primary and secondary teachers. Johnson et. al (1999) states how well any small group performs depends on how it is structured. To ensure a group is cooperative, teachers must recognize that various methods can be used to for a variety of purposes and the essential elements that need to be carefully structured within every cooperative activity.

Differences exist between urban primary and secondary mathematics teachers’ responses in regards to the impact cooperative learning has on the achievement of gifted students. Johnson (1990) note that high achieving students benefit from cooperative learning in various ways such as from scores on retention test that are higher verses high achievers participating in competitive or individualistic learning environments.

**Limitations**

The following limitations were present for this study:

1. The number of participants was determined by the number of urban primary and secondary mathematics teachers employed by the district. The number of mathematics teachers provided a sample but is somewhat limited considering
larger urban school districts may employ larger numbers of mathematics teachers, which would have provided a better generalization of the findings.

2. Data collected from this study will be of benefit to teachers, principals, curriculum directors as well as colleges and universities. However, the data collected from this study will be somewhat limited because only one urban public school district was involved in the study. The utilization of several urban school districts would have provided a better generalization of the findings.

3. This study was limited to utilizing a survey to gather data on cooperative learning. Other data collection tools could have been utilized to provide more in-depth findings to better understand how urban mathematics teachers’ knowledge and perceptions of cooperative learning impact student achievement.

4. The sample group for this study was assembled from and limited to urban primary and secondary mathematics teachers. Focusing only on this group of educators limits the generalization of the findings since teachers’ knowledge and understanding of cooperative learning can also impact the mathematics achievement of students in other educational settings.

5. The study was limited to one urban public school district in Central Ohio. The number of individuals who participated in the study provided a sample but is somewhat limited since larger urban school districts exist, which would have provided a better generalization of the findings.

Implication of the Results for Practice

It is imperative that teachers, curriculum directors, facilitators, and administrators to first understand the theories that support cooperative learning and then apply the
knowledge and understanding of this instructional method in the classroom to successfully impact student achievement in mathematics. Once the knowledge and understanding of cooperative learning is obtained, administration is encouraged to express an interest in teachers implementing it into their classrooms. In order to make certain teachers have a thorough knowledge and understanding of cooperative learning, they must first participate in quality professional development sessions offered by school districts and schools in general. Quality training must focus on helping teachers to become acquainted with cooperative learning to recognize the benefits to students, teaching and learning. School districts are encouraged to employ a full-time facilitator of cooperative learning to work in the school, visiting classrooms to provide feedback and assist with assessing student progress, performance as well as other functions essential to improving the implementation and utilization of cooperative learning.

In order to promote student learning, teachers must thoroughly understand the principles of cooperative learning. Each principle is unique and has a specific purpose that contributes to the academic success of students in mathematics. Additionally, the structures that support cooperative learning are essential to supporting teaching and learning. Teachers must be encouraged to utilize the structures in the manner prescribed by researchers so students can receive all the benefits of cooperative learning.

School districts are encouraged to examine how cooperative learning is utilized in classrooms in order to align best practices that support student learning as they transition from primary grade levels to secondary grade levels. These practices help students to understand they must be dedicated to their own success as well as to the success of other group members. After all, this commitment is at the heart of cooperative learning.
Additionally, when cooperative learning practices are properly implemented at all grade levels, students’ skill sets are likely to advance as they transition from grade level to grade level.

Institutions of education as well as school administration are encouraged to help teachers to develop a deep understanding of cooperative learning, including its principles and structures. It is likely teacher’s knowledge and perceptions of cooperative learning will change so that they recognize and acknowledge its benefits, inspiring them to utilize it in the classroom to meet the diverse needs of students and to improve student achievement in mathematics.

**Recommendations for Further Research**

The following recommendations are suggested for further cooperative learning research:

- It is recommended that a qualitative study is conducted to examine primary, middle and secondary teachers’ knowledge and perceptions of cooperative learning in order to determine the impact on student learning as they transition from grade to grade.

- It is recommended that a quantitative study is conducted to examine teacher’s knowledge and understanding of cooperative learning principles to examine how it influences how teachers implement it as well as its impact on student achievement.

- It is recommended that a quantitative study is conducted comparing an urban primary, suburban primary and rural primary teachers’ knowledge of cooperative
learning principles and how it influences the manner in which it is utilized in the classroom.

• It is recommended that a longitudinal research design study is conducted to examine how teachers’ knowledge and perceptions of cooperative learning evolves overtime after completing cooperative learning training and consistently utilizing it as an instructional strategy in the classroom.

• It is recommended that a qualitative cooperative learning study is conducted comparing the knowledge and perceptions of teachers who teach in different high school settings (Career Tech-vs- School for the Arts) to the impact on teaching and learning.

• It is recommended that this quantitative cooperative learning study is conducted with a larger sample to support the findings.

Conclusion

The debate surrounding cooperative learning and its impact on teaching and learning is likely to continue throughout the field of education. This study provided insight into urban primary and secondary mathematics teachers’ knowledge and perceptions of cooperative learning. Teachers are responsible for educating students to their fullest potential, which is a daunting task. Therefore, it is imperative to pose questions to understand how they view topics such as cooperative learning, which impact teaching and learning.

The knowledge and perceptions of teachers in this study indicate differences exist between urban primary and secondary teachers’ knowledge and understanding of cooperative learning principles. Participants in this study indicated they held different
views pertaining to individual accountability and group processing. Urban secondary
teachers indicated they did not place emphasis on individual accountability and group
processing which can adversely affect student achievement in mathematics. Participants
in this study also revealed there are differences that exist between the two group’s
perceptions related to cooperative learnings impact on gifted students. Teachers’
perceptions may be altered by providing extensive professional development in
cooperative learning methods, and by providing support in the classroom that include
frequent opportunities to obtain feedback on their use of cooperative learning structures
as well as help assessing student progress, performance as well as other functions
essential to the effective use of cooperative learning. When teachers are provided
support, it is likely their knowledge and perceptions of cooperative learning will change,
inspiring them to utilize it in classrooms to meet the diverse needs of students.

Politicians, scholars of education, school districts, and administrators can use the
knowledge and experience of teachers who participated in this study to provide quality
training that will guide teachers in a systematic manner to implementing cooperative
learning improve student achievement in mathematics.

APPENDIX STATEMENT OF ORIGINAL WORK

Academic Honesty Policy

Capella University’s Academic Honesty Policy (3.01.01) holds learners accountable for the integrity of work they submit, which includes but is not limited to discussion postings, assignments, comprehensive exams, and the dissertation or capstone project.

Established in the Policy are the expectations for original work, rationale for the policy, definition of terms that pertain to academic honesty and original work, and disciplinary consequences of academic dishonesty. Also stated in the Policy is the expectation that learners will follow APA rules for citing another person’s ideas or works.

The following standards for original work and definition of plagiarism are discussed in the Policy:

Learners are expected to be the sole authors of their work and to acknowledge the authorship of others’ work through proper citation and reference. Use of another person’s ideas, including another learner’s, without proper reference or citation constitutes plagiarism and academic dishonesty and is prohibited conduct. (p. 1)

Plagiarism is one example of academic dishonesty. Plagiarism is presenting someone else’s ideas or work as your own. Plagiarism also includes copying verbatim or rephrasing ideas without properly acknowledging the source by author, date, and publication medium. (p. 2)

Capella University’s Research Misconduct Policy (3.03.06) holds learners accountable for research integrity. What constitutes research misconduct is discussed in the Policy:

Research misconduct includes but is not limited to falsification, fabrication, plagiarism, misappropriation, or other practices that seriously deviate from those that are commonly accepted within the academic community for proposing, conducting, or reviewing research, or in reporting research results. (p. 1)

Learners failing to abide by these policies are subject to consequences, including but not limited to dismissal or revocation of the degree.
Statement of Original Work and Signature

I have read, understood, and abided by Capella University’s Academic Honesty Policy (3.01.01) and Research Misconduct Policy (3.03.06), including the Policy Statements, Rationale, and Definitions.

I attest that this dissertation or capstone project is my own work. Where I have used the ideas or words of others, I have paraphrased, summarized, or used direct quotes following the guidelines set forth in the APA Publication Manual.

Topic Area: Teacher Education
Format: Paper Session

Description: This paper offers a particular analytic method from Systemic Functional Linguistics, thematic analysis, which reveals textual-meaning potentials due to a speaker’s choice of Theme. In order to account for the meaning-making potential of language, I draw on Halliday (1994) and his proposal of three metafunctions: ideational, interpersonal, and textual. This paper presents a Halliday-inspired analysis of how one secondary mathematics student teacher helped a group of students find meaning in computing compounded interest.

Abstract

Research has shown that a teacher’s choice of words and grammar relates to meanings made by students in the classroom. Through a detailed linguistic analysis of one particular secondary mathematics student teacher, Aaron, I aimed to learn more about the purposes behind his choices of language – in particular, the ‘beginning part’ of each spoken clause, or Theme. Drawing on Halliday’s (1978, 1994) Systemic Functional Linguistics (SFL) approach to language, I analyzed the spoken text of Aaron as he facilitated problem-solving discourse with small groups of students. A teacher’s choice of how to begin each clause is instrumental in helping students piece together mathematical meanings. By developing a money-borrowing scenario in which one student was designated to play a principal role, Aaron invited group members to follow along through a ‘flow’ of mathematical processes. As a result, the students were able to connect calculator results to those obtained from their paper-and-pencil computations. Through analyzing the textual aspects of this scenario, I suggest that Aaron’s choices of Theme served as ‘signposts’, or points of departure which served to identify what each clause was about.

Keywords: Teacher Education, Secondary Mathematics, Systemic Functional Linguistics, Classroom Discourse
Within the social nature of learning mathematics language can be viewed as the principal resource for making meaning in the classroom (Halliday, 1978). “The teacher’s oral language is a key means of linking between visual and symbolic representations, making the spoken language very powerful in classroom learnings” (Schleppegrell, 2010, p. 88). This suggests that the way that language and mathematics interact needs to become a focus of attention in the classroom. However, using aspects of mathematical language necessary to diagnose student thinking and give appropriate responses in the context of classroom discourse is a key challenge for prospective teachers (Schleppegrell, 2012). In response to this concern, this paper (as part of a larger study) examines classroom discourse through a linguistic lens and focuses on one particular student teacher in an Algebra 2 classroom. While much of mathematics instruction can be expressed in semiotic signs and symbols, the associated words and grammatical structures of classroom discourse remain the fundamental processes for a shared construction of mathematical meaning (Halliday, 1978). In this paper I focus linguistically on language through a perspective of Systemic Functional Linguistics (Halliday, 1978, 1985) and examine the ways that particular choices of words and grammar influence the meanings shared by speaker and listeners.

**Theoretical Perspectives**

Halliday and other scholars of Systemic Functional Linguistics (SFL) are concerned with how human beings construe experiences – both their own and those of others (Halliday & Matthiessen, 2006). It is language that helps us understand and analyze our world experiences and also enact our understandings as we interact others. SFL views language as a network of systems, or inter-related sets of choices for making meaning (Halliday, 1994). From this perspective the overall purpose of language can then be described as a semantic one in which researchers can record and analyze the meanings made in a particular context. In order to account for this meaning-making potential of language, Halliday (1994) has proposed three metafunctions (or meanings) that speakers or writers draw on as they choose from available language options. In this paper I focus on spoken word choices.

**Metafunctions**

Halliday (1994) has identified the three metafunctions as ideational, interpersonal, and textual. The ideational metafunction construes a model of experience in which a speaker uses language as a resource in order to represent and reflect upon the world; the interpersonal metafunction enacts social relationships through language; and the textual metafunction creates relevance to context and organizes a speaker’s message (Halliday, 1994). In addition to viewing these metafunctions as fundamental organizing principles of language, researchers can also think of them as ‘tools’ to analyze, understand, and talk about a speaker’s lexico-grammatical choices.

This study focuses on the textual metafunction and examines the way a text is organized as a piece of speech. However, it is important to note that while this organization has textual meanings, it is also inseparately and simultaneously related to a speaker’s choices in both the
ideational and interpersonal metafunctions. Consequently, these other functions cannot be ignored. Halliday and Matthiessen (2006) have described the textual function as ‘enabling’ because of its resources that organize all three meanings as discourse – meanings that can be contextualized and shared.

**The Textual Aspects of the Theme/Rheme Structure**

Halliday and Matthiessen (2006) define Theme as the element which serves as the starting-point for the message; it is what the clause is going to be about. Together with Rheme these two choices form the major system in a clause. In English, the identification of Theme is based on order and is realized by what is placed at the beginning of a clause. That is, Theme comes first, and whatever is not Theme is Rheme. The textual aspects of Theme represent the ‘signposts’ for a speaker’s point of departure or that which identifies for the listener what the clause is all about. Also, Theme typically contains familiar or ‘given’ information – information that has already been mentioned somewhere in the text or is familiar from the context (Eggins, 2004). Rheme is the temporary destination (Halliday, 1994). According to Eggins (2004), Rheme is that part of the clause in which the Theme is developed or realized. Because textual messages most often depart from the familiar and head towards the unfamiliar, Rheme typically contains unfamiliar or ‘new’ information.

Theme is the ‘glue’ that structures and binds both ideational (what the message is about) and interpersonal meanings (who is involved in the message) (Halliday, 1994). An examination of Theme and Rheme reveals connections at the clausal level between ‘new’ and ‘old’ meanings. This paper focuses on Theme and recognizes that its initial position yields a ‘special status’ within the clause. The reason for this is that Theme is one of the means by which the clause is organized as a message. Most often the success of the message in the text depends upon how a speaker begins each clause (Matthiessen, 1995). For this reason Theme, as part of the textual metafunction, is an important tool in helping to understand how a speaker focuses and organizes a message, thus contributing to its coherence and success (Matthiessen, 1995).

**Purpose**

The purpose of this paper is to contribute to the scarce literature on the preparation of secondary mathematics prospective teachers as related to their own awareness of how language choice relates to student understanding and sense-making. Through a SFL perspective of language, I report findings that explicate ways in which structures of language can be appropriate to the facilitation of problem-solving discourse in the mathematics classroom. While it is understood that experienced teachers are more adept at predicting student responses to a variety of problem-solving tasks, little is known about the ways prospective teachers are able to respond to students who find certain mathematical concepts challenging. Additionally, while Theme has been investigated in a range of genres (e.g., Berry, 1995; Davies, 1997), only limited research has been carried out at a lexico-grammatical level into authentic workplace texts such as the mathematics classroom.

Theme, both as a valuable SFL analytic tool and as a pedagogic resource, can help those in mathematics education better understand the ways prospective teachers anticipate the meaning-making needs of students. Understanding how Theme functions can answer questions about the ways a prospective teacher orients and re-orient students’ expectations for the direction of unfolding text – what Martin and Rose (2006) have referred to as periodic waves of the information flow. For these reasons, my overall purpose in this research is to learn more
about the ways prospective teachers make choices of Theme – choices which are crucial to the organization, interpretation, and construal of mathematical meanings.

**Participants and Context**

In my larger study I video-recorded 53 conversations, each 5–15 minutes in length, involving three prospective secondary mathematics teachers and 14 small groups of students. The video recordings and subsequent transcripts captured the speech of these student teachers as they facilitated problem-solving discourse at each of their respective high schools. The student teachers chose their own mathematical tasks which they designed to ‘spark’ group discourse. I collected the majority of data over two visits to each school, allowing for a period of two to three weeks between each visit. In this paper I report on Aaron who was placed as a student teacher at a large public high school (over 1000 students) in the desert southwest. Specifically, I report on my analysis of Aaron’s spoken text with one particular group of four Algebra 2 students (Juan, CeCe, Alfredo and Leslie). The discourse between Aaron and the four students evolved around the task of finding interest and amount due on a bank loan of $1000, compounded yearly at 10%.

For this paper I chose to analyze one particular excerpt of this discourse (see Table 1 in the Analysis section of this paper). However, in order to add to contextual aspects of this study, I first report that prior to this excerpt, the students had revealed a shared misunderstanding of how to calculate compounded interest. As Aaron came to discover, their paper-and-pencil calculations did not match output values from the calculator (values that resulted from inputting a value \( t = 2 \) into the function \( y = 1000(1.1)^t \)). As Aaron walked around the group, looking at each student’s work, he noticed that two of the students used paper-and-pencil to find amounts due (after the first year and then after the second year), one student only used a calculator, and the fourth student was using both a calculator and paper/pencil to record findings. Prior to Aaron talking with the group, the students could not agree on their findings and were unable to explain to each other why they had different results ($1200 vs. $1210). Additionally, one student, Juan, had not yet contributed verbally to the group’s discussion. After observing and listening to the group for a time, Aaron said, “Alright, Juan, you’re going to borrow $1000 from me.”

Through a detailed linguistic analysis of Aaron’s speech in the money-borrowing scenario, I aim to learn more about the purposes behind his particular choices of language. My research questions are:

- What in Aaron’s text helped the students develop an understanding of compounded interest?
- How did Aaron’s textual messages mesh with his overarching purpose or concern in the text?
- In what ways was Aaron able to anticipate the understanding needs of the group members?

**Analysis of Theme**

Theme is the first experiential element in the clause; the meanings are encoded as *participant, process* (verb), or *circumstance*. As mentioned previously, Theme is always first, followed by Rheme. Identifying Theme is a bit more complicated and can have as many as three different Theme-types. Additionally, scholars vary in how they choose to identify textual Themes (e.g., Davies, 1997; Ravelli, 1995). I draw on the research of Halliday (1994) and Matthiessen (1995) and identify Themes according to the following categories: *textual, interpersonal, and topical*. 
Textual Theme

In order to create a cohesive text with well-signposted connections between messages, speakers often preface experiential meanings with a group or phrase whose function is to connect a message to a previous message. Conjunctions serve as text-creating meanings and are referred to as textual Themes. While textual Themes do not fulfil the primary requirement of Theme which is to signal the point of departure for the experiences in the clause, Conjunctions such as if, although, unless, because, and in order to are likely to introduce dependent clauses which enhance the argument. Other Conjunctive Adjuncts such as therefore, nevertheless, in addition, finally, and in conclusion may also be thematic if they are used at the beginning of a clause to signpost the development of the discussion (Butts, Fahey, Feez, Spinks, & Yallop, 2000).

Interpersonal Theme

There are also times when clauses begin with interpersonal meanings indicating the kind of interaction between speakers or the positions they are taking. These times refer to using the interpersonal Theme. Examples of constituents which can function as interpersonal Themes are the categories of Mood Adjuncts (I think, always, probably), Comment Adjuncts as related to attitude (unfortunately, apparently) and Vocative Adjuncts in which a person is addressed by name (Eggins, 2004). There is some divergence regarding how to classify interpersonal Themes in the interrogative Mood. Eggins (2004) has referred to Finites in this Mood (could, shall, what, where, how) solely as topical Themes, while Butts et al. (2000) include such Finites as interpersonal and topical at the same time.

<table>
<thead>
<tr>
<th>Where did you go yesterday?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Topical Theme</td>
</tr>
<tr>
<td>Interpersonal/Topical Theme</td>
</tr>
</tbody>
</table>

Topical Theme

Often the first element in the experiences encoded in a message is a Circumstance (as early as last year), an adverbial group (merrily, merrily), or a prepositional phrase (on the first day of school). These topical Themes signal the point of departure for the experiences in the message. Additionally, an entire nominal group also serves frequently as a topical Theme (the man in the moon; Peter, Paul, and Mary). According to SFL researchers, the thematic potential of an English clause is not considered exhausted until reaching the end of the topical Theme (Butts et al., 2000); and the rule is to identify only one topical Theme per clause (Eggins, 2004). This means that if the clause begins with a textual or interpersonal Theme, analysis must continue until reaching a topical element. Once a topical constituent has been identified, all remaining constituents can be consigned to the role of Rheme.

Marked and Unmarked Themes for Different Mood Types

In a thematic analysis Mood plays a substantial role in influencing choices of Theme. The following sections explain these influences of Mood on Theme. For example, when asking a question in the interrogative Mood, it is typical to begin with words such as what, where, when, why and how. However, and more interesting to linguists, is when the question asked is in the declarative Mood. Later in this paper the reader will see where Aaron asked a question but did so in a way in which the word ‘how’ did not begin the clause. In cases such as these, the Theme choice is unexpected for the particular Mood. Situations such as this bring up the notion of ‘markedness’ and its application to Theme.
When linguists say that a part of language is unmarked, they mean that it is the most expected, common and unremarkable case (Butts et al., 2000). Conversely, when something is marked, it is unusual and should be noticed because of the way it stands out. In my analysis I apply this notion of markedness to Aaron’s choices of Theme in order to separate the typical and expected patterns from the atypical and unexpected.

**Identifying Theme in the Declarative Mood (Statements)**

**Unmarked.** In this Mood, the Subject is the element chosen as Theme unless the speaker has a reason for choosing something else. Because this is the most typical or expected pattern, it is called the default or unmarked pattern. As a side note, a cline in scaling from ‘unmarked’ to ‘most marked’ does exist in every mood rather than any clear-cut division (Butt et al., 2000). The subject can be a noun group (pronoun, common or proper noun) or nominalization in the form of a wh-clause:

| He | laughed at my joke. |
| My sister Becky | lives in another state. |
| What I need | is to get a good grade on the test. |
| **Theme (unmarked)** | **Rheme** |

**Marked.** A speaker can depart from these more typical patterns by putting an adverb/adverb group or prepositional phrase in Theme position. For example:

| Class: adverb group | Early yesterday, | we went out for breakfast. |
| Class: temporal location adverb | Now | I see what you mean. |
| Class: prepositional phrase | In the end | they lived happily ever after. |
| **Theme (marked)** | **Rheme** |

An even more marked pattern emerges when the speaker wants to focus on the direct object rather than the subject. The direct object can be a noun group or a wh-clause:

| Class: noun group | This paint color | I love! |
| Class: wh-clause | What luggage they couldn’t carry with them | they put in a locker. |
| **Theme (marked)** | **Rheme** |

**Identifying Theme in the Interrogative Mood (Questions)**

**Unmarked.** The interrogative is typically used when the speaker asks a question. Interrogatives are separated between polar (yes-no) questions and content interrogatives. The natural starting point for polar questions can be a finite verb (can, might, have, do), and the topical Theme (sometimes noted as the ‘interpersonal/topical’ Theme) is realized by the subject:

| Have you | found the answer yet? |
| Finite, Interpersonal Theme | Topical Theme (unmarked) | Rheme |

Where the speaker requires specific information in a wh-interrogative, the wh-word (where, why, what, which, who, how) is the unmarked Theme:

| How | did you find the answer? |
| Interpersonal/Topical Theme (unmarked) | Rheme |
Marked. All other variations apart from the two examples above are considered to be marked – for example, when the Circumstance displaces the Finite or wh-word as Theme because it appears first in the clause:

<table>
<thead>
<tr>
<th>Circumstance/Theme (marked)</th>
<th>Finite</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the spring shall we go boating?</td>
<td></td>
</tr>
</tbody>
</table>

Identifying Theme in the Imperative Mood (Commands)

Unmarked. The typical function of an imperative clause is to give a command (do, put, give) or make a suggestion (let’s). The basic meaning conveyed from the speaker’s point of view is ‘I want you (or us) to do something’. When ‘you’ is not part of making a command, the unmarked Theme is the finite verb (give, don’t, let’s).

<table>
<thead>
<tr>
<th>Theme (unmarked)</th>
<th>Rheme</th>
</tr>
</thead>
<tbody>
<tr>
<td>Give it to me!</td>
<td></td>
</tr>
<tr>
<td>Let’s read the story together.</td>
<td></td>
</tr>
</tbody>
</table>

Marked. When you does begin the Command, it is considered a marked Theme:

<table>
<thead>
<tr>
<th>Theme (marked)</th>
<th>Rheme</th>
</tr>
</thead>
<tbody>
<tr>
<td>give it to me!</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, clauses with Circumstance as Theme are even more marked:

<table>
<thead>
<tr>
<th>Theme (marked)</th>
<th>Rheme</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under no circumstances open the door before you see who’s there.</td>
<td></td>
</tr>
</tbody>
</table>

Analysis

All choices are meaningful, but when researchers find marked Themes, they look for the purpose behind the speaker’s patterning (Butts et al., 2000). Examples of such a purpose may include a speaker’s intention to draw the listener’s attention to a particular group of words. However, according to Butts et al. (2000), more often it is to build a coherent text that is easy to follow.

The table below (Table 1) shows a separation of unmarked and marked choices of Theme in Aaron’s scenario text. I examined the marked Themes in order to help interpret Aaron’s purposes in choosing those Themes, along with any resulting messages these choices may have revealed to the students. Additionally, I observed how Aaron’s Thematic choices meshed with his overarching concerns in the text. Lastly, I made note of the ways Aaron was able to anticipate any understanding needs of the students. [Note: Because some adverbs refer to points or intervals of time in which an action or event takes place, I have chosen to classify Aaron’s word choices of ‘now’ and ‘then’ as temporal location adverbs (Altshuler, 2009). As adverbs, these two words constituted marked topical Themes in the table below.]

After analyzing Aaron’s clauses encoded in experiential, interpersonal and textual meanings, I put those meanings back together in order to talk about the scenario text as a whole – that is, the overall patterns of experiential meaning and message organization. Examining the structural configurations of each clause in Aaron’s text helped me understand the contribution that Aaron’s choice of Theme made to the cohesive development of the text.
Table 1. Aaron’s Scenario Text

Marked Theme selections are in red print; student responses are in blue.

Overview of Theme/Mood Analysis

The majority of this text was spoken in the declarative Mood (10 out of 15 clauses, approximately 67%). Only one clause was in the imperative Mood, and the remaining four clauses were in the interrogative Mood. Six of the 15 clauses followed a Theme to Rheme pattern while the remaining clauses followed a Theme to Theme pattern. The Theme to Rheme patterns were split between the declarative and interrogative Moods (four were declarative; two were interrogative). The nine Theme to Theme patterns were divided between the declarative, interrogative, and imperative Moods (six were declarative; two were interrogative; one was imperative). Eight of the 15 clauses were analyzed as marked (a little more than 50%), and through my analysis I concluded that there were four individual reasons doing so (see Table 2).

Table 2. Reasons for Selecting Themes as Marked

<table>
<thead>

Findings

Clauses 1.1 – 1.3

The first section of text is an introduction, although in clause 1.3 Aaron broke away from a more traditional introduction and asked a question. In noting the marked Themes, I found that Aaron’s purpose may have been to draw the group’s attention to Juan as the principal actor in the scenario. The following summarizes the Themes in this text with the experiential meanings italicized:

Textual Themes: none
Interpersonal Themes: Juan
Topical Themes:  
  Process: none  
  Circumstance: none  
  Participant: You’re (marked)  
  I (unmarked)  
  He (marked)
In this first section of text Aaron has set up a scenario for the group, his goal being to make borrowing money ‘more real’ for the students by involving them in the scenario. The experiential meanings center on the participants in the scenario: you’re (Juan), I (Aaron), and He (Juan). In particular, Juan is to be the main ‘actor’ in the scenario – that is, the person who would borrow the $1000 from Aaron. I selected both clause 1.1 and clause 1.3 as marked clauses for different, yet related reasons.

Aaron’s main purpose in the marked Theme in 1.1, ‘Juan’ (interpersonal) and ‘you’re’ (topical), may have been to engage Juan in discourse due to a concern that Juan was not interacting verbally with other group members. By designating Juan as principal actor in the scenario, Aaron signaled an expectation that he and Juan would need to talk about the task. Also, recognizing Juan by name suggests that Aaron made an interpersonal connection to Juan’s identity and individuality. Even though the students understood that Juan was not really going to borrow money from Aaron, clause 1.1 served as a command in the context of the scenario. While Aaron could have said “Juan is going to borrow $1000 from me”, his use of the verb ‘is’ reflected a state of being or that of existence. Using ‘is’ in that way would have indicated the declarative Mood rather than the imperative Mood. With Aaron’s command “Juan, you’re going to borrow $1000 from me”, the obligation to do so (or to think about doing so) was stronger.

Beginning clause 1.3 with the subject ‘He’ is an atypical way to begin a question in the interrogative Mood. However, this pronoun-reference to Juan again focused the group’s attention on Juan – that is (and to paraphrase), ‘Juan is the person who owes me money and how much money does he owe me?’ Aaron’s choice of ‘He’ in 1.3 did not signal a question directed to Juan alone; rather, all members of the group were invited to answer. However, Leslie was the student who answered with “one thousand, one hundred.”

**Clauses 2.1 – 2.8**

The second section of text is a procedure. In this section Aaron’s purpose may have been to build a coherent text that would be easy for the group to follow. The following summarizes the Themes in this section of text:

| Textual Themes: | Okay so, and, And, So |
| Interpersonal/Topical Themes: | What (unmarked) |
| Topical Themes: | none |
| Process: | now (marked), then (marked), now (marked), Now (marked) |
| Circumstance: | How (marked), what it says in the problem there (unmarked), you’re (unmarked) |

In this section Aaron used the conjunction ‘and’ with discourse markers ‘okay’ and ‘so’ as textual Themes (see marked clauses 2.1, 2.4 and 2.5). Prefacing the experiential meanings of participant, process, circumstance with these markers functioned to connect these meanings to neighboring clauses. This served to ‘signpost’ or guide the students through the scenario. For example in 2.1, Aaron said, “Okay, so now he owes me $1100. ‘So now’ served to characterize the upcoming action of owing money as pending or emerging (Altshuler, 2010). The temporal adverb ‘now’ (used in clauses 2.1, 2.5 and 2.7) located the action of owing money in a time continuum. In other words, Juan owed $1100 at that point in the scenario.
In clause 2.2 ‘how’ was identified as the topical Theme due to its adverbial nature. The word choice of ‘how’ as Theme is important here because it served to signal that Aaron was going to share his way of thinking about what it means to compute 10% interest compounded over two years’ time. Pedagogically, I found Aaron’s views interesting; he viewed the continuous nature of the function \( y = 1000(1.1)^t \) in the context of two discrete moments in time – a loan and a re-loan after the initial loan was paid back in full. Aaron told the group “…I’m going to pretend he (Juan) paid back all of that $1100. And then, I’m going to re-loan him that $1100 to him” (2.3, 2.4). In this way Aaron may have anticipated that the students needed to experience computing interest in that way; and that this manner of thinking could help the students better understand the relationships between using the y-function (with a calculator) and computing compound interest at two discrete points in time with paper-and-pencil.

**Clauses 3.1 – 5.1**

Aaron’s purpose in the last section of text may have been to signal a conclusion to the scenario and to end with a message that would turn the previous two sections of discourse into a coherent whole (5.1). In this section there is only one Theme identified as marked; the following summarizes the Themes in this text:

- **Textual Themes:** So, And, So
- **Interpersonal Themes:** How
- **Interpersonal/Topical Themes:** Isn’t
- **Topical Themes:** 
  - **Process:** none
  - **Circumstance:** now (marked), much total (unmarked)
  - **Participant:** the reason you’re not adding $110 each time (unmarked)

The purpose of the marked Theme in this section again served as a temporal location adverb.

**Interpretations of the Text as a Whole**

In this study Aaron attempted to guide an exchange of meanings as he tried to help a group of four students follow and understand essential meanings related to a task about compounded interest. To do so, he developed a scenario in which he invited one of the students, Juan, to be the principal actor. In this way he communicated to Juan a desire to include him in the discourse. And while Juan still did not interact with other group members in this excerpt of text, he did participate verbally later on with other group tasks. Aaron used textual and topical Themes that (1) cued the students about topics that were to follow and (2) drew their attention to particular statements or points in the scenario. Throughout Aaron’s text his choice of Themes focused on Juan and the other students. This was evidenced by the marked Themes in which Aaron chose participant as the experiential meaning. This suggested that ‘who’ was doing the mathematical work was as important to Aaron as the work processes themselves. I concluded from this that Aaron’s textual messages did mesh with his overarching concern that the students be engaged in thinking and talking about the mathematics.

While the majority of Aaron’s text was stated in the declarative Mood, he did ask questions in order to better grasp the students’ level of understanding. Working to guide an exchange of meanings with the students helped to signal a caring, an interpersonal relationship
with the students to ‘come along with me and my thinking’ in this scenario. Aaron’s questions towards the end of the text served to help him decide whether to go back and review any prior messages. For example, in clause 1.3 Aaron drew on Leslie’s correct answer and continued with, “Okay, so now he owes me $1100.” Again in 2.8, Aaron confirmed Alberto’s response and replied, “So now, you have $110 interest.”

**Concluding Remarks**

The third metafunction, the textual metafunction, constructs ideational and interpersonal meanings as information that can be shared by speaker and listener. “It enables this sharing by providing the resources for guiding the exchange of meaning in text” (Matthiessen, 1995, p. 22). I have introduced and elaborated on this metafunction and used a SFL technique that analyzes how speakers organize their messages. I used this technique to analyze the ways one secondary mathematics student teacher, Aaron, facilitated a group discussion – how he was able to keep the group well-informed about where they were in their understanding of compounded interest and where they were headed as the text unfolded.

As a mathematics educator and researcher, it has been both intriguing and challenging to view classroom discourse from a linguistic perspective. I have found it intriguing because zooming-in at such a fine-grained level has provided the analytical tools needed to reveal meanings about classroom discourse that I might have otherwise missed. However, I have also found using textual tools of analysis challenging because (1) I am not a linguist, and (2) I know that along with the ‘zooming-in’ there would also need to be a ‘zooming-out’ in order to provide enough context to make the analysis mean something to others in mathematics education. I conclude this paper by stepping back from my linguistic analysis and findings in order to highlight a few implications I see for using this analytic method.

From a practical perspective a teacher’s choice of how to begin each clause is instrumental in helping students piece together and connect mathematical meanings. Therefore, what comes first signals an important and separate kind of meaning to students. While experienced mathematics teachers may have the discursive moves to continually re-orient students’ expectations for the direction of an unfolding text, novice teachers may not be as aware of how students construe their messages. Examining Aaron’s text at such a fine-level of analysis has added to my understanding of how Aaron used textual resources to organize his messages. Stepping back to look at the scenario text as a whole, its overall patterns of experiential meanings and message organization, has helped me to see the contribution that choices of Theme make to the cohesive development of a text.

Moschkovich (2010, p. 152) has recommended that research needs to “recognize the complexity of language use in classrooms and the need to explore language in all its complexity” as a meaning-making system. SFL tools of analysis allow for the analysis of any text, thus providing a basis from which to discuss complex relationships between grammatical patterns and any meanings realized as expressions of semantic choices. Understanding more about the complexities of language and the ways that novice teachers chose to orient meanings in their messages can support researchers and educators in their efforts to help novice teachers become aware of their own language choices.

Problem-Based Learning Innovation and High School STEM Programs

STEM Education

Paper

This presentation will include an overview of STEM education in the United States and globally. A detailed overview of three California high schools utilizing problem-based learning in the context of STEM education will be shared.

Pepperdine University

Janice.filer@pepperdine.edu
Abstract: California is a world leader in STEM education in the preparation of students for the global society through innovation, inquiry, collaboration and creative problem solving (California Department of Education, 2016). This paper explores STEM education globally and includes a comprehensive overview of three high school programs. STEM education includes science, technology, engineering and mathematics. Through small learning pathways, three California High Schools have created problem–based learning through STEM curriculum. These schools have developed projects to provide students with the tools to examine real world problems through engineering, health/medical, criminal justice, and international business as focus areas.

Abstract

Having students involved with such service-learning web projects activities parallel my teaching philosophy as "you have to be able to practice what you teach". This session will describe the community outreach service-learning web projects where I have collaborated and coordinated with several local, regional and international non-profit organizations and small businesses to connect students in my Web Design Programming class with an actual business client as a requirement of the student final project.

Full Paper

These are communities’ outreach service-learning web projects where I have collaborated and coordinated with several local, regional and international non-profit organizations and small businesses to connect students in my COMP 2680, Web Design I Programming class requiring students to complete a final project for the course with an actual business client.

These outreach activities where students in my COMP 2680 would either create and/or modify a web site has become a win-win for the organizations involved, Thompson Rivers University (TRU), TRU Computing Science (CS) department and more importantly students in my COMP 2680 classes since 2003.

Starting in July 2016 these service-learning web projects have been extended to my distance education students via Thompson Rivers University Open Learning in my COMP 2681 course

How it all started?

I started teaching COMP 2680 in January 2001. Previously, this course was taught by a different faculty member, Dr. Richard Paweska. When Richard taught this course, he made students create an on-line version of their resume that usually consisted of about 3 web pages. I tried this for a couple of years and the feedback received from students was that it was boring and non-challenging.

As I was fairly new to Kamloops, and that the web was just starting to gain popularity an idea came across in 2003 about helping non-profit and small businesses develop web sites for their businesses. I knew that during that time very few businesses had a web site, so I knew this idea would be highly beneficial.

Why do outreach activities?

Having students involve with such service-learning web projects activities parallel my teaching philosophy as "you have to be able to practice what you teach". Further my philosophy is actioned in my curriculum by inclusion of the following three factors:

- Actual problem based hands-on learning
- Effective communication skills
- Foundation for life-long continual learning

My students learn to practice problem-solving, and critical thinking techniques for lifelong learning skills during the process of completing the service-learning web project with clients. Key benefits of service-learning web projects:
• For the students:
  - Interact with a real client, thereby promoting student engagement and learning. This enabled them to build skills like time management, project management, communication and technical skills to name a few.
  - Network with businesses thus building their own portfolio for either co-op jobs, webmasters or career upon graduation.

• For the organizations:
  - Have a current web site(s) with current web technologies implemented at no cost.

• For the department:
  - Enhances the name of the program in the communities where the web sites are designed and created.

• For the university:
  - Name is promoted and enhanced locally, regionally and internationally in the communities where the web sites are designed and created.

These outreach activities have been recognized by both within and outside TRU contributing to enhanced and innovative teaching, learning and service. Evidence shown in my application for promotion to SL by external reviewers.

**Process Involved**

First: I had to craft a web project document, a structure for students to follow. Sample shown during presentation

Second: Reaching out to local and surrounding businesses: Done by creating a small ad that was advertised with no charge through a couple of local radio stations, local TV station as well as through the local newspapers. Note: The responses received was overwhelming and it was no surprise I had a waitlist.

Third: Connecting teams of student with businesses. For the most part I gave students the liberty of forming their own groups usually two on average, though at times I have allowed 3 depending on the nature and complexity of the business. I require students to have their first meeting face to face within a week. The important piece is that businesses need to be aware that the web site would be limited to within the scope of the web project document. Further, a disclaimer is to be signed in that this work is student based not professional. Also businesses are required to provide contact, including images, video, audio and any other relevant information for instance logos, background images etc.

Fourth: Students embark on the creation of the web project. Businesses are free to suggest a design for the web site or alternatively students are free to suggest some design options.

Fifth: Students are often reminded to follow timelines in developing the web site based at the same rate as topics are presented during lectures.

Sixth: Sometime around just past mid-way of the semester the first evaluation of the web project is done. By this time, HTML & CSS must be in place. Placeholders are used for images or other content if not supplied by client.

Seventh: Three weeks later a second evaluation is done, by now JavaScript functional, advance CSS, multimedia features should be implemented.
Eighth: At this point teams wanting to implement extended web features are encouraged to have its implementation done. Note: Criteria for extended features will be explained during presentation. Base features must be in place before any extended features will be considered.

Note: Teams are encouraged throughout the project to work on project documentation, including the creation of the cross reference table for ease of marking. I will explain the purpose of the cross reference page during my presentation.

**Project Evaluation by Businesses:**

Students are to create an evaluation form that has to be signed off by the business. Samples of these will be shown during the presentation.

**Maintaining Such Outreach Activities:**

As the years went by from first initiation in 2003, the local environment was kind of saturated. Those wanting to have a web site created had one done. This is where I expanded to areas outside the Kamloops areas and went to other parts of BC. Communities included Chase, Salmon Arm, Nakusp, Clearwater, Kelowna, Vernon. Later it was expanded to include international organizations coming from mainly from international students who were enrolled in my classes.

Note: The various departments within TRU often has requested my help as well. This includes professors web page, research students wanting to showcase their work to the community.

Recently, some older businesses were wanting to have their sites updated with newer web standards, as well as, newer businesses moving to the Kamloops areas.

I believe that the web is an area where constant upgrading/maintenance is required on an on-going basis.

**What are the dangers in integrating these activities into courses?**

Not all businesses web sites would require all the requirements in the project document be fulfilled. In this way, students are given some flexibility, in that certain elements of the project requirements can be made as a sample but not included in the business web site. A link called cross reference page is where students can include info strictly for fulfilling course requirements.

**How to manage the client expectation in such activities?**

1. Clients need to know that web sites designed and created are by students' who are learning web design programming. Hence not to expect professional web sites, though in some instances client can expect one or the other extreme. (Web sites that are either badly designed or created or very well designed and created.) Lots depend on who are the students' being allocated.

2. Clients need to know that their web sites will be designed and created within the scope of the web project document which is in line with the course requirements. Although there are instances where some students’ go over and beyond the expectations of the course and project requirements.

**Web Project Listing:**

Listing of some web projects built by students of COMP 2680/COMP 2681 (Online version of the course) over the years can be viewed at:

http://faculty.tru.ca/mohda/studentsite
**Web Masters and further development:**

After the project is completed some businesses take on the students for further enhancing the web site beyond the scope of the project requirements and/or to be web masters for web maintenance.

Abstract and Full Paper

Yoga for Computer Users

Our bodies have been built to move! In our postmodern age we are spending too many hours in sedentary position, especially those hours spent in front of our computers. To counter the effects of this join us for ~ Awakening the Spirit Within ~

A 90-minute workshop for the practice of breath work, mindfulness, and a series of office stretches. An experiential environment that will promote a healthy kinesthetic environment!

Consciously, give yourself permission to be here, in this room, at this time. This is about you, for you. This experience is about you being with you. Lay down all that has come before and deliberately close the door to what lies ahead. Be in the moment, the now and become aware of what lies within you.

To do this, we start with Pranayama (Prana), the breath:

Key advantages of Prana:

1. Boast vitality
2. Gain confidence
3. Relieving stress
4. Rid of negative emotions

Different types of Prana breathing techniques

1. Cleansing or sigh breathe
2. Diaphragmatic or belly breathe
3. 4 part or square breath
4. Alternate nostril breathe (Balance breathing technique)
5. Lion’s Breathe

Mindfulness:

While focusing on your 4-part breath sequence, as thoughts come up recognize them for what they are and allow them to go thru’ you. You might find the River Bank analogy helpful.

While sitting comfortably on the banks of a river you see a raft floating down stream. As it passes by willing place your thoughts upon it knowing you can gather them later, that the universe will keep them safe until you retrieve them.

Title: Proposal Title: Decoding and Challenging Pre-established Notions of Female Oppression

Topic Area: Women of Color in Higher Education

Presentation Format: Panel Sessions (Panel or poster).

Abstract: This study examines how dominant Western discourse constructs the Middle East women as oppressed while it describes the views different individuals and societies have of them based on their culture, religion, and politics. This study seeks to extend gender theory and research on gender-based inequalities while addressing cultural imperialism and moral authority of Western culture and media. There is a strong correlation between women’s level of higher education and their critical consciousness regarding their oppression.

Paper Authors:

Author 1. Shahla Fayazpour; Department of Teaching and Learning/Curriculum and Instruction; University of Nevada, Las Vegas; fayazpou@unlv.nevada.edu

Author 2. Dr. Jane McCarthy; Department of Teaching and Learning/ Teacher Education; University of Nevada, Las Vegas; jane@unlv.nevada.edu
Abstract

Objective: This study challenges preconceived western-dominant critiques of female oppression through the comparative and intersectional analysis of women in the Middle East. Analysis of the gendered modernity/tradition binary logic serves as the conceptual backbone of the East and the West while it critiques the influence of media on individual and societal perspectives. Researchers in this study use the personal narratives of women to challenge capitalist views and notions of gendered oppression. This research offers a critical perspective on the Western construction of women in the East as oppressed and discusses the context and importance of storytelling to increase the level of critical consciousness. Researchers explore how “other oppressed” women might self-define their situation of oppression outside of media depictions and capitalistic notions propagated by the West. Most importantly, we highlight how women self-identify to debunk or challenge the “single stories” and essentialist categorizations of their particular cultural group. In this study, a critical pedagogy project emerged to bring about critical media literacy and intercultural perspectives of the “other” women in this study. This qualitative study also offers that women in the Middle East expressed personal might not offer resistance to their oppression; however, higher levels of education were associated with higher levels of critical thinking. In this study, women acknowledged the permeation of patriarchy across all aspects of society. In conclusion, it is important to mention that the “single story” of women’s oppression in the East such as Iran should not be used to generalize a situation of oppression for all women from this country.

Methodology: This research began with an interest in the inequalities of our society and schools. This study uses a multiple case study approach while it focuses on Feminist Theory and Critical Race Theory (CRT) as its framework in order to explain the role of media in the relationships
between the East and the West. This study comprises two phases, surveys and interviews as data-
gathering techniques. Participants include Women from the East. This research is advocacy
oriented with the aim of political and ideological motivation for society and institutions
regarding women oppression in society and schools.

**Expected outcomes:** The outcomes of this research might be helpful for future studies about
Women’s oppressions. This study might reduce West’s negative attitudes regarding Women of
color and might improve diversity and multicultural education in schools. Feminist theory is
integral to this study as it challenges essentialist categorization and a commonality of oppression,
recognizing that different individuals experience oppression differently. The interactive
educational project, which emerges from this study research, employs critical literacy to analyze
media representations of gendered oppression and deconstruct this media to redefine how our
oppression is propagated to others through a transformative critical media collage. The critical
pedagogy utilized in this study warrants a thorough exploration of the collaborative problem-
posing approach undertaken by the researchers.
Title: Co-navigating the U.S. Educational System by ESL students’ Parents

Topic Area: ESL/TESL

Presentation Format: Paper Session

Abstract: America is a complex society, which has been formed by diverse culture and languages. The number of ESL students is growing everyday while their academic success is essential in the greater achievement of the United States. Recognizing the increasing academic achievement gap between ESL students and majority students, and the role of parents in ESL students’ achievements, it is important to understand how these parents navigate ESL students’ education in the United States.

Paper Authors:

Author 1. Shahla Fayazpour; Department of Teaching and Learning/Curriculum and Instruction; University of Nevada, Las Vegas; fayazpou@unlv.nevada.edu

Author 2. Dr. Jane McCarthy; Department of Teaching and Learning/ Teacher Education; University of Nevada, Las Vegas; jane@unlv.nevada.edu
Abstract

**Objective:** The number of ESL (English as a Second Language) students is growing everyday, and many studies report persistent educational achievement gaps between majority groups and ESL students in the United States. Language barriers, lack of communication, and poor academic performance are the main issues that ESL students and their parents face in society and educational system (Nieto, 2004). Monocultural policymakers and teachers blame ESL students for being unwilling to learn English, and blame their parents for not caring about their children’s success or being involved in their children’s education. In addition, one-size-fits-all curricula in school disregard the knowledge and skills that bilingual and bicultural students bring with them to school. The goal of this intentional ignorance is forcing ESL students to fully adopt American culture and language and assimilate into the American melting pot. ESL students and their families are not welcome in American society and schools. The apparent strengths of knowledge and skills on the part of ESL students are converted to deficits in American society and schools. Consequently, bilingual students and their parents are considered as issue and problem in the U.S. educational system. Very few research studies examine the role of ESL students’ parents in their children’s academic outcomes. Likewise, researchers have not yet adequately analyzed how, why, and to what extent the parents of ESL students influence their children’s education and the strategies that they might use to be involved in ESL students’ academic outcomes. There is a need for a fundamental shift in society and schools’ deficit thinking about ESL students and their parents in order to reduce the achievement gaps across student populations. Identifying the barriers that ESL students and their families face in schools and the strategies that they use to navigate academic challenges is central in this research.
**Methodology:** This research began with an interest in a problem rooted in the inequalities of our society and schools that need information to make changes. This study uses a multiple case study approach while it focuses on Critical Race Theory (CRT) as its framework in order to explain the role of parents in academic performances of ESL students. This study comprises two phases, including pre-interview questionnaires and interviews as data-gathering techniques. Participants include eight parents of ESL students. This research is advocacy oriented with the aim of political and ideological motivation for society and institutions. The outcomes of this research might be helpful for future studies about the challenges that ESL students face in society and schools and the role of parental involvement and funds of knowledge in ESL students’ achievements. This study might reduce teachers’ negative views regarding ESL students and their families and might improve cultural practices that teachers implement in classrooms.

**Expected outcomes:** This study is based on several assumptions. First, it assumes that, with the shifting demographic origins of immigrants from Europe to other countries such as Latin and Asian countries, the one-size-fits-all European norms and standards aligned with American society and schools create social and academic barriers for ESL students and their families (Nieto, 2004). Second, society and Schools’ policy imparts bilingual and ESL students’ skills and background knowledge in order to prepare them for future globalization. Third, despite the deficit thinking paradigm held by dominant groups, teachers, and policymakers, ESL students’ parents use different strategies to be involved in their children’s education development and find a balance between home and dominant cultures to navigate their children’s education in the United States (Moll & González, 2004).
1. **Title of the Submission**: Towards a Framework for Building International Joint Degree Programs

2. **Name of the Author**: Shaohua (Linda) Pei

3. **Affiliation of the Author**: School of Education, College of Human Sciences, Iowa State University

4. **Address of the Author**: E045 Lagomarcino Hall, Iowa State University, Ames, IA, 50010

5. **Email Address**: lindapei@iastate.edu

6. **Abstract**: This presentation aims to develop a sustainable framework for building new international joint programs. Built on the comprehensive internationalization model proposed by American Council on Education, the proposed framework will serve as a practical road map for the specific procedures in establishing new international joint programs. Consists of three major steps, the framework is applicable to developing new international joint programs in diversified areas. A case study in a Sino-US joint program of food science will be demonstrated as the application of the framework. Potential difficulties through each step of the procedures will also be discussed, useful suggestions on how to overcome challenges will be provided as well.
IS THE KEY TO DEVELOPING A CRITICAL THINKER FOUND IN INSTRUCTIONAL APPROACHES?

Karla Saeger
University of Wisconsin-Whitewater
800 W. Main Street
Whitewater, WI 53190
saegerk@uw.edu
Introduction

Critical thinking has emerged as an essential learning outcome at all levels of education (Bailin, Case, Coombs, & Daniels, 1999) and a necessary skill to prepare students to be successful in a competitive, global environment (Partnership for 21st Century Skills, 2008). The 21st century has brought significant changes to the world economy. Trilling and Fadel (2009) described this shift as one moving from an industrial emphasis to one focusing on a global network of knowledge as the main contributor of economic growth. Senechal (2010) concluded these shifts in the global economy call for all of education to emphasize 21st century skills.

To be competitive in today’s global economy, educators in the United States must continue to demand innovation by incorporating skills that include critical thinking, problem solving, communication, collaboration, and creativity into every aspect of our education system (Partnership for 21st Century Skills, 2011), “creating an aligned, 21st century public education system that prepares students, workers, and citizens to triumph in the global skills race is the central economic competitiveness issue for the next decade” (p. 1). “We can no longer claim that the U.S. educational results are unparalleled. Students around the world outperform American students on assessments that measure 21st century skills” (National Education Association, 2012b, p. 1). It is imperative that education recognize and restructure, if necessary, the development of critical thinking skills to remain competitive in the global economy.

Facione (1990) argued that, since the late 1980s, critical thinking has been an important component of the K-12 and post-secondary curricula. More recently, the Association of American College and Universities (2007) identified critical thinking as one of several innovating skills needed to prepare students for post-secondary education. Many colleges and universities have recognized their role in developing critical thinking at the higher education level by specifically highlighting critical thinking as an institutional goal or outcome. Although teaching critical thinking is an essential priority of higher education, it is important to determine the extent to which critical thinking is already being addressed at the post-secondary level. In a recent study, Arum and Roksa (2011) found that undergraduates, during their first two years of college, only slightly improved in their critical thinking and complex reasoning skills. This evidence questions the effectiveness of the current approaches of teaching critical thinking skills in higher education.

Wisconsin’s vision of student success ensures every child is a graduate who has “successfully completed a rigorous, meaningful, 21st century education that will prepare [students] for careers, college and citizenship” (Department of Public Instruction, 2011, p. 11). In 2013, Wisconsin Department of Public Instruction released the Wisconsin Standards for Career and Technical Education ensuring rigorous and relevant content preparing students for college and career readiness. Included in these standards are the Wisconsin Common Career Technical Standards (WCCTS), which include specific competencies related to the development of critical thinking, reinforcing the importance of developing critical thinking skills in PK-12 students (Wisconsin Department of Public Instruction, 2013). This suggests that the development of critical thinking is not limited to higher education, but an integral part of K-12 education as well (National Education Association, 2012a).
As with higher education, PK-12 also has a role in developing critical thinking skills; however, Hayes and Devitt (2008) explained, “critical thinking strategies are not extensively developed or practiced during primary and secondary education” (p. 65), yet, critical thinking is supported as a skill that is important for students to be able to achieve as defined by the Wisconsin Common Career Technical Standards. Higher education is experiencing a similar challenge – critical thinking is often listed as an important outcome, and yet evidence suggests that students are not developing critical thinking skills (Arum & Roska, 2011). Daud and Husin (2004) described higher education’s instructional approach to develop critical thinking skills as often emphasizing, “what to think rather than how to think” (p. 478) and questioned this approach’s effectiveness. Critical thinking is clearly an important learning outcome at all levels of education; however, debates continue about how to best develop critical thinking.

**Literature Review**

There is little debate about the importance of critical thinking, but agreement on the best approach to teach critical thinking continues (Bailin, Case, Coombs, & Daniels, 1999). The American Philosopher, Robert Ennis, has an extensive career studying critical thinking focusing on how to define, instruct, and assess critical thinking in all levels of education. Ennis’ (1989) critical thinking typology of four types of courses offer a classification for instructional interventions related to instructional approaches. The four approaches are general, infusion, immersion, and mixed. Table 1 summarizes the four approaches as defined by Ennis (1989).

Table 1

<td>Combination of the General Approach with either of the Infusion or Immersion Approach</td>
</tr>
</tbody>
</table>

There is substantial research on the development of critical thinking skills in relation to specific pedagogical methods, but the research yielded mixed results. Bailey (1979) found greater gains of critical thinking scores in courses that emphasized critical thinking and problem solving instructional approaches whereas Eason (1986) found greater gains for students using out-of-class assignments designed to increase critical thinking. Tsui (1999) found writing assignments with instructor feedback, independent research projects, group projects, and essay exams seem to enhance critical thinking skills. Halpern (2001) showed instructional approaches that explicitly state critical thinking learning outcomes in discipline specific courses (infusion
approach) or in a separate, stand-alone critical thinking course (general approach) can improve critical thinking. Abrami et al.’s (2008) findings indicated larger instructional effects when critical thinking is clearly a part of course design. “Developing CT [critical thinking] skills separately and then applying them to course content explicitly works best; immersing students in thought-provoking subject matter instruction without explicit use of CT principles was least effective” (p. 1121). Aizikovitsh and Amit (2010) conducted a study that evaluated the infusion approach to the teaching of critical thinking skills through mathematics and used the Cornell Critical Thinking Test instruments and found considerably improvement in critical thinking abilities and dispositions. These studies indicate that critical thinking skills can be developed using various instructional approaches.

In contrast, some studies found no significant effects on the development of critical thinking skills in relation to specific pedagogical methods. For example, Mentkowski and Strait (1983) conducted an extensive longitudinal and cross-sectional study utilizing several measures of critical thinking at Alverno College. Critical thinking is the foundation of the curriculum at Alverno and followed an infused approach where courses specified critical thinking objectives as outcomes and included systematic assessments. They found no significant gains in critical thinking skills of the cohort groups in the cross-sectional comparison and no significant gains in critical thinking skills using two other testing instruments. Cotter and Tally’s (2009), findings supported the conclusion that differences in teaching method do not impact the development of critical thinking skills and concluded “critical thinking assignments did not have a positive effect on either formal operational thought or critical thinking skills” (p. 3). Johnson, Tenenbaum, and Archibald (2010) conducted a study that investigated if online social annotations affect the development of reading comprehension, critical thinking, and meta-cognitive skills in second semester freshman English classes. The results of this study found no significant difference between the online social annotation approach and the control group.

It can be concluded from the literature that studies involving the development of critical thinking skills through instructional approaches have produced inconsistent results. For example, studies conducted by Mentkowski and Strait (1983) and Cotter and Tally (2009) showed that the pedagogical approach to teaching critical thinking has no effect on the development of critical thinking. At the same time, Abrami et al. (2008) concluded the pedagogical approach to teaching critical thinking is most favorable to the development of critical thinking when critical thinking skills are first taught separately then applied to course content. Aizikovitsh and Amit (2010), found improvements in critical thinking when critical thinking instruction is infused in the subject-matter and critical thinking objectives are made explicit. These inconsistent results support the need for additional research in the area of developing critical thinking skills through instructional approaches. The following question guided this paper: What influence do embedded implicit or explicit approaches to the instruction of critical thinking have on the development of critical thinking skills?

Method

The literature suggests a long history of critical thinking development at all levels of education. Higher education does not seem to question the importance of critical thinking, but research findings showed complex and conflicting results. The focus of this investigation was to determine whether alternative instructional approaches to developing critical thinking,
exemplified by different general education requirements at different institutions, influence the development of critical thinking skills among undergraduate students.

This study focused on the development of critical thinking skills in Minnesota undergraduate students; therefore, the target population of this study was all undergraduate students enrolled in Minnesota four-year state universities. All universities share a common definition of critical thinking, but can be categorized into two distinct instructional approaches to developing critical thinking. Minnesota State University, Moorhead; Southwest Minnesota State University; and St. Cloud State University require a specific course in critical thinking. Bemidji State University; Minnesota State University, Mankato; Metropolitan State University; and Winona State University maintain critical thinking develops as a result of the completion of general education requirements, but does not require a specific course in critical thinking. This study compared the scores of the Cornell Critical Thinking Test between undergraduate students that were required to take a critical thinking course and undergraduate students that did not take a specific course in critical thinking.

**Population.** St. Cloud State University was selected because it is the largest university in the Minnesota State Colleges and University (MnSCU) system and represented students who were required to take a specific course in critical thinking. Winona State University was selected because it specifically promotes an “in-depth knowledge base along with the critical thinking and communication skills” (Minnesota State Colleges & Universities, n.d.) needed in careers and advanced studies. Winona State, the oldest university in the MnSCU system, represented students not required to take a specific course in critical thinking. These two campuses were selected to try and best represent the undergraduate population in Minnesota as well as the two differing approaches to critical thinking.

To obtain a sample of the larger population, this study utilized a stratified random sampling. At St. Cloud State University (SCSU) and Winona State University (WSU) by the end of their third year of college most students have completed the requirements to satisfy the critical thinking goal area; therefore, third-year undergraduate students were the population of this study. Working with the institutional research departments, I obtained the email addresses of third-year, non-transfer students as of the 2013 fall term at each respective college (defined by 60-90 credits completed). These lists were used to contact, by email, potential participants in this research study. The total number of possible participants at SCSU was 1,504, and the total number of possible participants at WSU was 1,211.

A total of 105 participants volunteered; 40 participants from WSU, and 65 participants from SCSU. The total number of participants from St. Cloud State University was 32 or 2.12% of the sample population. Of the 32 SCSU participants, 29 participants completed a critical thinking course and three participants did not complete a critical thinking course. The total number of participants from Winona State University was 22 or 1.8% of the sample population. Of the 22 WSU participants, zero participants completed a critical thinking course and 22 participants did not complete a critical thinking course. Overall, of the 54 total participants, 29 participants did complete a critical thinking course; 29 participants from St. Cloud State University and zero participants from Winona State University. Of the 54 total participants, 25 participants did not complete a critical thinking course; three participants from St. Cloud State
University and 22 participants from Winona State University. The total number of participants who completed a critical thinking course and the total number of participants who did not complete a critical thinking course are presented in Table 2.

Instrument for Data Collection. The Cornell Critical Thinking Test (CCTT), Level Z, was used to measure the development of critical thinking skills. The CCTT is a general critical thinking ability test used to determine the critical thinking abilities of students (Ennis, Millman, & Tomko, 2005). The test evaluates and predicts student skills in critical thinking. Level Z is for advanced and gifted high school students, undergraduates, graduate students, and adults and tests critical thinking in the areas of induction, deduction, observation, credibility, assumptions, and meaning (Ennis et al., 2005).

The test is structured as a multiple choice test where students are presented with a passage in which certain conclusions are underlined. Students then determine if the conclusions follow logically, contradict, or do neither. The CCTT is scored using the total number of right answers. No subset scores in the areas of induction, deduction, observation, credibility, assumptions, and meaning are calculated. Ennis et al. (2005) recommended “for rough diagnostic purposes, it is possible to compute subtest scores. Such subset scores, since they are composed of a small number of items, should not be used to make individual comparisons” (p. 7).

Reliability estimates for Level Z, using the Spearman-Brown approach, have ranged from .49 to .87 (Ennis et al., 2005). Ennis et al. (2005) used another measure of internal consistency defined as the “set of correlations between parts of the test and the total score” (p. 16). Known as the Kuder-Richardson approach, it “provides an index of internal consistency, not of ability to provide the same results repeatedly” (p. 16). The part-score for internal consistency KR-18 estimates for Level Z were .76, .66, .60, .55, .72, .65, and .65 with an overall total score of .76. Ennis et al. (2005) stated the scores were “almost as high as the internal consistency estimate (.76) for the whole test with the same administration of the test” (p. 17).

The validity of the Level Z test is based on criterion-related evidence and the correlation between level Z and other critical thinking and reasoning tests. Of the 11 critical thinking tests, Ennis et al. (2005) reported that “seven correlations between Level Z and other critical thinking
tests ranged around .50” which indicated a “reasonable degree of relationship, given the differences in approach of different test makers” (p. 32). Additional correlations of Level Z and other variables (IQ/Aptitude/Admissions, gender, academic accomplishments, grade level, personality, socio-and economic status) supported the “consistency and generalizability of these relationships, provid[ing] strong support for the construct validity of Level Z” (p. 38).

**Research Design.** This study followed a causal-comparative research design and investigated if alternative instructional approaches to developing critical thinking skills, exemplified by different general education requirements in two different MnSCU institutions, impacted the development of critical thinking skills in undergraduate students. This study compared two institutions, St. Cloud State University and Winona State University, as the independent variable, with critical thinking scores as the dependent variable. This study compared the scores between St. Cloud State University third-year, non-transfer students and Winona State University third-year, non-transfer students.

**Data Collection.** Students completed the Cornell Critical Thinking Test in paper-pencil format. Student identification was verified prior to testing. No other identifying information of the participants was collected or recorded. Each of the SCSU participants completed a course completion form indicating if they have completed one of the following courses: PHIL 194 Critical Reasoning, CMST 306 Rhetoric in Popular Culture, CMST 318 Argumentation and Advocacy, ENGL 306 Rhetoric in Popular Culture, POL 191 Introduction to Political and Legal Reasoning, and POL 192 Critical Reasoning: Issues and Events in American Politics. Each of the WSU participants completed a course completion form indicating if they have completed PHIL 110 Critical Thinking. In each testing session, students were given a testing booklet and scantron form. The testing booklet, course completion sheet, and scantron were collected at the end of the testing session. The scantron number, a yes or no indicator of completion of a critical thinking course, and scores from the scantron were manually entered in Statistical Package for Social Sciences (SPSS) for statistical analysis using a group statistics t-test that compared the scores of the Cornell Critical Thinking Test Level Z between participants who did not complete a critical thinking course with participants who did complete a critical thinking course.

**Results**

This study investigated the effect of two differing pedagogical approaches on the critical thinking skills among undergraduate students. Outcome variables are scores obtained as an overall score on the Cornell Critical Thinking Test Level Z. The data analysis included a group statistics t-test that compared the critical thinking scores of the Cornell Critical Thinking Test Level Z between participants who did not complete a critical thinking course with participants who did complete a critical thinking course. The aggregated data for this study showed that the scores of participants who did not complete a critical thinking course were slightly higher than the scores of participants who did complete a critical thinking course; however, the data analysis indicates that the effect was not statistically significant. Scores for students who completed a critical thinking course (M= 26.28, SD 5.61) were not significantly higher than the scores of students who did not complete a critical thinking course (M=28.10, SD 4.84), t (52) = 1.28, p = .205.
Discussion

Overall, the findings of this study did not reveal a significant difference in student scores resulting from the use of different instructional approaches; however, the current trend within education is to define critical thinking as a measurable student learning outcome, increasing the need to identify the most effective instructional approaches to improve critical thinking skills.

Perhaps it is not enough to study the difference in critical thinking scores based solely on Ennis’ (1989) classification of instructional approaches, but to include the dispositions necessary to use critical thinking skills. Ennis (1987) defines dispositions as seek reasons, try to be well informed, be open-minded, and be sensitive to the feelings, level of knowledge, and degree of sophistication of others (p. 12) among others. By definition, the general, infused, imbedded, and mixed instructional approaches each reference the development of critical thinking skills and dispositions. The Cornell Critical Thinking Test is a “general critical thinking ability test . . . and does not cover attitudes or dispositions of a critical thinker (Ennis et al., 2005, p. 2). This study focused on the approach of developing critical thinking skills rather than seeking to further define the specific skills and dispositions related to each respective approach. Understanding to what extent critical thinking skills are covered in course work and the role of how dispositions are included in the instructional process could impact whether students are able and willing to engage in critical thinking.

The inconsistency of content and delivery of critical thinking course materials may further complicate the effectiveness of a single critical thinking course. Tsui (1999) stated that “courses and programs designed to foster critical thinking might differ widely in content as well as delivery” (p. 186). It is questionable whether an institution can consistently apply critical thinking instruction across the curriculum in a way that improves upon the delivery of the content of critical thinking in the infusion or the immersion approach. Nonetheless, inconsistent instructional techniques between institutions and courses may have influenced the results of this study to find no significant gains in critical thinking.

This study is important because it brings to the forefront that instructional approaches alone may not influence the development of critical thinking skills. A closer look is needed at the impact of dispositions on critical thinking development and the delivery of course content. This study can further the discussion at all levels of educational institutions to be purposeful in including critical thinking learning outcomes in the overall curriculum plan and measuring the development of critical thinking skills and dispositions with consistent institutional assessments.

**Limitations.** The Cornell Critical Thinking Test (CCTT) measures critical thinking ability in the areas of induction, deduction, observation, credibility, assumptions, and meaning. The CCTT is a well-established testing instrument, “designed for evaluation and have been used in curriculum and teaching experiments for appraisal of the critical thinking ability of a group” (Ennis et al., 2005, p. 1). This study may be limited because the CCTT measures critical thinking ability, but does not measure if alternative approaches impact the development of critical thinking skills in undergraduate students.
This study assumed that the similarity of average ACT scores, average high school GPA, class rank, and high school preparation curriculum between SCSU and WSU participants would produce very similar study groups. That, in turn, would focus the interpretation on the primary dependent variable, the form of critical thinking instruction, rather than student’s academic abilities. This may not have been a valid assumption and, therefore, represents the second limitation of this study. This relationship between average ACT scores and average high school GPA could suggest WSU participants may have developed critical thinking skills prior to enrolling in college or were better equipped academically to further develop critical thinking skills during college instruction, whether through the general or immersion approach. In effect, the slightly higher scores of WSU students on the Cornell Critical Thinking Test Level Z may have occurred independent of the different methods for fulfilling the critical thinking goal area within the universities’ general education curricula.

A third limitation of this study is that it does not account for variables that could potentially contribute to the development of critical thinking skills such as: employment, leadership roles, and sports participation, among others. The development of critical thinking is not isolated to the general, infused, immersed or mixed approaches used in college curricula. Critical thinking skills can be developed through personal and professional experiences outside the classroom. This study is limited in that it did not account for other experiences related to developing critical thinking outside the college curriculum.

**Recommendations.** Several recommendations can be based on these findings. Instructors need to evaluate the role dispositions play in the development of critical thinking. Dispositions may influence the learning process in a critical thinking course, the delivery of content, and the overall learning process; factors that could potentially impact the development of critical thinking skills. Objective, standardized testing instruments are available to measure the growth in dispositions to think critically.

Pedagogy approaches to teaching and learning critical thinking may impact the development of critical thinking skills and dispositions. This study focused on the type of instructional approach (general, infusion, immersion, and mixed) and did not consider the impact of instructional techniques used in classroom to teach critical thinking abilities and dispositions. It is necessary to consider the instructional strategies, at the very least, utilized in critical thinking courses or content-specific courses that identify critical thinking outcomes.

**Future Research.** A more in depth study is needed on both the instructional approaches and instructional strategies used in classrooms to teach critical thinking abilities and dispositions. If the development of critical thinking is a gradual and cumulative process, then it is necessary to have multiple courses in which critical thinking skills and dispositions can be developed. It is Ennis’ (1989) mixed approach that combines a stand-alone critical thinking course with courses that infuse or immerse critical thinking skills and disposition into the content of the subject-matter. Further research on how instructional strategies develop dispositions is also needed to determine if students can apply critical thinking abilities to different contexts outside a critical thinking course.

The Role of Art in Chinese Society: Past and Present

Dr. Sally Stephenson
Frostburg State University

Abstract

Art has been an integral part of Chinese culture since time immemorial. For thousands of years, emperors and government officials have commissioned magnificent works of sculpture and architecture, while scholars, poets and painters have developed calligraphy, poetry and paintings of great delicacy and finesse. Historically, art in China has served important functions for those in power: protection, luxury, guardianship, politics, preparation for the afterlife, and maintaining historical records. Ways in which art has played a role for the general population have traditionally included creating harmony and balance, expressing beauty, scholarship, cultural decoration, providing a livelihood and entertainment.

Art in today's China takes on new significance with the modernization begun by the economic reforms of the twentieth century. In many ways, the traditional arts have survived in spirit and, in some cases, preservation (despite significant losses during the Cultural Revolution of the 1960's and 70's). However, a daring new vision of artistic self-expression is now emerging through the work of certain artists, not all of whom are in favor with the Chinese government. This presentation explores visually how the rich artistic traditions that have graced Chinese cultural life for millennia are still very much present in
modern China, a land and people striving to merge their ancient past with the dynamic present and the challenges of the future.
Experiential Learning in the Classroom: An OB/Leadership Simulation Project Phase II

Abstract
This is part II of a multi-phase project addressing the use of two specific experiential learning exercises and their results in both face-to-face and online leadership education in a college of business. In the first phase, we used Kolb’s (1984) Experiential Learning Theory (ELT) to conduct a role-play exercise based on Comer’s (1993) face-to-face role-play. We conducted the exercise through asynchronous discussion boards in a learning management platform. In part II, we use a synchronous team based simulation to determine the impact of experiential learning on leadership classroom. We use the Harvard Business School “Leadership and Team Simulation: Everest” exercise to examine how instructors can use this tool to help facilitate student learning. Instructions for conducting the simulation are outlined. Results of the data are discussed as well as the future direction of simulation use and learning in the classroom.

Experiential Learning Online and in the Classroom:
An OB/Leadership Simulation Project Phase II

Introduction

This is the second phase of a multi-phase project addressing simulations in face-to-face and online leadership education. In the first phase of our research, we used Kolb’s Experiential Learning Theory (ELT) to evaluate the impact of experiential learning by comparing face-to-face and online learning environments. A role-play exercise based on Comer’s (1993) in-class (face-to-face) role-play was conducted through the online discussion boards of a learning management platform. Issues that arose during the first phase of the project involved online students being required to log in periodically during the week the exercise was conducted to post their comments and discussion. This allowed some of the students to social loaf or provide limited participation potentially negatively impacting the outcomes for the other students on their team. These issues were not present in the face-to-face courses since the exercise was conducted in a single class session rather than during a weeklong virtual session. As an extension of this research, the exercise was changed to mitigate the impact of time for online students. In phase II we again, investigate how experiential learning may improve student learning of leadership and teamwork skills through a simulation exercise in online classes using face-to-face courses as a control. In Phase II, the simulation we used is the Harvard Business School “Leadership and Team Simulation: Everest”. We provide instructions and best practices for conducting the exercise. Results of the data will be discussed as well as the future direction of experiential learning in online classrooms.

Research Objectives
1. Is experiential learning/classroom simulation an effective way to learn leadership and team dynamics in the classroom?

2. Is experiential learning effective in an online classroom?

3. Can a role-play exercise facilitated in an online discussion board effectively foster learning in an online classroom?

**Methodology**

**Sample.** The sample for this study is graduate students enrolled in a graduate Foundations of Teams and Leadership course at a private western university in the United States.

**The Exercise.** The students will participate in the Harvard Business School “Leadership and Team Simulation: Everest” exercise. The exercise is conducted in a computer-based environment where students will work on individual workstations. Participants can discuss actions, make decisions and communicate openly but must use the simulations chat function so that conversations can be monitored and captured. Since this exercise is conducted in a virtual environment and all communications are done by electronic means makes this an excellent choice to compare learning in both the face-to-face and online learning environments.

**Procedures.** All activities will take place in either a computer/collaboration classroom or through the discussion module of a learning management system. Subjects will first be asked to fill out a pretest asking general knowledge about leadership, teamwork and organizational behavior concepts. The instructions specifically ask subjects not to refer to the course textbook or to use the Internet to find the answers.

Next, each subject will register for the simulation at HBS Publishing website (link provided). Subjects are assigned to groups of five individuals at the beginning of the semester so they may develop as a team. Each student is assigned a role within his or her team. These roles
are pre-determined in the simulation. The roles within the simulation include the team leader, a team physician, a photographer, a marathon runner and an environmentalist. In the event there are more members in a specific course a sixth team member can be assigned as an observer. Subjects are told that they will partake in a role-play activity that will demonstrate different leadership and teamwork concepts. Each individual in the group then can view the role they have been assigned and instructions for completing the simulation exercise. The scenario of the simulation involves being part of a team attempting to climb Mount Everest. The simulation covers five simulated days of activities where the teams will ascend to four separate camps and finally to the summit. Groups have one class period (approximately two hours) to conduct the simulation. Subjects are reminded to “keep in character” for the duration of the activity. At the conclusion of the role-play activity, subjects will fill out a posttest and participate in a debriefing of the exercise.

In addition to the post-test, students will complete a reflective analysis on the exercise that addresses the four components of Kolb’s (1984) Experiential Learning Theory and specifics about the dynamics of the team they were assigned to. These reflections are composed of open-ended responses to a number of prompt questions.

**Data Analysis.** Data will be analyzed using both simple t-tests to compare face-to-face and online classes perceptions of learning and team performance. Additional multivariate tests will be conducted on the data using participant demographics as controls. These include student gender, program and mode of instruction. Testing will be based on descriptive statistics. Simple t tests will be used to compare pre- and post-test results from the groups.

**Discussion of Expected Outcomes**
Following experiential learning theory outlined by Kolb (1984), the modality of a learning exercise administered in either an online or face-to-face classroom should not matter. According to Kolb & Kolb (2005), learning is a process that allows individuals to reflect on past knowledge and experience while integrating new knowledge and experience. Instructors need to be prepared to deal with social loafing in groups in both modalities. This can occur in both classroom modalities, however, it is much easier for students to “drop out” of their participation in the group role-play. This has a negative consequence to those who are participating in an simulation. This phase of the research removes the need for participants in the online environment to frequently log into the LMS to participate by conducting a simulation that runs continuously requiring students to remain logged in for the entire duration. The one drawback to this for online students is the need to set a time for the simulation at a day and time that would be available for all students to participate regardless of where they are physically located. In the six times the simulation has been conducted there have been no problems arriving at a day/time that works for all participants.

Work in progress: Research proposal

Kitty L. Deal

Ph. D. student at the University of Alaska Fairbanks, Indigenous Studies: Education & Pedagogy
Abstract

Gilmore, Smith and Kairaiuak (1996) challenged faculty within the University of Alaska system with the following: “It is imperative that we take individual and institutional responsibility for critically examining the practices of our own institutions and for initiating and maintaining an open dialogue that will ultimately nurture the possibilities for growth and change within our institutions” (p. 274). In my research, I will examine my implementation of the University of Alaska Anchorage (UAA) College of Education (COE) Education program at Kodiak College (KoC) from a macro- to micro-level, looking for the benefits and challenges for Kodiak Island teacher candidates in delivery methods, community integration, and departmental practices. As Coordinator of UAA Education programs on the Emerald Isle, I have a vested interest in this mixed methods, participatory action research (PAR) study designed to increase the number of Alutiiq (Alaska Native) teachers for our local community and village schools.
Research Issues

Current and future rural Alaskan teachers

Who is currently teaching in rural Alaska’s schools?

In the majority of the classrooms, Caucasian teachers, educated in the Lower 48, are instructing children in Alaska’s rural schools. “Statewide, about half the students in Alaska public schools are White, but almost 90% of the Alaska’s teachers are White. Alaska Native and American Indian teachers continue to comprise only 5% of the teacher workforce and other minorities another 5%” (Hill & Hirshberg, 2013, p. 4). Significant differences exist not only in the ethnicities, but also between the worldviews of Alaska’s students and their teachers. These disparate demographics, unfortunately, have remained consistent in last ten years (Hill & Hirshberg, 2005). Kodiak Island Borough School District does not publicly disseminate information on current teacher demographics, but like the rest of the state, the workforce appears to be overwhelmingly Caucasian. Research has shown that the prevalence of Caucasian teachers in rural, predominantly Alaska Native schools continues to perpetuate the dominant Western culture and educational philosophies of assimilation. (Anderson-Spear & Hobson, 2003; Kawagley, 1999; Kawagley, D.Norris-Tull, & R.Norris-Tull, 1998; Lipka, 1998; MacLean, n.d.; Ongtooguk, n.d.)

Preliminary findings in Alaska’s teacher supply, demand, and turnover were recently released by Hill and Hirshberg (2013) of the Center for Alaska Policy Research (CAPR) at the University of Alaska Anchorage. Teacher turnover in rural Alaska schools was found to be twice as high, on average, compared to urban schools (p. 1). The findings also revealed new teachers prepared outside of Alaska, had twice the turnover rate as new teachers prepared inside the state
Teacher turnover can be correlated with low student achievement (Hill & Hirshberg, 2005). Data on teacher turnover were, unfortunately, consistent with reports done over the last ten years (Hill & Hirshberg, 2005).

**Who should be our future teachers for Alaska?**

Rural Alaska Native students have the right to receive a culturally relevant education delivered by teachers who desire to live in rural Alaska, understand the context, and support the Alaska Native language and culture. Culture based education (CBE) has been a key component in significant educational progress being made with Hawai‘i’s K-12 indigenous students. (Kana’iaupuni & Kawai‘ea’a, 2008; Kana’iaupuni, Ledward & Jensen, 2010). For the purposes of their research, Kana’iaupuni, Ledward, and Jensen (2010) explained that “CBE is identifiable by five critical components including language, family and community, content, context, and assessment” (p. 4). I propose that Native Alaska educators are best situated to connect to their students through their Alaska Native language, involve the families, and fully understand and engage in the local community because they are already an existing member of the community.

The University of Alaska (UA) Statewide has identified teacher education as a primary initiative in its *Shaping Alaska’s Future* (2014) Mission statement: *Productive partnerships with Alaska’s schools:*

The professional preparation that leads to retention of Alaska-educated teachers, especially those in rural Alaska, begins with UA’s education programs and continues into UA Statewide’s Alaska teacher placement process and the Alaska Statewide Mentor Program. The legislature has made it clear that UA is neither recruiting enough education students nor graduating enough teachers who are willing to accept positions in rural
Alaska and remain teaching there long enough to positively impact student learning.

(Issue B)

As a teacher educator for the University of Alaska Anchorage’s (UAA) College of Education (COE) at Kodiak College (KoC), a rural Alaska community campus, my charge is clear, not only as University directive, but also from a social justice stance.

**Embracing the challenge**

Gilmore, Smith and Kairaiuak (1996) challenged faculty within the University of Alaska system with the following: “It is imperative that we take individual and institutional responsibility for critically examining the practices of our own institutions and for initiating and maintaining an open dialogue that will ultimately nurture the possibilities for growth and change within our institutions” (p. 274). In my research, I will examine my implementation of the UAA COE Education program from a macro- to micro-level, looking for the benefits and challenges for Kodiak Island teacher candidates in delivery methods, community integration, and departmental practices. As Coordinator of UAA Education programs on the Emerald Isle, I have a vested interest in this mixed methods, participatory action research (PAR) study designed to increase the number of Alutiiq (Alaska Native) teachers for our local community and village schools.

Tedmanson and Banerjee (2010) explain that participatory action research “is an emancipatory method in which individuals affected by an issue or problem engage in activities of practical relevance to their lived experience, generating new understandings of both process and context. It is a method that enables the coproduction of new knowledge and theoretical insights for innovation and social change in applied contexts” (p. 656). The authors go on to explain that
“when communities initiate, design, implement, and participate in directing collaborative actions for local benefit, a transformation of power occurs. This method contributes to decolonizing power relations between the researcher and the researched” (p. 658). PAR also emphasizes the necessity to reflect on the application and results of the actions taken, consider what worked and what did not, and make changes in the process or activity if needed. These “cycles of reflexivity” (p. 658) require that research should not be just an academic exercise, but a catalyst for action and change when indicated. This pattern of reflection is consistent with Indigenous research. Patel explained that she would take a “pause” (p. 358), and Walters (2009) stated that silence can be healthy when used as a time of quiet before “seeking the sacred” (minute 6:08). Archibald (2008) reported that an Elder shared that the ancestors “said that it is important to take time to sit, think about, and feel what we have learned” (p. 53). A deep reflection on one’s practice can result in powerful understanding and lead to effecting change.

Participatory action research resonates with my epistemology, as I acknowledge different Ways of Knowing, information gathering, and knowledge transmission which goes beyond Western academic research methods. Seeking the wisdom of the People in the community, the researched, is necessary for this researcher. Participatory action research also aligns with my ontology, a social justice stance to approaching education and research. Billies, Francisco, Krueger, and Linville (2010) articulate my views when they wrote,

“We have been influenced by the work of activist scholars from the late 1960s and 1970s—an era when activists challenged oppressive and exclusive structures that maintained social inequalities and academics sought ways to make their research relevant to the social issues demanding attention and social change.” p. 277
The macro- to micro-level review of benefits and challenges for Kodiak Island teacher candidates calls for a mixed method review, examining both quantitative institutional data and qualitative information gathered from community agencies/organizations, community members, Elders, and teacher candidates. Four areas of focus will contribute to answering the primary and secondary research questions:

**eLearning for future educators in rural Alaska**

During his keynote address to the Alaska Federation of Natives in 1985, John C. Sackett stated, “To get a degree and a high-paying job means that Native students must leave their village. They must leave home and family. They must leave a way of life to relocate in larger communities, indeed in another world, in order to achieve the success defined by our schools” (p. 32-33). It was a hard sacrifice for young men and women then, as it is now, 29 years later. What
has changed in that time period, however, is access to higher education and the ability to earn a teaching degree without leaving home in rural Alaska. Ray Barnhardt (2010) voiced encouraging words in relation to Alaska Native education by saying, “This picture is not as bleak as it once was, however, as indigenous people themselves . . . have begun to rethink their role and seek to blend old and new practices in ways that are more likely to fit the contemporary conditions of the people being served” (p. xxi).

I propose eLearning teacher preparation programs could fit into contemporary conditions and positively effect change by increasing the number of indigenous teachers serving rural Alaska schools, and specifically Kodiak Island. Teacher candidates in rural Alaska do not have access to a main University campus so a significant portion of any Education degree must be earned via eLearning. Determining students’ success in eLearning based on delivery methods would provide valuable information for University of Alaska Education professors in scheduling courses to meet the needs of Alaska Native students.

Using a University of Alaska Banner system search, I will identify eLearning Education courses successfully completed by self-identified Alaska Native students who have an Alaska rural zip code. Successful completion rates of eLearning courses, based on synchronous or asynchronous delivery, will be compared. For the purpose of this study, course completion will be defined as earning a passing graded (Letter grade D or higher).

**Strength-based research with community collaboration**

The characteristics of Indigenous research begin with an obligation to serve the community and its members above all (Archibald, 2008) and conduct research with respect, relevance, reciprocity, responsibility, (inter)relatedness/relationships (Archibald, 2008; Brayboy
et al., 2012; Johnson, 2013; Leonard, 2013; Smith, 2012; & Wilson, 2008), holism, and synergy (Archibald, 2008). Another primary consideration for conducting Indigenous (or any marginalized group) research is using the “Rs” to build a framework of “self-determination, decolonization, and social justice” (Smith, 2012, p. 4). Using a “strength-based” process has the potential for “essentially redefining relationships between and among researchers and the researched to establish truly collaborative relationships in which power is viewed as a shared resource” (Brayboy et al., 2012).

Collaborative, reciprocal relationships between the KoC Education Department and Kodiak Island’s community agencies/organizations will provide a platform for shared dialogue, understanding, power, and action. The Alutiiq Museum, Native Village of Afognak, Kodiak Area Native Association, and the KoC Alutiiq Studies Program are key agencies/organizations that represent the Alutiiq People on Kodiak Island. Linda Smith (2012) reminds researchers, “In Indigenous frameworks, relationships matter. Respectful, reciprocal, genuine relationships lie at the heart of community life and community development” (p. 125). After consent is in place, I will build collaborative, reciprocal relationships as “community capacities” (Smith, 2012, p. 213) by holding multiple discussions and brainstorming sessions with the respective directors or key personnel from the identified agencies/organizations. Mutually beneficial projects, priorities, and/or processes, designed to bridge the educational institution with the community agencies/organizations will be identified and Memoranda of Understanding will be signed. Articulating expectations and activities will provide structure for the partners and a document to guide reflection on what is working, and what needs to change. It can be a tool to effect change through the participatory action research cycle. Barnhardt and Kawagley (n.d.) remind scholars that establishing partnerships with Alaska Native groups has great potential benefit. They note,
“We can enter into joint ventures that are mutually respectful and recognize the validity of diverse sets of knowledge, as well as the benefits to be gained if they are pooled together in complementary ways” (para. 22).

**Strength-based research with cultural input from community members**

In research and education it is important to get cultural input from Elders and community members. Although writing a dissertation is considered the work of the graduate student alone, input needs to come from appropriate sources. This directive is stated (Alaska Native Knowledge Network [ANKN], 2000) and thoroughly discussed as an imperative for Indigenous research (Alaska Federation of Natives [AFN], 1993; Archibald, 2008; Lewis, 2011; Smith, 2012; Wilson, 2008). The AFN *Guidelines for Research* (1993) declared, “The best scientific and ethical standards are obtained when Alaska Natives are directly involved in research conducted in our communities and in studies where the findings have a direct impact on native populations” (para. 3).

I will seek guidance from Alutiiq community members through conversations held in focus groups. The Kodiak Rural Regional Leadership Forum convenes twice a year so Alaska Native community representatives from town and the six villages on Kodiak can gather to discuss local concerns and seek solutions on community issues. This group would provide excellent feedback on existing benefits and challenges for local teacher candidates to pursue an education degree at UAA/KoC.

After obtaining consent for participation, either through written responses and/or audio/video recording the session, I will briefly explain that my research and goal is to promote Alaska Native teacher candidates in the KoC education program. I will seek advice from the
participants on ways to improve the existing program and departmental practices at KoC. Open ended questions will be asked to glean information. Questions or requests might include the following:

- Please share your opinion on having teachers who are Alaska Native at your local school and in your community.
- Please share your opinion on the challenges of recruiting and retaining teachers who are Alaska Native at your local school.
- How might KoC best serve Alaska Natives who might want to become teachers?
- Have you noticed any obstacles or challenges for your community members who might want to study education at KoC? How do you think KoC could eliminate, or at least reduce the obstacles?
- Do you have anything you want to add about teacher education on Kodiak Island?

Written responses or transcripts of the audio/video recordings will be analyzed for themes and specific feedback that could be applied in the teacher education program. Information gathered from participants could be reported back to the Kodiak Rural Regional Leadership Forum at a subsequent meeting.

**Strength-based research with cultural input from Elders**

The literature also encourages researchers to seek out the “mentorship” of elders to promote practices which are “culturally safe” (Smith, 2013, p. 186). Elders, keepers and dispensers of history and knowledge, share their stories, insights and wisdom in an individualized manner based on the needs of the listener. Researchers are encouraged to seek out guidance from Elders as they approach the community, patiently listen to gain insights, and then
double check their understanding by returning to the Elders for confirmation. The Elders know “values and respectful practices were intertwined with identity, places, and place-named stories” (Archibald, 2008, p. 74) and their expertise and insights play key roles in successful research.

Interviews with two or three Kodiak Island Elders and/or knowledgeable community educators would provide me with crucial insights and understanding on how the KoC Education program could best serve town and village teacher candidates. The consent process and topics of inquiry would be similar to the focus groups, and audio/video recordings would also be requested for transcription. With the Elders, however, I would hold more of a personal conversation and allow the answers to be given over time and repeated visits. Archibald (2008) reminds researchers that the expectation should be that “important cultural knowledge and teachings are learned carefully—over time—through interaction with Elder teachers” (p. 37). The transcripts and findings would be reviewed with the Elders to assure accuracy and gain any needed clarification.

**Strength-based research with input from Kodiak College students**

If recent Alaska Native graduates of the teacher education program are available for an interview, the feedback would be invaluable. Their knowledge and experiences of the institution and program benefits and challenges would be an authentic voice in the research process. They would have keen, realistic views of the system after successfully navigating it to reach graduation. At the time of this writing, there are Alaska Native teacher candidates in the Education program, but they have not yet graduated.

There is a conflict of interest in interviewing any student still in the education program, however, because of my dual role as the teacher candidates’ clinical faculty and seminar
professor. The role of clinical faculty is to evaluate interns’ performance in the classroom which determines the ability to earn an institutional recommendation for teacher certification. It would be inappropriate to ask a teacher candidate to participate in the study as s/he might feel obligated to agree to my request. The timing of the interviews and the potential for alternative interviewers will be explored as appropriate options.

My research issues

History of UAA College of Education at Kodiak College

According to Jacobs (2010), the UAA College of Education was officially established in 2002, and recognized by National Council for Accreditation of Teacher Education in 2005. The Bachelor of Arts in Elementary Education and Early Childhood Education, the two UAA COE programs supported at Kodiak College were introduced by the COE in 2006. The first KoC faculty member for the College of Education, Dr. Delany Smith, was hired in 2007, but served only three semesters before leaving the island. The Education program at KoC struggled with no faculty as attempts to fill the position were met with a failed search. I was hired in fall 2009 as a term associate professor. Over the past six years, the KoC Education program has grown to serve approximately thirty Kodiakans actively engaged in Education programs. The first on-island graduate walked across the stage in 2012, followed by another in 2013. There were four graduates in spring of 2014. Certified teachers from the UAA COE at KoC program now serve in all four of the Kodiak Island Borough School District Elementary Schools, and at Kodiak Middle School (sixth grade).

As a rural setting, accessible only by boat or plane, Kodiak has unique needs for teachers who want to commit to long-term island living. Offering Education programs to teacher
candidates already residing and invested in the community is a good solution to this need. The demographics of participants in UAA COE at KoC program do not yet mirror the students in Kodiak’s K-12 classrooms, however, I am hopeful that this participatory action research study will provide data to help me increase the Alaska Native teacher candidates in the program.

**Research/Cultural Documentation issues anticipated for my research**

Specific advice for sharing power with the Indigenous community and its members was gleaned from the literature. First, researchers must constantly question their personal motives, explore who benefits from the conducted research, examine who has the right to share discovered knowledge, and to what extent (Archibald, 2008; Brayboy et al., & Smith, 2012). A second piece of advice was to listen deeply and respectfully (Archibald, 2008; Brayboy et al., 2012, & McCarty, Wyman, & Nicholas, 2014). I particularly enjoyed the Elder’s advice shared by Archibald (2008) to listen with “three ears: two on the sides of our head and the one that is in our heart” (p. 8).

As a non-native in an Indigenous Studies program, I recognize I may at times find myself in conflict between Western and Indigenous theories. I must be especially cognizant of the biases formed as part of the dominant society. I must work harder to conduct research with respect, relevance, reciprocity, responsibility, and (inter)relatedness as an “outsider” (McCarty et al., 2014). I must be hyper-vigilant to promote self-determination, decolonization, and social justice with the individuals involved in my research. As Archibald pointed out, non-native researchers should not be excluded, but should be invited into the “conversation” and follow the lead set by Indigenous researchers (p. 19).
I also realize I have the obligation and opportunity to frame my research questions and methods differently than what might be expected in Western academia. I will avoid using a deficit model and strive to be mindful of the power, policies and practices used in my research in my local community. The PAR model, with a stance in social justice provides the platform to respond to the request by Indigenous scholars to discontinue coloniality currently found in educational research (Archibald, 2008; Battiste, 2008; Ormond, Cram, & Carter, 2006; Patel, 2014; Smith, 2013; Wilson, 2008). Patel (2014) encourages researchers to shift their focus away from “those struggling” and “the area of need” and instead focus on the bigger issue, the “system that comprehensively functions to secure and refresh higher status for those already holding power and marginalize non-dominant populations” (p. 365). My plan for this study will seek to focus on what strategies I can utilize in my practice as a pre-service teacher educator to recruit, best serve, and retain Alaska Native teacher candidates. The examination and focus of improvement is on the educational system and program delivery model to meet the needs of all teacher candidates, especially our future Alutiiq educators. Listening to voices of the teacher candidates and community will be courageous, essential, ethical, and necessary for successful social justice research (Ormond, Cram, & Carter, 2006).

As I seek answers to questions about teacher education on Kodiak Island, I also need to remember, “Researchers are knowledge brokers, people who have the power to construct legitimating arguments for or against ideas, theories or practices. They are collectors of information and producers of meaning which can be used for, or against Indigenous interests” (University of Victoria as cited by Ormond, Cram, & Carter, 2006, p. 177). I have a responsibility to my community to carefully consider the results of my research, since I am in a position to have the theories I develop inform my practice as the Education faculty and
Coordinator of UAA Education programs on Kodiak Island. I take this ethical responsibility seriously and will keep the research focused on practices that benefit the Alaska Native community with whom I work. I will also have the responsibility to reciprocate by keeping my community partners informed and taking action on pertinent recommendations.

**Respect for cultural knowledge and culturally considerate information analysis**

I will not only abide by UA’s Responsible Conduct of Research expectations throughout my research and reporting process, but additionally, in accordance with participatory action research. “PAR’s democratic ethics require that people have genuine say in the decisions taken within local action and work toward great participation by all strata of the population” (Billies et al., 2010, p. 280). This not only means checking in with the partners at the conclusion of the study, but throughout the study. Wilson (2008) reminded researchers, “One method through which authenticity or credibility may be ensured is through continuous feedback with all the research participants. This allows each person in the research relationship to not only check the accuracy of the analysis but also to elaborate upon ideas and to learn from other participants” (p. 121). The nature of my work in the KoC Education Department and involvement in the community will allow for continued reciprocal exchanges of information throughout the study, at the formal conclusion of the study, and beyond the writing of the dissertation. The true indication of the success of my research will be to see more Alutiiq educators on island for our local and village schools.

**Conclusion**

As I work and research in the Indigenous community on Kodiak Island, I will strive to humbly approach my task of building a framework of “self-determination, decolonization, and
social justice” (Smith, 2012, p. 4) in the KoC Education program based in the information
gathered in this study. I will work collaboratively with the community, Elders, and teacher
candidates to conduct participatory action research with respect, relevance, reciprocity,
responsibility, and to build relationships that persist beyond the study.

Belmont University’s Department of Education provides opportunities for teacher education candidates and faculty to advocate for children, families, and the community through engaged service in intentional field experiences and clinical placements. This paper discusses how and why Belmont’s Educator Preparation program utilizes embedded, cohesive coursework in local schools and community organizations accompanied by texts, speakers, and resources that provide multiple perspectives on development, education, and community to develop faculty and pre-service teachers intellectually and socially.

ABSTRACT:
Advocating for Intellectual and Social Development Through Engaged Service Learning Opportunities in Teacher Education

Belmont University’s Department of Education continually strives to be a teacher education program dedicated to preparing educators by utilizing real world experiences through the spirit of service. As a School within a University that has a heart for service learning, it is a natural extension of Belmont’s mission and vision for the Department of Education to provide opportunities to learn, serve, and advocate for children, families, and schools in our diverse community. We have found through our own experience, as well as research, that we learn best through interactions with others in a real world context which allows us to develop not only intellectually but also socially (Bates & Lin, 2015; Dewey, 1916; Vogelgesang, Drummond, & Gilmartin, 2003; Vygotsky, 1978; McEwin, et. al, 1995).

In fall 2015, our department began the strategic planning process to develop a more clearly articulated Mission Statement as well as a shared Vision and set of Beliefs that more accurately reflect our mission to be an education program that prepares “educators and leaders of organizations who champion equity, opportunity, and dignity for all”. This Vision to “prepare professionals of diverse backgrounds to develop the knowledge, skills, and character necessary to become exemplary educators and leaders who advocate for children, families and communities” plays a pivotal role in the field placements, assignments, texts, and materials we utilize to create well-rounded and self aware educators. We, as a department, feel the best way to achieve our Mission and Vision is through embedded, cohesive coursework in local schools and community organizations accompanied by texts, speakers, and resources that provide multiple perspectives on development, education, and community.
These clinical experiences are designed to provide opportunities for faculty, students, and staff to inform, shape, and reflect on professional practices while investing in the community in which they live and work. Research has shown that the connections built through a common goal are powerful learning opportunities for the university, P-12 schools, and the community (Brumbach & Ridenour, 2003; Vernon-Dotson & Floyd, 2012; Larson & Kyle, 2014). These clinical practices are the foundation for developing leaders who are in touch with the needs of their community as well as ones who are knowledgeable about methods to actively address these within the systems and structures of society (Wiseman, 2009; Rigelman & Ruben, 2012; Soria, 2015). Relationships, research, sharing of resources and expertise, and collaboration are key components to developing these partnerships (Grobe, 1990).

Because faculty members in the Department of Education have a firm belief in the importance of community engagement through service learning, teacher education candidates have the privilege of being connected and involved in the educational lives of the students and families in our surrounding community through courses that are embedded within local schools and after-school programs. These opportunities range from university courses being taught within local schools where candidates learn about schools and learners through tutoring, observations, assisting in classrooms, and guest speakers from the school or community who have a vested interest in supporting learner and community development to weekly tutoring in local after-school and adult learner programs that serve diverse populations including second language learners, students living in poverty, and refugees. For example, our candidates visit a local Islamic Center to learn more about traditions, practices, and ways they can best support Islamic students in the classroom. University faculty and students participate in school and/or organizational trainings and investigate the sites where we work and learn to gain an understanding of the specific strengths, needs, and populations. By doing so, we are all more informed and; therefore, able to be in a position to better initiate change and growth.

We have found that when all parties are invested in not only understanding the impact of generational poverty on children and families, but also in collaborating with others to build engagement and community in order to develop support systems, real change can occur. Teacher education candidates learn how to advocate for causes they hold dear through the creation of a multi-media advocacy toolkit in their initial education course. They are given the opportunity to meet with teachers, administrators, and community members to hear a multitude of voices and share insights into how best to prepare teachers and students for the future. Teacher education candidates also design lessons, develop materials, and provide services these students and schools would normally not have access to as part of the required coursework for their licensure. By integrating the work in the field with the work in the university classroom, there is a seamless transition from theory to practice. Faculty and students at all levels encounter obstacles and must engage in problem solving and creative efforts to meet the goals set for the partnership. Sometimes this involves reaching out to other organizations for insight and resources. Our village grows with each new semester and is strengthened by the minds, voices, and hearts of all involved.
Belmont University’s Department of Education is truly connected to the schools and communities that surround us. Effective communication, active listening, and collaboration have allowed us to grow in our efforts to connect the teacher education candidates in our program with our world: local, regional, national, and international levels. This paper/presentation will highlight how the Department of Education at Belmont University, as a unit, builds faculty and student understanding through intentional field experiences and clinical placements using the lens of engaged service.
Belmont University and Service Learning

Belmont University in Nashville, Tennessee, is a “student-centered Christian community providing an academically challenging education that empowers men and women of diverse backgrounds to engage and transform the world with disciplined intelligence, compassion, courage and faith” (Belmont University’s Mission Statement). Our vision is to be a leader among teaching universities, bringing together the best of liberal arts and professional education in a Christian community of learning and service. Belmont ranked No. 6 in the Regional Universities South category and was named as a “Most Innovative” university by U.S. News & World Report. The university serves 7,700 students who come from every state and more than 25 countries. Belmont’s Vision 2020 reflects our continued commitment to be “Nashville’s University” by aligning our vision and resources with the ever-changing needs of the community. Our campus is at the intersection of several culturally diverse neighborhoods and Nashville is home to thousands of refugees, immigrants, and disadvantaged families and children.

Service Learning begins the moment new freshmen arrive on campus. In Fall 2016, 2,000 new and transfer students participated in the SERVE Project volunteering in over 30 agencies and organizations their first week at Belmont. Over the next four years students continue to participate in service learning activities, such as required Convocation hours serving their community, service learning projects embedded in traditional classrooms, and multiple opportunities offered through the Office of Spiritual Development to provide Christian missions and service opportunities. Alumni also return to campus to share their experiences. For example, panels of alumni come speak to current students on various occasions throughout their program. During Justice & Missions week, an alum shared about his journey to pursuing justice through teaching in the inner city of Memphis, Tennessee.

The Department of Education puts a strong emphasis on our role as the “University with Feet in the Street.” We work alongside districts, schools, and communities to advocate for students, families, and the profession all the while developing teacher education candidates with a strong desire to transform the world in which they live and work. At the heart of our motto, Building Together for Excellence in Education is “building” an academically challenging teacher education program through collaboration and cooperative planning to engage candidates in transformative learning. Excellence is represented by the InTASC Standards (Council of Chief State School Officers, 2011) that embrace a collaborative and professional culture to advocate for children and involve the community in meeting common goals.

Our innovative pedagogy stresses the importance of individuals and the importance of community. The experiences we provide to our candidates require them to self-examine their habits of mind and to realize that teaching goes beyond subject matter. The intersection of a liberal arts education and professional education begins with the development of the person. Amidst a “selfie” culture, we invite our candidates into a learning environment where the camera is turned away from self and toward others. It is through this view that they begin to challenge their assumptions about diversity. As
individual candidates enter this process of transformation, they become mindful of the moral and ethical responsibilities to these communities of learning.

Undergraduate teacher candidates are grounded in a strong liberal arts background, an in-depth study in a major, and a major in education. Graduate and undergraduate programs emphasize knowledge and discernment, intellectual discourse and ethical and moral reflection. Our conceptual framework is grounded in the notion that teaching is an integral human activity that both imparts and facilitates the gaining of knowledge. According to the Association of American Colleges and Universities (AAC&U), a liberal education is an “approach to learning that empowers individuals and prepares them to deal with complexity, diversity, and change” (AAC&U, 2007).

These qualities are central to 21st Century teaching. A common thread woven throughout these qualities is effective decision making. Whether a teacher is in the role of leader, facilitator, social worker, manager, or advocate they make important decisions approximately every two minutes (Borko, 2004; Ormrod, 2011) Oftentimes outcomes standards simply rely on the “what” and less on the “why.” Teacher candidates must go beyond narrowly defined teaching strategies and engage in a more holistic educational experience to equip them to become reflective practitioners (Schon, 1983). If education and learning are indeed social and interactive processes as Dewey (1938) purports, then it cannot be possible to provide a framework that prescribes specific formulas to use for every situation. These valuable interactions are made possible through engaged service learning opportunities designed and carried out through collaboration between the community and the university.

The Department of Education and the Office of Service Learning collaborate to maximize our impact on the community. The Office of Service Learning supports instructors in their work with the community by providing a plethora of resources ranging from research on the effectiveness of service learning to practical resources such as toolkits, surveys, memoranda of understanding templates, sample syllabi, forms, and assistance from the director. One such resource is the “Faculty Toolkit for Service Learning in Higher Education” (Seifer & Connors, Eds., 2007). These units of study break down the components of service learning in reference to coursework, community connections, cultural competence, and scholarship to name a few. As this resource is widely available across campus, we use its definitions to frame our understanding of service learning.

Service-Learning is defined as “a teaching and learning strategy that integrates meaningful community service with instruction and reflection to enrich the learning experience, teach civic responsibility, and strengthen communities” (Seifer & Connors, Eds., 2007, p. 4). Community, for the purposes of this paper, is defined as “people and organizations coming together either through a common bond or stake in a given interest or set of interests. The term community can be self-defined or can be geographic. The term community also connotes a climate to be created” (p.4). Partnership is essential when working to develop service-learning opportunities. The Learn and Serve America’s National Service Learning Clearinghouse (Seifer & Connors) defines partnership as a
"close mutual cooperation between parties having shared interests, responsibilities, privileges, and power" (Barnes, 2016, p.4).

Service learning allows university faculty and students the opportunity to work and learn in a “community context” (Seifer & Connors, Eds., 2007, p. 5) as an extension of their roles as educators and students into that of actively engaged citizens (Seifer & Connors; Bringle & Hatcher, 1995). These types of opportunities have the potential to provide students with “transformative learning experiences” (Seifer & Connors, p. 5) where they are able to grow, connect, and reflect through structured intentional interactions as well as unintended ones. Teacher education students applying knowledge from the university as well as field experiences in a real word setting can develop deeper understanding through critical reflections of their actions, planning, knowledge, and mindset (Darling-Hammond, 2000). Not only does engaged service learning in embedded learning environments provide opportunities to develop intellectually through content and pedagogical experiences, it also connects them socially on a personal level with the community through relationships modeled by faculty and community partners (Jagla, et al, 2013). These relationships highlight the importance of shared vision, voice, and responsibility in transforming education and, more specifically, the lives of the students and families with which we work. These models of intellectual and social development, in turn, can provide a foundation for the continuation of this work once the pre-service teachers enter their field as practitioners (Caspe, et al, 2011).

Service Learning’s focus on creating active citizens aligns to Belmont’s Department of Education’s focus on advocacy. Our department’s commitment to advocating for children, families, communities, and the profession naturally connects with the tenets of service learning. Advocacy, as defined by The National PTA and Harvard Family Research Project collaboration, is “supporting and speaking up for children-in schools, communities, and before government bodies and other organizations that make decisions affecting children” (PTA, 2014, p.1). Through assignments spread throughout the licensure program, teacher education candidates have the opportunity to learn about advocacy, effective ways to advocate for issues that impact the lives of children, and develop and create advocacy projects such as multi-media press kits on topics of interest and urgency and information briefs to support early childhood education. These projects give students real world experience and awareness that their voices matter for the profession and those we serve. These pre-service teachers are exposed to advocacy through the lenses of the profession, specific content areas, as well as for different groups served by schools, i.e., early childhood and English learners. Jagla, Erickson and Tinkler (2013) in the book Transforming Teacher Education through Service Learning avert that a “significant portion of advocacy is education” (p. xi) and as these students move into classrooms and schools they have the knowledge and skills to share and continue these effective practices and partnerships.

As our nation’s classrooms steadily grow more diverse, dispositions of teachers must also be considered as they meet these opportunities and challenges. Educators who are prepared to address these issues can bring about positive change in regards to attitudes and beliefs about children and families from diverse backgrounds and all they have to
offer. For example, addressing the persistence of achievement gaps for minority and low-income students is within our power as educators. Through collaboration with communities and families, teachers as well as pre-service teachers can make a positive impact on these gaps and provide opportunities for all learners to achieve (Caspe, et al, 2011). Meaningful collaborations and experiences in educator preparation programs can provide the intellectual and social skills and confidence needed to engage and transform the world through a vision of equity.

**Embedded Service Learning Experiences and School Partnerships**

Belmont University is situated in the heart of Nashville, Tennessee, where our campus is at the intersection of several culturally diverse neighborhoods and the city is home to thousands of refugees, immigrants, and disadvantaged families and children. Our school district services about 85,000 students with about 30% who speak a first language other than English. Over 70% of our students qualify for free and reduced lunch (The Tennessean, November 14, 2015).

In order to tap into the unique opportunities of working with diverse students and families, educators must be knowledgeable about the communities in which they serve and learn through extensive field experiences that represent the diversity of our nation (Barnes, 2016; Caspe, et al, 2011; Darling-Hammond, 2000). Culturally responsive teaching is a thread throughout the program, starting with the initial education course to the culmination of the clinical experience. Culturally responsive teaching, as described by Gay (2010, p. 31), is the use of “cultural knowledge, prior experiences, frames of reference, and performance styles of ethnically diverse students to make learning encounters more relevant to and effective for them.” Ladson-Billings (1994, p. 17-18) similarly describes it as “a pedagogy that empowers students intellectually, socially, emotionally, and politically by using cultural referents to impart knowledge, skills, and attitudes.” The idea of incorporating the lives and frames of references of the learners with whom we work is carried out through tutoring plans, interest and attitude inventories and surveys to design individualized instruction, interviews with children and families, as well as insights from community leaders from a variety of groups and organizations representing the diverse landscape of Nashville.

Social Emotional Learning (SEL) is another critical thread throughout the program. The Collaborative for Academic, Social, and Emotional Learning (CASEL) defines SEL as the “process through which children and adults acquire and effectively apply the knowledge, attitudes, and skills necessary to understand and manage emotions, set and achieve positive goals, feel and show empathy for others, establish and maintain positive relationships, and make responsible decisions” (casel.org). An extensive body of rigorous research demonstrates that SEL programs have a significant impact on academic achievement (Durlak, Weissberg, Dymnicki, Taylor, & Schellinger, 2011). SEL is an essential element of the learning process. While it is imperative that there is a focus on standards, objectives, and assessments to move our learners forward in an ever increasingly complex educational landscape, the importance of relationships, social and...
emotional competence and skills to thrive are equally essential (Darling-Hammond, 2006).

As teacher education candidates move into a more central role in the education of early childhood, elementary, middle and secondary students over the course of their program, their work with P-12 and university faculty takes on more concrete connections among content, pedagogy, and personal relationships. These learning experiences are designed to take place in intentionally selected field experiences and clinical practice sites. Faculty across the department reach out and make connections to various schools and/or programs as well as respond to specific requests from the community. It is essential that the community’s needs and voice be one of the driving forces of these partnerships so the instruction is targeted and meets the needs of the school community (Grobe, 1990; Brumback & Ridenour, 2003). Working alongside faculty who encounter instructional challenges and seek to be responsive to them provides teacher education students the opportunity to develop dispositions and strategies for more effectively meeting these needs.

While these types of courses and experiential learning opportunities are valuable, it requires extensive time, patience, and understanding that goes well beyond the typical course design process. Belmont faculty are well aware of the time commitments involved and weigh it against the overwhelming benefits for our pre-service teachers, the P-12 students and faculty, the community as a whole, and their own professional development (Jagla, et al, 2013). The university’s commitment to being “Nashville’s University” and the department’s commitment to being fully involved and invested in the community in which we live, work, learn, and serve is integral to the success of these engaged service learning embedded courses. Research has shown that programs that provide these types of interconnected experiences across field placements and courses develop educators who are prepared for the unexpected challenges and opportunities of the classroom and are able to apply theory to practice more effectively (Darling-Hammond, 2006).

In order to give our pre-service teachers a wide range of experiences, faculty provide service learning opportunities in a variety of environments ranging from urban elementary, middle, and high schools, after-school programs, outreach programs for refugees and adult learners to working with rural populations as well as families of children with disabilities. These experiences range in design and application of content and pedagogy, but all have the potential to expand their understanding of people from many different walks of life. We, at Belmont, count ourselves lucky that we are positioned in such an area as to have access to a variety of learning environments and potential partners. Collaborations with these entities allow students to develop intellectually and socially by diving deeper into their understanding of cultural contexts and their implications for expectations, planning, instruction, learning, assessment, and communication.

Belmont teacher education students explore the context of each school, organization, and community through research, site visits, meetings with school administrators, faculty, and community members before beginning their work with students, teachers, and families.
By learning about these sites’ missions and visions for learners, our teacher education candidates can more clearly see how it aligns with the university’s and department’s vision and mission (Slater & Ravid, 2010). Once the background information is gathered and analyzed, it becomes the responsibility of the faculty and pre-service teachers to personalize the data and create a more holistic understanding of what it means to work and learn in that particular context. Through this process, Belmont students and faculty grow in their social awareness as well as personal reflection of their own experiences and bias. These interactions, reflections, and critical thinking opportunities develop their understanding of the importance of social-emotional learning for educators and students.

These embedded experiences in diverse settings with educators and community members who see and value the potential in ALL learners can create future educators who embrace the whole learner. Field experiences in these diverse environments alone are not enough to instigate change. Intentional conversations, training, and in depth reflections are pivotal in bridging intellectual and social development. Utilizing resources from Southern Poverty Law’s Teaching Tolerance resource as well as protocols for reflection, identification of abuse and maltreatment trainings, and focused observations with critical thinking conversations make the abstract more concrete for our pre-service teachers.

School partnerships developed organically. It became our mission to be advocates for local families and children and to provide an academically challenging teacher education program. We approached schools with the idea of providing an innovative pedagogy for teacher candidates while also meeting the needs of the schools. While each university-school partnership shares the same mission, vision, goals, and commitment to transformational learning, they each share a unique learning environment. Initially Foundations of Education and Human Development courses were taught at Rose Park Math and Science Magnet Middle School located a few blocks north of campus, but this has since changed to only the Foundations of Education course meeting at this site. As a math/science magnet school, the school administrators selected math as the primary focus on learning outcomes for their students as a result of our partnership. The school provides the university with its own classroom in the school where education courses are taught. Candidates are then paired with students for math and literacy tutoring using the Common Core and Tennessee State Curriculum Standards. In addition to these tutoring sessions, candidates research the school and community and get detailed data on student demographics and performance as well as assessments used for placement from the numeracy and literacy coaches at the middle school. The school was recently named as the SCORE Outstanding Middle School for academic growth it achieved with its students. The principal of the school credits the work of his faculty along with the contributions made by Belmont candidates. Our candidates were able to see students move from below basic to proficient, proficient to advanced, and some as far as from below basic to advanced. In addition to gains in math and literacy scores, students also received the support of role models and mentors.

Teacher education candidates enrolled in the evening section of Foundations of Education also have the opportunity to work in an outreach program at a local church as an extended service learning field experience. The candidates tutor refugees on a weekly
basis and assist them in their transition to the United States and, more specifically, Nashville. Pre-service teachers engaged in this service learning field experience gain social and intellectual insight through the weekly interactions. Simultaneously they are developing and implementing English content lessons while learning about a variety of cultures and the everyday challenges these newcomers face. The pairing of course content and the human experience create a broader understanding of what it means to be a learner and an educator.

Teacher candidates receive an education into the lived realities of these students and its impact on social, emotional, physical, and cognitive development. Child Development was previously taught at Glendale Spanish Immersion Elementary School. Beginning in the fall of 2016, this course is now taught at Waverly-Belmont Elementary School. The school is located less than one mile from campus and is one of only two technology demonstration schools within the district. As a Title I school, the student population for the school is reflective of the diverse communities it serves and includes students from a wide range of socioeconomic statuses as well as race and ethnicities. The school provides Belmont with a demonstration classroom with a wide array of technology where the Child Development course is taught. The opportunity for teacher education candidates to observe, learn about, and use these innovative pieces of technology will set them apart and prepare them for their future classrooms. Candidates develop a child study over the course of semester through focused observations, interviews, and one-on-one tutoring on a weekly basis. These interactions and observations provide insight into child development in real time and within the context of a structured learning environment while also taking into account the child’s life outside of the school day. Candidates are able to see how a child’s development in one area can impact other areas of development. Along with the child study, teacher education candidates develop a compendium of resources gathered from interactions with mentors in the building; research based on multiple perspectives of child development, and develop parent/family information modules about child development at different stages from birth to age 10.

Candidates enrolled in Literacy Methods courses complete a year-long practicum experience in a Metro Nashville Reading Clinic. These clinics are housed in elementary and middle schools throughout the district and serve learners who are typically two grade levels below their current grade placement and oftentimes English learners. This partnership grew out of common concern for struggling P-12 students who were falling farther behind. A consortium of local universities and schools worked together to provide tutors and site coordinators for the clinics through their respective service learning programs. Candidates complete a training session with a Metro Reading Clinic Coordinator on how to structure the lesson, select developmentally appropriate materials, and assess progress over the course of the year. Teacher education candidates tutor weekly and reflect on student growth, interest and attitude, as well as instructional strategies that are effective in supporting the student’s literacy development. Data collected across the district shows a positive impact on student literacy scores based on the work of the reading clinics. Candidates are able to observe and participate in a child’s literacy development over the course of a year and make recommendations for future instruction based on this knowledge. The insight gained from this year long consistent
and cohesive service learning experience better prepares these future educators for working with a wide range of students in the classroom.

In an effort to provide an even wider variety of field experiences for our teacher education candidates, a collection of small grants were written to support STEM days with a rural elementary and high school. The schools are located approximately 50 miles from Belmont in an adjacent county. This partnership started with a candidate enrolled in the Reading Specialist graduate program at Belmont. After completion of her graduate coursework, this first grade teacher was a guest speaker in the literacy methods courses and addressed challenges and opportunities for working with rural populations as well as how to integrate literacy across the curriculum through fiction, nonfiction, writing, guest speakers, and field trips. The teacher education students welcomed this unique perspective and voiced an interest in visiting this classroom and school. Initially candidates who were able to commute visited the classroom as one of their required practicum observations. After multiple collaborations with the teacher in local, state, national, and international conferences, we worked to write multiple grants for developing a collaborative service learning experience for teacher education candidates seeking early childhood, elementary, and middle grades licensure. We received grants from Tennessee, Sumner, and Davidson County Farm Bureau, Ag in the Classroom, and Tractor Supply Company to provide transportation, materials, and texts for the STEM Literacy Days. These experiential learning opportunities allow candidates to work with students in a Title I rural elementary school as well as teachers and students involved in FFA and agricultural education courses at the high school. The candidates receive training and free materials from the State Coordinator for Tennessee Ag in the Classroom to prepare them to incorporate agricultural literacy in their future classrooms and for the purpose of this project. The candidates research the contextual factors of the schools and communities and develop lesson plans based on Common Core and Tennessee State Curriculum standards in literacy, math, science, and social studies for a STEM Literacy Day in the fall and spring. These hands-on lessons involve fiction and nonfiction literature accompanied by writing opportunities, hands-on science activities such as planting tomatoes, creating “soil cups” to simulate the layers of soil, making “gardens in a glove” to observe the germination of seeds, and using microscopes to identify features of various seeds. The high school students also plan and teach mini-modules on farm animals, green houses, and farm implements and tractors over time. These lessons are supplemented by community resources such as a tractor safety session from John Deere and a Combine Simulator from Tennessee Farm Bureau. These opportunities to work with a rural community expose the candidates to a new context for teaching and learning as well as serve as a model for grant writing and community collaboration. The pre-service teachers were interviewed for a Farm Bureau radio show and shared how they learned about agriculture as well as how to integrate content areas in a more seamless manner through this engaged service learning project. The success of this project was such that the teacher and course instructor were selected to present at the National Ag in the Classroom Conference to share about collaboration and its impact on students at the P-12 and university levels.
Our first partnership began in 2010 with a course in Human Development taught at a private middle school for African-American boys. The school was closed due to financial issues so the class moved to a charter middle school where many of these students transferred. Two years later this school was closed by the district due to low test scores. We continued to follow the children and moved to Pearl-Cohn Entertainment Magnet High School. We were able to follow these students because of relationships built with teachers and administrators who saw our commitment to work with these students despite the barriers often imposed by outside financial, political, and administrative forces.

Pearl-Cohn Entertainment Magnet High School is located approximately six miles from campus and is the only entertainment magnet school in the country. African-American students comprise 90% of the student population. The school offers pathways in Marketing Communications, Personal Care Services/Stylist and Image Consulting, and the Recording Industry. In partnership with Warner Music Group, Pearl-Cohn is the first school in the nation to house a student-run recording label affiliated with a major recording label. A student was awarded a National Academy of Television Arts and Sciences Student Production Award in October 2016 for his non-fiction short form documentary “Citizen Laith” about his life as a refugee.

Since 2013 Educational Psychology continues to be taught at this school, but the field experiences have varied across the years. Teacher candidates typically spend 30 minutes working one to one with high school students and then spend an hour assisting teachers in the classroom. The professor shadows the candidates as they work with students and conducts planning meetings with administrators while candidates are in the classrooms. Following the time with students and observations in classrooms, candidates meet as a class to connect educational psychology theory to practice. The first year the literacy coach provided content and materials for weekly tutoring sessions with a focus on literacy. The test scores of students tutored that first year in English I and II revealed an 8.1% increase over the previous year’s performance in English I and a 5.7% increase over previous year’s performance in English II. The school exceeded their goal in English I by 2.7% and in English II by 0.6%. While the tutoring sessions may have had some influence on these test scores, the overwhelmingly noticeable change could be found in the transformations we were observing as positive relationships were formed between teacher candidates and high school students. School personnel also serve as guest speakers including the executive principal, literacy coach, SEL counselor, academic counselor, curriculum specialist, and a variety of nonprofit community service personnel.

The following two years we adjusted the clinical experience to focus more on Social Emotional Learning (SEL), particularly on setting and achieving positive goals,
establishing and maintaining positive relationships, and making responsible decisions. Teacher candidates are given various prompts and activities for each session with their student. For example, students take the Myers-Briggs Type Indicator and then have a discussion the following week with the teacher candidate about how these results can provide them with personal insight and may help students to better understand themselves and others. (Note: teacher candidates take and study the Indicator prior to meeting with the students). Another example includes teacher candidates giving a survey to students on their knowledge and understanding of college and the application process. The purpose of this activity is to promote a college mindset and encourage students to think beyond high school.

Teacher candidates conducted research on their clinical experiences and their findings consistently showed the experience to be positive from both the high school student and the teacher candidate. Students’ research reveals that we are having a positive impact on students and that teacher candidates are being transformed. While these studies are not able to draw any conclusions due to the limitations, it has prompted a serious conversation among school administrations, candidates, and the professor on where we might have the greatest impact. Using anecdotal data, we are developing a quantitative survey to track the extent of transformations and the impact candidates have on high school students. A majority of our students are middle- to upper-class white students. Few of these students have any experiences with inner-city schools. Following are a few quotes that reveal the changed perceptions of teacher candidates over the course of a semester.

Being in Pearl-Cohn struck a very deep cord for me because of my past personal experiences with the area...when I was a junior in high school, my father was kidnapped at gun point at a gas station located literally blocks away from the school. The two men and women who kidnapped him drove him around all night forcing him to withdraw money from his bank account. When they had gotten all they needed from him they took him to a house close to the school to shoot him. My dad sat in the car as a group of guys discussed who would be the one to shoot him. The older guys didn't want to do it because they didn't want to go to prison- so they recruited a teenager to do it. My dad said the kid respected these guys and would have done anything they asked him to...he bolted out of the car and took off running... As I began walking through the halls of Pearl-Cohn, observing, and tutoring I changed the way I looked at my father's perpetrators. I wondered where they had gone to high school and if they had graduated. I then thought about all the kids I was seeing at the school here and what dilemmas they faced when not at school...It was inspiring in that it made me want to be a force in these young people's lives that could help them change the track that they were on and rise above any negatives they may be faced with. At the same time I became enraged at the unfairness so many children and young adolescence face.

Walking in to Pearl-Cohn for the first time I was nervous. I want to be K-6
licensed and I was worried that these high school students, not far from my own age, would be out of my helping reach and I would not be able to teach them anything. I had never tutored in a high school before. Soon I realized that this fear was not valid. Tutoring at Pearl-Cohn was a very rewarding situation.

Janea was very sweet. She loved to talk about home, school and her friends. She talked to me about her problems to see what input I had…We would always get the work done and then spend the rest of the time chatting. I think this was very important to her because she knew that she had someone there for her who would listen. Janea was very outgoing and had a personality just like mine. She always wanted to be out there with me and appreciated the help I was giving her. She was my student who looked forward to coming to tutoring. A or B day, she was ready to go when her name was called to come outside. She looked at me more like a mentor than a Belmont student that tutored her.

I have heard some bad things about Pearl Cohn. I tried not to be judgmental going into the school, but it was hard. I looked at reviews of the school and student test scores …my experience at Pearl Cohn was one of a kind. I know I would not have gotten this experience at any other school. It was a challenge, but also a very good experience…This experience will be one I will never forget and can learn from to apply learning strategies to my own classroom.

I’ve never really had much experience at an inner-city high school. I was homeschooled most of growing up, and then senior year I went to a private missionary academy, so this will be a very different environment for me. Through tutoring, I learned that is crucial that you meet students where they are. You cannot be an effective teacher without somehow finding a way of making information relevant to students. You have to be the person to bridge the gap between knowledge and the student and somehow make the student feel like what you are trying to teach is actually important.

Being in Pearl-Cohn helped me to recognize the value of engaged time. Realistically, you only have 15 minutes or so before you lose students’ attention even if you are having a great lesson at the time…I never imagined that the particular amount of time students were engaged on a particular task made a difference….As a teacher, you have to do your best to maximize learning time in the classroom for your students.

My initial thoughts before walking into Pearl Cohn were pretty skeptical since I was from the area and have only heard negative things about the student body and how discipline was handled there. All I could hear were talks of weapons and drugs and even student against student or even student against teacher fights that would break out at any possible second.
The first day when we were taken on the tour of the school I noticed that it was very clean and very updated so the students could obtain the very best education possible.

I was overridden with anxiety after my first day at Pearl Cohn and I was even more nervous after hearing unfavorable comments and negative talk about the high school from my peers who had grown up in the Nashville area. I was troubled and soon began second-guessing my desire to teach in Metro Nashville. I kept thinking to myself “What is this small country girl doing in a poverty stricken inner city high school? There is absolutely no way that I can relate to these kids!” … Now that the end of the year is coming to end, I have come to the realization that my time at Pearl Cohn was much needed. I observed a lot of good theories and philosophies being put into practice… Although it only appeared that the Belmont students were tutoring to help these “on the bubble” Pearl Cohn students, these students helped us in ways they will never know.

I was very surprised to read over my pre-practicum journal and realize that I really have come a long way in such a short time! I didn’t expect that I would feel so comfortable and empowered in such a short time, but I did. I had been concerned that I would not be a good observer, but would instead lose out on the riches of being a good listener by being an obstinant “doer”. Instead, I felt at Pearl Cohn that I did gain the trust of the students and that I was able to enhance not only their learning experiences but their knowledge content as well. This practicum has resulted in me taking a hard look on my direction and to whom I feel called to serve. The experience at Pearl Cohn was incredible, and I am so grateful that I had the opportunity to tutor and observe in an inner-city high school.

The school setting opened my eyes further to diversity and the impacts it can have on learning as well. This valuable, hands-on learning experience provided me with ample opportunities to apply what I have learned thus far, and explore best teaching practices by adapting to different learning styles in real situations with my assigned students.

The pride showcased throughout the school was really refreshing. In my time in high school, we had a similar pride, but theirs seemed more genuine. For some of them, the school and their friends there were the only things they had, while in my suburban upper-middle class high school, we had lots to fall back on. This experience really opened my eyes to inner city schools, and teaching in one is definitely an option for me, now that I’ve seen the need for teachers and the struggles that they’re having.

Overall, my experience at Pearl Cohn is one that will always stay with me. It got me out of my comfort zone and forced me to start interacting with students, even if I didn’t feel ready. This type of field experience is
invaluable. I really did feel a part of that school and their mission. To be an effective teacher, you can’t just learn from lectures in a classroom. Actually observing and working with students is the best way to prepare. Pearl Cohn has been an immense part of my preparation.

I am leaving with a wealth of knowledge through my experiences with the students I tutored, the class I observed, and the multiple speakers that offered their time and insight. Inexperienced in the world of high school, I came into this class anxious about starting. Over the course of these past three months, I have gotten to apply theories and concepts to real-life scenarios, ultimately enriching my learning experience. Along the way, I had never predicted that I would be drawn to teaching an older age group. So upon analyzing this class in its entirety, I credit it for my reconsideration of my licensure area.

I definitely did not expect to be working in a school like Pearl Cohn in my first semester of graduate school. The initial exposure was a bit of a shell shock in all honesty- I have never been in an environment like it before. But, I as grew more accustomed to Pearl Cohn and the people there, my eyes were opened to a life and a culture that I had been completely ignorant of. The faculty and staff are attempting to do what some would call the impossible at Pearl Cohn, and I would call the experience overall as exceptionally humbling.

Marian Wright Edelman, President of the Children’s Defense Fund, quoted students from Pearl-Cohn in a recent an article (The Huffington Post, August 14, 2015):

I have no friends that I grew up with and I lost my [first] friend. He got killed. Seventh grade, my friend killed somebody,, and he’s in jail for life…From my freshman year to now, I have been to 12 to 13 funerals. And I grew up with everybody that I went to those funerals with, and now they are gone. It’s hard to cope with it. It’s hard to—sometimes I cry all night, you know, and I ask God why.

I had a good friend that I grew up with…He ended up dying because he was robbed and he tried to fight back and they ended up shooting him in the chest. So they ended up killing him. And when I found this out, you know, I almost cried, but at the same time [you’ve] seen so many classmates and so many people…you just sort of say, ‘Man, I sort of knew that was going to happen.’

We live in the worst conditions where nobody helps you. And we live in a condition where you’ve got to watch your back every 30 seconds. You know, you don’t know when you’re going to get robbed, you don’t know [when] you’re going to get shot, you don’t even know [when] you’re going to get stabbed…For some of us that is our reality.
Wright goes on to ask, “Where are the adults?” “Where are schools and community organizations?” She urges people to simply speak to them and say hello and give them a sense of being seen and heard. We believe our move away from a cursory attempt to increase literacy skills to engaging students and teacher candidates in meaningful conversations may provide some additional support these students need.

These stories represent a small portion of our curriculum. There are equally powerful stories to be told for the transformational learning in the methods and clinical components of our teacher education program. Yes, our candidates still enjoy their “selfies” but we believe turning the camera around has transformed them to be teachers with “disciplined intelligence, compassion, courage and faith” (Belmont University’s Mission Statement).

Our weakest link is in telling our story. We are so busy going about “doing” our story that we often forget to “tell” our story. Throughout the community, however, people are talking about what we’re doing. This paper is our first step to get our story out.

“Given the great influence teacher education candidates and newly minted teachers have on literally millions of children every year we owe it to them and to ourselves… to examine our own practices, and take heartfelt actions to transform teacher education” (Jagla, et al, 2013, p. xii). It is with this goal in mind that we intentionally design experiences to foster development in content, pedagogy, and a deeper understanding of the social issues of learners and education. Through focused and critical reflections, our candidates have shown growth in knowledge and understanding, but have also been transformed through these engaged service learning experiences. Knowing they are capable of advocating for students, families, communities and the profession along with creating and developing content lessons based on standards, evidenced-based strategies, and effective forms of assessment has empowered their actions and mindsets. After participating in the service learning field experience in Foundations of Education, one student who matriculated through Metropolitan Nashville Public Schools reflected on her experience, “Personally, by viewing education through service learning it adds motivation to a greater cause. I am not only helping those in my community through my passion but by doing so I can inspire others to share their talents with our community as well. Ultimately, creating a better future for everyone because service learning is a powerful tool. It is an agent of change.”

Universities bring together learners from diverse backgrounds and life experiences in much the same way P-12 schools do. They work and learn together and create a body of knowledge that is unique and shared. A graduate student who had previously attended only private/independent schools marveled at how these field experiences changed her understanding of education and learning. “Coming into the MAT Program, I had very little insight into what “real” teaching looked like and these field experiences provided me with more knowledge than what you would learn in a traditional classroom setting. I had the opportunity to not only observe, but also assist in the classrooms and tutor one-on-one. As each of these schools differed in diversity, size, and demographics, I feel that
I was truly provided the opportunity to see culturally responsive teaching firsthand and learn how to teach based on the context of each student’s life. I believe it is crucial for me, as a future educator, to have seen different learning environments and understand how to plan and teach accordingly. The service learning aspect of Belmont’s Education Department has served as a wonderful eye-opening experience that I know will transfer to my future endeavors as a teacher.”

Reflections by students were unique to their life experiences as well as the program field experiences. A nontraditional student seeking an undergraduate degree in education was moved by the variety of experiences and collaboration that is required to make these opportunities impactful. She commented that, “These unique learning experiences helped me realize (through reflection) the changes that needed to be made for future lessons and the importance of being flexible with students…. Equally important were the observation placements where we observed students in various settings. I have observed students with special needs, students in high-risk areas, students in affluent communities, and students with varying learning abilities. Being aware of these diverse situations helps me to understand the challenges I will face with students, parents, and colleagues; the knowledge of watching the situation being handled by an experienced professional, and feeling equipped with the tools that I will need as a teacher to be successful has given me confidence.” She also added, “My favorite experience was working with elementary and high school students in Portland, Tennessee, on a joint venture learning opportunity for STEM. This opportunity (along with my Science Methods course which encouraged professional development opportunities) has ignited a spark to include science into everyday learning and pass this excitement and enthusiasm on to my students. We learned how to integrate literacy with science and hands-on applications to reinforce the lessons. I was so impressed with the community collaboration and support between the schools involved and community helpers like Farm Bureau. We were able to see first-hand the many opportunities that are available to teachers and the wonderful resources and willingness of others to support education in our schools. I feel incredibly blessed to have been afforded these opportunities through my education courses at Belmont and I feel ready and eager to engage students as I prepare on my new adventure.”

A graduate of the program reflected on his time at Belmont and how these transformational experiences prepared him to step into the classroom. “Belmont’s program goes beyond the mechanics of teaching, combining a challenging curriculum with real classroom experience and lessons that no textbook can teach.”

The positive changes we have seen in our teacher education candidates align with studies that have determined that teacher education candidates have positive experiences with service learning initiatives (Anderson, Swick, & Yff, 2001; Moguel, 2003; Lake, Winterbottom, Ethridge, & Kelly, 2015).

While we are thrilled that these experiences have brought about reflection, refinement of knowledge and skills, dispositional changes that reinforce the gifts of all learners, we cannot become complacent. Each semester we revisit field experiences to look for stronger and more effective ways to being about this transformation. Conversations among all stakeholders in the process must take place in order to bring multiple
perspectives to the table. Effective communication between community and university as well as teacher education candidates and faculty at the university and P-12 levels are a necessity. Learning from one another and listening to the voices of the children we serve is essential if we are to be truly responsive to the needs of our schools and the educators who are stepping out into them. Collaboration, communication, and listening are key.

*The Tennessean* (November 14, 2015) Nashville schools have thousands of EL students.

Makerspaces provide technology, equipment, and collaborative knowledge for hands-on idea exploration and prototyping within lab, shop, and conference spaces (ELI, 2013). Inquiry-based learning drives makerspace pedagogy and allows students to define and design projects, therefore allowing each to take ownership of their learning process (ELI, 2013). The integration of makerspaces into education has shown to contribute to learning and creative inquiry by providing students with authentic explorations of digitally fabricated 3D objects (Johnson, Adams, Cummins, Estrada, Freeman, & Ludgate, 2013).

Digital fabrication involves creating an object from a digital file through the use of additive and/or subtractive manufacturing processes (Pryor, 2014; Lipson & Kurman, 2013). Additive process machines (3D printers) extrude material that builds layers from the bottom up to create a finished 3D printed object. Subtractive process machines (laser and CNC machines) utilize flat sheet goods to cut 2D patterns that are assembled into 3D objects. Both additive and subtractive machines provide distinctly different approaches to designing, planning, and constructing objects for learning.

Background:

In recent years, Makerspaces have been growing popularity in academic, institutional and professional settings. Before this, access to digital fabrication technologies in higher education had been a previous “silo” experience, confined to specialized fields such as: architecture, industrial design, jewelry design, and civil engineering (Pryor, 2014). However, an exploratory report on the future of higher education technology projects significant increased use of digital fabrication tools over the next 4 years in cross-disciplinary projects (Johnson, et.al, 2013). The resulting increase in makerspaces on campuses across the country has been focused on interdisciplinary education. The campus makerspace strives to be a gathering place for people, ideas, and networking across majors and disciplines. Widespread adoption of digital fabrication technologies and the growth of makerspaces is also fueled by significant price reductions that make equipment easily available (Pryor, 2014; Eisenberg, 2013; Johnson, et.al., 2013; Lipson & Kurman, 2013). Further, the integration of technology and equipment is not only seen at the college and high school level, but is currently being implemented in primary school education for young children (Eisenberg, 2013). As the availability and integration of this equipment increases for current and future students, so do expectations of use and access to learning environments such as makerspaces with digital fabrication technologies.
Framework:

This presentation outlines the following strategies for educators on common issues and considerations of developing, maintaining, and teaching in a makerspace with digital fabrication technology and equipment. Strategies for developing a successful makerspace or adopting equipment range from selecting appropriate equipment and software, assessing infrastructure demands, planning a start-up and operation budget, overseeing equipment set-up, to understanding equipment opportunities and limitations. Further, guidelines for maintaining the space and equipment focus on keeping the lab and equipment in safe and reliable working order, providing supervision and training on equipment, understanding equipment maintenance needs, and planning a material and parts budget. The strategies presented for teaching with the assistance of digital fabrication technology and equipment include selecting equipment based on pedagogy needs, assessing student understanding of basic fabrication prior to digital fabrication interactions, providing training on equipment and software use, and inspiring innovative and meaningful social and learning experiences.

Results and Discussion:

Examples of digitally fabricated work will be paired with instructor and student experiences to uncover specific learning opportunities in the makerspace. The makerspace serves academia in a teaching and learning capacity, beyond that of a standard production facility. This designation places specific demands on the development and maintenance of the space and equipment. This presentation provides an discussion on issues and considerations along with strategies for successfully developing, maintaining, and teaching within a makerspace for student learning.

6. abstract:
    Introduction:
    This presentation explains the pedagogical development of rubrics to assess and evaluate critical thinking in problem-based learning. Implementing rubrics in the teaching and learning process allows instructor and student discussions to remain focused, objective, and open to identify critical thinking benchmarks within the problem at hand. By identifying critical thinking within discipline specific problem solving, students will recognize aspects of critical thinking and be more prepared to apply critical thinking skills beyond their major.

   Background to the problem:

   A recent survey of new graduate employers in 2015 from the Association of American College and Universities revealed 91% of employers desired graduates who could think critically, communicate clearly, solve complex problems, and apply knowledge within and beyond their discipline and major course of study (HRA, 2015). Employers recognize the need for critical and creative thinking skills beyond the major, and project long-term career success for those who possess the capacity for continued learning and transferrable critical thinking skills (HRA, 2013). Being mindful of this, problem-based learning strategies can provide opportunities for students to recognize and evaluate critical thinking within their own problem solving process.

   Critical thinking is described as “a 'habit of mind' characterized by the comprehensive exploration of issues, ideas, artifacts, and events before accepting or formulating an opinion or conclusion” (AAC&U, 2010, ¶2). While programs seek to teach students critical thinking skills and cultivate this ‘habit of mind’, the delivery and assessment of critical thinking are many times difficult to objectively assess and discuss. Using rubrics in education can remove subjectivity when assessing student work and supporting student learning through meaningful discussions. Rubrics can also help blur the distinction between assessment of student work and instruction by providing a “roadmap” for success for the instructor and student to collaborate around (Andrade, 2000; AAC&U, 2010). While educational rubrics vary, common features are a list of criteria and gradations of quality with descriptive performance criteria that help instructors and students alike focus on enhancing the development of necessary skills (Andrade, 2000; AAC&U, 2010).

   Methodology:

   The rubrics presented here were developed within a larger university wide study that is explained here for context. The university adopted the VALUE critical thinking rubric in 2015 for a 2-year study of critical thinking of students in their last two years of baccalaureate degree programs. This rubric presents the aspects of critical thing as: explanation of issues, defining relevant evidence, using appropriate context and assumptions, defining a position, and assessing conclusions. Along with the VALUE rubric, The Critical Thinking Assessment Test (CAT) developed by Tennessee Technological University, was used as a pre and post
instrument to measure students ability to think critically beyond their major through real world problem solving. The CAT pre-test was administered to rising juniors enrolled in a problem-based curriculum in the spring of 2015 and post-test measures will be taken during spring of 2017. The CAT was also given to graduating seniors in spring of 2015 to represent a control group for the research design. Each of the 15 CAT questions was paired with the 5 critical thinking aspects in the VALUE rubric to uncover which aspects were opportunities for significant growth.

Based on results of the control group CAT scores, interventions were developed to enhance the 5 aspects of critical thinking (explanation, evidence, context, hypothesis, and conclusions) for implementation over the following two years of discipline specific problem-based curriculum for the test group. The critical thinking rubric for problem-based learning was modeled after the VALUE rubric and borrows from other rubrics in creative thinking, information literacy, inquiry and analysis, problem solving, and communication skills. The rubric outlines explicit and clear descriptions in a common language for students to go from simply understanding new knowledge to applying and generating new knowledge as they move from benchmark to capstone performance criteria within the rubric.

Results and Discussion:

Participants will be engaged through a short description of the larger university wide study and the role of the problem-based curriculum study presented here. The critical thinking VALUE rubric will be shared along with the adapted rubrics created for the research study in each of the areas of critical thinking including: explanation of issues, defining relevant evidence, using appropriate context and assumptions, defining a position, and assessing conclusions. The development of explicit and specific performance criteria will be discussed along with identifying relevant language to communicate effectively to students through the design of a meaningful rubric for problem-based learning. Results will also highlight deficiencies found in critical thinking from the CAT test and the way rubrics can enhance these skills for students, not only within domain specific problem solving, but as lifelong critical thinkers.

Title: The Accidental Special Education Teacher (#1245)

Author: Roberta C. Brack Kaufman, Ed.D.

Affiliation: Nevada State College

Address: 1021 East Paradise Hills Drive, Henderson, NV 89002

Email: Roberta.kaufman@nsce.edu

Abstract:

Although teacher education candidates often have what might be called a "myth-perception" of the profession, it is critical for teacher educators to recognize and value the energy while at the same time preparing candidates for complex teaching arrangements, under-sourced schools, unique student behaviors, political and economic challenges.

Novice teachers or those underprepared individuals who work with students with disabilities and their families are most at risk of missing opportunities to promote the practices known to be consistent with legal and ethical standards of the profession. Multiple narratives from young teachers and those in the trenches describe the juxtaposition of policy and practice. The individualized education of students with disabilities is not always a priority consideration and ultimately their achievement is impacted.

Data are clear. Within the first two years of teaching as many as 12 percent of the new teachers leave the profession (NCES, 2011). By year five of their career, upwards of 50 percent of new teaching recruits are gone (DeAngelis & Pressley, 2011). Competing agendas is clearly at work given the factors cited by those leaving the profession. Policies, practices, pedagogy, preparation, principals, and personal preferences have all been cited as influencing a teacher's departure.

Often the reality of a policy is that best practice becomes circumvented. Forty years after the passage of PL94-142, now IDEA, many of the principles that set the stage for creating educational opportunity and educational access have been challenged. With more and more educators entering the profession on the fast track as "accidental special educators" some of this history has been lost. With more and more diversity of students and families in communities some of the commonalities educators experienced in the past are being shaken up. With more and more inclusion, economic necessity, shortages, standards-based assessments, teacher evaluations, and an array of other social dynamics, best practices are at a premium in many schools. The intended cure (i.e. policy design and implementation) is, in many cases, a barrier to best practice.

How do teacher educators balance the reality of the profession? How do programs ensure those entering the profession as accidental special educators are given skills consistent with best practice aimed at ensure the success of students with disabilities? There is a sense of urgency related to reinvigorating the principles behind IDEA. It appears there is a tipping point. Comments from young teachers reflect the need to better advocate as professionals for the profession before the past becomes prologue.

Title: East Asia & Pacific Principal Driven Philanthropy

21st Century Fully Equipped for Slaying Funding Dragons

Area of Submission: Human Resource Development

Principal Leadership Curriculum

Presentation Format: Thru the medium of PowerPoint, personal interview

(television production OLELO Channel 54 and wed site linkage)

Abstract Summary: Would the members of your committee like to entertain a paper which discusses the impact of the global financial crisis funding on education internationally? Which ask what possible solutions to solving these funding gaps are? Then, it traces the rise of philanthropy in Asia. Followed by identifying what are some of the philanthropic road block within Asia. Next, it examines a devoid of philanthropic management leadership of principals. Finally what are the best practices in utilizing strategic philanthropy? If so, let’s talk.
The deadline for UNESCO’s Education for All by 2015 has come and gone. In pursuit of this lofty goal the Education for All 2010 Report brought to our attention the stark reality of our interconnectedness during a global financial crisis and its impact on education worldwide. EFA 2010 Report revealed a spike in poverty levels, worsening incidents of malnutrition and education budgets coming under intense scrutiny to the extent that donor pledge commitments stagnated.

In confronting this crisis in funding of global education head on was met with a gamete of traditional financial solutions ranging from increasing taxes, creation of levies, floating bonds and offering loans. However desperate times call for drastic unconventional measures. Venture philanthropy, entrepreneurial philanthropy, hybrid philanthropy, disruptive philanthropy may work had they not been introduced so late in the game. Although we did see a surge in Asia charitable giving’s from the Nuevo riche of Hong Kong, Guangzhou and Singapore infrastructural obstacles blocked the act of giving in Asia. Obstacles like limitations in resources management, sustainability, scalability and severity of issues. Lower developed countries were particularly challenged by transparency, cost prohibiting NGO entry fee, donor rights of privacy, archaic accounting systems, inconsistency in record keeping and data collection.
When and if educational funding did successfully filtered down to its lowest Common denominator ultimately received by the chief instructional executive ie. the school principal, they were ill-equipped to budget, manage and distribute funds equitably and efficiently for the vast majority of their principal education programs had no money management course work, no financial management, no philanthropic education, no wealth creation in principal leadership curriculum requirement in any of their educational training programs.
TEACHING AND ASSESSING THINKING DISPOSITIONS: A COMPREHENSIVE REVIEW OF LITERATURE

ABSTRACT

Students’ thinking styles has become a hot topic over the last several years and is a priority for today’s educators as they determine how to best teach students the proper way to think. But if teachers want students to use learned thinking skills frequently and transfer these skills to feel committed to certain positive patterns of intellectual behavior, then the teaching of “dispositional thinking” is more powerful and long lasting (Tishman & Palmer, 2006). The purpose of this research was to provide a thorough review of the literature addressing research and theory related to the studies of thinking dispositions and assessment. A summary analysis of prominent themes and findings within the reviewed literature is presented at the end of the paper.

Key Words: Thinking dispositions

1. INTRODUCTION

Thinking is like breathing it is often taken for granted (Parlette & Rae, 1993). But how we think is vital to success in life just as breathing is to living. Thinking is defined as “a mental process in which the learner develops through mental interaction processes between the individual and the experiences that he or she acquires to develop structures of knowledge and access to new assumptions and expectations” (Turki, 2012, p. 140). Meanwhile “Disposition” is the “products of electrochemical activities within the neural networks of the genetic endowment of the human species” (Dickmann & Stanford-Blair, 2009, p. 174). Babies are born with dispositions, children are naturally disposed to construct understanding by forming hypotheses making predictions conducting experiments and formulating theories about how language work because dispositions are passed from parents to children. Dickmann and Stanford-Blair (2009) stated: even though dispositions originally installed, it is influenced by environmental
experiences. Therefore people are disposed to certain habits of mind by both nature and nurture. “The potential quality of course lies in nurture” (p. 175). A person’s multidimensional capacity for learning and achievements must be regularly exercised to realize its potential. Dispositions are frequently exercised and capacities are key to maximizing intelligence (Dickmann & Stanford-Blair, 2009). The literature suggests that thinking dispositions are fostered by nurture.

This paper creates paths for scholars and educators to choose from when teaching thinking dispositions.

2. DEFINITIONS OF THINKING DISPOSITIONS

Thinking dispositions are described as “styles, inclination, mindset, tendency, propensity, predilection, proneness, habit, characteristic, penchant, capability, aptness, potential, leaning, proclivity, urge, affinity, affection” (Costa & Kallick, 2014, p. 18).

Overall, researchers agreed on one broad definition of thinking disposition and that is the tendencies toward particular patterns of intellectual behavior (Tishman & Andrade, 1995). Ennis (1986), a philosopher of education, defines a thinking disposition as the tendency to do something given to certain conditions. While Norris (1992), another philosopher of education, described thinking dispositions as a tendency to think in certain way under certain circumstances. Tishman and Palmer (2006) stated, “traditionally, good thinking has been defined as a matter of cognitive skill. Therefore it is given the term, "thinking skills". Surely, good thinkers have skills, but, they also have more: Motivation, attitude, values, and habits of mind all play key roles in thinking, and, in large part, it is these element determine whether learners use their good thinking skills in situations” (p. 7). According to psychologist Salomon (1994), who agreed with Tishman and Palmer’s (2006) theory that thinking dispositions are more than just one described behavior or tendency; he urged that it is described as a cluster of preferences, attitudes, and intentions, plus a set of capabilities that allow the preferences to become realized in a particular way (Salomon, 1994). Facione and Facione (1992), authors of the California Critical Thinking Dispositions Inventory, also agree that thinking dispositions is a collection of attitudes, intellectual virtues, and habits of minds. While Stenberg (1997), defined a thinking style as a matter of preference. According to Stenberg (1997) thinking style is a person’s preference for a certain thinking process. He continued that thinking style is a specific reasoning and problem-solving strategy that helps to clarify why people respond in different ways to problems that need to be solved in the context of studies or work, or in social interactions with other people (Sternberg, 1997).
3. TYPES OF THINKING DISPOSITIONS

Some scholars described thinking dispositions and thinking styles from tendency perspectives, others defined them from state of mind or mindsets perspectives.

Langer (1989) doesn't use the term thinking dispositions, thinking styles, nor thinking skills. Instead she described thinking styles or dispositions as mindfulness. Langer (1989) focused on the view that good thinkers have towards mindfulness. Mindful thinkers tend to create new categories, or simply "pay attention" to given contexts; they tend to be open to new information, and they tend to cultivate an awareness of more than one perspective (Langer, 1989). Several scholars and educators, however, have proposed more precise definitions of thinking dispositions.

Dweck’s (2008), research and theory of Mindsets, distinguishes two specific perspectives that people hold about their abilities and adversity. She noted that people tend to have two different mindsets towards different aspects of their lives; the two specific mindsets suggested are fixed mindset and growth mindset. As stated in table 1, the theory of Mindsets explains thinking dispositions in two different ways, a preferred way (growth mindsets) and a distorted way (fixed mindset). It also detects actions and successful behaviors.

Table 1. The Theory of Mindsets

<table>
<thead>
<tr>
<th>Type of Thinking Disposition (Mindset)</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Growth mindset</td>
<td>Challenges are embraced rather than rejected. Effort is seen as worthwhile and a path to mastery. Getting things wrong and receiving feedback is positive—it guides further improvement.</td>
</tr>
<tr>
<td>Fixed Mindset</td>
<td>Thinking patterns are created in systematic fixed thinking in which challenges are avoided, as failures suggest lack of intelligence, and effort is seen as fruitless. Getting things wrong and receiving feedback is negative and it reveals limitations.</td>
</tr>
</tbody>
</table>

Source: (Dweck, 2008)

Burns (1999), however, specified and highlighted only distorted thinking patterns that work against a healthy outlook on life. The ten distorted thinking patterns are described in table 2.

Table 2. The 10 Distorted Thinking Patterns

<table>
<thead>
<tr>
<th>Type of Thinking Disposition</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <em>All-Or-Nothing thinking</em></td>
<td>Sees things in black-and-white categories</td>
</tr>
<tr>
<td>2. <em>Overgeneralization thinking</em></td>
<td>Sees a single negative event as a never-ending pattern of defeat.</td>
</tr>
<tr>
<td>3. <em>Mental Filter thinking</em></td>
<td>Picks out a single negative defeat and live on it exclusively so that the vision of reality becomes darkened, like the drop</td>
</tr>
</tbody>
</table>
4. **Disqualifying the positive thinking**
   Dismiss positive experiences by insisting they “don’t count” for some reason or other to maintain a negative belief that is contradicted by everyday experiences.

5. **Jumping to conclusions thinking**
   Make a negative interpretation even though there are no certain facts that convincingly support the conclusion.

6. **Magnification (Catastrophizing) or Minimization thinking**
   Exaggerate the importance of things or inappropriately shrink things until they appear insignificant. This is also called the “binocular trick.”

7. **Emotional Reasoning thinking**
   Assume that negative emotions necessarily reflect the way things really are: “I feel it, therefore it must be true”.

8. **Should statements thinking**
   Criticize self or others with should or shouldn’t statements.

9. **Labeling thinking**
   Identifying the shortcomings, instead of acknowledging mistakes. For example, Instead of saying “I made a mistake” one says, “I am not qualified”.

10. **Personalization and blame thinking**
   See self as the cause of a negative external event, and blame other people for actions that are related to outcome of self.

Source: (Burns, 1999)

Meanwhile some researchers pointed out negative thinking dispositions that creates unhealthy outlook in life, others highlighted the positive thinking dispositions that will allow flexibility, and healthy view of life. According to Tishman, Perkins, and Jay (1993), “Being a good thinker means having the right thinking disposition, because otherwise you'll never make full use of your abilities” (para 3). These Harvard education scholars argue that there are seven thinking dispositions that lead to successful outlook in life and that each disposition has its own set of tendencies, distinct abilities, and sensitivities. These seven dispositions are listed in table 3.

**Table 3. A list of the Seven Thinking Dispositions for Successful Outlook in Life**

<table>
<thead>
<tr>
<th>Type of Thinking Disposition</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. The disposition to be broad and adventurous</td>
<td>The tendency to be open-minded, to explore alternative views; the ability to generate multiple options.</td>
</tr>
<tr>
<td>2. The disposition toward sustained intellectual curiosity</td>
<td>The tendency to wonder, investigate, identify problems, the ability to observe and formulate questions.</td>
</tr>
<tr>
<td>3. The disposition to clarify and seek understanding</td>
<td>A desire to understand clearly, to seek connections and explanations; an ability to build conceptualizations.</td>
</tr>
<tr>
<td>4. The disposition to be planful and strategic</td>
<td>The drive to set goals, to make and execute plans, to envision outcomes.</td>
</tr>
</tbody>
</table>
5. The disposition to be intellectually careful
   The urge for precision, organization, thoroughness, the ability to process information precisely.

6. The disposition to seek and evaluate reasons
   The tendency to question the given, to demand justification, the ability to weigh and assess reasons

7. The disposition to be metacognitive
   The tendency to be aware and monitor the flow of one's own thinking, the ability to exercise control of mental processes and to be reflective.

Source: Tishman et al.,(1993)

Costa and Kallick (2014) also emphasized the dispositions of good thinkers versus poor thinkers in times of dilemmas and hard situations. They refer to dispositions as "Passion of Mind" or "Habit of Mind." According to Costa and Kallick (2014) in their book *Dispositions: Reframing Teaching and Learning*, a habit of minds means having a disposition toward behaving intelligently when confronted with problems, or having the answers that are not immediately known. When humans are confused by dilemmas or with uncertainties, the effective actions require drawing forth certain patterns of intellectual behavior. When people draw upon these intellectual resources, the results that are produced are more powerful, of higher quality, and greater significance than if they fail to employ those patterns of intellectual behaviors.

Costa and Garmston (2002), the founders of Cognitive Coaching, define thinking dispositions as strategies, a way of thinking, and a way of working that invites self and others to shape and reshape their thinking and problem solving capacities. Costa and Garmston (2002) indicated the “key passions” that characterize a good thinker are: efficacy, flexibility, craftsmanship, consciousness, and interdependence. The description of each passion of or habit of mind is indicated in table 4.

**Table 4. “Key Passions” or Thinking Dispositions that Characterize a Good Thinker**

<table>
<thead>
<tr>
<th>Type of Thinking Disposition (Key Passion)</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>High efficacy</td>
<td>Exhibit internal locus of control, engage in cause-and-effect thinking, set challenging goals, and devote energy to challenging tasks. They also persevere in the face of barriers and occasional failure. High efficacy thinkers are optimistic, confident, and feel good about themselves.</td>
</tr>
<tr>
<td>Highly flexible</td>
<td>Hold multiple goals, consequences, and time frames simultaneously; they can shift among different points of views. In addition, highly</td>
</tr>
</tbody>
</table>
flexible thinkers can engage in the mechanics of a situation (novice focus) and underlying causes/effects (expert focus). They also seek novel solutions and they can be comfortable with ambiguity.

**Highly craftsmanship**
Set high standards for themselves. They create and hold clear visions and goals and continuously monitor progress toward those goals. They use data to assess and improve their own performance and results. They are personally driven to hone, refine, and constantly work for improvement.

**Highly conscious**
Aware of one’s thoughts, feelings, viewpoint, behaviors and the effect they have on oneself and others. They notice others’ verbal and nonverbal communications. They also monitor their values, thoughts, behaviors, and progress toward goals. Consider their own and others’ feelings when examining situations and events to their responses.

**Highly Interdependent**
Have a strong sense of community and contribute themselves to the common good. They value collective work and know when to integrate and when to assert. They see resources within the group. They see conflict as a resource of learning and moving forward. They learn from others’ feedback.

Source: Costa and Garmston (2002)

Harrison and Bramson (2002), through their research detailed in their book, *The Art of Thinking*, highlighted the most common thinking styles in Western society, not necessarily the preferred or the distorted thinking styles, instead the neutral thinking styles. According to Harrison and Bramson (2002), there are five distinct styles of thinking. Most people show a marked preference for one or two of the styles. These styles are referred to as “Inquiry Modes.” The five styles of thinking are listed in table 5.

**Table 5. A list of “Inquiry Modes” Thinking Dispositions that are Most Common in Western Society**

<table>
<thead>
<tr>
<th>Type of Thinking Disposition (Inquiry Mode)</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Synthesis thinking</em></td>
<td>Focuses on integration while their behavior is often viewed as challenging.</td>
</tr>
<tr>
<td><em>Idealists thinking</em></td>
<td>Focuses on the process, aspirations, and values.</td>
</tr>

incremental.

**Analysts thinking**

This thinking is associated with abstracting facts into theories and problem solving approaches.

**Realists thinking**

Is associated with highlighting available resources and applicable facts. The realist thinkers focus on the task at hand while their behavior is often viewed as empirical and objective.

Source: Harrison and Bramson (2002)

Stenberg’s (1997) theory of self-government indicates that there are no “good” or “bad,” style of thinking it is a matter of fit between learner and situations. From the literature review, almost all the definitions of thinking dispositions underlies that people are disposed to certain habits of mind, and dispositions are tendencies rather than abilities. According to Sternberg (1997), styles pointed out in the theory are preferences they are not abilities. He noted that there are indeed differences between how creative a student is (ability) and how much the student has the tendency and would like to be creative (style).

According to Sternberg (1997), there are 13 different Self-Government thinking styles. The 13 different thinking styles come from the concept that people must govern themselves to have control on their lives (Sternberg, 1997). The way they do this corresponds to the kinds of governments and government branches that exist in the world; legislative, executive, judicial, monarchic, hierarchic, and oligarchic. These 13 government styles perform under five categories, and most people tend to lean toward one style or another within each category (Sternberg, 1997). The 13 suggested thinking styles are comprised in five dimensions, listed Table 6.

**Table 6. Self-Governing Thinking Styles of the MSG thinking styles**

Source: (Sternberg, 1997)

From the literature review it is notable that while some authors reviewed thinking disposition in one-line broad definitions (Costa & Kallick, 2013; Dickmann & Stanford-Blair, 2009; Tishman & Andrade, 1995; Ennis, 1962; Salomon, 1994; Facione & Facione, 1992; Langer, 1989), others specified them in lists of thinking disposition (Dweck, 2008; Burns, 1999); Tishman et al., 1993; Costa & Kallick, 2014). Burns (1999) highlighted negative thinking dispositions that influence life negatively such as the 10 distorted thinking patterns. Others highlighted the ideal thinking dispositions that should be taught and applied (Tishman et al., 1993; Costa & Kallick, 2014).

Harrison and Bramson (2002) described the neutral thinking dispositions that most people in western world holds and neutral dispositions that are detailed within dimensions such as
Sternberg’s (1997). Definitions of thinking dispositions were provided from multiple fields of studies, namely education, philosophy, psychology, and neuroscience. According to the reviewed literature, there are three ways scholars described thinking dispositions: cluster of neutral description of thinking dispositions. Cluster of good thinking dispositions that should be utilized “the good thinking dispositions”, and cluster of distorted thinking dispositions, or so called “bad thinking dispositions.

Figure 1 illustrates the major topics and themes found after reviewing the literature on thinking dispositions.

4. ASSESSMENTS OF THINKING DISPOSITIONS

In order to teach thinking dispositions there is a need to first identify which thinking disposition students do hold and there must be an appropriate assessments and measurements of thinking dispositions to do so.

According to Tishman and Andrade (1995), “The issue of assessment poses one of the greatest challenges to the concept of thinking dispositions” (p. 7). Most researchers measure thinking dispositions with multiple-choice questions, personality tests, and questionnaires to
participants to identify what types of thinking dispositions the participants are tend to lean towards. For example, Burns (1999), who highlight 10 distorted thinking patterns that work against a healthy outlook on life, assessment the 10 distorted thinking pattern with a tool called “The Dysfunctional Attitude Scale” (DAS). According to Burns (1999), DAS is a test that has been developed by Weissman who has compiled list of one hundred self-defending attitudes that create emotional disorders. Burns (1999) selected a list of 35 most common attitudes and added others in a test to help the reader identify which types of thinker are they. The questions in (DAS) are in forms of general statements that depict an attitude. The test taker must mark which attitude he or she agree strongly with, agree slightly, natural, disagree slightly, or disagree very much. After that the test taker evaluate their scores based on a given chart that represents areas of vulnerabilities or strengths.

According to Ennis (1996), a philosopher of education, the fundamental problem when assessing critical thinking dispositions is researchers want students to identify their thinking dispositions on their own without being pushed to choose it (Ennis, 1996). To solve this problem some researchers used practical observational methodologies instead of traditional questionnaire, and personality test. For example, the assessments based in theory of mindsets by Dweck (2008), are mainly based on experiments and structure observation. The author gave students experiments and observed them in settings that she called “the pressure cooker settings” (Dweck, 2008). In pressure cooker settings, the sample is observed while put into difficult situations. Experiments of students under pressure cookers help identify the two types of mindsets.

Another thinking disposition assessment tool is the California Critical Thinking Dispositions Inventory (CCTDI), developed by Facione and Facione (1992). This is a well-known assessment resource that examines individual's dispositions towards critical thinking. CCTDI measures one's intellectual curiosity and one's desire for learning even when the application of the knowledge is not readily apparent. CCTDI specifically examines the willingness of an individual to think critically rather than the ability of individuals to think critically. The CCTDI contains seven scales that measure the individual's dispositions towards the following: Seeking the truth or bias, anticipating consequences, proceeding in a systematic or non-systematic manner, open-mindedness or intolerance, inquisition or resistant to learning, mature judgment or simplistic thinking, and being confident in reasoning or mistrust of thinking. The test takers usually have 30 minutes to complete the test and most participants complete the test in less than 20 minutes (Facione & Facione, 1992).

Sternberg and Wagner (1991) developed the Thinking Styles Inventory (TSI). Sternberg (1997) mentioned that styles are measurable; they are measured by using various questionnaires.
TSI is a self-report test consisting of 65 statements. Each of the 13 thinking styles described in Sternberg and Wagner (1991) theory of mental self-government, is assessed by 5 statements. For each statement, the test takers rate themselves on a 7-point Likert-type scale, with 1 indicating that the statement does not describe the way they normally carry at all, while 7 implying that the statement characterizes extremely well the way they normally carry out tasks unlike the CCTDI, which measures the willingness of critical thinking, TSI measures only the 13 thinking styles that are noted under the light of Sternberg's theory of mental self-government.

5. DISCUSSION

According to the reviewed literature on thinking dispositions, people are disposed to certain habits of mind by both nature and nurture. Dickmann and Stanford-Blair (2009) urged, “The potential quality of “dispositions” lies in nurture” (p. 175). Also, people do not have one fixed disposition, dispositions are modifiable people are not “stuck” with certain disposition unless they want to (Sternberg, 1997). This indicates that thinking dispositions are teachable/learnable.

Meanwhile some people can easily switch among styles; others might find difficulty in doing so. That indicates educators might face some challenges in teaching thinking dispositions. However, according to Stenberg (1997), styles are not only modifiable they are also socialized; they can be learned through interactions with the environment. Styles of thinking can by change with age and time. There is no one fixed disposition that can lead to success, because styles or dispositions vary; the one style that leads to success in one school or one job, may lead to failure in another.

6. SUMMARY

The objective of this paper was to review the literature addressing research on the various thinking dispositions definitions from different schools of thoughts definitions, types of thinking dispositions, and measurements and assessments of thinking dispositions.

By reviewing the literature on different definitions thinking dispositions, it appears that some researchers named it “Thinking styles” “Thinking pattern”, “Passion of the mind” “Mindfulness”, “Mindsets”, or “Inquiry modes”. From the literature review it is notable that definitions of thinking dispositions were provided from multiple field of studies i.e., education, philosophy, psychology, and neuroscience.
By reviewing the literature types of thinking dispositions, it appeared that some researchers viewed thinking dispositions as one broad definition, while others defined them in detail. Thinking dispositions fall into three main areas of organization: distorted thinking dispositions, neutral thinking dispositions, and preferred thinking dispositions.

By reviewing measurements and assessments of thinking dispositions, it is notable that there is few of thinking disposition assessment tools scholars have used to measure thinking dispositions. Yet, there is no determined specified assessment that best measures all types of thinking dispositions. Scholars have yet to determine a categorized common definition of thinking dispositions and how to best teach and assess this construct.

Effects of Visual Working Memory Training and Direct Instruction on Geometry Problem Solving in Students with Geometry Difficulties

Area: Special education.
Format: Poster Session

We examined the effectiveness of (a) a working memory (WM) training program and (b) a combination program involving both WM training and direct instruction for students with geometry difficulties (GD). Four students with GD participated. During the Phase 1, students received six sessions of computerized WM training; during Phase 2, they received both six sessions of computerized WM training and six sessions of human-delivered direct instruction on triangle congruence. Results were reported.

Abstract

We examined the effectiveness of (a) a working memory (WM) training program and (b) a combination program involving both WM training and direct instruction for students with geometry difficulties (GD). Four students with GD participated. A multiple-baseline design across participants was employed. During the Phase 1, students received six sessions of computerized WM training (Jaeggi et al., 2011); during Phase 2, they received both six sessions of computerized WM training and six sessions of human-delivered direct instruction on triangle congruence. All four participants remarkably improved their WM. We also found some enhancement on the spatial rotation and general geometric problem-solving. However, the participants’ performance on specific triangle-congruence tasks did not improve until direct instruction was introduced. Practical recommendations were discussed.
Exploring the Experiences of Senior Enlisted Military Wives Seeking Higher Education Through Distance Learning

Submission 1261
EXPLORING THE EXPERIENCES OF SENIOR ENLISTED MILITARY WIVES SEEKING HIGHER EDUCATION THROUGH DISTANCE LEARNING

Abstract

The purpose of my study was to explore the experiences of senior enlisted military wives and document how the military lifestyle has affected their ability to attain higher education while their servicemember was on active duty. Specifically, my study focused on senior enlisted military wives who have chosen to pursue their higher education through distance learning. The study portrayed experiences of those spouses who are an integral component of today’s military, yet who are often unseen not only in the military world and the civilian sector, but also in higher education. In the study, I explored four research questions:

1) How do the life experiences of a senior enlisted military wife align with the features of a Model Military Wife in the contemporary era as described by Enloe (2000)?

2) How do the challenges and demands of the role of a senior enlisted military wife affect fulfillment of their educational goals?

3) How has the experience of distance learning contributed to transformations for the senior enlisted military wife?

In my study, I documented the narratives of senior enlisted military wives and described their educational journeys. Narrative inquiry allowed the five participants in my study to share their stories of their educational journeys. Their narratives were restoried and two categories of themes emerged:
1) Challenges of the military lifestyle.

2) Opportunities of the military lifestyle.

From these themes, several findings were identified and recommendations determined for the military community and higher education. The experiences of the senior enlisted wives in my study point to a need for more support and a better understanding of the numerous opportunities that are available to help them along their educational journeys. I recommend that institutions of higher learning survey current military spouses to determine what types of programs, services, and support could better assist them with their educational journeys. I also recommended that university personnel be informed of the challenges that military spouses face and understand that this population does not often fit within the mold of a nontraditional student. In addition, I recommend that the military-provided services such as military education centers, libraries, and other offices that assist military spouses in relation to education make an extra effort to inform and discuss better the different education opportunities with the military spouses in their community. Meeting with military spouses to discuss their interests and educational goals is paramount. My study extends the existing literature available about military spouses and ignites interest in military spouse learners as a separate population of learners.

Transformative Impact of Engaging Early Learners in Science and Literacy on Achievement Outcomes in Grades 1-2 and Beyond¹

Nancy Romance, *Florida Atlantic University*
Michael Vitale, *East Carolina University*

**Introduction and Objectives**

A daunting new challenge for educators is how to achieve the level of rigor for science learning and content-area reading comprehension and writing at early elementary grades as advocated by the Common Core State Standards –ELA (NGAC, 2010) and the Next Generation Science Standards [NGSS] (Achieve, 2012). In addressing the challenge, the present research project reports on the three-year findings of an initiative funded by the National Science Foundation (NSF DR-K12) that links core science concepts and common core English/Language Arts standards within an integrated instructional model implemented across grades 1-2 classrooms. The major objective of the study was to demonstrate the effectiveness of the integrated science/literacy model (Primary Science IDEAS) on early learners’ achievement outcomes in science and literacy. A secondary objective was to offer an evidence-based rationale for transforming elementary school curriculum policy to increase allocated instructional time for integrated science/literacy instruction in grades 1-2 as a way to support later learning in science and comprehension in grade 3 and beyond.

**Background and Theoretical Perspectives**

As an integrated instructional model, Primary Science IDEAS addresses two critical and persistent educational problems, namely student achievement in science learning and reading comprehension at the elementary school level (National Research Council [NRC], 2014; Institute of Education Sciences [IES], 2016; Institute of Medicine [IOM] and NRC, 2015; National Center Educational Statistics [NCES], 2012, 2013). In considering the NRC reports and the national statistics in science and reading achievement just cited as well as recommendations associated with Next Generation Science Standards [NGSS] (Achieve, 2013) and the Framework for K-12 Science Education (NRC, 2011), it is clear the decades of reform have done little to address desired student learning outcomes in science and literacy.

Beginning with NGSS and the Science Framework, there has been a resurgence of emphasis and a growing consensus suggesting the importance and far-reaching impact of early science learning on proximal and distal achievement outcomes and on student potential economic success resulting from early exposure to science. Specifically, NGSS and the National Science Teachers’ Association (NSTA) have suggested that “young children have the capacity for conceptual learning and the ability to use the skills of reasoning and inquiry as they investigate how the world works.” (NSTA, 2014 citing from NRC 2007, 2012). A recent publication sponsored by the National Science Foundation (NSF) - *Fostering STEM Trajectories* - (Cements, et al., 2016) strongly advocates for the importance of starting and continuing early (pre-K) experiences with STEM subjects. Others (e.g., Duschl et. al., 2007; IOM & NRC. 2015; Lee et al., 2016; Morgan et al, 2016; Tai et al., 2006) strongly suggest that not only are young learners capable of learning science, but that without such educational opportunities, achievement gaps will begin early and persist over the span of elementary school years, may impact educational achievement outcomes beyond elementary school and career-related opportunities.

What is not addressed by science educators is what happens when early learners have neither experienced science directly nor built the adequate background knowledge (i.e., vocabulary) or reasoning skills that result directly from science instruction. Further, lack of exposure to early science learning denies students opportunities to use scientifically-informed language that supports concept learning and the beginning development of scientific literacy and the practices of science. In turn, lack of development of rich and varied background knowledge which serves as prior knowledge, has a negative impact on reading.
comprehension, in general, and content-area reading comprehension, more specifically. Interestingly, large scale data analyses of STEM learning (IOM & NRC, 2015; Morgan et al., 2016; Romance & Vitale, 2016) reveals the direct impact and the importance of early preparation in science on later student learning and achievement in STEM and in reading, and in terms of economic factors and workforce readiness.

**National Standards in Science and English-Language Arts.** In science education, two highly-related and influential documents are providing both general guidance for and specific descriptions of the standards to be taught in science. First, the Framework for K-12 Science Education (National Research Council, 2012 [NRC]) calls for students to be actively engaged in exploring phenomena linked to a coherent set of disciplinary core ideas (DCI) and cross-cutting concepts (CCC) while using the practices of science (POS) (e.g., asking questions, constructing explanations, engaging in argument from evidence) (Banilower et al., 2013) to develop deeper, more meaningful understanding. Second, the NGSS places significant demands on science learning at every grade level (NRC, 2014, p. 45). In doing so, NGSS identifies then develops what can be described as a progression of understanding of DCI’s across each grade span (e.g., k-2, 3-5, 6-8, 9-12) resulting in students developing progressively more sophisticated ways of knowing and understanding the core ideas of science. Further, NGSS also identifies broadly-construed CCC (e.g., structure and function, energy, systems) which, when linked to the DCI’s and the POS, provide a newer vision of how to teach science. For example, as students explore phenomena, they need experiences enabling them to link the disciplines of science (e.g., energy serves as the explanation for phase change in matter, movement of the Earth’s crust, and atmospheric changes) in a manner that fosters coherence and depth of understanding. In supporting both the Framework and the NGSS, students need coherent curricular materials and forms of classroom instruction (including use of multiple science texts, opportunities to connect investigations to concept-based explanations) that support an interdisciplinary approach to both science teaching and learning (Harris, et al., 2015). Finally, active engagement of elementary students in science is supported by current views of learning (Duschl, et al., 2007) that suggest students have substantial knowledge of the natural world which, in turn, provides a strong foundation for science instruction and that what young children are capable of learning depends primarily on the combination of prior experiences brought to the classroom (i.e., not age- or grade-level) and the adequacy of the instructional approaches including students reading and writing more about what it is they already know (Romance & Vitale, 2010, 2011).

Similarly, in the reading education, the CCSS-ELA offer an interdisciplinary perspective in terms of what leads to and constitutes reading comprehension. The underlying rationale is suggestive of the importance of providing students with a rich array of reading materials and experiences with increasing emphasis on students reading with understanding progressively more sophisticated literary sources including an increase in time allocated to informational sources. When the general intent of NGSS is combined with CCSS-ELA, there results a synergy that supports advancing the learning outcomes for all students.

In addition, there is a plethora of related literatures that approach meaningful learning as a process that results in the building of age-appropriate conceptual understanding in areas such as science (Bransford et al., 2000) and that demonstrate how the integration of literacy (early reading fluency, comprehension, discourse, and argumentation) within science instruction increases science learning and reading comprehension development (Pearson et al., 2010; Romance & Vitale, 2012a). Further, both science and reading researchers are actively building a substantial evidence-base in support of an integrated model of instruction (Romance & Vitale, 1992, 2001, 2006, 2010; Vitale & Romance, 2011a, b, 2012; Duke, 2000a, 2000b, 2010; Guthrie et al., 2004; Pearson et al., 2010; Van den Broek, 2010; Yore et al., 2004).

Other interdisciplinary research involving an integrated approach to science and literacy suggests that rich hands-on learning experiences in science can impact science learning and literacy development (French, 2004; Romance & Vitale, 2001, 2012; Smith, et al., 2006). Specifically, research suggests that
reading helps build background information, close gaps in knowledge, and clarify what otherwise might not have been learned or understood (Cervetti & Pearson, 2009; Hapgood et al., 2004; Palincsar & Magnusson, 2001; Pearson et al., 2010). As conceptual knowledge deepens, student understanding of natural phenomena being studied through engagement in the practices of science also increases. In fact, literacy researchers have noted the similarities between the practices of science and literacy strategies such as observing, communicating through reporting data, and constructing evidenced-based arguments (Cervetti, et al., 2009). The growing body of interdisciplinary research offers promising ideas in support of the new recommendations from CCSS and NGSS.

**Instructional Model Overview**

The grade 1-2 Primary Science IDEAS Model is composed of six, interactive instructional elements: (a) hands-on, science investigations, (b) a reading comprehension strategy, (c) writing/journaling, (d) propositional concept mapping, (e) applications, and (f) accessing prior knowledge/cumulative review strategies. The Model is implemented across the school year and involves using daily, 45-minute time segments organized around core science concept clusters (matter, its phases and properties, force and motion [push/pull], forms/transfer of energy, changes in matters; living things, earth science). In turn, addressing these core concepts through hands-on activities serves as a meaningful context for integrating key aspects of literacy within science instruction (e.g., teacher read-alouds, teacher-guided student reading, student reading of age-appropriate science materials, writing/journaling, summarization, cause/effect relationships) which focus on and deepen student understanding of science concepts (French, 2004).

**Reading in Science.** Primary Science IDEAS describes reading comprehension as meaningful understanding. The instructional model employs a multi-part reading comprehension approach in which teachers (a) first read and reflect upon what students will be reading, and then teachers (b) think about and identify what they know about the topic that might be helpful in guiding conversation/questions with the students, (c) employ a guided reading, whole group approach in which a paragraph is read aloud (depending on levels of fluency) and each sentence is discussed for meaning and linked to the previous sentence and to any relevant student prior knowledge, (d) link the ideas across each paragraph, and (e) finally engage students in summarizing the page. The focus of reading within this model is upon student understanding of the concepts to be learned. Across multi-day lessons, students have additional opportunities to read across multiple sources, thus learning more about what it is they already know. In supporting comprehension, the Primary Science IDEAS model links all aspects of instruction (e.g., 6 elements of the model) to the core ideas (DCI’s).

**Writing/Journaling in Science.** Within the Primary Science IDEAS Model, students engage in a variety forms of writing in science which are added to their science journals, science folders, or become elaborate classroom displays. For example, in exploring phenomena, students may first create a picture of their investigation, then they discuss what they observed followed by learning how to link their observations to the underlying core science concept (e.g., we observed how drops of water on the wax paper remained as droplets, how when the string was wet, the water was able to slide down the string moving from drop to drop). The evidence shows that water droplets are attracted to each other because of cohesion.

Another important form of writing emphasized in Science IDEAS is student use of a concept map as a blueprint to guide more coherent forms of student writing. Students are guided by the teacher in creating a concept map as a summary for a series of lessons. Then, depending upon grade-level appropriateness, teachers can model for the students how to use the map to write sentences, and eventually paragraphs.

**Method/Data Sources**

The primary objective of this three-year NSF/DRK-12 project was (a) to replicate the direct
effects of the model in grades 1-2 in years 1-2-3 and then, in year 3, (b) to assess the transfer of the grade 1-2 effects to grade 3 in year 3.

The specific project research questions were:

- Was the model able to demonstrate direct effect on student achievement in science and reading (vs demographically comparable controls)?
- Was the model able to demonstrate transfer of effects in science and reading from grades 1-2 to grade 3 paralleling previous transfer found from grades 3-5 to grades 6-8?

Reported here are the results of the 3-year National Science Foundation project in terms of the direct effects of the Primary Science IDEAS model versus traditional reading and science instruction on the Iowa Test of Basic Skills Subtests (ITBS – Reading and Science) and, in Year 2, also on an objective-referenced science test.

**Sample and Setting.** The research involved 21 demographically similar elementary schools (9 experimental, 12 control) with N=168 classrooms in a large (185,000), diverse (African American: 29%, Hispanic: 19%, White: 45%, Free Lunch: 40%) school district in Florida.

**Research Design/Instruments.** Using a quasi-experimental design, year 1 of the project assessed the impact of the Model on learning in science and reading, while documenting teacher classroom fidelity. Both experimental and control schools followed the same District-adopted Reading/ Language Arts and Science curricula. Multilevel analyses (Level 3: schools, Level 2: teachers/classrooms, Level 1: students) using HLM 7 tested the effects of the model on student performance outcomes using ITBS Science and Reading. In addition, in years 2 and 3, project-constructed objectives-based science tests were administered in grades 1 and 2.

**Results**

Table 1 summarizes the results of the year 1 and year 2 project findings. In year 1, findings from a six-month implementation found significant differences in adjusted means between students in experimental and control schools (+0.51 Grade Equivalent (GE) in science, +0.26 GE in reading). Observational data indicated that the majority of experimental teachers (92%) implemented the Model with fidelity on a consistent basis.

In year 2, findings from a year-long implementation again found significant differences in adjusted means between students in experimental and control schools (+0.53 GE in science, +0.11 GE in reading). Observational data across 2-3 years indicated that a majority of experimental teachers (81%) implemented the Model with fidelity on a consistent basis. One possible factor explaining the differences in the level of fidelity is that many of the best grade 1-2 experimental teachers were moved to grades 3-5 and replaced with teachers transferred from grades 3-5 to grades 1-2. Year 2 analyses of the objective-referenced science tests showed that students in experimental schools performed significantly better, although the differences were not large (+4%). Year 3 findings again found significant differences in
adjusted means between students in experimental and control schools (+0.54 GE in science, +0.11 GE in reading). Finally, the project will report at the time of the conference the degree to which the positive achievement effects were transferred to grade 3 students without any further project intervention.

Discussion/Implications

The engagement of primary children in meaningful science learning linked to reading and writing is a synergistic approach that in the present project accelerated student achievement in both reading comprehension and content-area learning in science. Project findings align with a growing body of research evidence that early learners have reasoning abilities and can develop core concept learning abilities that impact future science learning, reading comprehension, and career opportunities. Further, the transfer of direct effects to students in grade 3 provides an evidence-based rationale for transforming present approaches that teach science and literacy as separate subjects in primary grades. The Model is also feasible to implement in regular classrooms settings across a wide range of student demographics, thus addressing another key issue in standards-based reform.

3. Abstract

This panel plans to include four presentations with the first two presentations covered in the first proposal.

Magnet Schools: Factors That Contribute to Diverse Student Enrollment and Academic Success
Gladys Park and Robert Brooks (40 minutes)

Magnet Schools, as the first major form of public schools choice in the United States based on racial, ethnic and socio-economic equity and excellence, have provided the landscape for excellence schools, and incubators of educational change throughout our county since the 1960’s. This is a time in our nation when division by race, ethnicity and socio-economic status is on the front page of every newspaper throughout the country. It is a time when racial and economic biases lead to deaths
and protests. It is a time when demographics of our county are changing rapidly and when we desperately need constructive ways to meet the challenges of a changing society and to celebrate our diversity rather than revert to re-segregation in our everyday lives and in our schools.

Public schools of choice, and magnet schools in particular, provide a strong incentive towards achieving a cohesive diverse society. Magnet school goals go beyond test scores or even high school graduations! The experiences of children from diverse schools go with them into adulthood, to where they live, the jobs they take and their success in a multiracial society. Magnet schools have attracted and sustained students through interest, motivation, relevant curriculum, and improved achievement.

Based on interviewing magnet school students, teachers and alumni, this presentation will discuss why magnet schools are needed, why they work and specific factors of successful magnet school districts including policies, innovative themes, sustainability/student retention, and Magnet School Standards of Excellence. Factors discussed include the importance of fidelity of theme implementation throughout the school, and inter-district desegregation plans including the merging of city and county schools.

The following is a list of methods/data and theoretical issues that will be addressed:

- Magnet School factors that enable successful magnet schools to achieve the goals of attracting, supporting and retaining students to achieve racial, ethnic and socio-economic integration.
- Academic improvement, narrowing the achievement gap for all subgroups, and innovation and theme integration in magnet school development.
- Factors of successful magnet school districts such as policies, innovative themes and insights of magnet school students, teachers and alumni will be discussed. Reviews of policies, themes, sustainability and student retention based on research and data from exemplary magnet districts including inter-district desegregation plans: Hartford CT, merging of city and county schools and magnet schools in Chattanooga TN, and METCO in Boston, in which minority students attend suburban mainly white and middle income schools.
- Data on how themes have attracted and sustained students and programs long term reflecting the importance of fidelity of implementation of the theme throughout the school. Magnet schools have been called "incubators of innovation." Through innovative themes such as STEM; Museum studies; etc. magnet schools have attracted and sustained students through interest, motivation, relevant curriculum, and improved achievement.
- Sustainability and Student Retention: A framework for sustaining school-wide diversity and student retention will be presented from the perspective of "stakeholders’ commitments.” Six levels of commitment are offered to define “key indicators” of long-term success. A “systems approach” will be offered defining Student Success and Supports; Student
and Family Engagement; Recruitment; Teaching and Learning; Magnet Pathways; Stakeholder Commitments; and Retention Foci—recruitment, relationships, relevance.

- The National Magnet School Certification Program, created by Magnet Schools of America, is a process to recognize the most exemplary magnet schools in the nation based on five pillars of magnet schools and ten National Magnet School Standards of Excellence. The standards define the essential elements and characteristics of high-quality magnet programs and offer assistance to schools with professional development.

Recent research and the data regarding successful magnet schools and districts help us to identify those factors that enable magnet schools to develop integrated learning environments for all students, and implement unique and successful themes that motivate students from different racial, ethnic and socioeconomic backgrounds. These magnet schools promote high achievement for students.

In light of the re-segregation of schools throughout our country, the changes in our nation’s demographics, and racially motivated incidents in our society, this magnet symposium is significant for policymakers as well as practitioners as the presenters explore those factors that lead to successful magnet schools and successful magnet students. In addition, these sessions open possibilities for further research to enable researchers to delve more deeply into those factors that make excellent magnet schools work.

A Rigorous Analysis of Magnet Schools through a Quasi-Experimental Lens: Desegregation, Integration and Student Achievement
Jia Wang and Kate Riedell (20 minutes)

Student diversity and academic achievement are two goals that are grounded in educational reform of magnet schools originating as a response to court-ordered urban school desegregation efforts. Characterized by a thematic curriculum, or instructional approach, as well as voluntary enrollment from both the local and outlying neighborhoods, magnet schools are often the result of a neighborhood school conversion in an effort to increase racial integration and academic achievement (Betts et al., 2015). With the continued expansion of magnet schools across the country, it is critical that all stakeholders be provided with a comprehensive review of the impact of magnet schools on school desegregation and integration, as well as student achievement.

Reviewing the existing literature found that both descriptive and lottery-based studies on magnet schools showed positive results, while the vast number of magnet studies fall in the middle of these two extremes, these quasi-experimental studies. These latter studies show very mixed results – in some cases positive, in others no effects and still in others negative effects relative to control students and schools.

This current analysis of the literature will provide an in-depth analysis of all quasi-experimental studies of magnet schools to date, with a particular emphasis on the evaluative criteria employed, along with the requisite results. Additionally, a critical examination of the remaining components of each study (e.g. geographic
location, number of magnet schools, and grade level) will be undertaken in conjunction with the evaluative criteria and results.

Researchers and policy makers will be able to capitalize on this rigorous analysis by clearly understanding not only what has not been addressed in the literature to date, but also gaining critical information on what needs to be attended to in greater detail, particularly in regards to the evaluative criteria used. Analysis of each component of the methodology of each study will lend critical dialogue to how the results should be interpreted and their potential impact on current and future school reforms. Thus, this study will serve as a critical, and comprehensive tool for multiple stakeholders who serve to shape the field of education and magnet schools.

What should be the Future Directions of Magnet School Research?
Joan Herman (20 minutes)

Magnet schools have evolved since they first were instituted nearly 50 years ago as a response to civil rights concerns for school desegregation. From an exclusive focus on promoting the racial integration of schools, the mission of magnet schools has grown. The accumulated research evidence shows mixed results whether the issue be effects on desegregation or effects on student outcomes. Likewise, studies on magnet school implementation are noticeably absent. Available research leaves a number of issues needing attention.

Future research might explore the continuing evolution of magnet schools’ goals in light of legal mandates and new MSAP requirements (e.g. Goldring, 2009). How effective are magnet schools relative to these new goals?

In this new era of school choice, it also seems important to examine how parents are responding. How and why do parents choose magnet schools? Do they differentiate magnet schools from other choice options? Do race-neutral admission policies affect choice (Smrekar, 2009a & 2009b)? Why has there been a reduction of White parents choosing city magnet schools compared to past years (Grooms & Williams, 2015).

Siegel-Hawley & Frankenberg (2013) observe the limited outcome measures that are used to evaluate magnet schools, ignoring those that relate to specific magnet school themes and objectives (Blank, 1989)? Does magnet school effectiveness vary by magnet program type and/or choice of outcome measure?

Additionally, follow-up studies are needed to examine the long-term effects of magnet school experiences, for example to follow up on findings related to career magnets’ effects on career planning (Flaxman, Guerrero, & Gretchen, 1997) and future educational goals (Bank & Spencer, 1997).

Our earlier study on magnet implementation (Wang et al., 2014) raises a number of implementation considerations. What aspects of magnet school implementation relate to the observed variability in outcomes? Extensive professional development and a sustained commitment to magnet theme integration appear to be key strategies for success, as also demonstrated by the broader professional development literature (Bryk, 2010; Bryk, Camburn, & Louis, 1999). Grounding federal programs in effective magnet school models seems
essential to future success, particularly for schools that serve high concentrations of segregated racial minorities.

Title of the submission: Avoiding the “inexorable push toward homogenization” in school choice: Education savings accounts as hedges against institutional isomorphism

Name(s) of the author(s): Lindsey M. Burke, George Mason University and The Heritage Foundation

Address(es) of the author(s): 214 Massachusetts Ave. NE Washington, D.C. 20002

E-mail address(es) of the author(s): lindsey.burke@heritage.org

Abstract:
The assumption that rational choice dynamics will lead to diversity of school supply is at the heart of K-12 school choice arrangements. Yet as the field of school choice becomes more established, there will be the “inexorable push toward homogenization” as a result of the coercive isomorphism created through regulations, and as parents become pulled toward a standard model of schooling as a result of the unwritten normative ideas of school structure and function. If vouchers, tuition tax credit scholarships, and education savings accounts become more significant players in the education market in the years to come, isomorphism, if it occurs, will limit the utility of school choice. Using an organization theory framework and drawing on experiences from the charter sector and the Louisiana Scholarship Program, this paper considers whether education savings accounts might encourage less isomorphism of practice among participating private schools than school choice options such as vouchers and tuition tax credit scholarships.
Private school choice programs in the form of vouchers, opportunity scholarships, and tax-credit scholarships are expanding rapidly across the U.S. and the design of recently enacted programs expand access to a greater number of students than ever before. The success of the educational marketplaces created by such programs depends on the quality and diversity of school providers, yet little is known about school leaders’ concerns about participating in state-funded programs of this nature. This four-state survey of private school leaders offers insight into operators’ perceptions of large-scale school choice programs with broad-based eligibility. School administrators, headmasters, principals, and founders share the challenges they face when attempting to maintain private school autonomy and independence in a school choice environment, document which program regulations are particularly tricky to accommodate, and share insights on program design to enhance participation by high-quality operators. Subgroup analyses investigate differences in concerns shared by religious and secular providers, school age, and principal tenure.
TEACHERS’ DISPOSITION TO INCLUSIVE EDUCATION PRACTICE AT THE PRIMARY SCHOOL LEVEL IN OSUN STATE

BY

Victoria I. Iroegbu (PhD)
Institute of Education

Abstract

Inclusive education is a practice in education in which special needs pupils learn together with their non-special needs peers. The practice is yet uncommon in Africa although Nigerian teachers are gradually being prepared for its implementation. This study employed a survey research design to investigate teachers’ disposition to the practice of inclusive education at the primary school level. The sample was 225 primary school teachers, with adequate qualification and gender representation and varied year of teaching experience. The results showed that the teachers were 54.5 percent positive and 45.5 negative to the practice of inclusive education. A 2x3x3 factorial analysis of variance showed that the grouping (gender, teaching experience, qualification) was significant \( F_{(17, 224)} = 1.737; P < .05 \). Neither of the three factors nor their interactions was significant. The results were fully discussed and the recommendation that teachers should be further trained on the philosophy and strategies for implementing inclusive education.

Key words: Inclusive education, primary schools, teachers, disposition, gender

Introduction

All over the world, there is a general move by different nations to improve on the state of their systems of education in order to achieve improved learning and other learning outcomes. The move has the general objective of providing education that will benefit every citizen with ability or disability; boy or girl, from rich or poor home; from majority or minority community. The search for systems of education that will provide for the nations desirable educational outputs precipitated the ongoing educational reforms that is being witnessed all over the world since the last two to three decades (Evans and Lunt, 2010). This educational reform has brought to the fore an educational approach or system that is regarded today as inclusive education (Ferguson, 2008). The system has been embrace mainly in the developed world, by countries like the United States of America, Canada, Australia, and New Zealand (Wah, 2010)

The term inclusive education is difficult to define but various scholars have made attempts to synthesize definitions that could be used to attain an understanding of what the term means. Wanjoji (2013) summarized the definition as: the full integration of learners with and without special needs into the same classrooms and schools with their peers, thereby exposing them to the same learning opportunities. A comprehensive definition has been taken from the works of Stainback and Stainback, (1996): Inclusive education is a practice in education that is employed in some countries to educate students with special needs alongside their peers without special needs. The practice is not common in the developing countries but it is practiced in some developed countries such as the United States of America and Sweden. In this model of
instruction, students with special needs spend most of their time with non-disabled students (Stainback and Stainback, 1996). These authors further observed that inclusion rejects the use of special schools or classrooms to separate students with disabilities from students without disabilities.

PSBparents.org (2003-2017) opined that inclusive education happens when children with and without disabilities participate and learn together in the same classroom, and in the same neighborhood schools. PSBparents.org observed that research report has revealed that when a child with disability attends classes alongside peers who do not have disability, good things happen. They strongly emphasized that when children are educated together, positive academic and social outcomes occur for the children involved. The organization posited that inclusive education is based on the idea that every child and family is valued equally and deserve the same opportunities and experiences.

Inclusive education is viewed by some organizations and researchers as important including Haigh (2010), PSBparents.org (2003-2017). They put forward a long list containing the benefits of inclusive education. These include the making of meaningful friendship, increased academic and social interaction, increased appreciation and acceptance of individual differences, greater access to general curriculum, increased achievement, respect for all, opportunity to master activities by practicing and by teaching others, and greater academic outcomes. Haigh, (2010) proposed an international curriculum that will suit all learners both local and international whether at school or elsewhere.

The original practice in educational setting, which still remains current in Nigeria today is that physically able students and those with disabilities are put in separate schools; the physically able pupils go to the regular schools and those with disabilities go to special education institutions. Available primary schools today in Nigeria are too few to take up all children of primary school age. Moreover, as a consequence of the insurgency in the north-eastern part of the country, many communities remain displaced along with thousands of children. Both the children and their parents are afraid to return to their villages and schools for the fear of insurgents and their practice of abducting school girls. The need to find school places for thousands of those children displaced by the insurgence, and also others with special needs who are not in school or abandoned in special education institutions without resources, make the need for inclusive education attractive.

Inclusive education has been regarded by many researchers as being important. This position is evidenced by numerous researches that had been conducted in the area and published in reputable journals in Europe, America and Australia. Some of these include: Stainback and Stainback, (1996); Biklen (2000); Ferguson, (2008)); Miles and Singal (2009); Anke de Boer, Piji, &Minnaert (2010), Evans and Lunt, (2010), and many others. The central issue is inclusive education: attitudes, outcomes, curriculums and the reviews of empirical research literature. The conclusion that can be drawn from the various research reports seem to lead to the position that
inclusive education is worth practicing. There is however a strong view the teachers’ attitudes play a significant role in determining the eventual outcomes of inclusive education programme (Avramides, Bayliss and Burden, 2000; Anderson, Klasson & Georgiou 2007).

There are some researchers who oppose inclusive education practice on the ground that “without specialized instruction, disabled students would simply not learn and their futures would be sacrificed”. Ferguson, (2008) credited this assertion to Funch and Funch, (1994); Kauffman, (1999); and Sasso, (2000). There is some truth in that assertion that special needs pupils require specialized instructional aid for any meaningful learning in schools. However, if such needs are provided in regular schools, the practice of separating young school children on the basis of needs will then be unnecessary. Evans and Lunt (2010) asserted that the numerous school reforms and restructuring has not changed much. The authors believe that what the reforms and restructuring managed to change is “what things are called”. They further opined that what really changes are the old assumptions and practices that have governed schools for a century or more.

Nigeria ranks high among the nations of the world with low literacy levels. This problem is now compounded by the large numbers of children who are out of school for various man-made problems which are beyond the capacities of individual families to contain. The need therefore to search for “quick fixes” in the interim, for this educational problem becomes urgent. It is for this reason and other attributes of inclusive education which abound in literature that this study is premised.

**Statement of the problem**

There is urgency today, to find school places for all Nigerian primary school age children who are out of school in various parts of the country. Since funds are scarce, as Nigerian economy is in depression, the cost of building sufficient number of new schools to make up for the short fall is impossible for the nation to fund. The need arises to put together in available neighborhood schools as many children (with or without special needs), as each of the schools can contain and deploy available teachers and resources to these schools so that the children can start learning in a situation of inclusive education. The problem of this study therefore is to investigate primary school teachers’ disposition to the practice of inclusive education in Nigerian primary schools.

**Research questions**

In this study, three research questions were employed to explore the dispositions of primary school teachers to the practice of inclusive education in Nigerian primary schools. The research questions are as follows:

1. What is the nature of teachers’ dispositions to the practice of inclusive education at the primary school level?
2. Do male and female teachers have the same or different disposition to inclusive education practice?
3. Does the educational qualification of teachers affect their disposition to inclusive education practice?

Methodology

This study is a descriptive survey involving primary school teachers from two senatorial districts in Osun state, Nigeria. A 2x3x3 factorial matrix was adopted for matching the variables (gender, qualification and years of teaching experience). The sample size was 225 teachers who willingly completed and returned the research instrument. The sample consisted of 116 males and 109 females. The distribution of respondents according to their qualifications is: National Certificate in Education (NCE) contributed 62 teachers; BEd/BA/HND provided 103 teachers; MEd/MA/PhD contributed 30 teachers for the study. For years of teaching experience, the distribution is: Inexperienced teacher (0 - 5 years) had 62 teachers; moderately experienced teachers (6 – 10 years) contributed 109 teachers; and very experienced teachers (11 year and above) contributed 55 teachers. This design was influenced by the study of Anke de Boer et al. (2010) that reviewed 26 most important empirical studies on the subject of this study.

The instrument was a 22 item questionnaire of the Likerts’-format with four options of: Strongly Agree (SA); Agree (A); Disagree (D); and Strongly Disagree (SD). The instrument was scored as follows: for positively worded stem, mark distribution was SA= 4, A=3, D=2, SD=1. Negatively worded stem was scored in the reverse (Gall, Borg & Gall, 2007). The instrument measured teachers’ disposition to the practice of inclusive education and has Cronbach’s alpha coefficient of .71.

Method of data analysis

Teachers’ disposition was analyzed by computing simple percentages after collapsing the scale into two, positive and negative responses. The total numbers of positive or negative items were then counted. Finally, the percentage of the total number of questionnaire items that were positive or negative was computed. The effect of gender, qualifications of teachers and years of teaching experience on disposition of teachers to inclusive education was evaluated by employing analysis of variance technique.
Result:

Research question 1 states: What is the nature of teachers’ dispositions to the practice of inclusive education at the primary school level?

The frequency of teachers responses to questionnaire items as collapsed in Table 1 are displayed in the Table below.

Table 1: Teachers disposition to questionnaire items (N = 225)

Summary: 12+ve 54.5 10-ve 45.5

Key: Ps = Nature of majority disposition, positive (+) or negative (-)
The data in Table 1 show that the teachers were positively disposed to twelve items on the questionnaire or 54.5 percent of the whole, while they were negative to ten items or 45.5 percent. This result has revealed that teachers’ dispositions to the practice of inclusive education are more positive than negative if this instrument is used as the measure.

**Research question 2:** Do male and female teachers have the same or different disposition to inclusive education practice? The answer to this research question is contained in Table 2 which contains the analysis of variance according to gender, teaching experience and years of teaching.

Table 2: Analysis of teachers’ disposition according to gender, teaching experience and years of teaching qualification

</table>
a. R Squared = .125 (Adjusted R Squared = .053); *=significant, P < .05

The result in Table 2 shows that the three factor model employed in this analysis is significant \( F_{(17,224)} = 1.737; \ P < .05 \). However gender of the subject was not significant \( F_{(1,224)} = 1.050; \ P > .05 \). This result implies that men and female teachers have similar dispositions to the practice of inclusive education at the primary school level.

Research question 3 asks: Does the educational qualification of teachers affect their disposition to inclusive education practice? The answer to this research question is to be found in Table 2. The data in Table 2 show that years of teaching experience of teachers did not produce a significant effect on teachers’ dispositions to inclusive education practice at the primary school level \( F(2, 224) = 2.12, \ P > .05 \).

Discussion: This study was conducted to find out what the likely disposition (attitude) of primary school teachers would be if the current situation in the country necessitates the introduction of inclusive education at the primary school level. The results of the study reveal that male and female teachers have similar dispositions. Further analysis showed that their dispositions were not significantly different. This finding is similar to the findings of Anke de Boer et al. (2010).

The data from research question 1 showed that the level of positivity (54%) for this sample to inclusive education was higher than the level of negativity (46%). This result is slightly better than that reported by Anke de Boer et al. (2010) from the review of 26 empirical studies where it was reported that no study reviewed produced clear positive results.

The results from the data analysis of research questions 2 and 3 showed gender had no significant effect on teachers’ disposition to inclusive education practice; so also teaching experience and teachers’ qualification.

Conclusion: Inclusive education is theoretically in practice in many countries around the globe (Haigh, 2010) but practically Evans and Lunt (2010) submit that there are substantial obstacles in the way of full inclusion everywhere. Evans and Lunt (2010) reveal that schools as currently organized are frequently unable to meet the wide range of individual needs. The situation reported here referred to England and Wales where priorities are accorded to human needs of citizens. That being the case it will be unreasonable for us in Nigeria to implement inclusive education in haste. Appropriately trained teachers constitute a major factor in the successful implementation of inclusive education (Ferguson, 2008; PSBparents.org 2013-2017; Anke de Boer, 2010). Nigeria requires engaging in extensive and intensive teacher training for many years before consideration for installing inclusive education can be plausible.

Recommendation: More research work is required now on the nature, requirements, and attitudes of teachers, pupils and society to the establishment of inclusive education in the country. Anke de Boer et al (2010) summarized the requirements for success in implementing inclusive education as training, resources, legislation and teachers.

1. Introduction

According to Dörnyei (2001), demotivation can be defined as “specific external forces that reduce or diminish the motivational basis of a behavioral intention or an ongoing action” (p.143). Demotivation is dynamic and remotivated if external changes are changed. If the demotivation factors are affected by external factors, the external factors should be identified and changed for remotivation to study English (Kim and Kim, 2016, p. 130). The purpose of this study is to investigate which educational factors caused EFL freshman students’ motivation to be reduced while learning English before entering the university in Korea. It can finally provide an English teaching model for improving motivation in learning English in universities. For the research purpose, the research questions are as follows.
(1) What are the main demotivating factors of Korean EFL university students?
(2) Are there significant correlations between the English proficiencies- high, intermediate, low- and demotivating factors?
(3) What factors affect English proficiency scores?

2. Research Methods

2.1 Participants

A total of 224 freshman students participated in this study, with 111 female students and 113 male ones, from two private universities in Korea. One hundred twenty five students were majoring in Liberal Arts and Social Sciences and ninety nine ones belonged to Engineering.

2.2 Demotivation questionnaire

In order to identify the demotivating factors in English learning, the questionnaire developed by Kikuchi and Sakai (2009) was used to ask participants to what degree they felt demotivated in the given situations. The questionnaire developed by them consisted of 35 5-point-Likert type question items. Only 27 out of 35 questions were used for the current study after excluding the 7 ones which were excluded in the analysis for their study.

2.3 Procedure

The study was done during the 1st week of the 1st year in the university before experiencing English classes in the university. The students were asked to answer the background information including gender and majors. The EF standard English test was conducted in order to measure their English proficiency levels. The test consisted of listening,
vocabulary, and reading sections. The participants were then asked to answer the demotivation questionnaire.

2.4 Analysis

To figure out the most affective factors which made the learners reduce their English learning motivation, the descriptive statistics analysis was performed. Furthermore, a confirmatory factor analysis was carried out in order to explore the factor structure of the questionnaire items.

3. Results

3.1 Salient Demotivation Factors

The participants reported that Item 4 (entrance examination oriented lessons) was the most affective factor which reduced their motivation in English learning. Item 3 (grammar focused lessons) was the second most affective factor for their demotivation in learning English. Item 6 (memorization of sentences) and Item 7 (words and phrases) were ranked the third and fifth most affective factor reduced the students’ motivation, respectively. However, the learning equipments were reported the least affective factor for demotivation. Item 20 (lack of computer equipment) was the least affective demotivation factor and Item 22 (lack of the Internet) was the fourth least affective factor of demotivation for the participants.

To figure out the factors constructing the demotivation to study English, a confirmatory factor analysis was conducted using a Varimax rotation analysis. Among 27 question items, 26 ones were examined because the question item 12 was excluded because of the floor effect showing, after examining the mean scores minus one standard deviation fell outside of the range of Likert scale (Kikuchi & Sakai, 2009). Using a confirmatory factor analysis, six factors were extracted and a total of factor loading was 60.702% as shown in Table 2. The reliability coefficients were measured by Cronbach’s alpha. The reliability coefficients ranged from .554 to .863 indicating reasonable internal consistencies.

<td>.473**</td>
<td>.358**</td>
<td>.382**</td>
</tr>
</tbody>
</table>

**. p<.01, *. p<.05

As shown in Table 3, there were statistically relationship between English proficiency levels and factors 1(r= -.368), 4(r= -.141), 5(r= -.164), or 6(r= -.289). And also all the six factors have negative correlations with English proficiency levels, which implied that the lower the English proficiencies were, the higher the demotivation factors were.

3.4 Regression Analysis between Factors and the Overall English Proficiency
To estimate how the English proficiency scores were affected by the factors, regression analysis was conducted. The independent variables were six factors and the dependent variable was the English proficiency scores and the results are shown in Table 4.

<Table 4> Regression Analysis Result

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

R=.447, R²=.199, adjusted R²=.185, F=13.635, p=.000, Durbin-Watson=1.787

The results showed that factor 1 (t=-5.697, p<.001) and factor 3 (t=2.619, p<.01) affected English proficiency scores. To figure out the importance level of effects of factors on English proficiency scores, the standardized regression coefficient β values of factor 1 and 3 were compared. It showed that factor 1 (β=-.436) was more effective than factor 3 (β=.193). Therefore, it implied that the higher Factor 1 among the six factors was, the lower English proficiency scores were. However, the higher the mean scores of factor 3 were, the higher English proficiency scores were.

References

ABSTRACT

This essay discusses how students participating in two interdisciplinary courses (offered in the summer of 2012 and of 2013 at Boise State University) were able to produce two documentaries on the Latino and Refugee communities in Treasure Valley, Idaho. The investigative component of these classes allowed students to engage in verifying their global knowledge while exploring the Latino and Refugee communities. Our hope, as authors of this informative essay, is that a project like this one could inspire educators to carry out similar endeavours to explore global issues in their local communities.

Interdisciplinary, Film, Documentary, Latinos, Refugees, Communities, Global, Local.
Visual Literacy: Creating Documentaries that Address GloCal Issues

This essay explores how Bilingual Education and Communication students from Boise State University, Idaho, combined their linguistic, cultural and social knowledge to understand and address issues of immigration and migration, under the guidance of two educators and a filmmaker during two team-taught film course seminars in the Summer of 2012 and 2013. These two courses provided students with a unique opportunity to explore global issues through the lenses of the local community of Boise, Idaho’s capital. In 2012, students were asked to broaden their knowledge and understanding of the impact that the Latino community has in Idaho; while in 2013 they were asked to expand their awareness of (and, often, test their prejudices on) the local Refugee community. As we will explain in more detail later, this more traditional and content-based part of the courses took place while students were also asked to learn the basics of documentary filmmaking.

Both Film Production Seminars provided a hands-on learning experience, a unique opportunity not often granted to students in undergraduate and even graduate programs. In this case, however, the hands-on learning experience was twofold because, thanks to their being ontologically interdisciplinary, these courses had students learning about the Latino and Refugee Communities, while also learning the basics of documentary making (fig. 1). Indeed, both courses had a multidisciplinary approach which combined content based on Dr. Claudia Peralta’s research in the field of Bilingual Studies, with a form grounded in Dr. Orsitto’s expertise in the field of Film Studies (both Peralta and Orsitto supervised the course). Another unique facet of these courses was their investigative component, which resulted in great empowering
consequences for students. Indeed, even though students were asked to learn new information and were constantly solicited to juxtapose their previous knowledge about the Latino and the Refugee communities (through the assigned readings and the interviews that constituted the raw data of the two documentaries that came out of these two seminars), students also became dynamic actors in the documentary-making process.

![Fig. 1 - Farmers Market, Boise, ID](image)

In both summer of 2012 and of 2013, during the course of three weeks, students were encouraged to seek out informants, become familiar with the agencies that work with the Latino and the refugee communities, and with the social actors representing these communities as well (fig. 2 and fig. 3). Students were also encouraged to recognize the importance of using the right tools in collecting the data (i.e., type of interview questions, focus groups) (fig. 4). Moreover, they were engaged in analyzing and organizing the data.
As educators, one of the first choices we had to make was choosing which pedagogical approach would inform these courses. It may be useful here to recap that there are five primary
pedagogies that one may follow in the field of Education: Traditional, Progressive, Transformative, Critical and Enlightened. Only some of these pedagogies allow actors working in the field of Education to truly educate students, while others only permit them to impart instruction, making them teachers (or instructors) rather than educators. Indeed, the fact that students might or might-not be allowed to be actively involved in the learning process truly differentiates educators from teachers.

Fig. 4 - Interviews in the Classroom, Boise State University, ID

For these two film production seminars we chose to use Enlightened pedagogy. This term was coined by Dr. Patricia Wang and Dr. Claudia Peralta in 2005\(^1\) in an effort to bridge the distance between the cultural, economic and linguistic experiences of educators and students. Enlightened pedagogy is informed by Buddhist teachings and practices. Wang and Peralta do not claim to be experts in Buddhism, but they use Buddhist teaching and practices because they

\(^1\) This pedagogy was developed when both Wang and Peralta were working at California State University, Monterey Bay, in the 5th year teacher preparation program.
provide concrete advice for nurturing and sustaining caring relationships. Furthermore, Buddhism provides concrete tools for achieving a greater awareness and pensiveness, and for freeing oneself from physical, cognitive or emotional (re)actions. *Enlightened* pedagogy prepares educators to educate effectively across differences, and in ways that actively resist perpetuating the injustices or indignities that commonly oppress too many people. *Enlightened* pedagogy is grounded in the belief that “the method is mindfulness, the expression is compassion and the essence is wisdom” (Goldstein, 2002). Hence, in an effort to provide students with the opportunity to question and, at some level, face or hear the realities of Latinos and Refugees in Idaho, *Enlightened* pedagogy was the pedagogical approach of choice also because we deemed it most appropriate in highlighting the injustices suffered by these two communities. This pedagogy effectively engaged students in questioning and understanding how these injustices are often perpetuated in silent and invisible ways in the host communities. Finally, thanks to *Enlightened* pedagogy, students were compelled to reflect upon the purpose of their involvement in researching the Latino and the Refugee communities, while they were also asked to confront their own ignorance or inner fears and prejudices these two groups.

In 2012, only a small percentage of students were Latinos, and very few of them had a diverse cultural, historical and linguistic background. Three out of the eleven course participants were foreign born: two Latinas (a Guatemalan, and an Ecuadorian) and one Asian (a Taiwanese). In 2013, the situation was very similar. Three out of the thirteen participants were Refugees themselves, two Bosnians and one Iranian. As a consequence, even in terms of class demographics, Latinos and Refugees were in both occurrences an actual minority. Hence, it was important to elicit from students who did not have a Latino background or that were not Refugees (or foreign born) a certain level of empathy, for them to be able to answer the key-question of *Enlightened* pedagogy: “Why do we care?”
The second very important decision we had to make was about which supervising filmmaker would guide our students through the making of a didactic documentary in only three weeks. To guide students on this journey of discovery and, ultimately, empathy towards the Latino and Refugee communities, we chose Fabio Caramaschi, a well-known documentary director from Italy who has worked extensively with the Tuareg community living in Rome, Italy, and directed the documentary *One Way, a Tuareg Journey* (2010), an inspiring film that represents his understanding of working with Refugees.

The third choice we had to make was about the class structure. Both seminars lasted three weeks, and were structured almost identically as workshops. Students were divided into three integrated groups, with at least one representative from the Bilingual Studies department and one from the Communication Studies department in each one of them. This kind of assemblage allowed students to work collaboratively for the entire length of the courses.

On week one, the class met five times. The first half of every session was used to show students various news reports and clips from documentary films directed by Caramaschi, and also by other directors. Afterwards, students were asked to discuss the material screened. The group discussion was followed by a team-building exercise and a hands-on experience.

During week two, after a list of prospective interviewers was created with the help of students and faculty, the search began to take shape. Supervisors and students alike worked hard to get a wide array of members of the Latino and the Refugees communities to participate in the project. The main purpose was to involve people representing various experiences of migration. In 2012 we focused on newcomers, immigrants that had been in the community for several years, first generation Mexican Americans, and Mexicans (born and raised in Mexico, but who had immigrated to the United States, and also students who were born in the United States but defined themselves Mexicans). In 2013, we focused on people representing various refugee
experiences and various countries. A secondary goal was to create some sort of historical timeline of the experiences of Latinos and Refugees in the Boise area.

Before conducting interviews, students were asked to do an in-depth research on the interviewee, and to bring to class questions that they deemed appropriate to ask (including justification of why the specific questions were to be used). The exchange of information was done a day or two before the interview was to occur, providing members of the class plenty of time to select the best questions. These questions were then used as a framework that helped students realize that (as ethnographic tools) interviews can lead to very different kinds of inquiries and/or discussions. During this process, students also became aware of the number of questions they should ask. In fact, it also became clear that, if interviews were too long, the time allocated for transcription during the third week would not be sufficient (since a 30 minute interview can require a two-hour transcription, it was important to remind students to focus on the topic at hand).

Various responsibilities (i.e.: interviewers, students holding the microphone and lights, etc.) were assigned every day of this week and shifted as much as possible among students. After every interview, students and supervisors met on campus to debrief on what had taken place, and to label the tapes and assign tasks. On campus, students were also responsible for: loading batteries for the next shooting, checking and labeling the tapes, watching and discussing with the supervisors the shooting, and learning how to transcribe an interview. They were also responsible for discussing problems experienced during the shootings, and evaluating the results of the shootings and getting organized for the editing.

**Week three** was mainly devoted to the editing process. In class, students explored the meaning of off-line editing and learned how to build a structure on paper before entering an editing suite. Students also examined some of the footage they had done the week before. They
worked on building a narrative structure on paper, and tried to establish if extra shooting was needed to fully achieve the potential of the abovementioned structure. Moreover, during this final week, individual students were interviewed to learn about their take on the experience of the course. The groups entered (one at the time) the editing suite with Caramaschi to make the first selection of the interviews and the classification of the generic video shots. Finally, students began editing the final cut of the documentary (working also on audio editing and color correction).

As previously mentioned, these two film production seminars brought about two different areas of expertise, filmmaking and bilingual education. The two educators and the filmmaker supervising these two projects wanted all students to have the opportunity to be involved in a hands-on experience in documentary filmmaking (which included fundraising, commissioning editors, selecting locations, casting interviews, shooting audio and video, and editing - as well as learning about the history of the Latino and the Refugee communities in Boise). From an organizational perspective this could have been a daring challenge, because some of the students enrolled were graduates and some undergraduates, some were novice to filmmaking and its equipment, while some brought to the table a lot of practical experience in terms of filming. At the end, however, the intrinsic variety of students’ backgrounds made this interdisciplinary course ontologically diverse, and it became one of its strengths. Having to relate to something unfamiliar on a daily basis (the Latino and Refugee experience for the Communication students, and the filming process for the Bilingual students) pushed everyone out of his/her comfort zone, and made students more accepting of their own limitations and, consequently, more predisposed to accept the limitations of others. This ideal combination of theory and practice also proved to be effective for students willing to challenge what they knew about global and local issues, while learning from the readings and intactions with community members.
Students shared that the two documentaries *Latino Community in Treasure Valley Idaho* (https://www.youtube.com/watch?v=C_q90k_51e4) and *Starting Over Again: The Refugee Experience in Boise, Idaho* (https://thebluereview.org/starting-over-again-the-refugee-experience-in-boise-idaho/) changed them in different ways. They learned to listen deeply to stories and the power and potency in sharing and analyzing stories because of the ways stories can raise awareness, bridge distance and create community. The documentaries confronted the students with a reality that demanded a response. The documentaries reminded them to continue to envision a just world where everyone is respected and honored.
Pre-service Teachers’ Competency in Division of Fractions before an Intervention

Abstract

This study investigated the influence of mathematical dispositions toward elementary pre-service teachers’ competency in learning division of fractions. This study is the first portion of a larger study being conducted to investigate how fostering elementary pre-service teachers’ mathematical dispositions can enhance students’ learning division of fractions. This study reveals the pre-test data of thirty-six participants majoring in elementary education; of them, there were 5 minors in mathematics, 15 minors in science, and 16 in other subject minors. The study found there were some factors which caused problematic issues for the elementary pre-service teachers to conceptualize the concept of division of fractions: limited capacity in conveying concept with creating figures, inflexible and insufficient procedural knowledge, ineffective descriptions on illustrating concepts and procedures, and deficient connection between different representations. Further, the data leaves room to believe that an intervention fostering elementary pre-service teachers’ mathematical dispositions and competency could be a way to increase elementary pre-service teachers’ understanding in the division of fractions.

Keywords: Division of fractions, Mathematical dispositions, Elementary pre-service teachers
Introduction

There are problematic issues among elementary pre-service teachers when they are learning division of fractions. Research indicates that elementary pre-service teachers were taught the procedural algorithms of division of fractions without receiving meaningful instruction when they were elementary school students (Cluff, 2005; Isik & Kar, 2012; Niemi, 1996). This has caused elementary pre-service teachers to have misconceptions about the division of fractions and has led to low success rates on tasks related to the concept (Tirosh, 2000; Utley & Redmond, 2008). Therefore, teaching division of fractions is considered a challenging content area in the elementary mathematics curriculum for the pre-service teachers (Ma, 1999; Redmond, 2009). In addition, many elementary pre-service teachers often consider division of fractions to be the most difficult content area of number operations (Ball, 1990; Huang, Lui, & Lin, 2009). If future elementary teachers have a thorough understanding of division of fractions, they can avoid misconceptions and help their students learn and understand division of fractions.

Because interaction between mathematical competency and mathematical dispositions may influence the pre-service teachers’ conceptualization of division of fractions, it is important to understand how mathematical dispositions affect pre-service teachers’ mathematical competency in learning division of fractions. Therefore, this study aims to investigate the following research question: What is the status of elementary pre-service teachers’ mathematical competency in learning division of fractions before they receive an intervention of incorporating mathematical disposition into learning processes?

Related Research

Learning and teaching division of fractions has been one of the most problematic areas for elementary pre-service teachers (Ball, 1990; Huang, et al., 2009; Simon, 1993; Triosh, 2000). In order to better understand this study’s participants pre-test data the literature review will focus on the following inquiries: (a) What issues do elementary pre-service teachers have while learning division of fractions that might be problematic? (b) What mathematical capabilities do elementary pre-service teachers need toward division of fractions?
Problematic Issues Related to Learning Division of Fractions

The fundamental problem in learning division of fractions among elementary pre-service teachers is the nature of division of fractions. When learners encounter division of fractions word problems, it becomes obvious that the division of fractions is division of division. The fractional learning confuses students and makes learning concepts difficult (Schwartz, 2008). For example, Ball (1990) investigated elementary pre-service teachers’ understanding of division of fractions and found that it was difficult for elementary pre-service teachers to come up with real world situations or story problems to show the meaning of division of fractions. In addition, the nature of division of division makes the concept of “a unit” difficult for pre-service teachers to understand (Behr, Khoury, Harel, Post, & Lesh, 1997). Several studies found that this concept of “a unit” not only confused elementary school students but also caused a challenge among elementary pre-service teachers (Gregg & Gregg, 2007; Perlwitz, 2005; Zaleta, 2006). In other words, pre-service teachers might not be able to explain the concept and assist their students in figuring it out.

Also problematic is how elementary pre-service teachers tend to approach or work with division of fraction problems. Graeber, Tirosh, and Glover (1986) found that pre-service teachers tended to think “the divisor must be a whole number.” However, it is more difficult to make models (e.g., figures or manipulatives), which is necessary when using partitive division, as compared to using measurement division, which allows students to use repeated subtraction (Simon, 1993; Sharp & Adams, 2002). In other words, applying the concept of partitive division for dealing with the division of fractions limits elementary pre-service teachers’ conceptualization during the learning processes. In addition, elementary pre-service teachers exclusively using invert-multiply algorithms to deal with division of fractions problems instead of understanding and explaining the concept with meanings, which also impacts their learning of division of fractions in a negative way (Redmond, 2009; Tirosh, 2000). Students (including elementary pre-service teachers) solve division of fractions problems by using the invert-multiply algorithm, which has been taught for decades (Alkhatteb & Nicholls, 2001; Ball, 1990; Redmond, 2009).
Teachers tell their students to simply follow the procedural directions to find the correct answer (Lubinski, Thomason, & Fox, 1998; Mewborn, 2001). Therefore, the learning and teaching toward division of fractions is based on memorization rather than conceptual understanding.

**Mathematical Capabilities for Learning Division of Fractions**

In order to help pre-service teachers conceptualize the knowledge of division of fractions easily, Schwartz (2008) categorized division problems of fractions as four types of problems. This made division of fractions problems more manageable. The four categories are: (a) Type I problems—Problems that have a whole number divided by a fraction and a whole number answer; (b) Type II problems—Problems that have a fraction divided by a fraction and a whole number answer; (c) Type III problems—Problems that have a fraction divided by a fraction, with a mixed number answer; (d) Type IV problems—Problems that have fractions divided by fractions with answers that are fractions. These four types of problems represent increasing levels of difficulty and complexity. Once the pre-service teachers have passed through the first two stages, pre-service teachers are ready to step into the third stage, the stage of algebraic operation. In this stage, the definition and function of reciprocal will be introduced and how it applies in an invert-multiplication algorithm. Invert-multiplication and complex fractions are introduced with the algebraic operations (Li, 2008; Perlwitz, 2005; Schwartz, 2008; Yetkiner & Capraro, 2009).

Developing pre-service teachers’ mathematical competency is one of the key capabilities to help pre-service teachers learn division of fractions effectively. Mathematical competency is a set of abilities for the pre-service teacher to develop for their mathematical literacy. The more pre-service teachers retain and activate their mathematical competency, the more the pre-service teachers will be able to solve mathematical problems effectively (Zollman, 2012). Mathematical competency includes: (a) communication, (b) mathematizing, (c) representation, (d) reasoning and argument, (e) strategic thinking, and (f) using symbolic, formal, and technical language and operations (Turner, 2011). Mathematical competency can be operated and expressed with the conceptual understanding and procedural fluency when learners construct any content knowledge in mathematics, such as division of fractions (Livy & Vale, 2011; Turner, 2011).
Methods

Participants

The participants in this study were enrolled at a four-year public university in the Midwest in the United States. They had finished two-years of general coursework before they were admitted to a teacher-education program. The participants were beginning their first semester in a teacher-education program while the study was conducted during the fall of 2010. The sample consisted of 36 pre-service teachers who were being prepared for teaching at K-6 levels. Moreover, the sample was composed of three groups: Five were elementary education majors with mathematics minor, 15 were elementary majors with a science minor, and 16 were elementary majors with another subject minor.

Research Design

A one-group pre-test design was used to identify pre-service teachers’ understanding of division of fractions before an intervention. Results from the pre-test specifically addressed the research question: What is the status of elementary pre-service teachers’ mathematical competency in learning division of fractions before they receive an intervention of incorporating mathematical disposition into learning processes? During the pre-test, pre-service teachers were asked to complete four division of fractions problems. The pre-test took 40 minutes.

Instrumentation and Data Analysis

A developed analysis framework of conceptual understanding (Niemi, 1996; Wu, 1999) led to the use of the pre-test instruments for this study. Four types of division problems of fractions were used in the pre-test for evaluating the components of the mathematical competency among participants (see Appendix A). The components included figure representation, symbolic representation, language-describing representation, and connecting different representations. Varying figures and conveying concepts were used to determine participants’ abilities in the aspect of figure representation. Participants’ abilities of operating mathematical sentence with accuracy, flexibility, and efficiency were defined as symbolic representation. In the aspect of language-describing representation, it mainly examined how
participants describe problem understanding, problem-solving processes, and result interpretation. For the aspect of making connections between different representations, this study focused on examining participants’ capacity to make connections between models, symbols, and language descriptions. Participants’ work in each evaluated item was scaled as sufficient (2), mildly sufficient (1), and insufficient (0) based on the descriptions of an evaluating rubric (see Appendix B). Statistical procedures selected for the analysis included descriptive statistics of frequency distributions, means, and percent.

Results

This study is one part of a larger experimental study investigating the dynamic relations between division of fractions and mathematical competency. It focuses on examining what strategies elementary pre-service teachers used for solving division of fractions problems by looking at students’ thinking habits and problem-solving skills before they received an intervention. Based on the data analysis, this study found the following phenomena:

**Limited Ability in Conveying Concept with Created Model.**

Participants used area models, length models, set models, and other figures to represent their understanding and problem-solving abilities when they solved type I, II, III, & IV division of fractions problems, but each model (figure) did not effectively conveyed the concept of division of fractions. When examining figure representation, 24% of the participants’ work exhibited no figure representation, 30% of the participants’ work was of an area model, 34% of participants’ work was of a length model, 8% of the participants’ work was of a set model, and 4% of the participants’ work fell into the category of “others” (see Table 1). Although participants could create various models or figures, each figure was not able to help participants construct meaning when they dealt with the problems of fractions in the pre-test. By looking at the participants’ work in Table 2, 80% of the participants’ work earned a score of zero, which meant that the participants’ work could not convey adequate meanings. There were 5% of the participants’ work at the score level of one, which meant their work somewhat could construct the meaning. There was 15% of the participants’ work at the score level of two, which meant their figures could correctly and accurately convey the concept.
Inflexible and Insufficient Procedural Knowledge.

According to the Table 1, some symbolic representations, such as invert-multiplication algorithm and common denominator algorithm, were used for expressing participants’ procedural knowledge when participants solved division of fractions problems in the pre-test. When examining symbolic representation, 50% of participants’ work showed that they used invert-multiplication algorithm to solve the problems, 6% of participants’ work demonstrated common denominator algorithm, and 2% of participants’ work used other methods. Remarkably, 42% of participants’ work was in the category of none. That means participants did not know how to solve the problems. Examining participants’ work with the validity of scores (see Table 2), the study finds that 25% was at the score level of two, 27% was at the score level of one, and 48% was at the score level of zero. This information implies that half of participants somewhat knew how to use symbolic representations to convey their understanding and resolve problems when they solved division of fractions problems before they received the intervention. However, around half of the participants’ work was invalid. Based on the above descriptions, this study found: (a) Participants were inflexible in conducting procedural knowledge toward division of fractions problems. In other words, most participants did not use alternative ways to solve division of fractions problems other than invert-multiplication algorithm; (b) Participants did not have sufficient procedural knowledge toward the division of fractions problems, to include the knowledge of invert-multiplication.

Deficient Connections between Different Representations.

Participants’ work of making connections between different representations in the pre-test can be seen in the following categories: no connection between different representations (None), a connection between figure representation and language representation (F & L), a connection between figure representation and symbolic representation (F & S), a connection between symbolic representation and language representation (S & L), and a connection between figure representation, symbolic representation, & language representation (F, S, & L). This study found that 68% of the participants’ work was in the category of None, 16% was in the category of F & L, 1% was in the category of F & S, 12% was in the category of S & L, and 3% was in the category of F, S, & L. This implies that participants’ work shows limited capacity in connecting different representations. In addition, looking at the validity of their scores, 72% of participants’ work was at the score level of zero, 23% of participants work was at the score level of one, and 5% of participants work was at the score level of two. This shows that participants were not properly equipped with the ability to connect various representations in order to construct comprehensive meaning toward the division of fractions before the intervention.

Discussion

This study reveals that there are four possible factors, which explain why pre-service teachers do not come equipped with adequate mathematical competency to conceptualize the knowledge in this
content area. First, conveying mathematical concepts by creating figures is related to participants’ ability of using visual materials to help them perceive problems and express the path of solving problems, but elementary pre-service teachers lack this ability (Nillas, 2003). This study found that participants had limited capacity in conveying concepts by creating figures before the intervention. Second, elementary pre-service teachers were taught with invert-multiply algorithm when they were elementary school students with non-meaningful procedural knowledge transferred from their teachers. This may cause a problem in reconstructing the concept after they have forget the procedural knowledge (Cluff, 2005; Isik & Kar, 2012). Based on the data analysis, the study found that participants had inflexible and insufficient procedural knowledge to support them in solving division of fractions problems. Third, elementary pre-service teachers are rarely guided to portray their mathematical work in constructing descriptions, so they describe and interpret problem-solving approaches and processes ineffectively (Gregg & Gregg 2007). Fourth, this study found that there were deficient connections between different representations while they were dealing with the division of fractions problems. This corresponds to Lo and Luo’s study (2012) about how connecting different representations to express a complete thinking picture has not been totally implemented among elementary pre-service teachers. The current study suggests that fostering elementary pre-service teachers’ mathematical dispositions may be a way to increase students’ competency in division of fractions.

In sum, this study has echoed the findings from previous studies. Meanwhile, it also contributes some new findings toward the body of knowledge regarding the competency elementary pre-service teachers need to have when learning division of fractions. However, the data gained in this study is just a start and the bigger picture involves what mathematics educators can do to help elementary pre-service teachers better understand the concept of division of fractions. This will be addressed in a further study.

Q1: What does $4 \div \frac{2}{3}$ mean? Support your answer by: 1) drawing a model; 2) using a mathematical sentence (numbers) to describe your model; 3) using words to describe your problem-solving processes.

Q2: What does $\frac{3}{4} \div \frac{3}{8}$ mean? Support your answer by: 1) drawing a model; 2) using a mathematical sentence (numbers) to describe your model; 3) using words to describe your problem-solving processes.

Q3: What does $\frac{5}{7} \div \frac{1}{2}$ mean? Support your answer by: 1) drawing a model; 2) using a mathematical sentence (numbers) to describe your model; 3) using words to describe your problem-solving processes.

Q4: What does $\frac{2}{3} \div \frac{3}{4}$ mean? Support your answer by: 1) drawing a model; 2) using a mathematical sentence (numbers) to describe your model; 3) using words to describe your problem-solving processes.
Appendix B: Rubric for Pre-Test

Figure representation:
1. The figures display the concept of division of fractions completely and accurately (2)
2. The figures display the concept of division of fractions incompletely or inaccurately (1)
3. The figures do not display the concept of division at all (0)

Symbolic representation:
1. The math sentences show efficiency (concise and coherent steps) and accuracy (issue in the right answer)—(2)
2. The math sentences show inefficiency or inaccuracy (1)
3. The math sentences do not show efficiency and accuracy at all (0)

Language representation:
1. The word descriptions of solving the problem of division of fractions are complete and accurate (2)
2. The word descriptions of solving the problem of division of fractions are incomplete or inaccurate (1)
3. The word descriptions of solving the problem of division of fractions are incomplete and inaccurate (0)

Connecting different representations:
1. The clear and complete connections between symbols, graphic representations (figures), and situational knowledge expressed in language (word descriptions) (2)
2. The unclear or incomplete connections between symbols, graphic representations, and situational knowledge expressed in language (1)
3. No connections between symbols, graphic representations, and situational knowledge expressed in language (0)
Best Practices in STEM Outreach, Recruitment and Retention Programs Across Multiple Institutions

STEM Education

Poster Session

Our poster presentation will show the collaborative potential for outreach, recruitment, retention, and academic excellence programs across several universities with a focus on underrepresented minority populations. Institutions are members of the National Association of Multicultural Engineering Program Advocates (NAMEPA, Inc.).

Abstract

African Americans, American Indians/Alaska Natives, and Latinos have historically been underrepresented in Science, Technology, Engineering and Mathematics skills, yet these populations will become the majority over the next 20 years. The percentage of students from these populations that are interested in and/or entering into STEM fields is not adequate to fuel the engineering, technology and innovation required to sustain current technology and bring economic innovation and universities across the country are revisiting strategies to move the needle of pre-college preparation, math readiness, and persistence towards STEM careers.

The National Association of Multicultural Engineering Program Advocates consists of program directors across the country that focus on student access and success in engineering and STEM Fields. We will be presenting a collaborative poster session to illustrate best practices and the potential for national impact in communicating opportunities and achievements in driving a focused effort to prepare students for STEM careers. This poster session will illustrate several programs in outreach, recruitment, retention and academic excellences across several universities, including Purdue University, Georgia Institute of Technology, Clemson University, and The University of California, Irvine. Highlights of the poster session from NAMEPA will include:

- The Summer Engineering Institute – for rising 11th and 12th grade students
  - Metric results: 90% of participants’ matriculate to college and pursue STEM degrees
- PEER 2 PEER Mentoring program – tiered mentoring of undergraduate ethnic minorities majoring in STEM
  - Metric Results: 98% retention rate to degree attainment
- Engineering Academic Boot Camp – for incoming freshman engineering students
  - Metric results: 95% first year retention rate in engineering
- Algebra by 7th Grade Initiative – Initiative to improve math proficiency beginning with second graders so that they are algebra proficient by the end of the 7th grade.
- Bridge from Community College to four year institutions
- Successful recruiting of women and minorities in engineering and STEM fields
  - 200% increase in women students
  - 400% increase in minority students
- The BOLD Center
  - recruiting and retaining underrepresented students
  - enhanced recruitment contacting
  - participation scholarships
  - a model next-tier program and in-house, drop-in tutoring.
- Access Summer Program to Inspire Recruit and Enrich (ASPIRE) - Experiential learning program to teach high school and community college students how to code, design, build, and test innovative prototypes.
TITLE: Hidden Features of Literacy in Academic Journals’ Guidelines: a Real Challenge for Non-Native Graduate Students to Publish in English

NAME: Bruna Gabriela Augusto Marçal Vieira

AFFILIATION: Universidade Estadual Paulista – Júlio de Mesquita Filho (UNESP) and University of California at Santa Barbara (UCSB)

ADDRESS: 1025 Rock Rose Lane, Lompoc, California, 93436

EMAIL ADDRESS: brugabiguto@yahoo.com.br or brunagabliela@gmail.com

ABSTRACT: This presentation aims to present an analysis of texts of Authors’ Guidelines from six computer science journals in English. The research, supported by São Paulo Research Foundation (FAPESP – process numbers 2015/11088-1 and 2016/06589-4), aims to verify the existence of “hidden” features of academic literacy in the texts, which may hide relevant information about the production of papers according to what is expected by the journals. Through a discursive ethnographic analysis (Corrêa, 2011), which enabled us to understand the concepts of language, text and genre that grounds the literacy practices of the journals, some “hidden” features were identified and related to social assumptions of the genre research article. The analysis showed, among other things, that the journals, based on a concept of language, text and genre, which is very similar to the academic socialization approach to teaching writing (Lea & Street, 1998), mostly center the guidelines in formal and structural aspects of the text, failing to approach some literacy features, such as content, rhetoric and ideology. Although these themes are not approached in the guidelines, the journals tend to take them into account when evaluating the manuscripts, as evidenced by some editors through an email inquiry. Thus, they count on some type of knowledge from the authors, which inexperienced researchers may not have yet, making it more difficult for these novices to engage in academic discussion in their field, especially for non-native speakers, who also have to struggle with the difficulties of English.

**Topic Area:** STEM Education

**Presentation Format:** Paper Session

**Description:** Come learn about how you can use popular video games - including Minecraft, Scrap Mechanic, and Universe Sandbox² - in physics classrooms to engage students in meaningful problem-solving as they learn valuable physics concepts. We will discuss the three games’ applicability to physics curricula by walking you through relevant game mechanics. Come prepared to share your own successes and challenges of using video games in the classroom.

**Introduction**

In the United States, video games are a ubiquitous pastime amongst teenagers, with 97% playing on a regular basis (Lenhart, Kahne, Middaugh, Macgill, Evans, & Vitak, 2008). Within that age group, the average amount of time spent playing per day is approximately 1 hour and 13 minutes, an almost 50% increase from the average daily time spent playing in 2004 (Rideout, Foehr, & Roberts, 2010). And while this shift is often cast as a threat to teenagers’ academic success and physical well-being, the benefits of gaming on a regular basis have been established. Dramatic boosts to spatial skills (Uttal, Meadow, Tipton, Hand, Alden, Warren, & Newcombe, 2013), more efficient allocation of attentional resources (Bavelier, Achtman, Mani, & Föcker, 2012), and improvements in problem solving ability (Adachi & Willoughby, 2013) have all been causally tied to the amount of time participants spent in front of the screen. Additionally,
correlations have been established between gaming and creativity (Jackson, Witt, Games, Fitzgerald, von Eye, & Zhao, 2012), persistence in the face of real-world challenges (Ventura, Shute, & Zhao, 2013), civic engagement (Lenhart et al., 2008) and prosocial behaviors (Ewoldsen, Eno, Okdie, Velez, Guadagno, & DeCoster, 2012; Gentile et al., 2009).

More significantly, video games have the power to engage students, (Anetta, Minogue, Holmes, & Cheng, 2009; Ke, 2008; Malone, 1981; Papastergiou, 2008; Prensky, 2001; Rieber, 1996) especially those who are difficult to reach through more traditional instructional methods (Barab & Dede, 2007; Klawe, 1994; Squire, 2008). Because of this, educators have increasingly aimed to incorporate them into the classroom. In recent years, a growing body of evidence has begun to suggest that supplementing traditional instruction with video games can boost academic achievement or encourage deeper learning (Coller & Scott, 2009; Corsi, Boyson, Verbraeck, Van Houten, Han, & Macdonald, 2006; Dempsey, Rasmussen, & Lucassen, 1994; Ke & Grabowski, 2007; Kebritchi, Hirumi, & Bai, 2010; Klawe, 1998; Lopez-Morteo & Lopez, 2007; McClean, Saini-Eidukat, Schwert, Slator, White, 2001; Moreno, 2002; Owston, Wideman, Ronda, & Brown, 2009; Papastergiou, 2008; Rosas et al., 2003; Squire, Barnett, Grant, Higginbotham, 2004; Vogel, Vogel, Cannon-Bowers, Bowers, Muse, & Wright, 2006; Yip & Kwan, 2006).

Commercial Off The Shelf Games

However, it appears that not all games are created equal. Within the literature, frequent mention is made of the “chocolate-covered broccoli” phenomenon, where games designed from the on-set to be educational wind up “[missing] the most essential mechanism of engagement in games -- the fun” (Granic, Lobel, & Engels, 2013). When a game is thought of as nothing more than a fancy way of dressing up content, a core component of the experience is lost. This has led many in the field to instead turn towards “Commercial Off the Shelf” (COTS) games with the
goal of co-opting them for educational purposes (Baek, 2006; Boyle et al., 2015; Kim & Kim, 2005). Using existing software is advantageous because designing games from the ground-up is expensive and time-consuming, especially for educators who may lack the know-how or infrastructure necessary to create a polished product, and because games created for the market are first and foremost engaging, which appears to be necessary in order to access the benefits that video games stand to bring to the classroom (Kim, Park & Baek, 2008).

COTS games have been used to supplement instruction in a variety of fields, including language arts (deHaan, Reed, & Kuwada, 2010), urban planning (Minnery & Searle, 2014), world history (Squire, 2004), and economics (Kim, Park, & Baek, 2008; Yang, 2012). However, many of the efforts to utilize video games in educational contexts have focused on STEM subjects, and for good reason (Boyle et al., 2015). Success in STEM subjects is often contingent on students’ ability to construct mental models of concepts that are difficult to visualize (Barnett, Keating, Barab, & Hay, 2000; Chi, Feltovich, & Glaser, 1991; Redish, 1993). Physics is especially prone to this, as being able to picture the distribution of forces in a field or those acting on an object is, for many students, unintuitive. Therefore, there is a particular need to apply video games’ interactivity and ability to display graphical representations of abstract concepts to physics classes.

A number of COTS games have been released in recent years that offer themselves as plausible candidates for use in a physics class, with three games in particular holding exceptional promise for use in a high school physics classrooms. The first, Universe Sandbox², gives players the ability to experiment with a high-fidelity simulation of our solar system, where gravity and the properties of planetary bodies are infinitely modifiable. The second, Scrap Mechanic, challenges players to survive on a deserted planet using only their engineering prowess to
construct intricate moving machines. The final game, *Minecraft*, presents a sprawling
environment for players to explore and develop, while providing the tools needed to build nearly
anything imaginable. Due to time constraints, only the first game, *Universe Sandbox*², will be
discussed in detail for this conference proceeding. All three games will be discussed in detail
during the conference presentation.

**Physics Curricula**

There are a number of modern standards that each make recommendations regarding the
style or content for physics instruction in US schools. One such set of standards are the Next
Generation Science Standards (NGSS), the final version of which were released in April 2013.
As explained by the American Association Of Physics Teachers, the NGSS does not divide
standards on the basis of subject (AAPT, 2015). Physics concepts can therefore be found within
the Physical Science set of standards, as well as the Earth and Space Science, Life Sciences, and
Engineering portions of the NGSS. Of particular relevance to educators interested in
incorporating the game *Universe Sandbox*² in their classrooms are the following standards:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>HS-PS2-4</strong></td>
<td>Use mathematical representations of Newton’s Law of Gravitation...to describe and predict the gravitational...forces between objects</td>
</tr>
<tr>
<td><strong>HS-ESS1-4</strong></td>
<td>Use mathematical or computational representations to predict the motion of orbiting objects in the solar system</td>
</tr>
<tr>
<td><strong>HS-ESS2-4</strong></td>
<td>Use a model to describe how variations in the flow of energy into and out of Earth’s systems result in changes in climate</td>
</tr>
</tbody>
</table>

(NGSS, 2013)
The “Physics First” (PF) movement is another attempt to structure physics education. Standing in contrast to the NGSS, which offers examples of competencies while eschewing specific suggestions on the order or pacing of instruction, PF focuses primarily on when students are exposed to scientific disciplines. While the majority of high school students in the US today progress along a biology-chemistry-physics (BCP) sequence, PF emphasizes the value of an inverted PCB progression (Hetzner, 2002). This model does not conflict with the NGSS; rather, PF has been suggested as a model curriculum for meeting the NGSS (Bouma, 2013). When physics is taught earlier in high school students’ careers, specifically before they have been exposed to more advanced mathematics, there is a shift towards more conceptual coverage of topics. This further aligns with the push towards “conceptual” or “qualitative physics,” which argues for a more naturalistic or conceptual, rather than mathematical, method for teaching the subject (diSessa, 2000; Forbus, 1997; Hewitt, 2002). To this end, physics educators are encouraged to incorporate “experiments, labs, demonstrations, and visualizations” to build students’ understanding (Squire, Barnett, Grant, & Higginbotham, 2004). Because video games, especially simulations like Universe Sandbox, enable for experiments or demonstrations that would otherwise be logistically infeasible (Berson, 1996), the combination of PF and conceptual physics provides a premier opportunity for the integration of video games into the classroom.

A final model for physics instruction, which is entirely consistent with and has in some cases been co-implemented alongside the aforementioned standards and approaches, is Problem-Based Learning (PBL). It has been argued that science education is most impactful when presented as an inquiry-based framework, and that video games can serve as valuable tools in this endeavor to contextualize scientific knowledge by offering intricate and authentic problems towards which students can apply their newly-acquired knowledge. (Barab & Dede, 2007; Coller
There has already been at least one attempt to co-opt COTS games for use in PBL-oriented physics courses, from Dr. David Rosengrant and Berkil Alexander of Kennesaw State University (Rosengrant, 2015). Their project demonstrated the feasibility of modifying games for use in a PBL setting by creating exogenous problems that are not an intrinsic part of the game. However, the lessons involved students watching video clips of games being played and then applying physics concepts to explain what they saw occurring. While this model certainly has logistical advantages in terms of reducing the hardware and class time needed for the lesson, the full benefits of incorporating video games into the classroom are only realized when students are given the opportunity to engage with the game for themselves. Furthermore, the games used were in several cases outdated, and were not representative of the complexity of games that are currently on the market. Modern simulation games such as Universe Sandbox² offer a more immersive experience and a more comprehensive model of a physical system, and therefore afford the possibility for a wider range of more complex problems when seeking to tie the game into a PBL curriculum. Thus, Universe Sandbox² has the potential to be a valuable resource for physics education in courses abiding by the NGSS, the “Physics First” model of instruction, and curricula based around “conceptual physics” as well as Problem-Based Learning.

Universe Sandbox²

According to the Universe Sandbox² website (http://universesandbox.com), the game “merges gravity, climate, collision, and material interactions to reveal the beauty of our universe and the fragility of our planet.” Gamers are invited to “create, destroy, and interact on a scale you've never before imagined.” The game retails for $24.99 and is available as a digital download from the distribution platform “Steam.”
Universe Sandbox\(^2\), published by the studio “Giant Army,” seemingly straddles the line between entertainment game and high-fidelity simulation. Upon opening the game, players are greeted by a god’s-eye view of our solar system, with planetary bodies circling the sun at a rate proportional to their actual orbits. From this point, the options for experimentation are endless. Over 50,000 unique objects can be inserted into the simulation, ranging in size from comets to entire galaxies, and in obscurity from the familiar north star Polaris and our very own planet Earth to the mostly unheard of exoplanets PSR B1620-26 b and 91 Aquarii b. Nearly 200 pre-loaded simulations besides that of our solar system can be queued up, including both simple models containing only the Earth and moon along with intricate representations involving dozens of planets, moons, and various minor objects. Density, mass, chemical composition, rotational period, surface temperature, magnetic field strength and orbital radius can each be modified for any body within the simulation. Interactions between entities can be mediated by adjusting the universal gravitational constant “G” or the effect of tidal forces. In short, players have the ability to manipulate and investigate visually many of the variables that students often work with mathematically.

For example, introductory physics courses almost invariably involve equations such as the one describing Newton’s law of universal gravitation or the orbital velocity formula. If a student uses the latter equation, presented here: \( v = \sqrt{\frac{G M_e}{r}} \) to calculate the radius of the orbit of a satellite traveling 6,400 m/s around a hypothetical planet with three times the mass of Earth, and determines the answer to be approximately 29,000 km, do they have the ability to assess whether that answer is reasonable given the context of the problem? Traditionally, this inability to critically assess the plausibility of a solution would be remedied through repetition; if a student has completed enough of these problems, they should be able to remember what a likely
answer looks like. The drawback is that memorization is always transient in comparison to understanding. The problem then is how to encourage understanding of a subject with which students have little to no experience. Universe Sandbox\textsuperscript{2} offers a solution by enabling students to place objects in stable orbits, modify variables such as the orbital velocity or the universal gravitational constant, and then visually observe the results of their alteration in real-time. As well as reinforcing the relationships between the variables in the equation, this also allows students to develop a sense of the order of magnitude in which the values reside. Universe Sandbox\textsuperscript{2} is thus able to assist students in overcoming at least one major obstacle standing in the way of full comprehension of the orbital mechanics covered in a high school physics setting.

What follows is an example of how the game could be used in a high school physics class. It is important to note that the greatest educational strength of video games, and sandbox (open-ended simulation) games specifically, lies in their potential to act as low-risk environments for experimentation and hypothesis-testing, rather than vehicles for delivering content (Coller & Scott, 2009; Gee, 2005; Herrero, Castillo, Monjelat, García-Varela, Checa, & Gómez, 2014; Kapp, 2007; Kirriemuir, 2002). This is especially advantageous when working with a large, diverse pool of students as the user-driven manner in which players progress through sandbox games naturally allows students of different learning styles and academic abilities to engage according to their interests and learn at an appropriate pace (Kirriemuir, 2002; Sedighian, 1994; Squire, 2008). Therefore, educators should remember that giving students the time to adequately explore concepts through the game is among the most significant aspects for efficaciously incorporating games into the classroom. The significance of offering students time to investigate is supported by Dr. Peter Rillero at Arizona State University (personal communication, July 27, 2016), who suggests that providing students with a challenge (such as
launching one small particle in such a way that it enters a circular orbit around another object) and then allowing them to experiment with various methods of accomplishing the goal can serve as an effective introduction to a more comprehensive lecture on the topic.

**Prerequisite Knowledge**

While the background knowledge that students must possess in order to explore *Universe Sandbox*² to its full potential will vary greatly depending on how the teacher chooses to employ the game, the way in which it is described here assumes familiarity with the following concepts:

- Newton’s gravitational constant (G)
- Newton’s law of universal gravitation: \( F_1 = F_2 = G \frac{m_1 m_2}{r^2} \)
- Orbital velocity equation: \( v = \sqrt{\frac{GM_e}{r}} \)

The role played by the Earth’s axial tilt in determining seasons

**Single-player or Pairings**

Your school may have the resources to provide each student with the opportunity to play the game individually. However, concerns over the cost or digital rights management (DRM) of games have the potential to impede teachers from securing enough machines or copies of the game for this to be possible (Poli, Berenotto, Blankenship, Piatkowski, Bader, & Poore, 2012). In this case, placing students in pairs or small groups can be highly advantageous, not only because of the established benefits of cooperative learning more generally (Johnson, Johnson, & Karl, 1998) but because discussing gameplay with peers has been identified as a much more effective metacognitive strategy than individual self-recording activities for cementing the learning gains made through video games. (Kim, Park, & Baek, 2008).

**Playthrough**

I first began by opening the game and was greeted by the following scene:
From here, I decided to begin by experimenting with how varying Newton’s gravitational constant affects planets’ orbits around the sun.
Modifying the value for G is as simple as moving a sliding scale or entering a new value in place of 1.00. Increasing G predictably caused planets to have significantly tighter orbits, while decreasing G caused planets to have wider orbits. The next step was to alter the mass of the sun.
Again, the results were predictable in that a more massive sun caused planets to orbit more closely. Finally, the masses for each planet could be modified in the same way.

In order to engage students in class-level discussions, it is critical that students take notes about what worked and what didn’t work during their game play. Multiple attempts are encouraged and will enrich the classroom discussions. As mentioned before, it is beneficial for peers to discuss as they are playing (Kim, Park, & Baek, 2008). In addition, it can be helpful for students to have an opportunity to have a second opportunity to explore their game after having time to discuss game play and patterns noted as a whole class.

Further information and examples will be provided in the HICE 2017 conference presentation.
Conclusion

While *Universe Sandbox*² is an unusually accurate simulation game, it still fails as a perfect depiction of the system it models. *Universe Sandbox*² cannot incorporate gravitational waves, and gravity propagates instantaneously rather than at the speed of light within the simulation (Seiler, 2016). Furthermore, since n-body problems are notoriously computationally intensive, the simulation is condensed down to a series of 2-body problems when running at high-time steps (“Working through the n-body problem,” 2016). This enables the game to run more smoothly at the cost of accuracy. However, this is not surprising as all models of real-world phenomena are inevitably incomplete (Jonassen, 2006). This is not to suggest that simulations are therefore devoid of pedagogical value; in fact, the inaccuracy of COTS games can often be an educational asset. One leading example of a COTS game that incorporated the notion of biological evolution with significant flaws managed to bolster students’ understanding of the topic when educators challenged the class to articulate how the game’s depiction of evolution contrasted with the academic consensus (Poli, et al., 2012). Additional examinations of the same game, called Spore, further supported the benefits of tasking students with refuting inaccuracies, especially those that have the potential to reinforce pre-existing misconceptions (Bean, Sinatra, & Schrader, 2010; Cavanagh, 2008; Herrero, et al., 2014). Therefore, when paired with instructional techniques that highlight and refute the biases or inaccuracies that are embedded in the game, even flawed simulations possess the ability to enhance students’ educational experience.
